S. CERULESCENS, *Poir. Dict.* vii. 350; *Camb. Monog. in Ann. Sc. Nat.* i. 374; *DC. Prodr.* ii. 544, brought from India by Sonnerat, with axillary panicles, is unknown, but as Sonnerat was never in any part of India where *Spiræa* is indigenous, his plant is possibly the garden *S. cantoniensis*, Lour.

S. CORYMBOSA, Roxb. *Fl. Ind.* ii. 512. *S. chamædrifolia*, L. ? *Wall. Cat.* 701, is *S. CANTONIENSIS*, Lour., a native of China only (see Benth. *Fl. Hong Kong*, 105) and not of the N. of India.

8. **RUBUS**, Linn.

Creeping herbs or erect or sarmentose shrubs, almost always prickly. *Leaves* alternate, simple or compound; stipules free or adnate to the petiole. *Flowers* in terminal and axillary corymbose panicles, rarely solitary, white or red. *Calyx-tube* broad; lobes 5, persistent. *Petals* 5. *Stamens* many. *Disk* coating the calyx-tube. *Carpels* many, on a convex receptacle; style subterminal; ovules 2, collateral, pendulous. *Drupe*s many, 1-seeded, crowded upon a dry or spongy

conical or cylindric receptacle. *Seed* pendulous.—**DISTRIB.** Abundant in the northern hemisphere, rare in the southern; species 100.

A genus of which the western European species are notoriously difficult of discrimination, as are some of the Himalayan.

SERIES 1. Leaves simple, undivided or lobed.

* Herbs with creeping or prostrate stems.

1. **R. calycinus**, *Wall. in Don Prodr.* 235; *Cat.* 737; eglandular, stem and petioles hirsute and prickly, leaves orbicular-reniform obscurely lobed toothed hairy above glabrous beneath except on the prickly nerves, flowers axillary, calyx densely prickly, lobes deeply toothed. *R. lobatus*, *Wall. MSS.* *Dalibarda calycina*, *DC. Prodr.* ii. 568.

Central and Eastern temperate Himalaya; NIPAL, *Wallich.* SIKKIM alt. 6–9000 ft. BHOTAN alt. 8500 ft. KHASIA Mts. alt. 4–5000 ft.

Almost black when dry; prickles slender, slightly curved on stem and petioles. *Stem* creeping for 1–3 ft. *Leaves* 1–3 in. diam., sometimes hairy beneath; petiole 2–4 in.; stipules $\frac{1}{4}$ – $\frac{1}{2}$ in., broadly ovate, serrate. *Flowers* 1 in. diam., solitary or twin, usually on erect 1–2-leaved shoots. *Calyx-tube* densely clothed with long straight prickles; lobes foliaceous, broad. *Petals* shorter than the calyx-lobes, erect in fruit. *Fruit* globose of few large scarlet fleshy carpels; stone rugose.—Very near a Philippine Island species which has stipules cut into narrow lobes and smaller flowers.

** Shrubs, erect sarmentose or climbing.

† *Leaves oblong, entire (obscurely lobulated in R. assamensis); stipules pectinate (except in R. acuminatus and Griffithii).* *Carpels* few, 6–12.

2. **R. acuminatus**, *Sm. in Rees Cyclop.* xxx. *Rubus* 43; eglandular, quite glabrous, prickles very few scattered curved, leaves ovate or lanceolate caudate-acuminate doubly serrate, flowers small corymbose long pedicelled, corymbs axillary and in elongated terminal panicles, bracts setaceous glandular, calyx-lobes ovate glabrous with pubescent margins, carpels about 8. *Wall. Cat.* 726. *R. oxyphyllus*, *Wall. Cat.* 7110. *R. betulinus*, *Don Prodr.* 233. *R. triflorus*, *Ham. MSS.*

Central and Eastern temperate Himalaya from KUMAON, *Blinkworth*, and NEPAL to SIKKIM, alt. 4–7000 ft. KHASIA Mts. alt. 4–5000 ft.

Scandent. *Branches* long, arching, cylindric; prickles very small, flattened, rarely on the petioles. *Leaves* 3–5 in., rather membranous; base rounded; nerves 6–8 pair; petiole slender, $\frac{1}{2}$ – $\frac{3}{4}$ in.; stipules slender, almost setaceous, glandular. *Panicles* sometimes a foot long; bracts small. *Flowers* $\frac{1}{2}$ in. diam., in threes or fives; pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx-lobes* with recurved or hooked sometimes dorsal tips, erect in fruit. *Petals* much shorter than the calyx, white. *Carpels* glabrous. *Fruit* of large globose scarlet drupes enclosed by the calyx, receptacle villous, stone rugose.

3. **R. Griffithii**, *Hook. f.*; eglandular, branches and leaves glabrous, prickles few scattered curved, leaves oblong-lanceolate caudate acuminate doubly serrate, panicles axillary and terminal elongate, flowers sessile scattered or crowded, bracts linear-oblong serrate, calyx hoary with appressed down.

Eastern Himalaya; SIKKIM, *Herb. Griffith.*

Very similar to *R. acuminatus* in foliage, but with very short petioles, a totally different inflorescence, the flowers never in corymbs or fascicles, a densely tomentose calyx, and linear serrated bracts.—I have seen but one specimen, which is in bud only. Possibly the locality is erroneous, as Griffiths' collections were in great confusion and it was often difficult to decipher the localities.

4. **R. hexagynus**, *Roxb. Hort. Beng.* 39; *Fl. Ind.* ii. 516; eglandular,

pubescent tomentose or glabrate, prickles short stout recurved, leaves oblong obtuse acute or acuminate serrate, stipules pectinate, panicles terminal, bracts tomentose pectinate not exceeding the buds, calyx hoary with white down, petals small, carpels 6. *Wight & Arn. Prodr.* 299; *Wall. Cat.* 725 in part; *R. indicus*, *Lesch. in DC. Prodr.* ii. 568. *R. pyrifolius*, *Herb. Ind. Or. Hook. f. & T. in part, not of Smith*; *Kurz For. Flor. Brit. Burm.* i. 436.

ASSAM, SILHET and the KHASIA Mts. ascending to 4500 ft. Katchyen hills, AVA, *Kurz*.—DISTRIB. YUNAN.

Climbing; stem as thick as the arm; prickles flattened. *Leaves* $1\frac{1}{2}$ –4 in., usually cordate at the base, glabrous above, beneath pubescent or tomentose wholly or on the nerves only, usually rugose when dry, not shining; nerves 8–10 pair, spreading and arched; midrib beneath prickly; petiole short, $\frac{1}{4}$ in., stout, tomentose; stipules white and hoary, with no lamina. *Panicles* large and spreading, densely white-tomentose; bracts $\frac{1}{8}$ – $\frac{1}{4}$ in. *Flowers* $\frac{1}{3}$ – $\frac{1}{2}$ in. diam. *Calyx-lobes* erect in fruit, villous within, entire, rarely 3-fid at the tip. *Petals* linear, white, shorter than the calyx. *Carpels* glabrous, with very slender styles. *Fruit* of 1–6 large red-purple drupes; receptacle villous; stone rugose.—This and the following have been usually confounded with the Java *R. pyrifolius* which has shorter leaves with fewer and more oblique nerves.

5. ***R. Hamiltoni***, *Hook. f.*; eglandular, glabrous or pubescent, prickles short stout recurved, leaves oblong-ovate or -lanceolate acuminate serrate, stipules pectinate, panicles terminal, bracts glabrous pectinately laciniate far exceeding the buds, calyx with appressed hairs, tips of lobes long acuminate usually laciniate, petals small, carpels 6. *R. pyrifolius*, *Ham. in Herb. Wall. not of Smith*; *Wall. Cat.* 725 in part.

Central and Eastern tropical Himalaya; BHOTAN alt. 5000 ft., *Griffith*; SIKKIM alt. 2–3000 ft., *J. D. H.* ASSAM, *Hamilton, Masters, &c.*

Very similar to *R. hexagynus*, but readily distinguishable by its brown colour when dry, usually narrower and more acuminate leaves, less tomentose inflorescence, which is nearly black when dry, and by the very large pectinately laciniate curved bracts which are membranous and curving over the young buds give a curiously crinite appearance to the immature panicles; the sepals also have usually longer tips split into setaceous lobes. *Fruit* as in *R. hexagynus*.

6. ***R. assamensis***, *Focke Batogr. in Abhandl. Naturwiss. Verein, Bremen*, iv. 197 (1874); eglandular, branches petioles and panicles villous with soft spreading hairs, prickles very few short, leaves oblong or ovate-oblong very obscurely lobed acuminate toothed hairy above hoary with whitish down beneath, nerves 5–6 pairs, petioles very short, panicles triangular, flowers small, calyx-lobes tomentose, carpels 10–12 glabrous. *Rubus* 20 *Herb. Ind. Or. H. f. & T.*

MISHMI HILLS, *Griffith*, and KHASIA Mts. at Syong, alt. 5500 ft., *H. f. & T.*

An erect whitish shrub; prickles hooked. *Leaves* 3–4 in., acute or obtuse at the base, rarely subcordate, nerves very oblique, margins sometimes without trace of lobing; petiole $\frac{1}{4}$ in.; stipules woolly, small, pectinately pinnatifid. *Panicles* as broad as long, shortly pyramidal; pedicels short; bracts small, cleft half way into setaceous lobes. *Flowers* $\frac{1}{3}$ in. diam., white. *Calyx-lobes* ovate, long-acuminate, usually quite entire, erect in fruit, inner surface glabrous with a broad tomentose margin. *Petals* wholly absent in Khasia specimens. *Carpels* with a few long hairs and very long styles. *Fruit* (in Mishmi specimens) globose, hardly exceeding the calyx; drupes few; receptacle villous; stone pitted.

†† *Leaves lobed at the sides towards the base, normally longer than broad; stipules pectinate. Carpels many.*

7. ***R. glomeratus***, *Blume Bijl 1111*; eglandular, branches slender and leaves beneath tomentose with white or buff down, prickles minute, leaves ovate-cordate acuminate 3–5 lobed, the lateral lobes near the base of the leaf very

shallow toothed, flowers in small axillary and terminal eglandular downy panicles, calyx-lobes villous quite entire, petals obovate equalling the calyx, carpels many. *R. Hasskarlii*, *Miquel, Flor. Ind. Bat. i. pars*, 381. *R. acerifolius*, *Wall. Cat. 744*.

PENANG, *Wallich, Maingay*.—DISTRIB. Java, Borneo, Philippines.

This resembles a slender narrow leaved small-flowered state of *R. moluccanus*, but may at once be distinguished by the narrow leaves, lobed on each side towards the base only. The flowers are small ($\frac{1}{2}$ in. diam.) usually in loose panicles, the stipules and bracts laciniate.—I have seen in Mr. Clarke's collection a small specimen very like this from the Khasia Mts., alt. 4500 ft., but it is so difficult to distinguish imperfect specimens of this from the *paniculatus* and *moluccanus*, var. *micropetalus*, that I hesitate to include the habitat of Khasia.

8. ***R. paniculatus***, *Smith in Rees Cyclop. xxx. Rubus 41*; eglandular, branches slender, leaves beneath and panicles clothed with white or buff cottony tomentum, prickles very few minute, leaves ovate-cordate or oblong-ovate caudate-acuminate obscurely lobed toothed, nerves 5-7 pair, panicles terminal very lax and much branched, bracts linear-oblong serrate, calyx-lobes silky usually entire, petals very small linear-oblong, carpels many glabrous. *Wall. Cat. 749*. *R. tiliaceus*, *Sm. l. c.*; *Wall. Cat. 745*.

Temperate Himalaya from RAJAORI, alt. 3-7000 ft. to SIKKIM, alt. 6-8000 ft. KHASIA Mts. alt. 4-5000 ft.

A very rambling climber; all parts except the leaves above densely pubescent or tomentose, with usually cottony white or buff tomentum; prickles hooked, flattened, *Leaves* 3-5 in., rarely as broad as long, rather membranous, sparsely hairy above, lateral lobes usually very obscure; midrib without prickles; petiole 1-2 in., slender, rarely with a prickle; stipules small, laciniate. *Panicles* very large and open; bracts small. *Flowers* $\frac{3}{4}$ -1 in. diam., often long pedicelled. *Calyx-lobes* ovate, acute acuminate or lanceolate and caudate-acuminate, when they are often incised towards the tip, erect in fruit. *Petals* much smaller than the calyx-lobes, white. *Carpels* glabrous. *Fruit* globose, exposed; drupes many, large, black; receptacle villous; stone rugose.

9. ***R. insignis***, *Hook. f.*; eglandular, clothed with buff cottony tomentum, prickles numerous short, leaves hastate-oblong acuminate toothed lobulate towards the base, nerves 12-15 pair, panicles very long lax open prickly, petals broadly obovate equalling the silky entire calyx-lobes, carpels numerous glabrous.

Eastern tropical Himalaya; BHOTAN, *Griffith*. KHASIA Mts. alt. 2-3000 ft., *J. D. H. & T. T.*; *C. B. Clarke*.

A very noble species, with the habit of *R. paniculatus*, but much larger in all but the flowers, and at once distinguished by its prickles, which extend along the petiole and midrib of the leaf beneath, by the numerous nerves, and large almost orbicular petals. Bhotan specimens have the flowers crowded at the end of the long branches of the panicle, whilst in the Khasia ones the branches are open and exceedingly lax to the end. Fruit as in *R. paniculatus*.

10. ***R. ferox***, *Wall. Cat. 724*, eglandular, tomentose, prickles on the stem numerous short stout, leaves cordate sharply toothed upper ovate-lanceolate entire lower more orbicular shortly 5-7-lobed glabrous above pubescent or glabrate beneath, panicles lax-flowered, margins of calyx-lobes pectinate, petals broad, carpels about 8. *Kurz, For. Flor. Brit. Burm. i. 437*.

Central Himalaya; NEPAL, *Wallich*. KHASIA Mts., alt. 3-4000 ft., *Griffith, &c.* BURMA, probably Ava, *Kurz*.

Very robust; stem and especially inflorescence and petioles densely tomentose; prickles hooked, compressed. *Leaves* not white or buff beneath; lower 3-5 in. long and broad; lobes deltoid, acute; nerves palmately spreading; petiole 1-2 in., densely

tomentose, often prickly; stipules and bracts pectinately pinnatifid. *Flowers* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam. *Calyx-lobes* broadly ovate, acute, with 2–5 long marginal teeth, densely tomentose, almost villous, erect in fruit. *Petals* as long as the calyx, white. *Filaments* hairy. *Carpels* numerous, glabrous. *Fruit* of 20–30 small drupes, stone wavy on the surface.

A specimen from Birma? in Griffith's Herb. is more glabrous with more slender petioles. *R. Finlaysonianus*, Wall. Cat. 7109, from Siam, known only from a fragment in bud, differs in the apparently entire calyx-lobes clothed with buff tomentum.

††† *Leaves* normally broader than long, palmately 5–7-lobed; stipules pinnatifid or pectinate. *Carpels* many.

11. ***R. moluccanus***, Linn.; DC. Prodr. ii. 566; eglandular, tomentose villous or sublanate, prickles scattered short curved, leaves long-petioled usually deeply cordate broad ovate or orbicular obtusely or acutely 3–7-lobed toothed smooth scabrid or rugose above, beneath clothed with grey or yellow wool or pubescence, panicles axillary and terminal, calyx villous and silky, lobes lanceolate or ovate acute entire or with pectinate margins, carpels very many.—*Roxb. Fl. Ind.* ii. 518; *Miq. Fl. Ind. Ind. Bat.* i. part 1, 382; *Wall. Cat.* 743; *Kurz For. Flor. Brit. Burm.* i. 437. *R. rugosus*, Smith in Rees Cyc. xxx. *Rubus* 34; *Don Prodr.* 234; *Wight et Arn. Prodr.* 299; *Dalz. & Gibs. Bomb. Flor.* 89; *Thwaites Enum.* 101; *Wight. Ic.* t. 225; *Wall. Cat.* 743; *Plant. As. Rar.* iii. 19, t. 234 (*Hamiltonianus*). *R. alceaefolius*, Poir. *Encycl.* vi. 247. *R. micropetalus*, macrocarpus, and Fairholmianus, *Gardner in Calc. Journ. Nat. Hist.* viii. 6. *R. cordifolius*, *Don Prodr.* 233. *R. reflexus*, *Ker in Bot. Reg.* 461; *Benth. Hong-Kong Flor.* 104. *R. Hamiltonianus*. *Seringe in DC. Prodr.* ii. 566.—*Rumph. Amboin.* v. 88, t. 47, f. 2.

Central and Eastern tropical and temperate Himalaya. NEPAL, Wallich. SIKKIM, alt. 3–7000 ft. ASSAM; KHASIA MTS., alt. 3–5000 ft. BURMA. EASTERN PENINSULA. WESTERN PENINSULA or the Ghats from Bombay Southward. CEYLON ascending to 7000 ft.—DISTRIB. Malay Archipelago and Islands.

Stem very robust, with wide spreading subscent branches, densely clothed with white grey or fulvous tomentum; prickles hooked, flattened. *Leaves* 2–10 in. diam., most variable in texture and pubescence; upper surface smooth or covered with tubercles answering to the spaces between the nervules; under pubescent villous or clothed with cottony wool, grey or green or buff-coloured, never quite white; petiole 2–4 in., glabrate or tomentose; stipules variable in size, oblong, toothed pinnatifid lacinate or pectinate. *Inflorescence* usually clothed with silky buff tomentum, rarely white or glabrate. *Flowers* very variable in size, from $\frac{1}{2}$ –1 in., in rather contracted terminal panicles and axillary capitate clusters; bracts like the stipules, never bearing gland-tipped hairs. *Calyx-lobes* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, usually triangular-ovate, rarely lanceolate, and then pinnatifid in the upper part, erect in fruit. *Petals* obovate, white, shorter than the calyx-lobes. *Filaments* glabrous. *Carpels* numerous, glabrous. *Fruit* globose, succulent, of many scarlet small drupes; receptacle villous; stone rugose.

I am quite unable to arrange the form of this common and protean plant under recognisable varieties answering to its synonymy. The original *R. moluccanus*, founded on the plate and description of Rumphius, has leaves with a rugose upper surface (folia superne quam maxime rugosa) and a whitish or ochreous under surface. I have it from Assam, the Khasia Mts., Penang and Java; and with the lobes rather acute from Nepal and almost all localities, where it becomes *R. rugosus*, Sm., described as such by Wallich (Plant As. Rar.), and figured under its synonym *R. Hamiltonianus*. Specimens with acuminate leaf-lobes occur at considerable elevations in the Himalaya and Khasia Mts., where the leaves also become more membranous and very large with pale undersurface; at similar elevations and localities large leaved states occur with very large flowers, and lanceolate sepals $\frac{3}{4}$ in. long. The branches and inflorescence of Malacca specimens are most densely

villous with spreading hairs and the basal leaf-lobes overlap. The Western Ghat specimens have the leaves rugose above and thin, and the branches and inflorescence densely clothed with firm buff cottony tomentum. This is also the case with the Ceylon specimens, of which Thwaites distinguishes 4 varieties:—*α*. bracts ovate entire or cut at the tip, fruit small red (Wight. Ic. t. 225); *β*. leaves smaller narrower more acute, stipules and bracts cut into filiform segments, petals small, fruit dark red (*R. micropetalus*, Gard.); (I should refer this to *glomeratus*, Bl.); *γ*. tomentose, pale, leaves very rugose and coriaceous, stipules and bracts less deeply cut, panicle dense, calyx-lobes ovate-lanceolate toothed, fruit dark red (*R. Fairholmianus*, Gard.); *δ*. prickles short, stipules and bracts less cut, panicles few-flowered, flowers larger, petals about equalling the calyx, fruit larger black (*R. macrocarpus*, Gard.); of these *α*. only inhabits low grounds.

12. ***R. reticulatus*, Wall. Cat. 747**; eglandular, pubescent with white tomentum, prickles few minute or 0, leaves cordate-orbicular subacutely 5-7-lobed reticulated on both surfaces finely downy beneath, panicles entire or lacinate ovate acute, calyx-lobes densely tomentose, fruit globose much larger than the calyx.

Temperate Himalaya; from KUMAON, alt. 7-8000 ft., to SIKKIM, alt. 9-10,000 ft.

This I expect will prove another form of *R. moluccanus* from a higher region, the leaves of the Kumaon and Sikkim specimens are large broad and rather thin in texture; Wallich's Nepal ones are more coriaceous, narrower and elongate with many lateral lobes, more like those of *R. paniculatus*, to which Wallich says it is 'valde affinis.' Sikkim specimens have the cut calyx-lobes. The fruit is very large.

13. ***R. lanatus*, Wall. Cat. 746**; glandular, branches and leaves beneath white cottony, leaves cordate orbicular-ovate acute obscurely lobed serrate glabrous or hairy above, panicles short dense densely villous and covered with gland-tipped hairs, petals small narrowly linear-oblong, carpels numerous. *R. tiliaceus*, *Herb. Str. & Winterb.*

Central and Western temperate Himalayas. NEPAL, Wallich. KUMAON, alt. 5-8000 ft., *Madden, Strach. and Winterb.*

The very broadly ovate cordate obscurely lobed leaves, white cottony tomentum, and above all the long glandular hairs of the young shoots and inflorescence best distinguish this species, which has the other characters of *R. moluccanus*. It may be likened to a dense-flowered glandular *R. paniculatus*, with broader leaves.

14. ***R. birmanicus*, Hook. f.**; eglandular, branches petioles and leaves densely clothed with long spreading flexuous hairs, prickles very copious hooked, leaves acutely palmately 5-lobed crenate rugose above white with appressed down beneath, stipules and bracts cut into long capillary lobes, flowers large, calyx-lobes broad, petals orbicular, carpels excessively numerous.

BIRMA; in the Patkaye hills, E. of the Assam frontier, *Griffith.*

Branches flexuous, hairs red brown when dry; prickles stout recurved flattened extending to petioles and nerves beneath, but not to the panicle, compressed. *Leaves* 3-4 in. diam., rather coriaceous, lobes extending nearly half way down, triangular, dark above when dry with pubescent nerves, dirty brownish white beneath; petiole $1\frac{1}{2}$ in., stout; stipules $\frac{1}{2}$ in., as broad as long across the almost capillary divisions. *Panicle* (in bud only) narrow with short branches, and bracts as large as the stipules; buds very broadly ovoid, densely tomentose but not hairy like the peduncles and pedicels. *Calyx-tube* hemispheric, lobes broad subacute, entire. *Petals* equalling the calyx-lobes, clawed. *Stamens* excessively numerous, in many series. *Carpels* upwards of 100, glabrous, styles very slender with a few hairs on the stigma; receptacle villous.—A very remarkable species.

15. ***R. Treutleri*, Hook. f.**; more or less glandular, softly tomentose with spreading flexuous hairs, prickles slender nearly straight, leaves orbicular-

cordate with 5-7 shallow crenate lobes, stipules leafy pectinate, flowers large solitary clustered or in short panicles, bracts leafy persistent, petals orbicular small, carpels very numerous hairy.—*Rubus* No. 24, *Hook. f. & Thoms. Herb. Ind. Or.*

Eastern temperate Himalaya; SIKKIM, alt. 7-10,000 ft., *Dr. Treutler*.

A large leafy erect bush, with often glandular bristles mixed with the soft flexuous hairs that cover all parts more or less; prickles passing into bristles, sometimes slightly decurved. *Leaves* 2-6 in. diam., membranous, green, with scattered hairs above; lobes shallow, rounded or acute, crenatures acute; petiole short or long and slender, sometimes 3 in.; stipules $\frac{1}{2}$ in., almost orbicular in outline, concave, green. *Flowers* $\frac{3}{4}$ -1 in. diam., shortly pedicelled; bracts sometimes reduced to narrow segments. *Calyx-tube* hemispheric, villous and often bristly; lobes large, often leafy and laciniate, or pectinately pinnatifid. *Petals* nearly orbicular, much smaller than the calyx, white or pink. *Stamens* very numerous. *Carpels* about 100. style very slender, stigma hairy.—This and *R. birmanicus* belong to the group with *R. Hookeri*, all having very numerous carpels and dry fruits.

SERIES II. Leaves digitately or pedately 3-5-foliolate.

* *Leaves glabrous or nearly so beneath.*

16. ***R. fragarioides***, *Bertoloni Miscell.* xxii. 16, t. 5; herbaceous, unarmed, stem petioles and peduncles faintly pubescent, leaflets 3 or 5 obovate or orbicular with a cuneate base lobulate quite glabrous, lobules with acute sinus and coarse teeth, calyx-tube glabrous, lobes ovate-lanceolate quite entire.

Eastern Temperate Himalaya in swamps; SIKKIM, alt. 10-13,000 ft., *J. D. H., C. B. Clarke*.

A very small species; stem chiefly subterranean, slender, woody, sending up very short floriferous branches bearing one or two pedately 3-5-foliolate leaves. *Leaflets* membranous, contracted into the 1-3 in. very slender petiole; stipules $\frac{1}{4}$ in., broadly ovate, obtuse, toothed or quite entire. *Flowers* $\frac{3}{4}$ in. diam., white, peduncle $\frac{1}{2}$ -1 in. slender. *Calyx-tube* glabrous; lobes acuminate, tips slender. *Petals* obovate, acute. *Carpels* about 5, not seen ripe.—Very near to *R. triflorus*, Richards. *β. japonica* of Japan; see Maximovicz Diagnoses, Dec. x. 375.

17. ***R. alpestris***, *Blume, Bijd.* 1108; erect, nearly glabrous, calyx and stipules eglandular, prickles small scattered, leaflets 3-5 elliptic narrowed at both ends acutely crenate-serrate, stipules linear-lanceolate, flowers 1-3 terminal on slender peduncles, calyx prickly, lobes caudate, carpels many glabrous. *Miquel, Fl. Ind. Bat.* i. part 1, 378. *R. pentagonus*, *Wall. Cat.* 731.

Temperate Himalayas; from GARHWAL, alt. 7-8000 ft., to SIKKIM, alt. 8-10,000 ft.—DISTRIB. Java.

A straggling shrub, with the young parts pubescent; stem stout, cylindric; prickles few, short, slightly curved. *Leaflets* 2-4 in., membranous, subsessile; terminal the largest, lateral often oblique; nerves 7-10 pair, slender, arched, sometimes faintly pubescent beneath; petiole 1-2 in., sometimes pubescent, usually armed; stipules small, membranous, usually glandular. *Flowers* $\frac{3}{4}$ -1 in. diam., usually solitary, rarely 3-nate; peduncles armed or not, more or less pubescent and glandular. *Calyx* armed, rarely unarmed, densely pubescent or glabrate; lobes often $\frac{1}{2}$ in. pubescent in the outer margins and within, suberect in fruit. *Petals* white, orbicular, shorter than the calyx. *Stamens* 1-seriate. *Fruit* globose; drupes 12-15, large, glabrous, stone rugose.

18. ***R. Thomsoni***, *Focke Batogr. in Abhandl. Naturwiss. Verein, Bremen* iv. 198; prostrate, slender, eglandular, prickles few very small, leaflets 3 broad-ovate acuminate two lateral much the smallest crenate or serrate very

membranous, stipules filiform, flowers axillary solitary or in very short racemes or panicles, calyx unarmed, lobes acute or caudate, carpels many pubescent.

SIKKIM HIMALAYA, alt. 8-11,000 ft., *J. D. H.*, &c.

A slender trailing species, nearly glabrous or with pubescent branches petioles peduncles and nerves of the leaflets beneath, rarely above. *Leaflets* very membranous, terminal 2 in., often rhomboid-ovate, contracted at the base; lateral usually not half the size, petiolate; petiole slender, 1-2 in., with few prickles; stipules entire or divided. *Flowers* $\frac{1}{2}$ - $\frac{1}{2}$ in. diam., peduncles and pedicels short. *Calyx-tube* nearly glabrous; lobes pubescent, sometimes produced and leafy, suberect in fruit. *Petals* small, orbicular, red. *Fruit* globose; drupes many, pale red, pubescent; stone minutely pitted.

** *Leaves silky beneath.*

19. ***R. lineatus***, *Reinw. in Blume Bijl.* 1108; eglandular, prickles 0 or few small scattered, leaflets 3 or 5 elliptic oblong or lanceolate ciliate-serrate caudate-acuminate, beneath with many straight nerves and dense silky silvery tomentum, calyx-lobes ovate acuminate silky. *Miquel Fl. Ind. Bat. i. part i.* 378. *R. pulcherrimus*, *Hook. Ic. Pl.* t. 729-730.—*Rubus Sp.*, *Clarke in Journ. Linn. Soc.* xv. 141.

SIKKIM HIMALAYAS, alt. 6-9,000 ft.—DISTRIB. JAVA.

A strong suberect herb; branches softly pubescent, young silky; prickles when present straight. *Leaflets* 3 or 5, 4-5 by $\frac{1}{2}$ -2 $\frac{1}{2}$ in., subsessile, coriaceous, acuminate or cuneate at the base, often doubly-serrate, upper surface glabrous ribbed, under shining with 20-30 straight nerves on each side, one to every tooth; petiole 1-2 in., pubescent; stipules $\frac{3}{4}$ -1 in., membranous, ovate-oblong, obtuse, entire, glabrate. *Flowers* in axillary short heads and terminal elongate silvery panicles, $\frac{2}{3}$ -1 in. diam.; bracts large, concave, orbicular, membranous. *Petals* obovate, shorter than the calyx, white. *Drupe*s numerous, small, red, stone rugose.—Very variable in the size of the flowers and breadth of the leaflets.

VAR. 1. *angustifolia*; smaller, leaflets much narrower.

VAR. 2. *glabrior*; leaflets silky beneath on the nerves only. MISHMI, *Griffith*.

20. ***R. Andersoni***, *Hook. f.*; glandular, unarmed, young shoots petioles and inflorescence hispid with spreading gland-tipped hairs, leaflets 3 or 5 elliptic or elliptic-oblong caudate-acuminate ciliate-serrate, beneath with many straight nerves and dense silvery silky tomentum, calyx-lobes triangular-lanceolate caudate. *Rubus Sp.*, *Clarke in Journ. Linn. Soc.* xv. 141.

SIKKIM HIMALAYA, alt. 7-8000 ft., *J. D. H.*, *Anderson*.

Very similar in foliage to broad-leaved states of *R. lineatus*, but at once distinguished by the almost setose purple gland-tipped spreading hairs, the long caudate-acuminate calyx-lobes which are also setose, and flowers in terminal broad panicles with long pedicels. It is a very rare plant; I gathered it near Darjeeling, as did Mr. C. B. Clarke, and on Sinchul. Dr. Anderson's specimens are stated to be from Punkabarri in a hot region, but I suspect some error.

SERIES III. Leaves pinnately 3-foliolate.

* *Stems slender creeping or prostrate.*

21. ***R. saxatilis***, *Linn.*; *Boiss. Flor. Orient.* ii. 691; eglandular, glabrous or slightly pubescent, prickles few slender straight, leaflets 3 rhombic-ovate somewhat lobed acutely doubly-toothed, calyx unarmed, lobes ovate-lanceolate acute longer than the narrow petals, carpels few glabrous.

Western temperate Himalayas in the Tibetan region from KASHMIR to KUMAON, alt. 10-11,000 ft. WESTERN TIBET, *Dras*, alt. 10,000 ft.—DISTRIB. Caucasus and westward to the Atlantic, Siberia, Dahuria.

Stems annual from a stout woody rhizome, short, erect. *Leaflets* 2-3 in., membranous, the lateral subsessile with cuneate bases and often a lobed outer margin; petiole very slender, 3-5 in.; stipules linear or linear-oblong. *Flowers* $\frac{1}{2}$ in. diam., 1-4, shortly pedicelled on the top of a slender axillary peduncle. *Calyx-tube* short, glabrous, unarmed; lobes lanceolate, erect in fruit. *Petals* white, small, slender. *Fruit* with few large scarlet drupes; stone reticulated.

22. **R. nutans**, Wall. Cat. 738; eglandular, unarmed, stem petioles peduncles and calyx-tube clothed with flexuous hairs or bristles, leaflets 3 orbicular or subrhomboidal obscurely lobed acutely doubly toothed, calyx-lobes large caudate-acuminate pinnatifid towards the tips, shorter than the obovate petals, carpels few glabrous. Hook. Bot. Mag. t. 523; Edgworth in Trans. Linn. Soc. xx. 45.

Temperate Himalayas, from GARHWAL and KUMAON, alt. 8-10,000 ft.

Stems as thick as a sparrow quill, 1-2 ft. long from a woody rootstock; hairs rather stiff, red-brown when dry. *Leaflets* $1\frac{1}{2}$ -3 in. long and broad, membranous, glabrous and dark-green above, hairy along the nerves beneath, base cuneate, lateral shortly petiolulate; petiole 2-4 in.; stipules large, broadly ovate or oblong, entire or toothed. *Flowers* usually solitary, axillary, $1\frac{1}{2}$ in. diam.; peduncle stout. *Calyx-tube* villous, lobes $\frac{3}{4}$ - $\frac{1}{2}$ in. *Fruit* of few scarlet drupes; stone smooth.

VAR. *nepalensis*; more slender, smaller in all its parts, leaflets $\frac{1}{2}$ - $1\frac{1}{2}$ in., flowers $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., calyx lobes acuminate, not quite entire.—East Nepal, Tambur River, alt. 9000 ft., J. D. H.

23. **R. Fockeanus**, Kurz in Journ. As. Soc. Beng. 1875, ii. 206; eglandular, unarmed, stem petioles and peduncles pubescent, leaflets orbicular finely toothed, nearly glabrous on both surfaces, flowers solitary, calyx-tube glabrous or sparsely setose, lobes ovate-lanceolate quite entire.

Eastern temperate Himalaya; SIKKIM on the Lachong River and Phullalong and Singalelah, alt. 10-14,000 ft. J. D. H., C. B. Clarke.

Stems wholly procumbent, widely creeping, slender, very sparingly pubescent. *Leaflets* $\frac{3}{4}$ -1 in. diam., not shining above, and with very few hairs on the nerves beneath, lateral petiolulate; petiole 1 in.; stipules $\frac{1}{4}$ in., oblong, obtuse, toothed or quite entire. *Flowers* on very short lateral shoots; peduncle exceeding the petiole. *Calyx* $\frac{1}{2}$ in. across the lobes, tube almost glabrous, lobes acuminate. *Petals* not seen. *Fruit* a few red drupes; stone quite smooth.—The small size, absence of long hairs, opaque foliage and smooth stone of the drupes distinguish this at once from *R. nutans*.

24. **R. Hookeri**, Focke Batogr. in Abhandl. Naturwiss. Verein Bremen, iv. 197 (1874); stem petioles and inflorescence pubescent with copious soft hairs and glandular bristles, prickles few straight, leaflets 3 large rhomboid-ovate or orbicular caudate-acuminate lobulate and toothed, stipules pectinate, flowers large solitary and in few-flowered axillary panicles, calyx hispid, lobes with filiform points, carpels very numerous. *R. macrocarpus*, Kurz MSS., Clarke Journ. Linn. Soc. xv. 141.

Eastern temperate Himalaya; SIKKIM, alt. 7-9000 ft.

A low shrub, almost hispid with gland-tipped hairs, prickles slender. *Leaflets* petiolulate, often subequal, 2-5 in., bright green, bases acute or rounded, upper surface glabrous with pubescent nerves, under also glabrous with hairy nerves; petiole 2-3 in.; stipules orbicular or broadly oblong, foliaceous, recurved, villous. *Flowers* $1\frac{1}{2}$ -2 in. diam., with often persistent foliaceous pectinate bracts. *Calyx* pubescent, bristly, lobes 1 in., triangular-ovate, often lacinate, spreading in fruit. *Petals* much smaller than the calyx, orbicular, greenish-white. *Stamens* very numerous. *Carpels* in a dense cluster of 2-300 or more, and base of long filiform conniving styles, vil-

lous. *Fruit* globose, $\frac{3}{4}$ in. diam.; outer carpels dry, glabrous below villous above, imbricating over the inner succulent carpels; endocarp pitted; receptacle broad, hemispherical, velvety, intruded at the base.

**** Stems erect sarmentose or climbing.**

25. R. niveus, Wall. Cat. 734; eglandular, bristles 0, branches and petioles glabrous or tomentose, prickles recurved, leaflets 3 (rarely 5) coarsely or finely double-toothed lateral obliquely ovate acuminate terminal elliptic ovate or rounded lobulate or lobed, glabrous above, usually white with dense pubescence beneath, stipules filiform, flowers in lateral and terminal few-flowered tomentose corymbs, calyx-lobes acuminate or caudate, petals small obovate pink, carpels many villous. *R. gracilis*, Roxb. Cat. Hort. Beng. 39; *Fl. Ind.* ii. 519.

Temperate Himalaya, from KASHMIR to BHOTAN, at elevation of 6-10,000 ft. in the west and 5-11,500 ft. in the east.

A large rambling bush, without bristles or gland-tipped hairs; very variable in all its parts. *Stem* stout and branches often purple, young often quite glabrous and glaucous or thickly or thinly tomentose; prickles short, scattered, pale. *Leaflets* 1-5 in., entire or lobulate, toothed or crenate, acute acuminate or caudate, terminal sometimes cordate, usually membranous and glabrous, above sometimes (*R. concolor*) green and glabrous beneath also; petiole slender, 1-2 in., with usually 1-2 prickles. *Flowers* $\frac{1}{4}$ -1 in. diam., usually on slender unarmed pedicels, lower axillary often solitary, upper, corymbosely arranged on a long peduncle, nodding; bracts filiform. *Calyx-tube* short, flat; lobes ovate-lanceolate, quite entire, $\frac{1}{4}$ - $\frac{1}{2}$ in., tomentose on both surfaces, spreading or reflexed in fruit. *Petals* much smaller than the calyx-lobes. *Stamens* very numerous. *Fruit* globose, large or small, of few or many dry or fleshy drupes; stone pitted.—Closely allied to *R. lasiocarpus*. I find it impossible to arrange satisfactorily the forms of this most puzzling plant; the following are noticeable.

VAR. *niveus* proper (Wall. Cat. 734), softly pubescent, leaflets 2-3 in. membranous ovate-lanceolate caudate-acuminate lobulate and very acutely deeply toothed, corymbs of 10-12 shortly pedicelled flowers $\frac{1}{2}$ in. diam.—Nepal and all along the Himalaya.

VAR. *pedunculatus*; more robust, leaflets 3-5 in. broader bases more rounded, flowers solitary or in pairs on slender pedicels $\frac{2}{3}$ in. diam., *R. pedunculatus*, Don Prodr. 234; Wall. Cat. 729.—Nepal, Sikkim.

VAR. *racemosus*; softly tomentose, flowers in short terminal racemes shortly pedicelled suberect. Kashmir, Jacquemont, Falconer. Murree, Fleming ("fruit large yellow brown"). Kashmir, Clarke (fruit bright red) who also has a densely cottony subvar. with abbreviated racemes (Kashmir, 8000 ft.). This resembles what a hybrid with *corylifolius* might be,

VAR. *hypargyrus*; leaflets $\frac{1}{2}$ -1 in., sometimes 5, doubly serrately-toothed membranous hoary beneath all over or on the nerves only, or quite glabrous. *R. hypargyrus*, Edgw. in Trans. Linn. Soc. xx. 45. *R. concolor*, Royle MSS. Approaches *R. lasiocarpus*.

VAR. *Aitchisoni*; slender, finely tomentose, leaflets broad membranous with very large crenatures, fruit $\frac{3}{4}$ in. diam. of very numerous orange fleshy almost glabrous drupes. Kashmir common at 7000 ft., Aitchison "fruit eatable."

VAR. *microcarpa*; branches and petiole (6 in.) nearly glabrous, leaflets 4-6 in. broad membranous lobulate and crenate, flowers $\frac{1}{2}$ in., fruit very small of 30-40 quite glabrous dry drupes.—Sikkim, Lachen, alt. 9000 ft., J. D. H.

VAR. *concolor*; leaflets as variable as any of above forms, usually membranous glabrous or nearly so beneath acutely inciso-serrate or toothed or coarsely crenate, flowers corymbosely, sepals $\frac{1}{4}$ -1 in. *R. concolor*, Wall. Cat. 733.—From Kashmir to Kumaon. This passes into var. *hypargyrus*.

VAR. *Falconeri*; similar to var. *concolor* but carpels quite glabrous!—N. W. India, Falconer. On the Kishengunga west from Kashmir, Stewart.—This connects *R. niveus* with *R. cæsius*, L.

According to priority, Roxburgh's name of *S. gracilis* should be retained for this

plant, but I am disinclined to replace so excellent, well known and suggestive a one as *niveus* for another that is in no way distinctive of the species.

26. **R. macilentus**, *Camb. in Jacquem. Voy. Bot.* 49, t. 60; nearly glabrous, eglandular, prickles stout flattened straight or hooked, leaflets 3 ovate or ovate-lanceolate obtuse acute or acuminate doubly-crenate-toothed, stipules setaceous, peduncles axillary and subterminal 1-3-flowered, carpels many glabrous. *R. uncatus*, *Wall. Cat.* 750. *R. asper*, *Hb. Royle*.

Temperate Himalaya; from HAZARA, alt. 4-6000 ft., *Stewart*, and KISHTWAR, alt. 5-9000 ft. to SIKKIM and BHOTAN, alt. 6-9000 ft.

Stems trailing, stout, red-brown, obtusely angled, shining; prickles much flattened, $\frac{1}{6}$ - $\frac{1}{4}$ in. *Leaflets* $\frac{1}{2}$ -2 in., rigidly coriaceous, brown when dry, glabrous on both surfaces, terminal usually ovate-lanceolate long-acuminate, lateral sessile, smaller, sometimes orbicular; midrib beneath with hooked prickles; petiole stiff, sometimes pubescent along the grooved upper surface. *Flowers* $\frac{1}{2}$ in. diam.; peduncles $\frac{1}{4}$ - $\frac{3}{4}$ in., pubescent, rarely 2-3-flowered. *Calyx* silky outside, tomentose within; lobes caudate, erect in fruit. *Petals* orbicular-obovate, clawed, exceeding the sepals, white. *Fruit* globose, enclosed in the calyx; drupes 20-30, yellow or red, glabrous, seated on a columnar pubescent receptacle; stone rugged.

27. **R. sikkimensis**, *Hook. f.*; glandular-hairy and covered with long straight prickles, leaflets 3 ovate acuminate lobulate and coarsely crenate glandular above nearly glabrous beneath, stipules linear, peduncles axillary 1-2-flowered, calyx glandular and hispid, lobes caudate, carpels numerous glabrous.

Subalpine SIKKIM HIMALAYA; Lachen, alt. 12-13,000 ft., *J. D. H.*

A small shrub, dark brown when dry; stems stout; gland-tipped hairs long spreading, half as long as the quite-straight shining prickles. *Leaflets* 1-2 in., terminal, sometimes deltoid-ovate, base rounded or subcordate, lateral subsessile, smaller, narrower; petiole 1-3 in., very slender, pubescent; stipules $\frac{1}{2}$ in. *Peduncles* $\frac{1}{4}$ -1 in., pubescent glandular and bristly as is the calyx. *Flowers* $\frac{3}{4}$ in. diam., inclined. *Calyx*-lobes lanceolate, pubescent on both surfaces. *Petals* red-purple.—This in many respects resembles *R. pungens*, *Camb.*, and *R. horridulus*, *H. f.*

28. **R. ellipticus**, *Smith in Rees Cyclop.* xxx, *Rubus* 16; shaggy with spreading flexuous hairs, prickles scattered stout hooked, leaflets 3 orbicular obovate or elliptic obtuse or abruptly acute toothed pale and pubescent beneath, panicles axillary and terminal dense-flowered, calyx-lobes mucronate or acuminate, carpels silky. *DC. Prodr.* ii. 563; *Wall. Cat.* 740 in part. *R. rotundifolius*, *Wall. Cat.* 730. *R. Gowry-phul*, *Roxb. Hort. Beng.* 39. *R. Gowreephul*, *Roxb. Fl. Ind.* ii. 517; *W. & A. Prodr.* 298; *Wight Ic.* t. 230. *R. flavus*, *Ham. in Don, Prodr.* 234; *Brand. For. Flor.* 197; *Kurz, For. Flor. Brit. Burm.* i. 438. *R. sessilifolius*, *Miq. Pl. Ind. Or. Hohenack*, 438a, 1153. ? *R. paniculatus*, *Moon. Cat. Ceyl. Pl.*

Temperate and subtropical Himalaya, from SIRMUR, alt. 2-7000 ft. to SIKKIM, alt. 4-7000 ft. and BHOTAN. KHASIA Mts., alt. 4-5000 ft. BIRMA. Western Ghats from CANARA southwards. CEYLON, central province, alt. 4-7000 ft.—DISTRIB. Yunnan.

A tall suberect bush; branches stout, spreading and recurved, obscurely angled; hairs red-brown, often very dense, covering a softer down with occasional glandular hairs; prickles stout, hardly compressed. *Leaflets* 2-4 in., coriaceous, dark green above, rarely glabrous beneath; petiole 1-3 in.; stipules subulate. *Panicles* small, many-flowered, pedicels short; bracts setaceous. *Flowers* $\frac{1}{2}$ - $\frac{1}{2}$ in. diam. *Calyx* densely pubescent and bristly or not; lobes ovate, acute acuminate or obtuse and mucronate, erect in fruit. *Petals* obovate, larger than the calyx, white. *Stamens* 1-seriate. *Fruit* globose, exposed; drupes on a cylindric hairy receptacle, many, golden yellow, succulent; stone rugose.

VAR. hirta; leaflets green beneath. *R. hirtus*, *Roxb. Hort. Beng.* 38; *Fl. Ind.* ii.

518; *R. Wallichianus*, *Wt. & Arn. Prodr.* 298; *Dalz. & Gibs. Bomb. Flor.* 89; *R. ellipticus*, in part *Wall. Cat.* 740; *R. affinis*, *Madden MSS.*—Himalaya and Western Ghats.

VAR. denudata; shaggy hairs absent or very rare. *R. rotundifolius*, *Wall. Cat.* 730 in part.—Kumaon, Bhotan.

29. ***R. fruticosus***, *Linn.*; *DC. Prodr.* ii. 560; *var. DISCOLOR*; eglandular, branches robust and leaves beneath hoary with white stellate tomentum, prickles short scattered hooked, leaflets orbicular obovate or elliptic obtuse or acute, stipules setaceous, flowers in dense thyrsoid terminal panicles, calyx-lobes short acute reflexed in fruit, carpels quite glabrous. *R. discolor*, *Weihe & Nees; Boiss. Fl. Orient.* ii. 695.

Western temperate Himalaya, alt. 3–7000 ft. from MURREE to JAMU.—DISTRIB. Afghanistan and westward to the Atlantic.

Stems arched, obtusely angled, channelled; prickles stout. *Leaflets* sometimes 5 at the base of the stem, 1–2 in., coriaceous, sometimes abruptly acuminate; petiole $\frac{1}{2}$ –1 in., flattened above; stipules subulate, velvety. *Panicles* 6–10 in.; branches short, very stout, densely tomentose; pedicels stout, short; bracts often toothed or laciniate. *Flowers* $\frac{3}{4}$ – $\frac{1}{2}$ in. diam. *Calyx-tube* short, lobes woolly on both surfaces, sharply reflexed in fruit. *Petals* obovate, pink. *Stamens* very numerous, in many series. *Fruit* small, globose; drupes many, fleshy, black; receptacle deciduous; stone pitted.

30. ***R. Clarkei***, *Hook. f.*; herbaceous?, eglandular, branches petioles and peduncles very slender faintly pubescent and with copious slender acicular straight prickles, leaflets 3 orbicular obtuse and coarsely doubly crenate laxly pubescent beneath, stipules oblong green, peduncles 1–3-flowered axillary, calyx-lobes lanceolate.

KASHMIR, at Sonamung, alt. 9250 ft., *C. B. Clarke*.

A very slender small perhaps herbaceous species; branches probably armed, soft, green, laxly clothed with spreading hairs; prickles numerous, very slender, quite straight, not extending to the midribs. *Leaflets* 2–3 in. long, nearly as broad, dark green, rounded or cuneate at the base, petiolulate; petiole 1–3 in., slender; stipules persistent, obtuse or acute, entire or serrate, pubescent. *Flowers* drooping, $\frac{1}{2}$ in. diam., solitary in the lower axils, corymbose in the upper; bracts green, small, oblong, acute. *Calyx-tube* not bristly, densely pubescent; lobes narrow-lanceolate. *Fruit* of few glabrous drupes; stone pitted.—Of this very distinct species I have seen no flowers.

31. ***R. antennifolius***, *Hook. f.*; eglandular, branches petioles and peduncles laxly pubescent and with copious slender straight acicular prickles, leaflets 3 orbicular-ovate acuminate lobulate and acutely doubly toothed, faintly pubescent beneath, stipules linear-lanceolate acuminate, corymbs axillary and terminal, calyx-lobes ovate with long slender tips, carpels very many glabrous.

KASHMIR; Sonamung, alt. 8500 ft., *C. B. Clarke*.

A much stouter plant than *R. Clarkei*, similarly clothed with slender straight prickles and soft hairs, but the leaflets are more coriaceous, very acutely toothed, the lateral sessile, the terminal cordate, and the inflorescence and flowers are quite different. *Stipules* $\frac{1}{2}$ – $\frac{3}{4}$ in., green, persistent, quite entire. *Peduncles* often 2–3 in., stiff, erect, the terminal continuing the branch and bearing a branched corymb; pedicels often long and slender; bracts filiform. *Flowers* erect, $\frac{3}{4}$ –1 in. across the sepals. *Calyx* not or hardly bristly, tomentose; lobes pubescent on both surfaces ovate, suddenly contracted into filiform tips often as long as themselves. *Petals* orbicular-obovate, white, about equalling the limb of the calyx. *Carpels* on a columnar pubescent receptacle.

32. ***R. purpureus***, *Bunge Enum. Plant. Chin. Bor.* 24; glandular, branches petioles inflorescence and calyxes densely covered with small deflexed

prickles, leaflets 3 (rarely 5) broad-ovate coarsely acutely doubly crenate white beneath, cymes axillary few-flowered, flowers drooping, carpels pubescent.

Western temperate Himalaya, KUNAWUR, in the Tibetan region, alt. 11–14,000 ft.. *T. Thomson*.—DISTRIB. N. China.

Branches stout, shining, pale or dark yellowish; purple glandular hairs few, scattered; prickles short, flattened, straighter on the petioles and inflorescence. *Leaflets* 2–4 in., glabrous above, terminal broad-ovate or orbicular, cordate; lateral sessile, smaller; petiole 1–3 in., stout, pale, coloured like the stem; stipules setaceous, glandular. *Flowers* $\frac{1}{2}$ in. diam., solitary in the lower axils, 2–4 in peduncled cymes in the upper. *Calyx* pubescent and bristly; lobes ovate-lanceolate, finely acuminate, erect in fruit. *Petals* smaller than the calyx, orbicular-oblong. *Fruit* enclosed in the calyx, globose, red, of many (about 20) tomentose drupes situated on a columnar pubescent receptacle; endocarp pitted. Very near *R. colchicus*, Herb. Stev., from the Caucasus, if not a few-flowered variety of that plant. Jaeschke sends 5-foliolate leaves of apparently this species from Lahul.

VAR. *subinermis*, more slender and lax with the prickles reduced almost to bristles. —Kishtwar, *Thomson*; Kashmir, *Falconer*, alt. 9250 ft., *C. B. Clarke*; common in water channels at 8–10,000 ft., *Aitchieson*.—Clearly a lax state of the Tibetan drier climate prickly plant.

*33. ***R. lucens***, *Focke Batogr. in Abhandl. Naturwiss. Verein, Bremen*. iv. 199 (1874); eglandular, almost glabrous, prickles scattered short hooked, leaflets 3 ovate elliptic orbicular or ovate-lanceolate caudate-acuminate serrate shining above, stipules linear, racemes axillary and terminal long slender, carpels few hirsute. *R. lævigatus*, *Wall. Cat.* 1280.

KHASIA MTS., alt. 3–4000 ft., *Simons, &c.*; ASSAM, *Jenkins*; MISHMI HILLS, *Griffith*.

Stem very stout, climbing lofty trees; branches angled, grooved, quite smooth; prickles very short. *Leaflets* 4–5 in., brown when dry, coriaceous, serratures simple, acute, petiolules short and nerves beneath puberulous; petiole 2–6 in., prickles many or few; stipules almost setaceous. *Panicles* 6–12 in., lower sometimes crowded in the leaf-axils; terminal slender, pubescent; bracts subulate. *Flowers* small, $\frac{1}{2}$ in. diam., in fascicles or short corymbs; pedicels slender. *Calyx* densely hoary; tube very short; lobes oblong, obtuse or apiculate, erect in fruit. *Petals* equalling the sepals, pink or white, obovate, clawed. *Stamens* 20–30, in one series. *Fruit* enclosed in the calyx; drupes 6–8, sweet; stone rugose; receptacle low, pubescent.

SECT. IV. Shrubs. Leaves pinnately 5–7-foliolate, upper (or all in 37. *foliolosus*) sometimes 3-foliolate.

34. ***R. biflorus***, *Ham.*; *Smith in Rees Cyclop.* xxx. *Rubus* 9; eglandular, prickles strong hooked, leaflets 3 or 5 ovate lobulate doubly toothed white and tomentose beneath, stipules linear-lanceolate, flowers 1–3 together on axillary slender peduncles drooping, calyx-lobes broad-ovate acuminate, carpels numerous woolly above. *Wall. Cat.* 735; *DC. Prodr.* ii. 558; *Bot. Mag.* t. 4678.

Temperate Himalaya; from SIRMORE, alt. 7–9000 ft., to SIKKIM, alt. 8000 ft., and BHOTAN.

A strong rambling shrub; stems and branches quite glabrous, white with glaucous bloom; prickles very strong and much recurved. *Leaves* chiefly on short lateral branches; upper sometimes 1-foliolate and 3-lobed; leaflets 1–1 $\frac{1}{2}$ in., rarely more, acutely toothed or serrate, pubescent or hairy above, densely tomentose beneath; petiole slender, 1–2 in., prickly, pubescent; stipules $\frac{1}{4}$ in. *Peduncles* $\frac{1}{2}$ –1 $\frac{1}{2}$ in., unarmed or prickly, usually glabrous; bracts subulate. *Flowers* $\frac{1}{4}$ – $\frac{3}{4}$ in. diam. *Calyx* pubescent on both surfaces or glabrate outside; lobes broad, suberect or spreading in fruit. *Petals* equalling or exceeding the calyx, orbicular, white. *Stamens* numerous. *Fruit* globose, $\frac{3}{4}$ in. diam.; drupes 20–30 golden yellow, succulent; stone reticulated with pits; receptacle columnar, villous.

35. *R. lasiocarpus*, *Smith in Rees Cyclop.* xxx. *Rubus* 6; eglandular, prickles scattered stout straight or hooked, branches glabrous very glaucous, leaflets 5-9 ovate elliptic or ovate-lanceolate acutely toothed or serrate, beneath ribbed and usually hoary with white tomentum, terminal alone lobulate, stipules subulate, corymbs small axillary and terminal tomentose, petals small red, carpels many tomentose. *DC. Prodr.* ii. 558. *Wight. & Arn. Prodr.* 299; *Wight. Ic. t.* 232; *Grah. Cat. Bomb. Pl.* 64; *Dalz. & Gibs. Bomb. Flor.* 89; *Kurz For. Flor. Brit. Burm.* i. 439. *R. distans*, *Don Prodr.* 256 (pinnatus 234). *R. Horsfieldii*, *Miq. Fl. Ind. Bat. i.* part 1, 375. *R. albenscens*, *Roxb. Hort. Beng.* 39; *Flor. Ind. ii.* 519. *R. rosæflorus*, *Roxb. Fl. Ind. ii.* 519. *R. rotundifolius*, *Royle Ill.* 203 (name only). *R. mysorensis*, *Heyne in Roth Nov. Gen. & Sp.* 235. *R. indicus*, *Heyne MSS.* ? *R. parvifolius*, *Moon Cat. Ceyl. Pl.* *R. furfuraceus*, *Wall. Cat.* 739. *R. bijugus*, *Focke Batogr. in Abhandl. Naturwiss. Verein, Bremen.* iv. 200 (1874).

Temperate Himalaya, from MURREE and KASHMIR, alt. 5-8000 ft. (ascending to 1500 ft. in Kumaon), to SIKKIM, alt. 4-10,000 ft. BURMA. WESTERN PENINSULA on the higher Ghats from Canara southwards. CEYLON, central province, alt. 4-7000 ft.—DISTRIB. Java.

A large rambling very variable plant; branches cylindric, with coloured pruinose bark, the very young only tomentose; prickles compressed, variable in size and curvature, extending to the petioles and rachis, but not or rarely to the inflorescence. *Leaves* 3-10 in.; leaflets 1-3 in., rather coriaceous, opaque, glabrous or silky above, almost plaited by the strong straight nerves, which are very prominent beneath, sometimes very acute, often doubly toothed and mucronate, terminal usually broad-ovate, or even orbicular, rounded acute or cordate at the base; lateral sessile, rarely ovate or orbicular; petiole stout, grooved above, glabrous and shining or tomentose; stipules $\frac{1}{2}$ in., linear-subulate. *Corymbs* axillary and terminal, simple or subpanicked, densely tomentose or villous, or merely puberulous, on short or long (1-2 in.) peduncles, 2-many-flowered; pedicels long or short; bracts setaceous or filiform. *Flowers* $\frac{1}{4}$ - $\frac{1}{2}$ in. diam *Calyx* densely woolly; tube small; lobes ovate or ovate-lanceolate, acute acuminate or caudate, spreading or suberect in fruit; laciniate and much lengthened in Moulmain specimens. *Petals* deep pink, orbicular or broadly obovate, rarely exceeding the calyx. *Fruit* $\frac{1}{4}$ - $\frac{1}{2}$ in. diam., globose, hoary; drupes numerous, dry, or fleshy and then red or orange; stone pitted; receptacle columnar, villous.

It is as difficult to define the varieties of this *Rubus* as it is those of *R. niveus*, to which they are in a degree analogous, and it is also difficult to separate the three following species from it by constant definable characters.

VAR. furfuraceus; a large form, leaflets narrow 1-2 $\frac{1}{2}$ in. grey with very fine down beneath, corymbs paniculate, terminal large much branched. *R. furfuraceus*, *Wall. Cat.* 739, Ava.

VAR. pauciflorus, a large very common Himalayan form, glabrous and shining except the white undersurface of the leaves, with corymbs of many crowded small puberulous flowers. *R. pauciflorus*, *Wall. Cat.* 727; *Lindl. in Bot. Reg. t.* 854. *R. longifolius*, *Wall. MSS.* *R. Ischelus*, *Herb. Ham.* *R. distans*, *Don Prodr.* 256 (pinnatus, 234).

VAR. micranthus; much smaller in all its parts, leaves almost glaucous beneath. *R. micranthus*, *Don Prodr.* 235. Nipal, *Wallich.*

VAR. sericeus; leaflets 2-3 in. coarsely serrate pale green membranous beautifully silky on both surfaces paler but not white beneath, corymbs many-flowered, sepals lanceolate. Kishtwar, *Thomson.*

VAR. membranaceus; leaflets 2-3 in. coarsely crenate-toothed very membranous perfectly glabrous above faintly downy beneath, corymb terminal compound. Kumaon, *Strach. & Winterb.* (18). Sikkim, J. D. H.

VAR. rosæfolius; quite glabrous except the branches of the corymbs and margins of sepals, leaflets 1-1 $\frac{1}{2}$ in. inciso-serrate membranous, dark brown when dry, flowers small in axillary corymbs, sepals with filiform points.—Sikkim, alt. 9-10,000 ft., J. D. H.

VAR. subglaber, *Thwaites Enum.* 101; leaflets 1-1 $\frac{1}{2}$ in. rounded, finely crenate-

serrate faintly pubescent on the nerves beneath; dark brown when dry, midrib beneath often prickly. Ceylon.—Kurz (*Journ. As. Soc. Beng.* 1876, pt. ii. 307) refers Roxburgh's *R. rosæfolius* to *R. rosæfolius*, Sm., but a reference to Hardwick's description cited by Roxburgh proves that this cannot be correct.

36. **R. racemosus**, *Roxb. Fl. Ind.* ii. 519; branchlets petioles and inflorescence clothed with glandular hairs, prickles straight or hooked, leaflets 5-7 ovate or orbicular-ovate acutely toothed, beneath usually densely white-tomentose, stipules lanceolate, corymbs axillary and terminal, calyx prickly, petals large red, carpels many villous. *R. lasiocarpus*, Sm., *Var.?* *Miq. Pl. Exsicc. Hohenack.* No. 1152.

NILGHIRI MTS., *Adam, Gardner, &c.* PULNEY MTS., *Wight.*

I cannot doubt this being an extreme form of *R. lasiocarpus*, readily distinguishable by the copious glandular bristles and hairs, the usually densely tomentose branches, corymbs, petioles, &c., and the prickly calyx and large petals; the leaflets too are usually broader, very coriaceous, glabrous above or with sometimes copious almost woolly hairs. In Hohenacker's specimens however the branchlets and petioles are nearly glabrous, and in all the branches are beautifully pruinose. The sepals are caudate and quite entire. Wight's Pulney mountain specimens have the leaflets more membranous, almost glabrous beneath except along the nerves, like var. *subglaber* of *R. lasiocarpa*. I have seen no authentic specimen of Roxburgh's plant (which Kurz (Andaman Report) refers to *lasiocarpus*) and refer the above to it as the only Peninsular species according with his description.

37. **R. foliolosus**, *Don Prodr.* 256 (*microphyllus*, p. 234); eglandular, branches petioles and inflorescence villous or densely tomentose, prickles straight or hooked, leaflets 3-7 small ovate or almost orbicular coarsely crenate-toothed or serrate white-tomentose beneath, flowers small in axillary branched long peduncled corymbs, petals small red, carpels villous.—*R. Roylei*, *Klotzsch in Reise Pr. Waldem. Bot.* 154, t. 6. *R. parvifolius*, *Smith in Rees Cyclop.* xxx. *Rubus* 21, not of Linn.; *Wall. Cat.* 736.

Central and Western temperate Himalayas. NIPAL, *Wallich*; CHAMBA to KUMAON, alt. 5-8000 ft., *Thomson, &c.*

Except by its usually prostrate habit and much smaller size, I do not think that this is distinguishable from *R. lasiocarpus*. In Wallich's specimens the leaflets are $\frac{1}{2}$ in. long, lateral orbicular cuneate, terminal lobed, are very pubescent above and white beneath, but in Thomson's and others they become more ovate glabrous above and almost silky beneath or even glabrous except along the nerves as in varieties of *lasiocarpus*. The flowers are numerous, about $\frac{1}{4}$ in. diam., with pink petals equalling the calyx-lobes; and the fruit is very small, white and villous. Don, misled by a specimen of *R. biflorus* sent under the same name by Wallich (and fastened on the same sheet in Herb. Linn. Soc.), describes the peduncles as 3-flowered. Maximovicz *Diagn.* x. 392, is certainly wrong in referring this to the *R. parvifolius*, Linn.

38. **R. opulifolius**, *Bertol. Misc. Bot.* xxii. 16, t. 4; inflorescence glandular-hairy and as well as the stout branches and petioles densely softly tomentose, prickles few straight or hooked, leaflets 3-5 acute or acuminate crenate-toothed coriaceous densely clothed beneath with white wool, lateral elliptic terminal broader lobed, flowers in axillary and terminal subsessile abbreviated racemes, calyx with glandular bristles, petals small red, carpels many silky.

KHASIA Mt., at Moflong, alt. 5500 ft., *Griffith*; J. D. H. & T. T. Upper Kala Pani, alt. 4000 ft., *C. B. Clarke.*

A much more robust plant than *R. lasiocarpus*, with dense soft tomentum on the young and even on last year's branches, the older of which are however glaucous and pruinose (as in all these red-flowered species); prickles when straight large and much flattened. *Leaflets* $1\frac{1}{2}$ - $2\frac{1}{2}$ in., softly downy or glabrous above, very white

beneath except the nerves which have a yellowish pubescence; petiole stout, prickly or not; *stipules* setaceous, quite entire. *Flowers* much crowded, $\frac{2}{3}$ in. diam.; bracts setaceous, very tomentose. *Calyx* densely tomentose and bristly; lobes lanceolate, acuminate, quite entire. *Petals* obovate-oblong. *Carpels* with long silky hairs, not tomentose as in the ordinary forms of *R. lasiocarpus*. *Fruit* globose, of many fleshy orange-red almost glabrous drupes; stone deeply pitted.—This is possibly another extreme form of *R. lasiocarpus*, which (like *R. racemosus*) has become glandular.

39. ***R. horridulus***, *Hook. f.*; eglandular, prickles very many crowded hooked, branches arched, leaflets 5–7 densely softly hairy incised-serrate, petioles and single-flowered peduncles densely clothed with hooked prickles, calyx-tube hemispheric densely clothed with straight prickles, petals purple, carpels villous.

BHOTAN, at Panga, alt. 7600 ft., *Griffith*.

Branches cylindric, slender, glabrous, with usually straight slightly compressed prickles. *Leaves* 2–4 in.; petiole very slender, sparingly hairy, with numerous strongly hooked prickles; leaflets $\frac{1}{2}$ – $\frac{1}{2}$ in., equally clothed with long soft flexuous hairs on both surfaces, acute or acuminate. *Peduncle* clothed and armed like the petioles, 1 in., always 1-flowered. *Calyx-tube* $\frac{1}{4}$ in. diam., quite clothed with spreading straight shining prickles; lobes large, ovate-lanceolate, long-acuminate, quite entire, pubescent on both surfaces, erect in fruit. *Petals* small, purple according to Griffith's notes. *Stamens* very numerous. *Carpels* numerous, villous, with long straight white hairs. *Fruit* small, of 6–12 subpubescent drupes; stone reniform, rugosely pitted.—This appears to be in every way a very distinct species, but it is impossible to say to what extent more copious materials may modify the above description; it is allied to *R. sikkimensis*, H. f., and *pungens*, Camb.

40. ***R. pungens***, *Camb. in Jacq. Voy. Bot.* 48, t. 59; eglandular except sometimes the inflorescence and petioles, prickles many slender straight, stems very long and slender, leaflets 5–7 membranous ovate deeply inciso-serrate glabrous concolorous, flowers solitary or 2–3 axillary long-peduncled, calyx densely prickly, lobes caudate, carpels with long hairs. *Maximov. Diagn.* x. 386.

KASHMIR, *Falconer, Jacquemont*; Shapinga, alt. 7000 ft., *C. B. Clarke*; woods at Gulmuz at 8600 ft., *Aitchieson*. KHAGAN, 100 miles N.W. of Kashmir, alt. 8000 ft., *Stewart*.—DISTRIB. Japan (a variety).

Branches long, lax, cylindric, trailing, green, glabrous except the pubescent tips. *Leaves* 2–4 in., petiole very slender, sometimes glandular, unarmed or with faintly hooked prickles; leaflets 1– $1\frac{1}{2}$ in., sessile, bright-green on both surfaces, quite glabrous or faintly hairy on the nerves beneath, terminal broader, cordate, 3-lobed; stipules narrow lanceolate or setaceous. *Flowers* nearly 1 in. diam., erect; peduncle stout, slender, prickly and pubescent. *Calyx-tube* hemispheric; lobes sometimes $\frac{2}{3}$ in. long, pubescent on both surfaces, spreading in fruit. *Petals* obovate-spathulate, longer than the calyx, white(?). *Fruit* globose, small; drupes few, on a conical glabrous receptacle, pubescent, stone minutely pitted.—Clearly closely allied to *R. horridulus* and *sikkimensis*, but with more the habit of *R. idæus* or *saxatilis*. The petals are multiplied in Falconer's specimen.

41. ***R. rosæfolius***, *Smith Ic. ined.* iii. t. 60; glabrous or pubescent, glandular-hairy or not, prickles scattered hooked, leaves long, leaflets 5–7 ovate-lanceolate acuminate doubly inciso-serrate, green on both surfaces, stipules subulate-lanceolate, flowers solitary and in very loose panicles, calyx-lobes caudate, petals white exceeding the calyx, carpels excessively numerous, fruit large of innumerable orange-red minute glabrous drupes. *Roxb. Fl. Ind.* ii. 518; *Wall. Cat.* 728; *Kurz For. Flor. Brit. Burm.* i. 439; *Hook. Ic. Pl.* t. 349. *R. pinnatus*, *Willd.* *R. asper*, *Don Prodr.* 234; *Wall. Cat.* 741. *O. sikkim-*

ensis, *Otto Kunze MSS. in Herb. Clarke?* *R. paniculatus*, *Clarke in Journ. Linn. Soc.* xv. 140, *not of Smith*.

Temperate Himalayas; from KUMAON, alt. 7000 ft., to SIKKIM, alt. 4-7000 ft., *J. D. H. KHASIA Mts.*, alt. 3-4000 ft. AWA and MARTABAN Hills, *Kurz*.—DISTRIB. Java. Naturalised and cultivated in the tropics and warm temperate regions; flowers often double.

Stems erect or inclined; branches slender, glabrous, pubescent or almost villous, as are the petioles and peduncles, sometimes crinite with long dark-brown spreading simple or gland-tipped hairs (*R. sorbifolius*, Maxim.); prickles sometimes very numerous, mostly straight on the stem and hooked on the petiole leaflets and inflorescences. *Leaves* 2-5 in. long, bright green, never glaucous or white beneath; petiole slender, often prickly; leaflets 1-2 in., rarely more, membranous or coriaceous, sessile or petiolulate; stipules linear-lanceolate or filiform, long-acuminate. *Flowers* $\frac{3}{4}$ -1 in. diam.; peduncles usually slender, prickly. *Calyx* glabrous or pubescent, not prickly, tube small; lobes acute or acuminate or hair-pointed, or drawn out to a serrated limb nearly an inch long; spreading in fruit. *Petals* orbicular-obovate. *Carpels* excessively numerous, glabrous, on a villous receptacle. *Fruit* globose or more often oblong; drupes smaller than in any other species; stone deeply pitted.—*R. paniculatus*, *Roxb.* (*R. Roxburghianus*, *Wall. Cat.* 732.) from the Moluccas is *R. parvifolius*, *Linn. & Rumph.* (Amboin. v. t. xlvii.), and perhaps also *R. fraxinifolius*, *Poir.*; it has larger leaves and smaller calyx and fruit than *rosafolius*. *R. Javanicus*, *Celebicus* and others are in various respects intermediate, and all may prove forms of one common Malayan plant.

DOUBTFUL SPECIES.

R. HIBISCIFOLIUS, *Focke Batogr. in Abhandl. Naturwiss. Verein, Bremen.* iv. 197; unarmed, stem smooth, floriferous branches slender and petioles puberulous, stipules broadly linear obtuse deciduous, leaves petioled ovate or ovate-lanceolate cordate long-acuminate 3-lobed unequally subincised-serrate hairy then glabrate above, paler and puberulous on the nerves beneath, flowers crowded subfascicled shortly peduncled forming a short narrow inflorescence, bracts ovate-lanceolate acute sometimes denticulate, calyx yellow tomentose cleft hardly to the middle, lobes shortly triangular.—Leaves exactly like those of *R. palmatus*, Th., flowers like those of *R. moluccanus*. *Nipal, Wallich* in *Herb. Copenhagen (Focke)*.—I have no idea what this species can be; I find nothing like it in *Herb. Wallich*.

R. HOFFMEISTERIANUS, *Kunth & Bouché Ind. Sem. Hort. Berol.* (1817 coll.) 14, is I suppose *R. niveus*, *Wall.*

9. *GEUM*, *Linn.*

Erect perennial herbs. *Radical leaves* crowded, pinnate; terminal leaflet large; stipules adnate to the petiole. *Flowers* solitary or corymbose, white yellow or red. *Calyx* persistent, 5-bracteolate; lobes 5, imbricate or valvate. *Petals* 5. *Stamens* very many, crowded. *Disk* smooth or with radiating grooves. *Carpels* many, on a long or short receptacle; style filiform, elongating much after flowering, straight or bent; ovules ascending. *Achenes* many, on a dry receptacle, each with a long filiform straight or bent terminal style which is often hooked at the tip.—DISTRIB. Temp. and cold regions of N. and S. hemispheres; species about 30.

SECT. I. *Geum proper*. *Style* in fruit hooked at the tip or below it.

1. *G. urbanum*, *Linn.*; *Boiss. Flor. Orient.* ii. 696; erect, sparsely softly hairy, lower leaves pinnatisect, leaflets 9-11 with the alternate smaller, upper sessile, flowers erect, head of hispid achenes sessile. *G. Roylei*, *Wall. Cat.* 713.

Western temperate Himalaya, alt. 6-11,000 ft., from MURREE to KUMAON.—DISTRIB. Siberia and westwards to the Atlantic.

Stems 1-3 ft., stout or slender, from a woody rootstock. *Terminal leaflets* of radical leaves 2-3 in. diam., orbicular, lobed and crenate; lateral much smaller, often minute, sessile, cut and lobed; cauline leaves sessile, broad, variously cut and lobed; stipules leafy, lobed and toothed. *Flowers* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam.; peduncle slender. *Petals* yellow, narrowly obovate, equalling or exceeding the calyx-lobes, which are acuminate and reflexed in fruit. *Achenes* spreading and recurved, hispid with long hairs; awn $\frac{1}{4}$ in., bent, hooked at the tip; receptacle villous.—C. B. Clarke has a very robust form from Kashmir (Alibad, 9,000 ft.).

SECT. II. **Sieversia.** *Style* straight in fruit.

2. **G. elatum**, Wall. Cat. 711; sparingly hairy, leaves pinnatisect, leaflets very many short lobed and crenate, flowers erect, achenes hispid. *Sieversia elata*, Royle Ill. 207, t. 39.

Subalpine and Alpine Himalaya; from KASHMIR, alt. 9-12,000 ft. to SIKKIM, alt. 12-15,000 ft.

Rootstock stout, woody. *Leaves* 4-12 in., linear-oblong; leaflets $\frac{1}{2}$ -1 in., close and imbricating or scattered, uniform or the alternate smaller, terminal orbicular, all lobed and coarsely crenate, upper or all adnate by a broad base. *Flowering stems* with few leaves and 1-6 flowers. *Flowers* $\frac{1}{2}$ -1 $\frac{1}{2}$ in. diam.. *Calyx-lobes* deltoid-ovate, acute, silky, spreading in fruit. *Petals* orbicular, yellow, much exceeding the calyx. *Carpels* sessile on the base of the calyx, clothed with long silky hairs. *Achenes* ellipsoid, acute at both ends, hairy; style $\frac{1}{3}$ in., slender.

VAR. *humile*, Royle l. c.; smaller, 1-flowered, Nipal Kumaon and Sikkim, alt. 12-15,000 ft. *G. adnatum*, Wall. Cat. 712. *Potentilla adnata*, Wall. MSS.; *Lehm. Pugill.* ix. 9; *Revis. Potentill.* 47, t. 17.

10. **FRAGARIA**, Linn. Strawberry.

Perennial scapigerous herbs, with creeping stolons. *Leaves* digitately 3-rarely 5-foliolate very rarely pinnate or simple; stipules adnate to the petiole. *Flowers* white or yellow, often polygamous. *Calyx* persistent, with 5 bracteoles at its base; lobes 5, valvate in bud. *Petals* 5. *Stamens* many, persistent. *Carpels* many, on a convex receptacle; styles ventral, persistent; ovule 1, ascending. *Achenes* many, minute, sunk in the surface of a large fleshy receptacle.—DISTRIB. Temp. and mountain regions of the N. hemisphere, S. America, Sandwich Islands, Bourbon; species 6 or 7.

* *Flowers* yellow.

1. **F. indica**, Andr. Bot. Rep. t. 479; very slender, leaflets 3-5 obovate serrate crenate or toothed, peduncles solitary axillary 1-flowered, bracteoles large cuneate-obovate 3-5-fid. *Roxb. Fl. Ind.* ii. 520; *Wight & Arn. Prodr.* 300; *Wight Ic.* t. 989; *Bot. Reg.* t. 61; *Wall. Cat.* 1236, excl. No. 3 for the most part. *F. malayana*, *Roxb. Fl. Ind.* ii. 520. *F. nilgirica*, *Zenker Pl. Ind. Dec.* 1. 7, t. 9. *F. arguta*, *Lindl. in Wall. Cat.* 1237. *F. Roxburghii*, *Wight & Arn. Prodr.* 300, name only. *Duchesnea fragarioides*, *Sm. in Trans. Linn. Soc.* x. 373; *Miq. Fl. Ind. Bat.* i. pt. 1, 372, et *D. chrysantha*, *Miq. ibid.* *D. fragiformis*, *Don Prodr.* 233. *Potentilla denticulosa* and *Wallichiana*, *Ser. in DC. Prodr.* ii. 573, 574. *P. Durandii*, *Torr. & Gr. Fl. N. Am.* 1. 444. *P. fragariaefolia*, *Klotzsch in Reis. Pr. Waldem. Bot.* t. 10. *P. trifida*, *Lehm. in Otto Garten. und Blumenzeit.* vii. 263; *Revis. Potentill.* 175.

Temperate and subtropical HIMALAYA and along the foot of the hills from the PUNJAB to ASSAM, ascending to 7500 ft. in the east and 8000 ft. in the west. KHASIA Mts. NILGHIRI Mts. PENANG (*Roxburgh*)—DISTRIB. Afghanistan, Mountains of the Malay Islands, Japan, Corea, and Formosa.

More or less silkily hairy. *Rootstock* stout, with many long slender prostrate stems. *Leaves* distant; leaflets rarely 5, 1-1 $\frac{1}{2}$ in., petiolulate or sessile, membranous, simply

or doubly crenate or toothed or serrate, base cuneate entire, nerves parallel; petiole 1-5 in., very slender; stipules leafy, toothed. *Peduncles* very slender, equalling the petioles, naked. *Flowers* $\frac{1}{2}$ -1 in. diam. *Calyx-lobes* ovate or lanceolate; bracteoles narrow or broad, often greatly exceeding the calyx-lobes, rarely quite entire. *Petals* obovate, cordate, yellow. *Fruit* spherical or oblong, bright red, spongy, insipid; achenes minute, obscurely pitted.

A very variable plant. I refer *Potentilla denticulosa* doubtfully to it on the authority of J. Gay (in Herb.), who has further verified the reference of the American *P. Durandii* to *F. indica*; M. E. Durand in 1860 having informed him that this plant was sent to him from Savannah, where it grew in the streets, and was no doubt introduced.

** *Flowers white.*

2. ***F. vesca*, Linn.**; leaflets sessile or nearly so many-toothed, fruit globose or subglobose, calyx-teeth usually entire.

VAR. *nubicola*; slender, silvery, nearly glabrous, runners filiform, hairs on petioles and few flowered peduncles appressed, calyx-lobes narrow spreading in fruit. *F. nubicola*, Lindl. in Wall. Cat. 1238.

VAR. ? *collina*, slender or stout runners with spreading hairs, hairs on petioles and few- or many-flowered peduncles more copious spreading, calyx-lobes narrow or broad spreading or suberect in fruit.

Temperate Himalaya, from MURREE and KASHMIR, alt. 5-10,000 ft., to SIKKIM, alt. 6-13,000 ft.—DISTRIB. *F. vesca*, Afghanistan, Java, N. temp. zone.

I am quite unable to identify the Indian strawberries by means of the characters given by authors to the European species, which differ in their several works. *F. vesca* is defined by Boissier (Fl. Orient.) as having the petioles with spreading hairs, and the peduncles with spreading or appressed ones; Ledebour (Fl. Ross.) describes the hairs of its peduncles as appressed, and Decaisne (Jardin fruitier) as spreading. In the common Himalayan *Fragaria* the hairs of both petals and peduncles are appressed in some forms, in others those of the petiole are spreading and of the peduncle appressed, and in still others both petiole and peduncle have spreading hairs. As the specimens with most appressed hairs appear from dried specimens to have spreading calyx-lobes I have referred them to *R. vesca* as var. *nubigena*. I must remark however that J. Gay, who was the greatest living authority on *Fragaria*, and to whom I sent a series of specimens, has regarded most of them as *F. collina*, but evidently with doubt; for a Simla and a Kashmir specimen he tickets *F. collina*? and then crosses out the mark of interrogation, and a Kishtwar specimen he tickets first *elatior*? and then crosses that name out substituting *collina*? and finally crosses out the mark of interrogation: of those marked *collina* by Gay; some have appressed, others spreading hairs on both peduncle and petiole. The Sikkim specimens, again, which I describe above as var. *nubicola*, are marked *F. vesca* without a doubt by M. Gay. This slender silvery form occurs throughout the temperate Himalaya; it has often small accessory pinnules on the petiole far below the tip and toothed or entire calyx-lobes.

3. ***F. nilgerrensis*, Schldl. in Hohenack. Plant. Ind. Or. Exsicc. No. 1518**; very robust, runners petioles and peduncles clothed with long stout spreading hairs, fruit subglobose or depressed, calyx-lobes entire spreading or suberect in fruit. *J. Gay in Ann. Sc. Nat. Ser. 4, viii. 206. F. elatior, Wight & Arn. Prodr. 300; Wight Ic. t. 988.*

KHASIA MTS., alt. 5000 ft. *J. D. H. & T. T. NILGHIRI MTS., Wight, &c.*

This will probably prove to be another form of *F. vesca*, and I find an approach to it amongst the Himalayan specimens of that plant; and there are specimens of it marked as from Sikkim in Griffiths' collection, but they are probably from Khasia and mislabelled. Gay who elaborately describes it says that the calyx-lobes are erect; this they seem to be in dried specimens, but Wight's excellent figure (which Gay does not refer to) shows them to be spreading. The fruit is white with a pale pink tint, and not worth eating; it is globose and inclined to be conoidal in the Nilghiris, but a very depressed sphere in Khasia.

4. **F. Daltoniana**, *J. Gay in Ann. Sc. Nat. Ser. 4. viii. 204*; smaller, slender, hairy or nearly glabrous, runners filiform, leaflets petiolulate with few teeth, flowers solitary, fruit elongate-ovoid or fusiform, calyx-lobes and bracteoles toothed spreading in fruit. *F. sikkimensis*, *Kurz in Journ. As. Soc. Beng. 1875, ii. 206*.

SIKKIM HIMALAYA, alt. 10–15,000 ft., *J. D. H., Kurz, &c.*

A very distinct species, at once recognizable by its smaller proportions, petiolulate leaflets with few teeth, toothed calyx-lobes, bracteoles, and curious fruit, which is often nearly 1 in. by $\frac{1}{2}$ in. broad, of a bright scarlet but with little flavour.

11. **POTENTILLA**, *Linn.* Cinquefoil.

Perennial herbs, rarely shrubs. *Leaves* compound; stipules adnate to the petiole. *Flowers* white or yellow, rarely red, solitary or in corymbose cymes. *Calyx* persistent, 5- rarely 4-bracteolate; lobes as many, valvate in bud. *Petals* as many, sometimes narrow. *Stamens* many, rarely few and definite. *Disk* annular or coating the calyx-tube. *Carpels* many, rarely 1 or few, on a small dry receptacle; style persistent or deciduous, ventral or terminal; ovule 1, pendulous. *Achenes* many, on a dry receptacle.—*DISTRIB.* N. temp., Arctic, and mountain regions, very few are found in the south; species 120.

The species of *Potentilla* are very difficult of discrimination, being chiefly mountain plants varying in habit and stature with elevation, much as *Ranunculi* do. I have no doubt that several here regarded as peculiar, will prove forms of more western ones, and those again of one wide spread European, Asiatic, and American plant. Lehman's "Revisio Potentillarum" is of little scientific value, and the 200 species it enumerates are reducible by at least one-third. Boissier in his "Flora Orientalis" has done excellent work. The character of the calyx and petals are excessively variable, and that of the terminal and ventral style is not so good as might be supposed, the outer carpels often differing somewhat from the inner in this respect. Smooth and wrinkled achenes are not always definite characters. I am inclined to think that the structure of the stigma is useful as a guide to the affinities of the species, but I hesitate to introduce it without a study of the whole genus.

SECT. I. **Sibbaldia**. *Stamens* 4, 5 or 10. *Flowers* often unisexual.

* *Leaves simple.*

1. **P. trullifolia**, *Hook. f.*; forming dense silky moss-like tufts, leaves trowel-shaped or $\frac{3}{4}$ -orbicular tip truncate 3-fid, stamens 5, achenes many smooth, styles short ventral.

SIKKIM HIMALAYA; rocky places on the Tibet frontier, alt. 16–17,000 ft., *J. D. H.*

Tufts matted, an inch high, soft, of densely packed short branches from a woody slender rootstock. *Leaves* $\frac{1}{4}$ in., densely imbricated, flat, clothed on both surfaces with long silky hairs, tip with 3 broadly triangular obtuse teeth; petiole short; stipules very broad, membranous, with triangular acute free portions. *Flowers* solitary, subsessile, $\frac{1}{8}$ in. diam. *Calyx* hemispheric, silky; tube very short; lobes ovate, obtuse; bracteoles much smaller, narrow, oblong, obtuse. *Petals* not seen. *Stamens*, rudiments of 5 seen. *Achenes* about 10, on a villous receptacle, quite smooth.

** *Leaves digitately 3- or 5-foliolate.*

2. **P. Sibbaldi**, *Haller f. in Ser. Mus. Helvet. i. 51*; leaflets 3 obovate-cuneate truncate 3–5-fid, flowers in branched cymes yellow 5-merous, achenes smooth, style short ventral. *P. procumbens*, *Clairv. Man. d'Herbor. en Suisse*

166. *P. Sibbaldia*, *Griesselich Statistik d. Flor. Badens*. 239. *Sibbaldia procumbens*, Linn. *S. parviflora*, Willd.; Boiss. *Fl. Orient.* ii. 727. *S. cuneata*, Edgew. in *Trans. Linn. Soc.* xx. 44. *S. cuneata*, Kunze in *Linnæa*, xx. 59.

ALPINE HIMALAYA and WESTERN TIBET, alt. 12–15,000 ft.—DISTRIB. Lofty mountains of the N. temp. zone; Arctic regions.

Covered with rather stiff silky hairs; rootstock woody, depressed, branched. *Leaves* chiefly radical; petiole $\frac{1}{2}$ in., slender; leaflets $\frac{1}{4}$ – $\frac{1}{2}$ in., rounded at the base, lobes short broad subacute, nerves obscure; stipules large, membranous. *Flowering stems* $\frac{1}{2}$ –6 in.; cymes leafy and silky. *Flowers* pedicelled. *Calyx* $\frac{1}{4}$ in.; lobes triangular-lanceolate, erect in fruit; bracteoles linear. *Petals* narrowly obovate, hardly exceeding the calyx. *Stamens* 5–10 (Edgew.) short. *Achenes* ovoid, smooth, obtuse, receptacle flat hairy.—I can detect no difference whatever between the *Sibbaldia parviflora* Willd. and *S. procumbens*, L., which latter varies greatly in size and hairiness and size of petals. J. Gay (in Herb. Hook.) failed to distinguish them.

VAR. *micrantha*; more densely tufted and smaller in all its parts, flowers sometimes solitary and alternate sessile amongst the leaves, calyx $\frac{1}{8}$ – $\frac{1}{6}$ in. long. Western Tibet; Tibetan region of Sikkim, alt. 16,000 ft.

3. ***P. perpusilla***, Hook. f.; very small, silky, leaflets 3 obovate-cuneate truncate 3-fid, flowers in very short cymes 4-merous, achenes smooth, style short ventral.

ALPINE HIMALAYA, from Champura, *Jacquemont*, to KUMAON, alt. 12,000 ft. *Strach.* & *Winterb.* (with *Potentilla* 26), and the Tibetan region of SIKKIM, alt. 16,000 ft., J. D. H.

A much smaller plant than *P. Sibbaldi* in all its parts, and always 4-merous. *Leaflets* $\frac{1}{6}$ – $\frac{1}{3}$ in. *Flowers* $\frac{1}{8}$ in. diam. *Petals* narrowly obovate, *Stamens* 4. *Achenes* 10–12.

4. ***P. tetrandra***, Bunge *Enum. Pl. Alt.* 17 (*Sibbaldia*); densely tufted, dioecious, silky, shining, leaflets 3 obovate-cuneate 3-fid, flowers yellow solitary or in pairs subsessile 4-merous, achenes 4, style terminal. *Dryadanthè Bungeana*, Ledeb. *Flor. Ross.* ii. 33. *Sibbaldia procumbens*, var. *tibetica*, Hook. f. & Thoms. *Herb. Ind. Or.*

WESTERN TIBET, alt. 14–18,000 ft., Falconer, Thomson, and Tibetan region of SIKKIM, alt. 15–16,000 ft., J. D. H.—DISTRIB. Altai Mts.

Forming dense moss-like patches covered with stout silky hairs. *Stem* densely leafy, 1–2 in. *Petiole* $\frac{1}{6}$ – $\frac{1}{4}$ in.; leaflets about as long. *Flowers* rarely on short peduncles, usually sessile amongst the leaves, $\frac{1}{8}$ in. diam. *Calyx-lobes* triangular; bracteoles linear. *Petals* obovate, much larger than the calyx, golden yellow. *Stamens* 4, very short. *Achenes* glabrous, smooth.

5. ***P. axilliflora***, Hook. f.; sparsely silky, stems prostrate very long and slender leafy throughout, leaflets 3 obovate acutely toothed, stipules small ovate acute, flowers all axillary small on capillary pedicels, petals minute, stamens 5, carpels many, styles sub-basal. *Fragaria indica*, Wall. *Cat.* 1236, 3 in part.

Western Himalaya, KUMAON, *Herb. Wallich*.

Rootstock as big as a walnut, apparently very short and broad, sending off 60–100 very weak almost filiform stems 1–2 ft. long, which trail on the ground, and are leaf- and flower-bearing along their length. *Leaves* chiefly cauline; leaflets $\frac{1}{2}$ – $\frac{3}{4}$ in., sessile, membranous, base cuneate entire; petiole $\frac{3}{8}$ – $\frac{3}{4}$ in.; stipules small, broad, membranous, toothed. *Flowers* $\frac{1}{4}$ in. diam.; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in. *Calyx* hairy, lobes triangular-ovate; bracteoles linear-oblong. *Petals* very small, oblong, yellow? *Sta-*

mens short. *Carpels* about 20. *Achenes* many, rounded, hard, slightly wrinkled; receptacle villous.

6. **P. purpurea**, *Royle Ill.* 208, t. 40, f. 3 (*Sibbaldia*); polygamous, leaflets 5 obovate-cuneate 3-fid, flowers purple 5-merous.

N. W. HIMALAYA, *Royle*.

I know this plant only from the figure and meagre description published by Royle, who gives no habitat, and I suppose it to be founded on a drawing of a native artist. The figure represents a procumbent branching rooting flexuous rhizome or stem 4 in. long, clothed with stipular sheaths, and bearing short lateral branches with tufts of leaves and flowers. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, hairy; leaflets 5, sessile, $\frac{1}{2}$ in., obovate-cuneate, 2–3-fid at the apex, green above, paler beneath. *Flowers* $\frac{1}{2}$ in. diam., solitary or twin from the axils of the leaves, peduncle naked. *Calyx* hairy, lobes triangular-ovate; bracteoles linear. *Petals* longer than the calyx, narrowly obovate, pale purple. *Disk* dark purple. *Stamens* 5. *Achenes* ovoid, smooth.

*** *Leaves* pinnate.

7. **P. albifolia**, *Wall. Cat.* 1018; stems very slender spreading, leaves pinnate, leaflets few subopposite or alternate obovate coarsely toothed white-tomentose beneath, stipules large, flowers solitary axillary, achenes many, style short ventral. *Sibbaldia potentilloides*, *Camb. in Jacq. Voy. Bot.* 54, t. 67.

Subalpine Himalaya from KASHMIR, alt. 8–10,000 ft., to SIKKIM, alt. 12–15,000 ft., *J. D. H., C. B. Clarke*.

Rootstock stout. *Stems* many, 6–12 in., flexuous, branched, pubescent. *Lower leaves* 2–4 in.; leaflets 5–9, very unequal, $\frac{1}{2}$ –1 in., orbicular or obovate, lateral smaller, lower smallest, green and glabrous above, snow-white beneath; petiole very slender; stipules sometimes $\frac{1}{2}$ – $\frac{3}{4}$ in., loose, sheathing, brown, acute, adnate for half their length to the petiole. *Flowers* $\frac{1}{2}$ in. diam., on slender peduncles 1–2 in. *Calyx* white-tomentose, lobes triangular; bracteoles linear-oblong. *Petals* small, oblong, obtuse, yellow. *Stamens* 5. *Achenes* numerous, large, deeply furrowed; receptacle tomentose.

SECT. II. **Trichothalamus**. *Stamens* numerous. *Flowers* sometimes dioecious. *Receptacle* with long erect stiff hairs, which entirely conceal the achenes.

* *Leaves* pinnate.

8. **P. fruticosa**, *Linn.*; *Boiss. Flor. Orient.* ii. 703; dioecious, shrubby, silky, leaflets 3–7 oblong-lanceolate or linear quite entire apiculate, flowers solitary, petals obovate exceeding the calyx, achenes furnished with a long pencil of silky hairs, style short subterminal. *P. rigida*, *Wall. Cat.* 1009; *Lehm. Revis. Potentill.* 19, t. 1. *P. Arbuscula*, *Don Prodr.* 256 (*nepalensis* 229); *Wall. Pl. As. Rar.* iii. 16, t. 228; *Lehm. Revis. Potentill.* 18. *P. reticulata*, *Bertol. Plant. Nuov. As.* i. 6, t. 2.

Temperate and subalpine Himalaya, from KASHMIR, alt. 8–12,000 ft., to SIKKIM, alt. 12–16,000 ft.—*DISTRIB.* N. Asia and Europe to the Pyrenees and England.

A much branched rigid robust erect or prostrate leafy low or tall shrub, 6 in.–4 ft. *Leaves* imbricating, $\frac{1}{2}$ –1½ in.; leaflets $\frac{1}{2}$ – $\frac{1}{2}$ in., coriaceous; petiole slender; stipules large, membranous, obtuse. *Flowers* usually solitary, $\frac{3}{4}$ –1½ in. diam.; peduncle rarely 1 in., silky; bracteoles entire or 2-fid. *Calyx*-lobes ovate or lanceolate. *Petals* broadly obovate. *Stamens* many. *Achenes* numerous, minute, with long hairs, and sunk in the long hairs of the receptacle.

VAR. glabrata; very short, glabrate, leaflets lanceolate. Sikkim, alt. 15,000 ft.

VAR. ochreatea; *Lehm.*; slender, very silky, almost white, leaflets much-reduced linear-lanceolate with revolute margins, flowers smaller. *P. ochreatea*, *Lindl. in Wall.*

Cat. 1028 ; *Lehm. Revis. Potentill.* 17. Western Tibet, from N. of Kumaon to Ladak, alt. 13–17,000 ft.

VAR. pumila; depressed, very dwarf, branches spreading, leaflets very silky $\frac{1}{8}$ – $\frac{1}{4}$ in., flowers sessile $\frac{1}{2}$ – $\frac{3}{4}$ in. diam. *P. Lindenbergii*, *Lehm. in Otto Gart. und Blumenzeit.* vii. 339 ; *Revis. Potentill.* 14, t. 2.

VAR. Inglisii; very dwarf, most densely tufted, leaflets $\frac{1}{2}$ in. linear-lanceolate, flowers often peduncled, peduncle bracteate. *P. Inglisii*, *Royle Ill.* 207, t. 41 ; *Lehm. Revis. Potentill.* 18. Kumaon and West Tibet, alt. 14–15,000 ft.—Very near *P. biflora*, Willd. of the Altai and American Polar regions, which has obcordate petals.

VAR. arnerioides; dwarf, forming dense hard tufts or cushions, branches with the densely crowded spreading leaves $\frac{3}{4}$ in. diam., leaflets linear-lanceolate very rigid, margins revolute to the midrib, achenes glabrous. Borders of Sikkim and Tibet, alt. 17–17,500 ft., *J. D. H.*

9. **P. Salessovil**, *Steph. in Mem. Soc. Nat. Mosc.* ii. 6, t. 3; silky, shrubby below, leaflets 7–9 oblong obtuse coarsely obtusely toothed above the middle, flowers large cymose, achenes villous, style ventral very slender. *Lehm. Monogr. Potentill.* t. 1 ; *Revis. Potentill.* 13. *P. discolor*, *Camb. in Jacq. Voy. Bot.* 53, t. 65. *Comarum Salessovii*, *Bunge*; *Ledeb. Flor. Ross.* ii. 63.

WESTERN TIBET, LAHUL and northern border of KASHMIR, alt. 11–14,000 ft.—DISTRIB. Altai and Thian Schan Mts.

Stems 1–3 ft., woody and as thick as the finger below. *Leaves* 4–6 in.; leaflets 1–1 $\frac{1}{2}$ in., subopposite, subequal, petiolulate, coriaceous, white or green beneath, base rounded; petiole stout; stipules membranous, caudate. *Flowers* 1 in. diam., very numerous, peduncled, in branched leafy cymes. *Calyx* tomentose, lobes ovate or lanceolate, acuminate; bracteoles linear. *Petals* obovate-oblong, exceeding the calyx, white? *Stamens* many, filaments long. *Achenes* minute, many, immersed in the long receptacular hairs, clothed with long silky hairs.

** *Leaves digitately 3-foliate*.

10. **P. ambigua**, *Camb. in Jacq. Voy. Bot.* 51, t. 62; tufted, silky or glabrous, stem very short leafy, leaflets 3 obovate- or orbicular-cuneate obtusely 3-toothed or 3-fid at the broad tip, stipules leafy, flowers solitary peduncled, petals much exceeding the calyx, achenes many smooth, style slender ventral. *Hook. Bot. Mag.* t. 4613 ; *Lehm. Revis. Potentill.* 21. *P. cuneifolia*, *Bertol. Misc.* xxiv. 15, t. 2. *P. cuneata*, *Wall. Cat.* 1015 in part.

Temperate and Alpine Himalaya; from KASHMIR, alt. 10–14,000 ft., to SIKKIM, alt. 9–15,000 ft.

Rootstock stout or slender. *Stems* 1–6 in. *Leaflets* $\frac{1}{4}$ – $\frac{1}{2}$ in., sometimes as broad as long, sometimes glabrate and glaucous beneath; petiole $\frac{1}{4}$ –1 in.; stipules variable. *Flowers* $\frac{1}{2}$ –1 in. diam.; peduncle $\frac{1}{4}$ –1 in., naked. *Calyx* pubescent or glabrate; lobes triangular, acute; bracteoles elliptic, obtuse. *Petals* orbicular, yellow. *Achenes* sunk in the very long receptacular hairs, smooth, clothed with long silky hairs.—Foliage of *P. Sibbaldi*.

11. **P. eriocarpa**, *Wall. Cat.* 1012; nearly glabrous, rootstock very stout, peduncles and long petioles very slender, leaflets 3 cuneate incised and toothed above the middle, flowers solitary, petals much larger than the calyx, achenes very small, style slender terminal. *Lehm. Revis. Potentill.* 22, t. 4.

Tibetan region of KUNAWAR, KUMAON, NIPAL, and SIKKIM, alt. 12–14,000 ft.

Rootstock long; branches like rootstocks, ascending, 4–10 in. long, as thick as a swan's quill, densely clothed with imbricating silky or woolly stipular sheaths; flowering stems from the tips of the branches, very slender, 2–18 in., suberect, glabrous or faintly silky, with one or two subsessile leaves above the middle. *Leaves* very few;

leaflets $\frac{1}{2}$ – $1\frac{1}{2}$ in., thin, bright green on both surfaces, 3-multifid; petiole $\frac{1}{2}$ –3 in.; stipules silky, acute. *Flowers* 1– $1\frac{1}{2}$ in. diam.; peduncle $\frac{1}{2}$ –3 in., naked. *Calyx* glabrous; lobes ovate, acute; bracteoles broadly elliptic, sometimes exceeding the calyx-lobes. *Petals* orbicular-obcordate, yellow. *Achenes* minute, clothed with very long flexuous hairs.

SECT. III. **Potentilla proper.** *Stamens* numerous. *Achenes* not concealed by the long hairs of the receptacle.

* Root perennial.

† *Leaves interruptedly pinnate, the alternate one or more pairs much smaller.* (See also 19 *P. leuconota.*)

12. **P. Mooniana**, *Wight Ic.* t. 233; hirsute or villous, leaflets very many pair elliptic obtuse serrate paler beneath, the smaller orbicular or cuneate, flowers paniced or corymbose, bracteoles broad toothed, achenes quite smooth, style very short ventral. *Lehm. Revis. Potentill.* 54. *R. polyphylla* and *barbata*, *Wall. Cat.* 1030, 1026; *Lehm. l. c.* 53; *Monogr. Suppl.* 1, t. 5. *P. sordida*, *Klotzsch. in Reis. Pr. Wald. Bot.* t. 9.

Temperate Himalaya; from KUMAON, alt. 11,500 ft. to SIKKIM, alt. 10–12,000 ft. KHASIA MTS., alt. 4–5000 ft. CEYLON, Horton plains, alt. 7000 ft.

A tall erect-branched leafy plant in Ceylon and at the lower elevations of N. India, but becoming stunted with almost prostrate flowering-branches at 12,000 ft., very variable in amount of hairiness, and sometimes having a few of the early leaves silky; rarely (*P. polyphylla*) glabrate with appressed hairs. *Leaves* 6–10 in., narrow, pinnate nearly to the base, the leaflets smaller downwards; larger leaflets, $\frac{1}{2}$ – $1\frac{1}{2}$ in., smaller $\frac{1}{10}$ – $\frac{1}{2}$ in., all sessile, membranous, coriaceous at higher elevations, brown when dry; petiole slender, silky; lower stipules usually membranous, upper leafy and toothed or lobed. *Inflorescence* from an open dichotomously branched lax panicle with slender pedicels, to a short almost umbellate corymb with stiff stout pedicels (*P. barbata*). *Flowers* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam. *Calyx* villous, lobes ovate, acute; bracts larger or smaller than the lobes, ovate or cuneate, usually 3-toothed or -lobed. *Petals* obovate-orbicular. *Achenes* on an elevated hairy receptacle, quite without wrinkles.—I can find no characters upon which to found definable varieties of this plant, which by its occasional silky leaves shows an affinity with *P. fulgens*.

13. **P. fulgens**, *Wall MSS. in Hook. Bot. Mag. under t.* 2700; softly silky, leaflets very many pair elliptic oblong or obovate obtuse sharply serrate clothed beneath with silvery hairs, interposed pairs minute, flowers paniced or corymbose, bracteoles quite entire or 2–3-fid, achenes small smooth, style short slender ventral. *Lehm. Revis. Potentill.* 54. *P. splendens*, *Wall. in Hook. Bot. Mag.* t. 2700; *Cat.* 1017; *Don Prodr.* 330; *Sweet Brit. Fl. Gard.* t. 191. *P. Siemersiana*, *Lehm. Ind. Sem. Hort. Hamb.* 1820, 8; *Pugill.* i. 31. *P. lineata*, *Trevir. in Spreng. Syst. Veg.* ii. 534; *Reich. Icon Exot.* t. 8. *P. Naspata*, *Ham. MSS.*

Temperate Himalaya; from KUNAWAR, alt. 6–7000 ft. to SIKKIM, alt. 7–13,000 ft. KHASIA MTS., alt. 4–5000 ft.

As variable as *P. Mooniana*, and in a very similar manner; and further almost connected with it by var. *intermedia*; but usually more robust, with more copious spreading hairs on the petiole and stem, and with the brilliant silvery clothing of the under surface of the leaves and inflorescence sometimes extending to the upper surface. *Rootstock* very stout. *Stems* 6–24 in., stout, ascending or erect, leafy. *Leaves* 2–6 in.; larger leaflets $\frac{1}{2}$ – $1\frac{1}{2}$ in., crowded or not, sometimes with deeply impressed nerves above, at others quite flat, teeth very numerous and acute; petiole rather stout; stipules and inflorescence and petals as in *P. Mooniana*, but calyx usually very silvery,

lobes acute; bracteoles very variable. *Achenes* on an elevated hairy receptacle.—Reichenbach figures the petals as retuse; they seem hardly so in our specimens, nor are they so represented in Bot. Mag. Lehmann's name *P. Siemersiana* published in 1820 has the priority, but is suppressed by the author himself (Revis. 55).

VAR. intermedia; leaflets fewer more oblong slightly silvery beneath, calyx green sparsely silky or hairy as in *P. Mooniana*.—Sikkim at Jongri, alt. 13,000 ft., C. B. Clarke.

14. *P. anserina*, Linn.; Boiss. *Fl. Orient.* ii. 707; rootstock sending out long racemes, leaves lanceolate, leaflets 6–10 pair with minute alternating ones obovate or oblong deeply sharply toothed silvery with white hairs beneath, scapes from the rootstock and from nodes on the runners slender naked 1-flowered, achenes many. *P. pseudo-anserina*, Bertol. *Misc.* xxiv. 15, t. 3.

WESTERN TIBET, PITHI, &c., alt. 12–16,000 ft., Thomson; Balti prov. of KASHMIR, alt. 7700 ft., C. B. Clarke.—DISTRIB. Kashgar, N. Asia, and from Persia westward to the Atlantic, N. America, Australia.

Rootstock very short; racemes a foot and more long. *Leaves* forming a spreading tuft from the crown, 2–10 in., green above, silky beneath; leaflets $\frac{1}{4}$ –2 in., sessile, smaller ones often minute lanceolate and entire; stipules membranous. *Flowers* $\frac{1}{2}$ –1 in. diam.; scape 1–6 in. *Calyx-lobes* lanceolate, acuminate; bracteoles lobed or cut. *Petals* yellow, orbicular. *Achenes* numerous, smooth, on a villous elevated receptacle.

†† *Leaves* not interruptedly pinnate (alternate leaflets not smaller except sometimes in 19. *P. leuconota*).

15. *P. Leschenaultiana*, Ser. in DC. *Prodr.* ii. 584; robust, villous, hairs long spreading soft and silky, leaflets 5–7 obovate or broadly elliptic obtuse coarsely toothed white beneath, flowers corymbose, petals obcordate, achenes on an elevated receptacle wrinkled, style subterminal. *Wight Ic.* t. 990; *Wight & Arn. Prodr.* 301; *Lehm. Monogr. Potentill. Suppl.* 1, t. 3; *Revis.* 41. *P. Grahamiana*, *Wight Cat.*

Temperate Western Himalaya, from KASHMIR to KUMAON. NILGHIRI HILLS abundant.

Rootstock short, stout. *Leaves* 1–10 in.; leaflets usually 5, sometimes 9 or even 11, $\frac{1}{4}$ –1 in., membranous or rather coriaceous, teeth acute or obtuse; petiole slender; stipules, lower membranous entire, upper often leafy and toothed. *Flowering stems* erect or ascending, 2–18 in., usually corymbosely branched above, the corymbs lax and spreading or close. *Flowers* subsessile or long-pedicelled, $\frac{1}{3}$ – $\frac{2}{3}$ in. diam., yellow, rarely white. *Calyx* villous or silky, lobes triangular or oblong, acute or subacute; bracteoles linear, oblong, acute. *Petals* longer than the calyx, orbicular obcordate or more obcuneate. *Carpels* numerous. *Achenes* on an elevated and often globose hairy receptacle, variable in size, minutely wrinkled.—A most variable plant, often a roadside weed.

VAR. bannehalensis; tall, more slender, copiously branched above, leaflets silvery white (rarely green) beneath, flowers 1 in. diam. on slender pedicels, calyx silky, lobes very acute. *P. bannehalensis*, Camb. in Jacq. *Voy. Bot.* 52, t. 64; *Lehm. Revis. Potentill.* 41.—Kumaon to Kashmir, alt. 6–12,000 ft.

16. *P. fragarioides*, Linn.; Ledeb. *Fl. Ross.* ii. 38; villous or hairy, hairs soft silky, leaflets 5–7 elliptic or oblong obtuse coarsely toothed hirsute but not white or silvery beneath, flowers corymbose, petals obovate or obcordate, achenes on an elevated receptacle, style subterminal. *Lehm. Revis. Potentill.* 42; *Maximov. Diagn. Dec.* xv. 158. *P. Gerardiana*, Wall. *Cat.* 1023; *Lehm. l.c.* 42. *P. variabilis*, Klotzsch in Reis. *Pr. Waldem. Bot.* t. 11. *P. Munroana*, *Lehm. Ind. Sem. Hort. Hamb.* 1849, 7; *Revis. Potentill.* 40, t. 13.

Temperate Himalaya, from WAZERISTAN, Stewart, to KUMAON and BHOTAN.—DISTRIB. Siberia to China and Japan.

A smaller plant (sometimes only 2 inches high) than *P. Leschenaultiana*, with which it is almost, if not quite, united through its var. *bannihalensis*, less villous, with smaller leaves, more branched open corymbs, longer and more slender pedicels, more acute calyx-lobes and smaller fruit.

VAR. *stolonifera*: Lehm.; Maxim. Diagn. Dec. xv. 160; stoloniferous, leaflets sometimes 9, the alternate smaller. Bhotan, *Griffith*; Sirmore, *Wallich*.—I give the Sirmore habit on Maximovic's authority; the specimens in Herb. Wallich have no stolons and are referable to the ordinary form of the plant. According to the same authority this variety is found in Japan and Kamtschatka.

17. *P. Clarkei*, Hook. f.; leafy, stout, hispid with long spreading hairs, leaves short, leaflets 5–7 lower much smaller obovate very coarsely crenate-toothed, flowers pedicelled in dichotomous cymes with very divaricate leafy branches and involucriform cut leaf-bracts, calyx-lobes acute, achenes many minutely wrinkled, style slender terminal.

KASHMIR, Sirinuggur, alt. 7000 ft., *C. B. Clarke*.

Stems 1 ft., ascending from a woody rootstock. *Leaves* 1–2 in., covered with spreading hairs on the petiole and both surfaces; leaflets $\frac{1}{2}$ –1 in., approximate, sessile, rigidly coriaceous, toothed $\frac{1}{4}$ way down, pale green when dry, lower lateral sometimes cuneate and 2–3-toothed; stipules on the stem large, semi-ovate, leafy, entire or toothed. *Inflorescence* very stiff, spreading, dichotomously branched, with sessile leaves; pedicel stout, $\frac{1}{2}$ –1 in. *Flowers* $\frac{1}{2}$ in. diam. *Petals* obovate, yellow. *Stamens* numerous. *Achenes* rather large, numerous, on an elevated hairy receptacle.—The rigid pubescence, habit, inflorescence and carpels at once distinguish this from its allies; its floral leaves form a sort of involucre of narrow almost pinnatifid spreading leaflets.

18. *P. Griffithii*, Hook. f.; tall, branched, hoary, leafy, leaves short-petioled, leaflets 5–7 white with appressed pubescence beneath 3 terminal leaflets obovate coarsely crenate-serrate lateral smaller orbicular or oblong, stipules leafy deeply toothed, flowers in paniced corymbs sessile or pedicelled, calyx-lobes obtuse or subacute, achenes very minute glabrous, style very short subterminal. *Potentilla* 15, *Herb. Ind. Or. H. f. & T.*

Eastern Himalaya, BHOTAN, alt. 6–8000 ft., *Griffith*; SIKKIM, alt. 7–14,000 ft., *J. D. H.*

Rootstock inclined. *Stem* 10–24 in., erect or ascending, stout or slender. *Leaves* small, 1–4 in.; leaflets $\frac{1}{2}$ –1 in., green and glabrous or hairy above, quite white beneath and sometimes hairy as well as clothed with white opaque down, base cuneate, lateral very irregular in size and shape, lowest pair often minute; petiole hairy; stipules large. *Flowers* $\frac{1}{2}$ –1 in. diam.; pedicel $\frac{1}{2}$ –2 in., pubescent or tomentose. *Calyx* silky, lobes acute or obtuse; bracteoles quite entire, oblong or ovate, acute or obtuse. *Petals* yellow, rounded or retuse at the tip. *Achenes* numerous, exceedingly minute, smooth, on a large globose somewhat hairy receptacle.—Near *P. discolor*, Bunge, of China, of which I have seen only a small specimen, and which is much smaller, with prostrate flowering stems and pointed tips to the calyx-lobes.

VAR. 1; very slender, flowers $\frac{1}{2}$ – $\frac{1}{2}$ in. on slender long pedicels, petals small.—Sikkim, alt. 7–9000 ft.

VAR. 2.; robust, sometimes $\frac{1}{2}$ –4 in. high, flowers $\frac{1}{2}$ –1 in. on stout shorter pedicels, petals large.—Bhotan and Sikkim, alt. 12–13,000 ft.

19. *P. peduncularis*, Don Prodr. 230; leaflets numerous oblong closely deeply serrate clothed beneath with long soft appressed silvery hairs, above silky or glabrous, flowering stems erect or ascending equalling the leaves, flowers few large corymbose, bracteoles usually 1–2-toothed, achenes very large almost globose, style very short ventral. *Lehm. Revis. Potentill.* 66, t. 25. *P. leuconota*, *Wall. Cat.* 1021, in part. *P. velutina*, *Wall. Cat.* 1016.

Alpine Central and Western Himalaya; NIPAL, *Wallich*. SIKKIM, alt 12-14,000 ft., *J. D. H.*; *C. B. Clarke*.

Rootstock very long and stout, inclined. *Leaves* 2-18 in., linear- or obovate-oblong in outline, 1-2½ in. diam. across the broadest part; leaflets usually close and often imbricate, ½-1½ in., tip rounded, sessile, many-nerved, the alternate nerves smaller, upper decurrent; petiole slender or stout; lower stipules membranous, upper leafy toothed. *Flowering stems* with one or two leaves and a few-flowered irregular corymb. *Flowers* ¾ in. diam.; pedicel elongating after flowering. *Calyx* silky, lobes triangular acute; bracteoles various, usually toothed. *Petals* orbicular, yellow. *Stamens* 20-30. *Achenes* few, ⅓ in. diam., four times as large as in any other Indian species, dark brown; receptacle low, villous.

VAR. obscura; covered with soft spreading hairs, not silvery, leaflets ½ in. broadly oblong membranous less closely serrate softly hairy on both surfaces.—Kumaon at Kalari, alt. 13,000 ft., *Strach. & Winterb.* I have but one specimen, and though I find no approach to pubescence on it, judging from the variation of *P. splendens*, *Mooniana*, and *Leschenaultiana*, it may well be referable to *peduncularis*, with which it altogether agrees in habit, flower, and achenes.

VAR. Clarkei; dwarf, sparsely silky, not silvery, leaflets narrowly oblong.—Sikkim at Yakla, alt. 14,000 ft., *C. B. Clarke*.

20. ***P. leuconota***, *Don Prodr.* 230; leaflets numerous (alternate sometimes minute) oblong obtuse sharply closely serrate clothed beneath with appressed shining silky hairs, flowering stems exceeding the leaves, flowers small subumbellate, bracteoles entire, achenes few hairy or glabrous, style very short ventral. *Wall. Cat.* 1021 (*excl. spec. of peduncularis*); *Lehm. Revis. Potentill.* 65, t. 24.

Alpine Himalaya; GARHWAL, 10,000 ft., *Madden*; NIPAL, *Wallich*; SIKKIM, alt. 10-16,000 ft., *J. D. H.*—DISTRIB. Borneo (Kina Balou, alt. 11,000 ft., *Low*).

Rootstock very stout, sometimes 1 in. diam., inclined. *Leaves* 2-6 in., very numerous, linear in outline or rather broader upwards; leaflets close or sparse, ¼-¾ in., sessile, glabrous or hairy above; petiole with appressed hairs. *Flowering stem* erect or ascending, with usually a leaf about the middle, and an imperfect whorl of reduced ones at the inflorescence. *Flowers* ½ in. diam., crowded the pedicels elongating stiffening and forming an imperfect umbel as the fruit advances. *Calyx* silky, lobes acute; bracteoles linear-lanceolate, entire. *Petals* obovate, retuse or rounded at the tip, rather longer than the calyx, yellow. *Stamens* about 20. *Achenes* not numerous.

21. ***P. microphylla***, *Don Prodr.* 231; dwarf, densely tufted, sparingly silky or glabrate, leaflets very numerous small oblong or rounded pinnatifidly toothed to the middle or deeper, scape exceeding the leaves 1- rarely 2-flowered, petals much exceeding the calyx, achenes many minute quite smooth, styles very short ventral. *Wall. Cat.* 1010.

Alpine Himalaya, from GARHWAL, alt. 10-14,700 ft. to SIKKIM, alt. 15-18,000 ft.

Very variable in habit and stature, forming at high elevations dense hard moss-like tufts, strewed with golden flowers and with the leaves so small and crowded as with difficulty to be distinguished; at lower elevations the leaves are 4-6 by ¾ in. *Leaflets* opposite and alternate, uniform, ⅓-½ in. broad, crowded and overlapping or scattered, flat, or complicate; petiole slender; stipules very large, membranous, obtuse. *Flowering stem* or scape erect, rarely shorter than the leaves, appressed-pubescent or silky, naked or with an undeveloped leaf and bud above the middle, rarely 2-3-flowered. *Flowers* ½-¾ in. diam. *Calyx*-lobes acute or obtuse; bracteoles oblong. *Petals* orbicular or obovate, yellow. *Stamens* 30-40. *Achenes* in a globose head on a villous receptacle.

VAR. a. microphylla proper; densely tufted, rootstock stout woody, leaves 1 in., petiole filiform, leaflets ⅓ in. 3-5-fid pointing forwards and upwards. *P. microphylla*, *Wall.* and *γ. depressa*, *Wall.*; *Lehm. Revis. Potentill.* 30; *Monog. Suppl.* t. 2, f. 2.

VAR. β. glabriuscula, *Wall. Cat.* 1010; less densely tufted, leaves 2-3 in., leaflets

nearly orbicular in outline flat cut in rather a fan-shaped manner, glabrous above, silky on the nerves beneath.

VAR. *δ. latiloba*, Wall. Cat. 1010; leaves 2-4 in., leaflets orbicular in outline flat toothed from below the middle to the tip, nearly glabrous beneath, scape slender 2-3-flowered sometimes decurved in fruit. *P. microphylla*, Royle Ill. 208, t. 41, f. 2.

VAR. *achilleaefolia*; leaves 1-2 in., leaflets most densely imbricate pointing obliquely forwards and upwards almost perpendicularly to the plane of the leaf very silky beneath.

VAR. *commutata*; leaves 3-4 in., leaflets $\frac{3}{8}$ in. separate flat broadly oblong pinnatifid to the middle, lobes slightly falcate glabrous above sparingly silky beneath, scapes shorter than the leaves, calyx-lobes and bracteoles obtuse. *P. commutata*, Lehm. Puggill. iii. 16; Revis. Potentill. 65.—Kumaon, Wall. Herb.; Bargi Kang Pass, Str. & Winterb. The most developed form, approaching in size and habit *P. peduncularis*, var. *obscura*, but widely differing in the fruit.

22. **P. bifurca**, Linn.; Boiss. Fl. Orient. ii. 707; small, slender, clothed with appressed silky hairs, stem leafy, leaflets 5-15 oblong entire 2-3-fid or -partite, flowers small solitary or cymose on slender peduncles, petals much exceeding the calyx, achenes glabrous except at the base, style slender ventral. *P. Moorcroftii*, Wall. Cat. 1014; Lehm. Revis. Potentill. 23, t. 3. *P. glauca*, Camb. in Jacq. Voy. Bot. 54, t. 66. *P. bidens*, Bertol. Misc. Bot. xxiv. 16, t. 4.

WESTERN TIBET, alt. 10-14,000 ft., and Tibetan border of LAHUL, KUMAON, and SIKKIM, alt. 13-17,000 ft.—DISTRIB. Soongaria, Altai Mts., Mongolia, Caucasus, Taurus.

Rootstock long, slender, branched, tortuous. Stems 4-8 in., suberect or diffuse. Leaves $\frac{1}{2}$ -2 in.; leaflets $\frac{1}{8}$ - $\frac{3}{4}$ in., usually linear-oblong, not toothed or serrate, obtuse or acute, sessile by a broad or narrow base; petiole slender; stipules acute or acuminate. Flowers $\frac{1}{2}$ in. diam.; peduncle $\frac{1}{2}$ -1 in., naked, flexuous. Calyx-lobes broad, rather obtuse. Petals obovate, yellow. Achenes few, large for the size of the plant, somewhat triangular, obtuse, quite smooth, exceeding the hairs of the elevated receptacle.

23. **P. corlandrifolia**, Don Prodr. 232; sparsely hairy or glabrate, rootstock very thick, leaflets 6-∞ pair broadly ovate deeply cut into spreading linear or subulate hair-pointed lobes, flowering stems ascending and prostrate, flowers subumbellately corymbose, petals obcordate, achenes nearly glabrous, style slender terminal. *P. meifolia*, Wall. Cat. 1011; Lehm. Revis. Potentill. 29; Monog. Suppl. i. t. 1.

Central and Eastern Alpine Himalaya; NIPAL, Wallich; SIKKIM, Jongri, alt. 13,000 ft., C. B. Clarke.

Rootstock as thick as the thumb, inclined. Leaves excessively numerous, spreading, 2-4 in.; leaflets $\frac{1}{4}$ - $\frac{1}{2}$ in. broad, opposite and alternate, sessile, glabrous except a few hairs beneath and at the tip of every segment, cut almost to the midrib in a fan-like manner, primary segments again divided, ultimate ones acute; petiole with appressed hairs; stipules subulate. Flowering stems 4-6 in., numerous, declinate and then ascending, with appressed hairs and a few much reduced leaves. Flowers $\frac{1}{2}$ in. diam. on slender pedicels. Calyx glabrate; lobes triangular, acute; bracteoles linear-oblong, acute. Petals twice as long as the calyx, yellow. Achenes smooth; receptacle hairy.—The leaflets of the Sikkim specimens are much more finely divided than those of the Nipal ones.

24. **P. multifida**, Linn.; Boiss. Fl. Orient. ii. 710; stems many and petiole and leaves beneath softly white-tomentose without silky hairs, leaves pinnate or subdigitately 3-5-foliolate glabrous above, leaflets linear-oblong or obovate pinnatifid nearly to the base, segments linear or lanceolate ascending, mar-

gins recurved, flowers yellow $\frac{1}{2}$ – $\frac{3}{4}$ in. diam. corymbose, achenes numerous minute, style terminal. *Lehm. Revis. Potentill.* 34. *P. breviscissa*, *Bertol. Misc. Bot.* xxiv. 17, t. 5.

KASHMIR and WESTERN TIBET, alt. 10–16,000 ft.; Niti Pass, KUMAON, alt. 16,300 ft., *Str. & Wint.*—DISTRIB. Afghanistan to the Caucasus. Northern and Central Europe and Asia from Lapland and the Pyrenees; China; temperate and Arctic N. America.

As variable in stature as *P. sericea*, and in other respects also. *Rootstock* short, erect, with many crowns of leaves and stout or slender, suberect or prostrate or ascending stems. *Leaves* $\frac{1}{2}$ –2 in. diam., normally with 5 subdigitate lobes, but often with lobes more pinnately dispersed on the slender petiole which is sometimes 4 in. long; divisions of pinnules $\frac{1}{16}$ – $\frac{1}{2}$ in. broad. *Flowers* $\frac{1}{4}$ – $\frac{1}{2}$ in. diam., in close or open corymbose cymes, or few, or solitary in reduced forms, subsessile or on long slender pedicels. *Calyx* silky; lobes ovate, acute; bracteoles linear-oblong, obtuse. *Petals* orbicular-obovate, retuse. *Achenes* glabrous, exactly like those of *P. sericea*; receptacle hairy.—A considerable number of species in different sections of Lehman's "Revision" are referable to this species. *P. altaica*, Bunge is a state with leaflets reduced to three. *P. verticillaris*, Steph., referred here by Ledebour, is according to our specimens partly *P. multifida* and partly *sericea*.

VAR. glabrata; dwarf, rootstock stout, stem prostrate, leaves dense nearly glabrous, flowers small.

VAR. minor, *Ledeb. Fl. Ross.* ii. 42; very slender, leaflets pinnate cut into very slender lobes. *P. tenella*, Turcz. West Tibet, *Falconer*. Afghanistan, *Griffith*.

VAR. Saundersiana; very small, leaves palmately 3–5-foliolate, leaflets $\frac{1}{4}$ – $\frac{1}{2}$ in. deeply incised tomentose or silky beneath. *P. Saundersiana*, *Royle Ill.* 207, t. 41, f. 1; *Lehm. Revis. Potentill.* 113. Western Tibet, alt. 15–17,000 ft. Also in Siberia and Arctic latitudes. Very small 3-foliolate specimens are perhaps undistinguishable from *P. nivea*, L., and var. *hololeuca* of *P. sericea* may be referable here. Dwarf forms of these three species are hardly distinguishable in a dry state.

25. ***P. sericea***, *Linn.*; *Boiss. Fl. Orient.* ii. 709; white, densely silkily tomentose, stems many, leaves oblong pinnate, leaflets 5–11 silky on both surfaces, cut nearly to the base into linear subacute ascending lobes with recurved margins, flowers yellow $\frac{1}{4}$ – $\frac{3}{4}$ in. diam. corymbose, petals orbicular-obovate, achenes many smooth, carpels glabrous, style terminal. *Lehm. Revis. Potentill.* 33. *P. cinerascens*, *Bertol. Plant. Nuov. Asiat.* 7, t. 63. *P. soongarica*, *Bunge; Ledeb. Fl. Ross.* ii. 42.

WESTERN TIBET, and Tibetan region of the Western Alpine Himalaya, from KASHMIR, alt. 9–17,000 ft. to KUMAON.—DISTRIB. Afghanistan to the Caucasus and Armenia. Soongaria, N. China, Temperate and Asiatic N. America.

A very variable plant, diminishing in size with the increasing elevation from 18 in. to 3 in.; covered more or less densely with soft shining silky hairs. *Rootstock* very stout, perpendicular, with many heads. *Leaves* crowded, 1–6 in. long, rarely more than 1 in. broad; leaflets oblong, all cut nearly to the midrib, rarely only half way to it, the terminal leaflets pedately disposed, the lateral opposite and alternate. *Flowering stems* ascending, densely tomentose, corymbosely many-flowered in the larger specimens, few or 1-flowered in the smaller. *Calyx-lobes* triangular-ovate or lanceolate, acute; bracteoles narrowly oblong, obtuse. *Achenes* quite smooth.—I can find no character whereby to separate *P. soongarica* from the common Tibetan form of *sericea* and it is difficult to retain *hololeuca* and *polyschista* as distinct forms, to which may be added certain forms of *P. pensylvanica*, L.

VAR. polyschista, *Lehm.*; dwarf, densely tufted, leaflets 3–5 short, flowers smaller—alt. 15–17,000 ft.—*P. polyschista*, *Boiss. Flor. Orient.* ii. 710.

VAR. hololeuca, *Boiss.*; *Fl. Orient.* ii. 710 (sp.); dwarf, leaflets 3–5, ovate pinnatifid to the middle, most densely white tomentose beneath, flowers few small. *Lehm. Revis. Pot.* 69, t. 27. Perhaps referable to *P. multifida*—Pugha in Little Tibet,

alt. 14–16,000 ft., *Thomson*. Small forms of this are undistinguishable in a dry state from those of *P. multifida*, especially when the leaflets are reduced to 3 or 5; its numerous forms have many names in Europe, Asia, and America.

††† *Leaves digitately 5-foliolate, or upper 3-foliolate.* (See also states of 24. *P. multifida*, 25. *sericea*, and 37. *nivea*).

26. ***P. desertorum***, *Bunge in Ledeb. Fl. Alt. ii. 257; Fl. Ross. ii. 53; Ic. t. 337*; erect, leafy, glandular hairy, radical leaves long-petioled 5-foliolate, leaflets sessile membranous obovate coarsely crenate, cauline stipules large lanceolate quite entire, flowers in capitate leafy heads, achenes very minute wrinkled, styles short subterminal. *Lehm. Revis. Potentil. 90.*

Western Himalaya; in the dry region of KASHMIR and KISHTWAR, alt. 7–9000 ft., *Thomson, C. B. Clarke*.—DISTRIB. Soongaria.

All parts covered with soft spreading often glandular hairs. *Stems* tufted on a woody rootstock, soft, erect or ascending. *Radical leaves* 4–8 in.; leaflets 1–2 in., entire towards the cuneate base, nerves slender, green on both surfaces; petiole slender, 2–6 in.; cauline leaves short-petioled or sessile, 3-foliolate; stipules $\frac{1}{2}$ – $\frac{3}{4}$ in. *Flowers* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., sunk amongst the uppermost leaves; peduncle elongating in fruit, strict and stout. *Calyx* large, $\frac{1}{8}$ in. long; lobes lanceolate, acute; bracteoles entire or 3-fid. *Petals* orbicular-obovate, dark yellow, not much exceeding the calyx. *Achenes* very numerous, on a globose villous receptacle. *P. Kotschyana*, Fenzl, of Cilicia, &c., seems to me to be this plant.

27. ***P. nepalensis***, *Hook. Exot. Flor. ii. t. 88*; more or less clothed with long soft spreading hairs, stem leafy branched, leaves long-petioled 5-foliolate, leaflets obovate or elliptic-obovate acute or obtuse coarsely serrate green, flowers pedicelled in dichotomous panicles, petals obcordate purple, achenes minute wrinkled. *Wall. Cat. 1027; Lehm. Revis. Potentill. 91. P. bifurcata, Wall. MSS. P. formosa, Don Prodr. 232; Sweet Brit. Fl. Gard. t. 136. P. colorata, Lehm. Ind. Sem. Hort. Hamb. 1820. P. coccinea, Hoffm. Brief. aus Ind. ii. App. 511. (Engl. edit.) P. Gulielmi Waldmeri, Klotzsch in Reis. Pr. Waldem. Bot. t. 13.*

Western temperate Himalaya, alt. 5–9000 ft., from MURREE to KUMAON.

Stems erect, from a woody rootstock, 1–3-flowered, stout or slender, from densely villous to glabrate. *Radical leaves* 12 by 3 in.; leaflets sessile, 1–3 by $\frac{1}{4}$ – $1\frac{1}{4}$ in., membranous, rarely acute, teeth obtuse or acute; base entire, cuneate; petiole slender; cauline stipules $\frac{3}{4}$ –1 in., ovate or oblong, lower entire, upper lobed. *Flowers* $\frac{3}{4}$ –1 in. diam; fruiting pedicels sometimes 3 in., divaricate. *Calyx-lobes* acute; bracteoles obtuse. *Achenes* very numerous, on a globose hairy receptacle.—In English gardens this species has been long cultivated and much hybridized.

28. ***P. kashmirica***, *Hook. f.*; erect, leafy, clothed with spreading hairs, leaves short-petioled 5-foliolate, leaflets obovate-oblong very coarsely serrate lateral lobes softly hairy on both surfaces, flowers in large wide-spreading dichotomous cymes, petals obcordate yellow, achenes deeply wrinkled, style short subterminal.

KASHMIR at Nowgunge, alt. 7500 ft., *C. B. Clarke*.

Stem a foot high, rather slender; hairs soft, flexuous. *Leaves* 2–3 in.; leaflets 1– $1\frac{1}{2}$ in., sessile, the lateral much shorter and broader, all cut $\frac{1}{3}$ way down into sub-acute lobes or serratures, paler and almost silky beneath; petiole 1–2 in.; stipules lanceolate, acute. *Inflorescence* 6 in. diam., repeatedly forked and more corymbose than paniced, many-flowered. *Flowers* $\frac{1}{2}$ in. diam.; pedicels slender. *Calyx* silky; lobes ovate, acuminate; bracteoles obtuse. *Petals* about $\frac{1}{3}$ larger than the calyx. *Achenes* many, on a globose hairy receptacle.—A very distinct plant, allied to *P. nepa-*

lensis; distinguished by the shorter petioles, very deeply serrate shorter leaflets the lateral of which are lobed on the lower margin, by the yellow flowers and strongly wrinkled achenes; the broad corymbose inflorescence further distinguishes it from both *P. nepalensis* and *desertorum*. Its nearest ally is the European *P. hirta*, L. which has much larger flowers and achenes.

29. **P. argentea**, Linn.; Boiss. *Fl. Orient.* ii. 714; hoary with appressed white tomentum, stems leafy, leaflets 5 oblanceolate pinnatifidly cut into broad subacute teeth, base entire cuneate, flowers very numerous subcorymbose, pedicels slender, petals yellow, achenes minute smooth, style subterminal.

KASHMIR, Jacquemont; Pir Punjal, Stewart; Alibad, 8,000 ft., C. B. Clarke.—DISTRIB. Soongaria, N. Asia, Asia Minor westward to the Atlantic.

Stems many from the root, 6–10 in., erect or ascending. Leaflets 1–1½ in., sessile, rather stiff, lobes pointing upwards, margins slightly recurved, glabrous above; petiole 1–2 in.; stipules lanceolate, acuminate, entire. Inflorescence broad, much dichotomously branched, leafy. Flowers ½ in. diam.; pedicels ½–1½ in. Calyx densely tomentose; lobes acute; bracteoles entire. Petals rather exceeding the calyx, obovate. Achenes on a villous elevated receptacle.

30. **P. reptans**, Linn.; Boiss. *Fl. Orient.* ii. 723; glabrous, sparsely hairy, stolons long slender rooting, leaflets 5 obovate or oblanceolate crenate-serrate, peduncles axillary solitary naked 1-flowered, achenes many smooth, styles subterminal.

KASHMIR, Falconer, Jacquemont, Thomson.—DISTRIB. Siberia, Afghanistan westward to Abyssinia and in Europe to the Atlantic, N. China, Japan.

Rootstock woody; runners 1–2 ft., slender, leafy at the nodes. Leaflets 1–2 in., membranous, somewhat pedate, sometimes petiolulate; petiole 1–6 in., slender; stipules small, oblong, entire. Peduncle 1–4 in., erect. Flowers ½–¾ in. diam. Calyx-lobes broad or narrow, acute; bracteoles ovate, entire. Petals obcordate, yellow. Achenes dark brown.

VAR. *minor*; leaflets ½ in. rigid obovate quite glabrous.

VAR. ? *trifoliolata*; pubescent, leaflets 3 obovate sparingly silky beneath. Kashmir valley, Thomson.—Probably a different species.

31. **P. pteropoda**, Royle *Ill.* 207, t. 40, f. 2; silkily hairy, leaves long-petioled fan-shaped in outline, leaflets 5 cuneate-oblong toothed at the tip, stipules very long adnate to and almost equalling the petiole, stems 1–few-flowered, petals large, carpels ovoid. *Lehm. Revis. Potentill.* 157.

Mountains surrounding KASHMIR, Royle l. c.

This is the only described Indian *Potentilla* of which I have not seen a specimen. The above character is extracted from Royle's, to which the plate enables me to add that the flowering stems equal or rather exceed the leaves, and that the petals are obcordate and twice as large in the acute sepals. The drawing represents a plant with very much the habit of *P. curviseta*, but far more robust, with 3–5 much broader leaflets, that have rounded 5–7-toothed tips.

††† Leaves digitately 3-foliolate (see also 30. *P. reptans*, var. ? *trifoliolata*, states of 24. *P. sericea* and 23. *multifida*).

32. **P. argyrophylla**, Wall. *Cat.* 1020; tall, leafy, clothed with white silky hairs rarely with opaque tomentum, leaflets 3 elliptic-ovate-oblong-orbicular or obovate acutely toothed white beneath, nerves prominent, flowers many in paniced cymes usually long-pedicelled, petals large red purple or yellow, achenes smooth on a densely villous receptacle, style subterminal.

Western and Central Himalaya, from KASHMIR, alt. 8–13,000 ft. to NIPAL.

Rootstock very stout; stem 2–3 ft., finely pubescent. *Leaflets* 2–3 in., sessile or petiolulate, green, glabrous or finely silky above, dirty white beneath; nerves not very prominent, teeth acute; petiole 3–6 in.; cauline stipules ovate-oblong, acute. *Flowers* $\frac{3}{4}$ – $1\frac{1}{4}$ in. diam.; pedicels sometimes 2 in., and very slender. *Calyx* silky, lobes acuminate; bracteoles elliptic-oblong, obtuse acute or acuminate. *Petals* obcordate-cuneate, varying from red-purple to almost brown-purple. *Stamens* about 20, dark purple. *Achenes* very numerous; styles long.

Except in the colour of the petals I can find no difference between *P. atrosanguinea* and *P. argyrophylla*, and I am hence compelled to unite them; in so doing I retain the name of *argyrophylla* from its representing a character known to both forms.

VAR. argyrophylla proper; flowers yellow. *P. argyrophylla*, Wall.; *Lehm. Monogr. Potentill. Suppl.* t. 9; *Revis. Potentill.* 151. *P. Jacquemontiana*, *Cambess. in Jacq. Voy. Bot.* 51, t. 63. *P. insignis*, *Royle MSS.*; *Lindley in Bot. Reg.*, 1841, t. 37.—I have not seen the quinate leaflets which according to Lindley occasionally occur, nor the broad 2–3-fid bracteoles mentioned by Lehman.

VAR. atrosanguinea; flowers red or purple. *P. atrosanguinea*, *Lodd. Bot. Cab.* viii. t. 786; *Don Prodr.* 232; *Lehm. Revis. Potentill.* 150; *Hook. Bot. Mag.* t. 2689; *Sweet, Brit. Fl. Gard.* t. 124. *P. Wallichiana*, *Govan in Wall. Cat.* 1013.

VAR. leucochroa; much smaller, leaflets sometimes $\frac{1}{2}$ in. densely silky often on both surfaces, flowering stems 1–few-flowered, flowers yellow or red. *P. leucochroa*, *Lindl. in Wall. Cat.* 1019. *P. Cantleyana*, *Royle Ill.* 207, t. 40, f. 1. *P. cataclines*, *Lehm. Pugill.* iii. 37; *Monog. Potentill. Suppl.* i. t. 10; *Revis. Potentill.* 150. *P. vestita*, *Klotzsch in Reiss. Pr. Waldem. Bot.* t. 14.—Kashmir to Nipal, alt. 10–15,000 ft.—Lehman (*Revis.* 171) includes Lindley's *leucochroa* under the American *P. villosa*, which differs totally in the short style and glabrous receptacle.

33. **P. gelida**, *C. A. Meyer*; *Ledeb. Fl. Ross.* ii. 59; sparsely pubescent or silky or glandular, leaflets 3 small obovate or cuneate deeply crenate, cauline few much reduced with broad-ovate large entire stipules, flowering stems slender ascending, flowers on slender pedicels yellow, calyx-lobes acute longer than the oblong obtuse bracteoles, achenes smooth, styles subterminal, *Lehm. Revis. Potentill.* 154. *P. grandiflora* and *P. alpestris*, *Herb. Ind. Or. Hook. f. & T.*

Western temperate Himalaya; from KASHMIR to KUNAWUR and in WESTERN TIBET, alt. 13–17,000 ft.—DISTRIB. N. Asia from the Caucasus to Dahuria.

Usually covered with soft spreading hairs, sometimes glandular, rarely somewhat silky. *Rootstock* rarely large. *Leaflets* $\frac{1}{3}$ – $\frac{2}{3}$ in. long, sessile or petiolulate, usually entire for $\frac{1}{2}$ or $\frac{1}{3}$ upwards from the base, crenatures very large, sometimes only 4 or 5, and towards the very end of the leaflet, rather membranous, flat, nerves indistinct; petiole $\frac{1}{2}$ –1, rarely 2 in.; stipules of cauline leaves $\frac{1}{4}$ – $\frac{1}{3}$ in. long, hoary. *Flowers* $\frac{1}{2}$ –1 in. diam., usually 1–4 on slender pedicels. *Calyx* pubescent or silky. *Petals* obcordate. *Achenes* many on an elevated villous receptacle.—A very variable plant. Some specimens of Mr. Clarke's from Karakoram, alt. 14,500 ft. are upwards of 2 feet high, others from Kumaon are not as many inches and are quite glutinous. The broad entire stipules and almost naked flowering stems are its best character. I do not see how it is to be distinguished from the European *P. grandiflora* and Siberian *P. fragiformis*, Willd. (exclusive of the Japan plant so called by A. Gay).

34. **P. doubjouniana**, *Camb. in Jacq. Voy. Bot.* 50, t. 61; sparsely pubescent, leaflets 3 obovate-cuneate deeply toothed, cauline with obtuse toothed stipules, flowering stems ascending slender leafy, calyx-lobes acute longer than the obtuse 3-fid bracteoles, achenes smooth, style subterminal. *Lehm. Revis. Potentill.* 157.

KASHMIR, alt. 9–10,000 ft., *Jacquemont, Thomson.*

Very similar to *P. gelida*, but distinguished by the more leafy flowering stems,

the obtuse cut stipules and trifid bracteoles. It appears to be a very scarce plant, and I regret to find Thomson's specimens have been by me mixed in the distribution with those of *P. gelida*, under the name of *P. grandiflora*.

35. **P. monanthes**, Lindl. in Wall. Cat. 1025; glandular or sparsely pubescent, leaflets 3 broadly obtuse coarsely crenate at the apex, cauline stipules broad-ovate acute, flowering stems very many ascending leafy, flowers sessile and pedicelled at the top of the stem, calyx-lobes broad obtuse, bracteoles orbicular-oblong, achenes minute smooth, style terminal. *Lehm. Revis. Potentill.* 175. *P. cryptantha*, Klotzsch in Reis. Pr. Waldem. Bot. t. 12.

Alpine Himalaya; from KASHMIR to SIKKIM, alt. 10,000 to 15,000 ft.

Forming large spreading tufts of leaves and stems 2–12 in. high from a rather small rootstock, very variable in size. *Leaves* radical and cauline, all short petioled; leaflets $\frac{1}{2}$ – $\frac{2}{3}$ in., rather soft, glandular-pubescent on both surfaces, crenatures rounded; petiole rarely 1 in.; stipules $\frac{1}{4}$ – $\frac{1}{2}$ in., rarely cut. *Flowers* $\frac{1}{3}$ – $\frac{1}{2}$ in. diam., axillary and subterminal, shortly pedicelled. *Calyx* pubescent, hemispheric; bracteoles often larger than the lobes. *Petals* obovate-orbicular, not much exceeding the calyx, yellow. *Achenes* exceedingly numerous and minute, on a globose villous receptacle.—The rounded tips of the sepals and bracteoles are good characters of this species. The *Potentilla* 26 of Strachey and Winterbottom from 12,000 ft. in Kumaon is, I think, a minute state.

VAR. *sibthorpioides*; much smaller, stems filiform prostrate, leaflets $\frac{1}{6}$ – $\frac{1}{4}$ in. broader, flowers $\frac{1}{4}$ in. diam., calyx-lobes and bracteoles narrower.—Lachen valley, Sikkim, alt. 11–13,000 ft., J. D. H.

36. **P. curviseta**, Hook. f.; rigid, thinly silky, leaflets 3 narrowly linear-cuneate truncate and trifid at the tip, stipules forming a narrow wing to the petiole for half its length, flowering stems slender, pedicels filiform decurved, achenes 5–6 hairy, style terminal.

KASHMIR; at Tilail, alt. 12,000 ft., C. B. Clarke.

Whole plant rigidly elastic when dry. *Rootstock* slender, crowned with stiff recurved almost woody leaf bases. *Leaves* few, 2–3 in. long; leaflets $\frac{1}{2}$ –1 by $\frac{1}{5}$ – $\frac{1}{3}$ in., suberect, coriaceous, hairy on both surfaces, teeth acute, the lateral leaflets with sometimes an additional tooth on the outer margin; petiole rigid, with a rather membranous brown sheath formed by the stipules which above the base form a green narrow margin along the petiole to its middle; free parts of stipules small, subulate, entire. *Flowering stems* 2–3 in., 2–3-flowered, slender, wiry, with opposite linear bracts at the middle and a cut one at the giving off of the pedicels; pedicels circinnately incurved after flowering, naked or with a bract at the middle. *Calyx* $\frac{1}{4}$ in. diam., silky; lobes lanceolate, acuminate, much larger than the oblong bracteoles. *Stamens* and carpels about 20. *Achenes* few, large, obliquely ovoid; receptacle flat, villous.—A very remarkable species, allied to *P. tridentata*, L. *P. Saxifraga*, Ard., and *P. alba*, L. The only Himalayan one with hairy carpels. Still more near to the *P. pteropoda*, Royle, which has 3–5 much broader more toothed leaflets rounded at the tip, and apparently larger flowers. I have seen no petals.

37. **P. nivea**, Linn.; Boiss. Flor. Orient. ii. 725; dwarf, densely clothed with white appressed tomentum, leaflets 3 rarely 5 small obovate acutely serrate, flowering stem 1–3-flowered, calyx villous, petals obcordate, achenes several smooth and faintly wrinkled, style terminal. *Lehm. Revis. Potentill.* 165. *P. cæspitosa*, *Lehm. Add. Ind. Sem. Hort. Hamb.* 1849, 10; *Revis. Potentill.* 172, t. 53. *P. argyrophylla*, var. prostrata, *Herb. Ind. Or. Hook. f. & T.*

WESTERN TIBET and drier Alpine regions of the whole Himalaya, alt. 10–17,000 ft. —DISTRIB. Caucasus and westwards to the Alps, Arctic and cold regions of N. Europe, Asia and America.

A small high Alpine species, very difficult in some of its forms to distinguish from dwarf states of *P. multifida* on the one hand, and but for the smaller flowers, from *P. leucochroa* on the other, which again resembles closely *P. argyrophylla* of the Himalayas and *P. villosa* of Arctic America.—*Rootstock* very stout and woody. *Leaves* 1–2 in.; leaflets $\frac{1}{2}$ –1 in., sessile, very coriaceous, glabrous or silky above, snow-white beneath; petiole stout; stipules ovate, acute, downy, entire or toothed. *Stem* with 1 (rarely more) reduced leaf. *Flowers* $\frac{1}{2}$ in. diam., on stout peduncles. *Calyx* woolly; lobes acute; bracteoles oblong, obtuse. *Petals* yellow, obcordate. *Achenes* few, pale, tumid, on a densely woolly low receptacle.

** Root annual.

38. *P. Kleiniana*, *Wight & Arn. Prodr.* 300; sparsely silkily hairy, stems many from the root very slender prostrate leafy, leaves digitately 3–5-foliate, leaflets 5 narrowly obovate or oblanceolate obtuse obtusely serrate, stipules $\frac{1}{2}$ -lanceolate, flowers small in terminal paniced cymes, achenes minute deeply wrinkled, style terminal. *Wight. Ill. t.* 85; *Lehm. Revis. Potentill.* 79. *P. Wallichiana*, *Wall. Cat.* 1022; *Lehm. Rev. Potentill.* 80, t. 34, not of *DC. Prodr.* *P. gracilis*, *Wall. MSS.* *Duchesnea sundaica*, *Miq. Fl. Ind. Bat. i.* part 1, 372, t. 6.

Temperate Himalaya from KASHMIR, alt. 3–7000 ft., to SIKKIM, alt. 4–9000 ft. and BHOTAN. KHASIA MTS., alt 4000 ft. NILGHIRI MTS., alt. 6–7000 ft. CEYLON, central province, alt. 6–7000 ft.—*DISTRIB.* Yunnan, Java, Japan.

Annual. *Stems* 3–24 in., flexuous. *Leaflets* $\frac{1}{2}$ –2 in., variable in breadth, membranous or rather coriaceous, entire towards the cuneate base, flat or complicate, beneath glabrous or with silky hairs on the nerves; petiole very slender, 1–4 in.; stipules $\frac{1}{2}$ in., entire or toothed. *Flowers* $\frac{1}{2}$ in. diam., usually pedicelled, or in spreading cymes. *Calyx* sparsely silky; lobes entire; bracteoles acute or obtuse. *Petals* yellow, not much exceeding the calyx. *Achenes* in a globose head with a large glabrous receptacle.—*Leaflets* very rarely 7, sometimes pedate.

39. *P. supina*, *Linn.; Boiss. Fl. Orient. ii.* 725; annual, hairy, stems spreading leafy, leaves pinnate, leaflets 3–9 opposite and alternate oblong obtuse lobulate or serrate, stipules ovate entire, pedicels axillary solitary, petals small, achenes minute, styles subterminal. *Wight & Arn. Prodr.* 300; *Lehm. Revis. Potentill.* 193. *P. cicutariæfolia*, *Willd.* *P. denticulata*, *Ser.*; *Wall. Cat.* 1029. *P. Heynii*, *Roth*; *Wall. Cat.* 1024. *P. cana*, *Wall. MSS.* *P. ruthenia?* *Herb. Ham.* *P. amurensis*, *Maxim.* *P. obovata*, *Bertol. Plant. Nuov. Asiat.* 8, t. 4. *Comarum flavum*, *Roxb. Cat. Hort. Beng.* 39; *Fl. Ind. ii.* 521.

Throughout the warmer parts of India, from KASHMIR to MALACCA and the NILGHIRI HILLS; ascending the Himalaya to 8500 ft. in the north-west. Iskardo in WESTERN TIBET., alt. 7–8500 ft.—*DISTRIB.* Afghanistan and westward to the Atlantic, N. Asia and N. Africa.

Stems very numerous from the root, 6–18 in., spreading, dichotomously branched, prostrate or suberect, stout or slender. *Leaves* $\frac{1}{2}$ –3 in., flaccidly membranous; leaflets irregular in position form and cutting, usually obovate, often oblong or cuneate, obtusely crenate incised or serrate; petiole slender, $\frac{1}{2}$ –2 in.; stipules very broad or narrow. *Flowers* $\frac{1}{4}$ – $\frac{1}{2}$ in. diam.; pedicels $\frac{1}{8}$ – $\frac{1}{2}$ in., slender. *Calyx-lobes* obtuse or acute, as are the bracteoles. *Petals* oblong, yellow, smaller than the calyx. *Achenes* very many, minute, smooth or ridged; receptacle globose, villous.—There are two extreme forms of this common plant both found everywhere in Asia and in Africa, and many intermediates; it appears to be very rare in the Western Peninsula absent from Ceylon, which is remarkable for a tropical and subtropical annual that extends to Malacca.

VAR. 1; stems excessively numerous from the root slender, flowers $\frac{1}{2}$ in. diam., achenes minute smooth. *Plains of India.*

VAR. 2; stems more robust more dichotomously branched, flowers $\frac{1}{2}$ in. diam., achenes larger ribbed. *Kashmir*.

DOUBTFUL AND UNDETERMINABLE SPECIES.

POTENTILLA *sp.* from Shillong, Khasia Mts., alt. 5,000 ft., *C. B. Clarke*; perennial, sparsely hairy, leaflets 3 sessile $\frac{1}{2}$ – $1\frac{1}{4}$ in. elliptic-ovate or obovate acutely toothed hairy beneath less so above, cauline stipules small cut, flowering stem inclined or prostrate slender 2–3-leaved, cymes corymbose rusty tomentose leafy flowers $\frac{3}{4}$ in. diam., calyx-lobes lanceolate acute, bracteoles elliptic obtuse, petals obcordate twice as long as the calyx, carpels many.

POTENTILLA *Candolleana*, *Royle Ill.* 203, name only.

POTENTILLA *Atropos* and *pteropoda* are names given without description or indication of affinity in Hofmeister's travels, and are no doubt described Himalayan plants.

12. **CHAMÆRHODOS**, *Bunge*.

Herbs with a woody rootstock, and ascending or erect leafy stems. *Leaves* alternate, divided; stipules membranous, adnate to the petiole. *Flowers* small, 5-merous, in branched cymes. *Calyx* persistent, tube ebracteolate; lobes erect, valvate. *Petals* 5, equalling or exceeding the calyx. *Stamens* 5, opposite the calyx-lobes, short. *Disk* lining the base of the calyx; its margins free, bristly. *Carpels* 5, 10, or more, sessile in the base of the calyx; style basilar, deciduous; ovule 1, ascending. *Achenes* few or many, dry, glabrous.—DISTRIB. Mountains of Northern Asia and N. America; species 4 or 5.

1. **C. sabulosa**, *Bunge*; *Ledeb. Flor. Ross.* ii. 35; *Ic.* t. 257; tufted, glandular and villous; leaves 3-partite, segments narrow lobed obtuse.

WESTERN TIBET, alt. 12–15,000 ft.—DISTRIB. Altai Mts.

Rootstock short, with many densely tufted short heads. *Stems* 2–4 in., slender, erect or ascending, branched, naked or leafy. *Leaves* with the slender petiole $\frac{1}{2}$ in. *Flowers* $\frac{1}{2}$ in. diam., yellow. *Achenes* smooth, ovoid, narrowed upwards.

13. **ALCHEMILLA**, *Linn.* Lady's mantle.

Annual or perennial herbs. *Leaves* orbicular, lobed or deeply divided; stipules adnate to the petiole. *Flowers* minute, in lax or crowded corymbose cymes. *Calyx* urceolate, persistent, 4–5-bracteolate; lobes 4–5, valvate in bud. *Petals* 0. *Stamens* 1–4, inserted on the mouth of the calyx. *Disk* coating the calyx-tube, and all but closing its mouth by its thickened margin. *Carpels* 1–5, basal in the calyx-tube; style basal or ventral; ovule 1, basal. *Achenes* 1–4, enclosed in the membranous calyx-tube.—DISTRIB. Natives chiefly of the American Andes; a few are European, N. Indian, and American; species 30.

1. **A. vulgaris**, *Linn.*; *Boiss. Fl. Orient.* ii. 729; leaves plaited orbicular-cordate 7–9-lobed toothed, stipules confluent into a funnel-shaped tube with short broad spreading toothed lips.

KASHMIR, alt. 8–9000 ft., *Falconer, Stewart, C. B. Clarke*—DISTRIB. Persia and westward to the Atlantic, N. Europe and Asia, Greenland and Labrador.

More or less clothed with silky hairs. *Rootstock* perennial, creeping. *Stems* 6–18 in., ascending, simple. *Radical leaves* 2–3 in. diam., basal lobes overlapping; petiole 6–18 in.; stipules usually spreading out like a fan. *Cymes* glabrous, irregularly racemed or paniced. *Flowers* $\frac{1}{2}$ in. diam., yellow-green; pedicel very short. *Achenes* 1–2.

2. **A. indica**, *Gard. in Calc. Journ. Nat. Hist.* viii. 8; villous with soft long spreading hairs, leaves orbicular-cordate 5-7-lobed minutely toothed, stipules confluent in a cylindric tube with oblong entire or toothed acute lips. *A. vulgaris*, *Wight Ic.* t. 229. *A. vulgaris* var. *sarmentosa*, *Thwaites Enum.* 102. *A. ceylanica*, *Moon Cat. Pl. Ceyl.* 37.

NILGHIRI MTS., *Wight &c.* CEYLON; Central Province, alt. 5-7000 ft.

Rootstock creeping, woody. *Stems* prostrate, stout, leafy. *Leaves* 1-2 in. diam., glabrous or silky above, margins silky, coriaceous, basal lobes overlapping or not; petiole 1-10 in.; stipules $\frac{1}{4}$ -1 in., the free portion membranous, erect or spreading, ciliate. *Cymes* globose, dense-flowered, on slender axillary peduncles 1-2 in. long. *Calyx* villous, $\frac{1}{10}$ in. long or less.

VAR. *sibthorpioides*; very slender, leaves $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., cymes paniced.—Ceylon, *Gardner*.

14. **AGRIMONIA**, *Linn.* Agrimony.

Slender erect leafy perennial herbs. *Leaves* interruptedly pinnate; leaflets coarsely serrate; stipules partially adnate to the petiole. *Flowers* small, yellow, in terminal spikelike racemes, 2-bracteolate; pedicels bracteate at the base. *Calyx* persistent; tube turbinate, spinous; mouth contracted; lobes 5, triangular, imbricate. *Petals* 5. *Stamens* 5-10 or more, inserted at the mouth of the calyx. *Disk* lining the calyx-tube, its margin thickened. *Carpels* 2, included in the calyx-tube; styles exserted, stigma 2-lobed; ovule 1, pendulous. *Fruit* pendulous, of 1 or 2 achenes enclosed in the hardened spinous calyx.—DISTRIB. N. temp. regions, and S. America; species 8.

1. **A. Eupatorium**, *Linn.*; *Boiss. Fl. Orient.* ii. 727; hairy or villous, leaflets elliptic-ovate or lanceolate acute obtuse or acuminate, coarsely obtusely serrate, bracts slender, calyx-tube villous deeply grooved, outer spines spreading. *A. lanata*, *Wall. Cat.* 709; *Wallroth Beiträg. Bot.* 1. 54, t. 1, f. 9. *A. nepalensis*, *Don Prodr.* 229; *Camb. in Jacq. Voy. Bot.* 55, t. 68.

Temperate Himalayas, from MURREE and KASHMIR, alt. 3-10,000 to SIKKIM, alt. 7-10,000 ft. KHASIA Mts., alt. 4-6000 ft. MISHMI Hills, *Griffith*.—DISTRIB. Westwards from Persia to the Atlantic, Siberia and Java, N. America, Java?

Rootstock woody, short or long. *Leaves* 3-7 in.; leaflets 6-21, sessile, alternate often small, hairy on both surfaces; larger 1-3 in., elliptic-ovate or -obovate rarely orbicular; smaller often orbicular and minute; petiole slender; stipules large, leafy, $\frac{1}{2}$ -lunate, entire or toothed. *Racemes* slender, lengthening in fruit; pedicels reflexed in fruit; bracts 3-fid or 3-partite. *Flowers* $\frac{1}{4}$ in. diam. *Petals* oblong-obovate, yellow. *Calyx-tube* $\frac{1}{3}$ in., hardened in fruit, grooved, lobes conniving in fruit; top of tube with a dense ring of spines which become hooked in fruit and are erect with the outer spreading.—I am quite unable to correlate the India form of this plant with the characters given for the European species so called; all are more or less glandular and have a deeply furrowed calyx-tube and a horizontal rootstock.—*A. javanica*, *Miq.* seems not different as far as a single specimen enables me to judge.

2. **A. pilosa**, *Ledeb.*; *Fl. Ross.* ii. 32; sparsely hairy, leaflets elliptic-ovate -obovate or -lanceolate obtuse or acute coarsely obtusely serrate, bracts slender, calyx-tube almost glabrous deeply grooved spines all erect. *A. viscidula*, *Bunge Mem. Sav. Etr. St. Petersb.* ii. 100, ex *Walp. Rep.* ii. 41.

KASHMIR to KUNAWUR, alt. 6-8000 ft., *Thomson, C. B. Clarke*.—DISTRIB. Russia to Manchuria, China and Japan.

Very similar to *A. Eupatorium*, but more glabrous than its Indian forms, and calyx almost glabrous with erect spines.—I do not see how *A. viscidula* differs.

3. **A. zeylanica**, *Moon Cat.* 37; villous with long spreading hairs, leaflets nearly orbicular coarsely obtusely toothed, lower bracts broad leafy, calyx-tube villous deeply grooved, spines spreading. A. *Eupatorium*, *Thwaites Enum.* 102; *Wight Ic.* t. 224.

CEYLON, central province, at an elevation of 5-7000 ft.

I keep up this species with great hesitation, suspecting it to be only a tropical form of *A. Eupatorium*, and there being approaches to it amongst the Sikkim and Khasia specimens of that plant; it is however far more unlike than these to any European form in the villous pubescence, short leaves and rounded leaflets. It is further remarkable that neither this nor any other *Agrimonia* should be found in the Western Peninsular mountains of the Indian continent.

15. **POTERIUM**, Linn.

Erect perennial herbs. *Leaves* pinnate; leaflets stalked; stipules adnate to the sheathing petiole. *Flowers* small, subsessile, in dense long-peduncled heads or centrifugal spikes, bracteate, 2-bracteolate, often polygamous. *Calyx-tube* persistent, turbinate, mouth contracted; lobes 4, petaloid, deciduous, imbricate. *Petals* 0. *Stamens* 4 or more, inserted at the mouth of the calyx, filaments slender pendulous. *Disk* lining the calyx-tube and closing its mouth. *Carpels* 1-3, enclosed in the calyx-tube; styles filiform, stigma penicillate; ovule 1, pendulous. *Achenes* solitary, enclosed in the hardened 4-angled often winged or muricate calyx-tube.—DISTRIB. N. temp. regions; species 20.

* *Carpels* solitary.

1. **P. filiforme**, *Hook. f.*; glabrous, very small and slender, leaflets sessile ovate-orbicular or -cuneate deeply toothed, peduncle subradical very long and slender, heads globose white, stamens 6.

SIKKIM HIMALAYA; in marshy ground, Lachen valleys, alt. 11,500 ft., *J. D. H.*

A small and very delicate plant quite unlike its congeners in habit; the stems being short and the heads on very long 6-8 in. filiform peduncles, each with a minute reduced leaf and bud about the middle. *Stems* tufted, ascending. *Leaves* 1-3 in.; leaflets 3-5 pair, $\frac{1}{4}$ in. broad. *Heads* $\frac{1}{4}$ - $\frac{1}{3}$ in. diam., quite white; bracts orbicular or oblong, membranous, glabrous; flowers monœcious. *Calyx-tube* ellipsoid. *Style* very slender, stigma capitate.

2. **P. diandrum**, *Wall. Cat.* 710 (*Sanguisorba*); tall, quite glabrous, leaflets petiolulate oblong-cordate crenate-toothed, heads globose, stamens 2, fruit oblong deeply 4-winged.

Temperate Central and Eastern Himalaya; NIPAL, *Wallich*. SIKKIM, alt. 10-13,000 ft., *J. D. H.*

Stem erect, 2-3 ft., branched above. *Leaves* 6-10 in.; leaflets $\frac{1}{2}$ -1 in., opposite or alternate, membranous, often complicate when dry, crenatures or teeth variable, acute or obtuse. *Heads* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., on slender erect axillary peduncles; bracteoles oblong, fimbriate. *Flowers* dark-purple, hermaphrodite (polygamous?). *Calyx-tube* ellipsoid, 4-gonous, glabrous; segments orbicular, concave, 3-nerved. *Style* short, stigma large plumose. *Fruit* pendulous, $\frac{1}{4}$ in. long, smooth between the undulate wings.

3. **P. indicum**, *Gardn. in Calc. Journ. Nat. Hist.* viii. 10; tall, base of stem and petioles clothed with rusty hairs, leaflets petiolulate orbicular or cordate-ovate with few large teeth, heads globose, fruit trapezoid. *Thwaites Enum.* 102.

CEYLON, Sir J. G. McKenzie; Adam's Peak, Alwis.

Very similar to *P. diandrum* in stature, habit, foliage, &c., but leaflets with fewer teeth, petiole and midrib of leaflets underneath with flexuous hairs; bracteoles orbicular, clawed, ciliate; calyx segments slightly hairy or scabrid on the back; fruit $\frac{1}{10}$ in., trapezoid, with short wings and a bony endocarp. The flowers are probably polygamous; I find 12 imperfect ones in one bud, and fewer perfect, but my materials are very insufficient.—This is a very little known plant, the only specimen I have seen is Sir J. McKenzie's (in Herb. Benth.). Gardner described it from some found by Mr. Alwis. Dr. Thwaites says that he has searched for it in vain. Like *Agri- monia*, the genus is unknown in the Indian Western Peninsula.

4. **P. longifolia**, Bertol. Misc. Dec. xxii. 14, t. 1 (SANGUISORBA); tall, glabrous, leaflets petiolulate linear-oblong crenate with often accessory leaflets at the base of the petiolules, heads cylindric, stamens 4, fruit short 4-winged.

KHASIA Mts., alt. 5–6000 ft., Griffith, &c.

Rootstock creeping, stout. Stem 2–4 ft., strict, much branched above. Leaves 10–16 in.; leaflets 1–3 in., rigid, base subcordate oblique, under surface reticulate; petiole stiff, erect; stipules very variable, of radical leaves subulate, of cauline foliaceous fan-shaped and toothed or produced and pinnate, tip rounded. Heads 1–2½ in., panicked, on slender stiff peduncles. Flowers purple, hermaphrodite; bracteoles oblong, fimbriate. Calyx-tube ellipsoid, 4-angled, compressed, pubescent, segments in opposite pairs of which one is broader than the other, thick, and thickened towards the tip which is notched with a mucro in the notch and 3-nerved, back with a few hairs. Stamens with slender filaments. Style filiform, elongate, stigma capitate. Fruit broader than long, $\frac{1}{10}$ in. long, wings membranous.

** Carpels 2.

5. **P. Sanguisorba**, Linn.; Boiss. Fl. Orient. ii. 733; sparsely hairy, leaflets petiolulate orbicular deeply toothed, heads globose, stamens about 20, fruit trapezoid acute at both ends.

WAZURISTAN (N. W. of the Punjab), alt. 5–8000 ft., Stewart.—DISTRIB. Persia and westward to the Atlantic, N. Asia.

Stems suberect or ascending, leafy, with lax flaccid hairs. Leaves 3–6 in.; leaflets opposite or alternate, $\frac{1}{3}$ – $\frac{2}{3}$ in., membranous, base rounded, petiolules very short; petiole slender. Heads panicked.—I have seen flowering specimens only, which seem not to differ in any particular from the European plant.

16. **ROSA**, Linn.

Erect, sarmentose or climbing shrubs, usually prickly. Leaves pinnate; leaflets serrate; stipules adnate to the petiole. Flowers terminal, solitary or corymbose, white yellow or red, bracts rarely persistent. Calyx-tube persistent, globose ovoid or pitcher-shaped; mouth contracted; lobes leafy, imbricate in bud. Petals 5, large. Stamens many, inserted on the disk. Disk coating the calyx-tube, all but closing its mouth by its thickened margin, silky. Carpels many, rarely few, in the bottom of the calyx-tube; styles subterminal, free or connate above, stigma thickened; ovule 1, pendulous. Achenes coriaceous or bony, enclosed in the fleshy calyx-tube.—DISTRIB. N. temp. regions, rare in America; extending into Abyssinia, India, and Mexico; species, about 30 very distinct forms with innumerable subspecies and varieties.

The following roses are so commonly cultivated by the natives of India, that I think it right to give a synopsis of them taken from Brandis' "Forest Flora," 199.

A. *Styles distinct*.

I. BRACTEATÆ. Fruit and branchlets densely tomentose; prickles twin, mostly infra-stipular; flowers bracteate; sepals deciduous.

1. *R. LYELLII*, (including *R. involucrata*). See below.

2. *R. BRACTEATA*, *Wendl.*; flowers large white, calyx-tube clothed with prickles.—The Macartney rose. China.

II. EGLANTERIA, Prickles some stout and some slender; flowers yellow or red; sepals persistent.

3. *R. EGLANTERIA*, *Mill.* See below.

4. *R. SULPHUREA*, *Ait.*; leaflets 7 whitish beneath, flowers large yellow double. *R. Rapini*, *Boiss. Fl. Orient.* ii. 672. Asia Minor to Persia.

III. GALLICÆ; erect, prickles mixed with glandular bristles; leaflets rugose; flowers rosy or purple; sepals more or less pinnatifid.

5. *R. DAMASCENA*, *Mill.*; *Wall. Cat.* 684; pickles unequal, larger hooked, sepals reflexed in flower.—The commonest Indian garden rose; cultivated for Attar. Native country unknown.

6. *R. CENTIFOLIA*, *Linn.*; *Roxb. Fl. Ind.* ii. 513; prickles unequal large hooked, bristles numerous, leaflets and calyx glandular-ciliate, flowers nodding.—The Cabbage, Moss, and Provence roses.—Caucasus and Assyria.

7. *R. GALICA*, *Linn.*; prickles slender equal, flowers erect.—Europe, Asia Minor.

IV. CANINÆ. Prickles uniform; bristles 0; flowers purple red, rosy or white.

8. *R. INDICA*, *Linn.*; *Wall. Cat.* 85, 685; evergreen, glabrous, stipules very narrow adnate almost to the top, flowers large on long pedicels rarely single, sepals reflexed. *R. chinensis*, *Jacq.*; *Roxb. Fl. Ind.* ii. 513. *R. sinica*, *Linn.* *R. fragrans*, *Redouté*; *R. semperflorens*, *Bot. Mag.* t. 284; *Roxb. Fl. Ind.* ii. 514; *Wall. Cat.* 686.—The Indian, China, Bengal and Tea roses, and hybrid perpetuals belong here. China.

9. *R. MICROPHYLLA*, *Lindl. Bot. Reg.* t. 919; *Roxb. Fl. Ind.* ii. 515; *Bot. Mag.* t. 3490; *Wall. Cat.* 692; branchlets flexuous, prickles infra-stipular, leaflets 9-15 small, scape densely prickly, sepals short broad-toothed, flowers large double rosy.—China.

10. *R. ALBA*, *Linn.*; leaflets 5-7 large grey rugose downy and pale beneath, flowers large white pale or blush double, sepals often pinnatifid. *R. glandulifera*, *Roxb. Fl. Ind.* ii. 514.—Caucasus, Afghanistan?

V. BANKSIANÆ. Climbing; stipules small, often deciduous; flowers rather small, corymbose.

11. *R. BANKSIÆ*, *Br.*; unarmed, leaflets 3 or 5 shining, flowers white or yellow. *Bot. Mag.* t. 1954; *Bot. Reg.* t. 1105. *R. inermis*, *Roxb. Fl. Ind.* ii. 516.—China, Japan.

12. *R. MICROCARPA*, *Lindl.*; prickles hooked, leaflets usually 3 shining, flowers white, sepals deciduous, fruit small globose red.—China.

13. *R. SINICA*, *Ait.*; *Bot. Mag.* t. 2847; *Bot. Reg.* t. 1922; *Wall. Cat.* 694; prickles red hooked, leaflets 3 shining, flowers solitary large white, peduncles and calyx clothed with straight prickles, fruit muciculate crowned with the spreading sepals. *R. triphylla*, *Roxb. Fl. Ind.* ii. 515.—China, Japan.

14. *R. FORTUNEANA*, *Lindl.*; prickles small hooked, leaflets 3 or 5 dark shining, flowers solitary white double, peduncles short bristly, calyx naked and glabrous.—China.

B. *Styles united in a column; flowers corymbose; prickles uniform*.

15. *R. MOSCHATA*. See below.

16. *R. SEMPERVIRENS*. See below.

17. *R. MULTIFLORA*, *Thunb.*; *Bot. Mag.* t. 1059; *Bot. Reg.* t. 425; stipules and bracts pectinate; flowers double rosy; petioles and inflorescence with long soft hairs and no glands; sepals broad ovate.—Japan, China.

SECT. I. *Styles* distinct.* *Sepals deciduous in fruit*.

1. **R. involocrata**, Roxb. *Hort. Beng.* 38; *Fl. Ind.* ii. 513; branchlets and inflorescence densely tomentose, prickles straight, flowers shortly pedicelled, bracts large lanceolate, calyx-tube unarmed. *Don Prodr.* 235; *Bot. Reg.* t. 739; *Wight Ic.* t. 234; *Kurz For. Flor. Brit. Burm.* i. 440; *Wall. Cat.* 696; *Crepin in Bull. Soc. Bot. Belg.* xiv. 140. R. *Lyellii*, *Lindl. Monogr. Ros.* 12, t. 1; *Crepin l. c.* 143. R. *Lindleyana*, *Tratinik Ros.* i. 190. R. *palustris*, *Buch. MSS.* R. *multiflora*, *Herb. Ham.*

By the sides of streams of the GANGETIC PLAIN. Westward to Mt. Aboo in MARWAR and eastward to BIRMA and along the lower Himalaya from KUMAON eastwards. MYSORE, Munro.

A stout bush, erect or with arching subscandent branches; prickles often in stipular pairs, compressed. *Leaves* 3-4 in.; leaflets 3-4 pair, $1\frac{1}{2}$ in. and less, elliptic or oblong, acute or acuminate, finely serrate, shining above, glabrous on both surfaces or tomentose on the under; stipules small lacinate. *Flowers* 2-3 in. diam., white, fragrant, solitary or in short corymbs, rarely axillary and longer pedicelled; peduncles and pedicels sometimes with glandular hairs; bracts more or less glandular-serrate, especially below. *Calyx-tube* obovoid; lobes caudate-acuminate, quite entire, deciduous. *Petals* retuse. *Fruit* globose, densely tomentose; mass of stigmas discoid, exerted; achenes very many, $\frac{1}{8}$ in. long, pale.—Except that one is described as scandent I cannot distinguish *R. involocrata* from *R. Lyellii*. It is the common rose of the Bengal plains and foot of the Himalaya and the only really tropical species of India. Lindley's varieties *burmana*, *parvifolia*, *glabra*, and *acutifolia* (in *Wall. Herb.*) explain themselves. Wallich's specimen of *involocrata* var. *glabra* is stated to come from the mountains of Pundua on the confines of Sylhet, i. e. the Khasia Mts., which I greatly doubt, for I found it in the Jheels only of Sylhet; and Blinkworth's habitat of the Alps of Sirinuggur probably applies to the Dheyra dhoon. Wallich who procured *R. Lyellii* in Nipal describes it as a large climber in woods, possibly confounding it with *R. moschata*. Crepin hazards the conjecture that *Lyellii* is a hybrid between *involocrata* and *moschata*, and regards it as a very doubtful plant, under which circumstances I have retained Roxburgh's name of *involocrata*, which first appeared in his "Cat. Hort. Bot. Calc." in 1814.

2. **R. anserinæfolia**, Boiss. *Fl. Orient.* ii. 677; tall, subscandent, prickles hooked, bristles C, leaflets broadly elliptic obtuse simply serrate and petioles pubescent beneath or on both surfaces, flowers in few- or many-flowered corymbs shortly pedicelled white, fruit very small globose.

WUZURISTAN; alt. 5,000 ft., Dr. Stewart. — DISTRIB. Affghanistan and Beluchistan.

This is a common wild and cultivated Affghan rose, ascending to 10,000 ft., of which Griffith gathered many specimens, and which no doubt extends within the British frontier, though the nearest hitherto detected habitat is that given above, whence the specimens have very small foliage and flowers.—A shrub often 10 ft.; branches with few or many unequal stout compressed prickles often in pairs; branchlets leaves beneath petioles and calyx covered usually with a rather furfuraceous pubescence mixed on the petioles and calyx with minute prickles and glands. *Leaves* 1-3 in.; leaflets $\frac{1}{2}$ - $\frac{3}{4}$ in., rarely glabrous above, sessile, nerves beneath indistinct; petiole slender; stipules broad, with glandular ovate free portion. *Flowers* from solitary to many in a short crowded corymb, $\frac{3}{4}$ -1 $\frac{1}{2}$ in. diam., fragrant; pedicels short, glabrous or pubescent; bracts ovate-lanceolate, densely glandular. *Calyx tube* globose, usually smooth and glabrous; lobes ovate-lanceolate, caudate-acuminate, tomentose, deciduous; tips pubescent, sometimes dilated. *Fruit* smooth, $\frac{1}{4}$ in. diam.; head of stigmas very large; achenes $\frac{1}{8}$ - $\frac{1}{4}$ in. long.—The above description is of the ordinary state of the plant. Stewart's specimens have more obovate green leaflets $\frac{1}{2}$ in. long, faintly puberulous beneath, and solitary flowers barely 1 in. diam.

** *Sepals persistent in fruit.*

3. **R. macrophylla**, *Lindl. Monogr. Ros.* 35, t. 6; prickles straight or 0, glandular and pubescent or not, leaflets elliptic-ovate acuminate or cuneately finely serrate, bracts large, flowers solitary or corymbose red, sepals very long tips filiform often dilated and serrate. *Brandis For. Flor.* 203; *Wall. Plant. As. Rar.* ii. 19, t. 117; *Cat.* 690; *Don Prodr.* 235; *Crepin in Bull. Soc. Bot. Belg.* xiii. 284, xiv. 167. *R. Hoffmeisteri* and *Gulielmi Waldemarii*, *Klotzsch in Reis. Pr. Waldem. Bot.* 153, t. 7, 8. *R. Hookeriana*, *Bertol. Misc. Bot.* xxiv. 14, t. 1.

Temperate Himalaya, from MURREE, alt. 3500–10,000 ft. to SIKKIM, alt. 8–10,000 ft.—DISTRIB. China.

Erect; prickles straight or slightly curved, with broad dilated bases. *Leaves* 2–8 in.; leaflets $\frac{1}{2}$ –2 in., usually pubescent beneath, base acute rarely rounded; petiole pubescent; stipules large, broad, spreading. *Flowers* 1–3 $\frac{1}{2}$ in. diam., bright red, peduncles pedicels and calyx usually very bristly and glandular; bracts foliaceous, oblong or lanceolate, glandular on the margin. *Calyx-tube* $\frac{1}{2}$ –1 $\frac{1}{2}$ in.; lobes 1–2 in., persistent. *Petals* broadly obcordate. *Fruit* sometimes 2 in. long; styles hairy, exserted; achenes large, often $\frac{1}{2}$ in. long, few or many.

VAR. *minor*, *Lindl. l.c.*; leaflets $\frac{1}{2}$ in. often obtuse, flowers 1–1 $\frac{1}{2}$ in. diam.

VAR. *Hookeriana*; nearly unarmed, leaves very pubescent, peduncles and calyx hardly glandular. *R. Hookeriana*, *Wall. Cat.* 691, not of *Bertol.* *R. torulosa*, *Wall. MSS.*

4. **R. Eglanteria**, *Linn.; DC. Prodr.* ii. 607; erect, branches with straight prickles, branchlets prickly and bristly or naked pubescent, rarely glabrous, leaflets deeply doubly-glandular-serrate, hairy and glandular beneath, flowers few yellow, calyx-tube hemispheric or globose. *R. lutea*, *Mill.; Boiss. Flor. Orient.* ii. 671; *Bot. Mag.* t. 363; *Brandis For. Flor.* 201. *R. bicolor*, *Jacq. Hort. Vind.* i. t. 1. (The Austrian rose.)

Drier parts of the inner Himalaya, from KISHTWAR westward and in WESTERN TIBET, alt. 8–11,000 ft.—DISTRIB. Afghanistan and westward to Asia Minor, and northward to Siberia.

A small bush, very leafy; prickles slender, much compressed, pale. *Leaves* 1 $\frac{1}{2}$ –3 in., leaflets 2–4 pair, $\frac{1}{2}$ – $\frac{3}{4}$ in.; petiolulate, elliptic-ovate or orbicular, obtuse or apiculate, rather membranous, glabrous or sparsely hairy above; petiole pubescent and glandular; stipules broad, free portion half ovate, toothed. *Flowers* 2–2 $\frac{1}{2}$ in. diam.; pedicel often glabrous; bracts ovate-lanceolate, long-acuminate, glandular. *Calyx-tube* glabrous, unarmed or prickly; lobes long-acuminate, tomentose, persistent, entire or with marginal laciniae; tips usually dilated. *Petals* obcordate, variable in depth of colour.

5. **R. Webbiana**, *Wall. Cat.* 683; erect, prickles pale, bristles 0, leaflets oblong or orbicular, flowers subsolitary, calyx-tube usually glandular-bristly, sepals exceeding the petals, fruit ovoid or globose. *Royle Ill.* 208, t. 42; *Crepin in Bull. Soc. Bot. Belg.* xiii. 274; *Brandis For. Flor.* 202. *R. unguicularis*, *Bertol. Misc.* xxii. 15, t. 3. *R. pimpinellifolia*, *Herb. Ind. Or. Hook. f. & T.*

Drier inner Himalaya, from KASHMIR to KUMAON and WESTERN TIBET, alt. 5–13,500 ft.

Glabrous, or with pubescent petioles and leaves beneath; glandular hairs 0 or confined to the inflorescence; prickles copious, $\frac{1}{4}$ – $\frac{3}{4}$ in., straight or curved, with long bases, yellow. *Leaves* $\frac{1}{2}$ –2 in.; leaflets 2–5 pair, $\frac{1}{4}$ – $\frac{3}{4}$ in., rarely obovate, entire towards the usually rounded base, rarely pubescent; stipules small. *Flowers* pink, 1–3 in. diam., usually solitary. *Calyx* globose or ovoid, often densely bristly, rarely quite smooth; lobes caudate-acuminate, glandular, often with dilated tips, entire, persis-

tent. *Petals* obcordate. *Fruit* ovoid or globose, $\frac{1}{2}$ –1 in. diam., glandular or glabrous stigmas villous; achenes many, $\frac{1}{8}$ in. long, pale.—Differs from *R. pimpinellifolia* in the fewer leaflets, uniform prickles, pubescent longer sepals, and fruit not depressed.

6. **R. sericea**, *Lindl. Monogr. Ros.* 105, t. 12; suberect, prickles broad compressed, bristly or not, leaflets acutely toothed towards the rounded tip silky beneath, flowers solitary ebracteate white or pale straw-coloured, petals usually 4, fruit pyriform. *Royle Ill.* 208; *Don Prodr.* 236; *Bot. Mag.* t. 5200; *Brandis For. Flor.* 202; *Crepin in Bull. Bot. Soc. Belg.* xiv. 151; *Wall. Cat.* 695. *R. tetrapetala*, *Royle Ill.* 208, t. 42. *R. Wallichii*, *Trattin. Ros.* ii. 293.

Temperate Himalaya, from KUMAON 9–13,000 ft. to SIKKIM, alt. 9–14,000 ft. and BHOTAN, alt. 5–10,000 ft.—DISTRIB. China, Yunnan (form with leaves very hairy on both surfaces).

Erect or subscandent; branches perfectly glabrous and unarmed or prickly only, or also loosely or densely bristly and glandular; prickles $\frac{1}{2}$ –1 $\frac{3}{4}$ in., straight, brown. *Leaves* 1–3 in., crowded; leaflets 7–9, $\frac{1}{4}$ –1 in., usually oblong, obtuse with an excurrent midrib, rarely villous on both surfaces; stipules oblong, membranous, apiculate. *Flowers* 2–2 $\frac{1}{2}$ in. diam., on short lateral shoots, hence almost axillary; peduncle and calyx-tube bristly and glandular. *Calyx-lobes* pubescent, ovate-lanceolate, persistent. *Petals* obcordate, rarely 5, white rarely pink or faintly yellowish. *Fruit* subglobose or broadly pyriform, silky or glabrous; achenes few, $\frac{1}{4}$ in. long.

SECT. II. *Styles* united into a column which is exserted far beyond the calyx-tube.

7. **R. moschata**, *Mill.*; *Brandis For. Flor.* 201; climbing, prickles recurved, leaflets ovate or ovate-lanceolate puberulous beneath, flowers many in compound corymbs white, sepals often pinnatifid, fruit small subglobose. *Wall. Cat.* 688; *Bot. Reg.* t. 829, 861. ? *R. recurva*, *Roxb. Fl. Ind.* ii. 514. *R. Brunonii*, *Lindl. Monogr. Ros.* 120, t. 14; *Don Prodr.* 236; *Bot. Mag.* t. 4030; *Wall. Cat.* 689 (*Brunonis*). *R. Lindleyi*, *Herb. Wall.* *R. pubescens*, *Roxb. Fl. Ind.* ii. 514. *R. glandulifera*, *Herb. Roxb.*

Temperate Central and Western Himalaya, from MURREE to NIPAL, alt. 2–11,000 ft.—DISTRIB. Afghanistan.

A tall climber; prickles scattered, stout. *Leaves* 2–6 in.; leaflets 2–4 pair, 1–3 in., acute or acuminate, serratures very numerous and acute, base rounded; stipules glandular, free part subulate. *Inflorescence* pubescent and usually glandular, but not prickly or bristly, bracts subulate. *Flowers* 1 $\frac{1}{2}$ –2 in. diam., very numerous; pedicels 1–1 $\frac{1}{2}$ in., slender. *Calyx-tube* small, obovoid; lobes $\frac{1}{2}$ in., lanceolate, caudate-acuminate, entire or cut or pinnatifid, reflexed after flowering, deciduous. *Petals* orbicular-obovate, yellowish-white. *Fruit* $\frac{1}{2}$ in. diam., dark brown, glabrous; styles far exserted.

8. **R. longicuspis**, *Bertol. Misc. Bot.* xxi. 15, t. 3; climbing, prickles scattered curved, leaves evergreen, leaflets glabrous shining ovate-lanceolate serrate caudate-acuminate, petioles and inflorescence glandular and bristly, flowers corymbose, petals tomentose externally, fruit subglobose. *Crepin in Bull. Soc. Bot. Belg.* xiii. 256. *R. sempervirens*, *L.*; *Hook. f. & Thoms. Herb. Ind. Or.*

KHASIA MTS., alt. 2–5000 ft. MISHMI HILLS, *Griffith.*

A tall and often very strong climber, with a stout trunk. *Leaves* 3–6 in.; leaflets 2–3 pair, 2–3 in., petiolulate, firmly coriaceous, very sharply serrate, quite glabrous, base rounded; petiole stout, often glandular and prickly; stipules with ovate or subulate free portions. *Corymbs* short, more or less glandular, sometimes with minute prickles; bracts large, lanceolate, caudate, glandular all over. *Flowers* 1 $\frac{1}{2}$ in. diam.; pedicels rather stout. *Calyx-tube* broadly obovoid; lobes very large with often ciliated toothed tips, sometimes with a few long teeth at the side. *Petals* obcor-

date, silkily tomentose externally. *Fruit* $\frac{1}{3}$ – $\frac{1}{2}$ in. diam.; styles far exserted; achenes $\frac{1}{8}$ in.—Crepin sums up the distinction between this and its very near ally *R. sempervirens*, L., in the more coriaceous leaves with longer tips, the narrower stipules and bracts, the more or less pubescent pedicels and calyx, the narrower sepals, longer buds, and velvety back of the petals. Of these all but the last character are excessively variable, and I expect that the latter even may disappear.—There is a single specimen of this in Herb. Wallich from the Khasia (Pundua) under No. 696.

9. **R. Leschenaultiana**, *Wight & Arn. Prodr.* 301; climbing, prickles scattered curved, leaves evergreen usually glandular beneath, leaflets elliptic-ovate acute or acuminate serrate, petioles and inflorescence glandular-bristly, flowers corymbose, petals at length glabrous, fruit subglobose. *Wight Ic.* t. 38; *Crepin in Bull. Soc. Bot. Belg.* xxiii. 259. *R. sempervirens* var. *Leschenaultiana*, *Thory et Redouté Ros.* iii. 87. *R. sempervirens*, *Hook. f. & Thoms. Herb. Ind. Or.* *R. Wallichii*, *Sabine in Wall. Cat.* 687.

Western Peninsula; NILGHIRI and PULNEY Mts.

Very closely allied indeed to *R. brevicuspis*, and I believe only a variety of that plant, itself too near *sempervirens*; it differs in being more glandular, leaflets less acuminate, larger sepals and petals, the latter of which are pubescent only before expansion.

DOUBTFUL SPECIES.

R. Moorcroftii, *Wall. Cat.* 693 from Ladak in Western Tibet. The specimen is wanting in Herb. Linn. Soc., but is probably *R. Eglantera*.

R. Jacquemonthi, *Crep. MSS.*—I have only a fruiting specimen of this, which is quite insufficient for description. It is Jacquemont's No. 1170, p.

17. **NEURADA**, *Linn.*

An annual white woolly depressed branched herb. *Leaves* ovate, petioled, lobed; stipules minute. *Flowers* axillary, solitary. *Calyx-tube* flat, dilated, at length conic spiny and forming with the ripe carpels an orbicular disk; lobes 5, triangular; bracteoles 5, subulate. *Petals* 5, small. *Stamens* 10, inserted in the contracted mouth of the calyx, filaments subulate. *Carpels* 10 in a whorl, spreading; styles subulate, persistent; ovules solitary from the apex of the carpel. *Fruit* a depressed cone, with spinous margins; carpels 10, horizontal, dehiscing above, styles spinescent. *Seeds* curved, germinating within the carpels.—**DISTRIB.** N. Africa, Arabia, Persia, Afghanistan.

1. **N. procumbens**, *Linn.*; *Boiss. Fl. Orient.* ii. 735; *Wight Ic.* t. 1596; *Hook. Ic. Pl.* t. 840.

SCINDE, *Stocks*. SOUTHERN PUNJAB, Mooltan and Adunwhari hills.

Branches 5–10 in. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., ovate, tomentose on both surfaces. *Flowers* $\frac{1}{4}$ in. diam., shortly pedicelled. *Fruit* $\frac{1}{4}$ – $\frac{3}{4}$ in. diam., under surface quite flat. The orbicular fruit forms a persistent collar at the top of the root of the young plant.

17.* **CYDONIA**, *Tourn.*

Bushes with black bark. *Leaves* simple, quite entire; stipules ovate, oblique. *Flowers* large, solitary, white or pink, woolly; bracts herbaceous, toothed. *Calyx-tube* clavate; lobes large, spreading, toothed. *Petals* 5, contorted in bud, claw woolly or glabrous. *Stamens* 20. *Ovary* 5-celled; styles 5, connate and

woolly below the middle; ovules many in each cell, 2-seriate, ascending or horizontal. *Fruit* subglobose, intruded at the base and apex, firm and fleshy, fragrant, 5-celled, cells many-seeded. *Seeds* small, plano-convex, testa mucilaginous.—DISTRIB. S. of Europe and the East, China.

1. **C. vulgaris**, Pers.; Boiss. *Fl. Orient.* ii. 656; Dcne. *Mem. Fam. Pom.* 128; Wall. *Cat.* 665. *C. Sumboshia*, Ham. in *Don Prodr.* 237. *Pyrus Cydonia*, Linn.; Roxb. *Fl. Ind.* ii. 511; Brand. *For. Fl.* 205.—The Quince.

Cultivated in N. W. India, and up to 5500 ft. in the Himalaya.—DISTRIB. Native country unknown; is self-sown in the East and in South Europe, &c.—Decaisne refers the Quince of N. W. India to *C. lusitanica*, Mill, but it certainly in no way differs from the common fruit of Europe.

18. **DOCYNIA**, Dcne.

Small trees. *Leaves* deciduous, simple, lobed in young plants; stipules small, subulate. *Flowers* white, solitary or fascicled. *Calyx-tube* clavate; limb shortly tubular, 5-partite; lobes reflexed, toothed. *Petals* 5, with long woolly claws, imbricate in bud. *Stamens* 30–50. *Ovary* 5-celled; styles 5-celled, connate and woolly below the middle; ovules 3, subbasilar in each cell. *Fruit* rounded ovoid or pyriform, flesh hard; cells 1–3-seeded; endocarp like parchment. *Seeds* plano-convex, testa coriaceous; cotyledons amygdaloid.—DISTRIB. Himalaya and the Khasia Mts.

1. **D. indica**, Dcne. *Mem. Fam. Pom.* 131, t. 14; leaves ovate or oblong-lanceolate long-acuminate entire or serrulate glabrous above beneath densely woolly at length glabrate, fruit almost globose. *D. Griffithiana*, Dcne. l. c. *Pyrus indica*, Wall. *Pl. As. Rar.* ii. 56, t. 173; Roxb. *Cat. Hort. Beng.* 38; *Fl. Ind.* ii. 511; Kurz, *For. Fl. Brit. Burm.* i. 441. *Cydonia indica*, Spach, *Suite Buff.* ii. 158; Wenzig in *Linnaea*, 1874, 12.

Eastern temperate Himalaya; SIKKIM, alt. 4–6000 ft. *J. D. H.* BHOTAN, alt. 7500 ft. KHASIA MTS., alt. 6000 ft. *BIERMA*, Kurz.—DISTRIB. Poneshee (Yunan).

A small tree, 12–15 ft., in a young state like a *Cratægus*, having 3-lobate lobulate and sharply toothed leaves and often spinescent branches; young parts of old plants densely clothed with white woolly tomentum. *Leaves* 3–4 in., coriaceous, at length quite glabrous, with prominent arched nerves beneath, serratures chiefly beyond the middle; petiole slender, $\frac{1}{4}$ –1 in. *Flowers* 1–1½ in. diam., shortly pedicelled, densely woolly. *Calyx-tube* pyriform; lobes narrowly lanceolate. *Petals* spreading. *Filaments* long, slender. *Styles* slender, united at the base into a woolly cone. *Fruit* a nearly spherical yellow green apple, with orange spots, 1–1½ in. diam., and rather longer, rounded at the base and crowned with the broken sepals, usually 5-celled; cells 3-seeded; seeds quite like those of apple—it is rather austere with a slight quince flavour and forms a good stew.—*D. Griffithiana* from Bhotan is only *D. indica*.

2. **D. Hookeriana**, Dcne. *Mem. Fam. Pom.* 131, t. 15; leaves oblong or linear-lanceolate long-acuminate serrate, fruit between fusiform and ellipsoid contracted below the sepals.

KHASIA MTS., alt. 5000 ft., at Myrong, *J. D. H. & T. T.*

Very closely allied to *D. indica*, but the leaves are larger (4–5 in.) and narrower in proportion, and the fruit is of a wholly different shape and not half as long as broad. I have only fruiting specimens; these show no trace of wooliness, but no doubt in a younger state the branches and leaves are as woolly as those of *D. indica*.

19. **ERIOBOTRYA**, Lindl.

Small or large trees. *Leaves* simple, entire or serrate, very coriaceous; stipules lanceolate or broad. *Flowers* in thyrsoid panicles, white. *Calyx-tube* turbinate obconic or clavate; lobes small, erect or spreading, persistent. *Petals* 5, contorted or imbricate in bud, obovate or orbicular, usually oblique and notched, margins sinuate, claw glabrous or woolly. *Ovary* 2-5-celled; styles 5, connate and woolly below; ovules 2 in each cell, basal, ascending, placenta sometimes cupuliform. *Fruit* a succulent or dry rarely 1-2-celled berry; endocarp membranous, 1- rarely 2-3-seeded. *Seeds* large, ovoid and cylindric or flattened on one side, testa hard coriaceous and mucilaginous; cotyledons very thick.—DISTRIB. Himalaya, Malay Peninsula, China, Japan.

I cannot distinguish *Eriobotrya* from *Photinia*, except by the inflorescence; all the other characters given by Decaisne break down amongst the species enumerated under it; thus the petals are contorted in all but *elliptica* and *japonica*, and their claws are glabrous in several; the styles are only two in all but the above, and one other, which has 3 styles; the crown of the ovary is glabrous in *E. dubia*, and I do not find the calyptiform process of the placenta in any but *japonica*; but I have not examined all for this character, and it is one difficult to detect in dry specimens.

* *Petals contorted in bud. Styles 2 or 3.*

1. ***E. petiolata***, Hook. f.; robust, leaves 6-9 in. long-petioled elliptic-lanceolate acuminate thickly coriaceous entire or obtusely serrate glabrous beneath, nerves 12-14 pair, inflorescence clothed with appressed tomentum, flowers pedicelled, calyx-lobes rounded, styles 2. *E. elliptica*, Herb. Ind. Or. H. f. & T.; Dcne. Mem. Fam. Pom. 145 in part.

Eastern Himalaya; SIKKIM, alt. 5-9000 ft. BHOTAN at Tongsa, Griffith.

A tree; branchlets glabrous. *Leaves* firmly coriaceous, 6-9 by 3-3½ in.; base acute; petiole 1½-2 in. *Panicles* 3-6 in. long and broad, branched from the base, very spreading, clothed with rusty tomentum as are the very young leaves on both surfaces. *Flowers* ½ in. diam., not crowded, shortly pedicelled. *Calyx-tube* short, obconic; lobes also short, semicircular. *Petals* contorted, orbicular, concave, claw glabrous. — Misled by the provisional naming of the Indian collections distributed by Dr. Thomson and myself, Decaisne has included this under *E. elliptica*, from which it differs entirely in the longer petioles, appressed almost scurfy tomentum of the panicle and form of calyx.

2. ***E. latifolia***, Hook. f.; stout, leaves 6-8 in. long-petioled broadly elliptic acute at both ends quite entire glabrous above beneath with deciduous tomentum, nerves 10-12 pair, panicle softly tomentose.

MOALMAYNE; on Thoung Gyne, alt. 5000 ft., Thos. Lobb.

A shrub, 12 ft. *Leaves* firmly coriaceous, 3-4 in. broad, opaque above, quite glabrous beneath when old, without a trace of serratures, narrowed into the stout petiole which is 1½-2 in. long, and glabrous except the young leaves which are softly woolly. *Panicle* 6 in. long and as broad, much branched, clothed with rusty pubescence. *Flowers* ½ in. diam., crowded. *Calyx-tube* broadly obconic; lobes rounded. *Petals* contorted, broadly obovate or orbicular, claw glabrous. *Styles* 2.

3. ***E. longifolia***, Hook. f.; robust, leaves 7-10 in. shortly petioled narrowly oblanceolate acuminate quite entire narrowed into the petiole, nerves 25-30 pair almost horizontal, panicle glabrate. *Photinia longifolia*, Dcne. Mem. Fam. Pom. 142.

MISHMI HILLS, Griffith.

A shrub, branchlets as thick as a swan's quill. *Leaves* firmly coriaceous, $1\frac{1}{4}$ – $1\frac{3}{4}$ in. diam.; margins revolute (in drying?), perfectly glabrous, hardly shining above; petiole $\frac{1}{2}$ in. *Panicles* 4–5 in. long, glabrate; branches rather slender. *Flowers* shortly pedicelled, white. *Calyx* appressed-pubescent, tube obconic; limb $\frac{5}{8}$ in. diam.; lobes triangular, obtuse, glabrous within. *Petals* cochleate, claw glabrous. *Styles* 2, the united part pubescent.—I have not seen the petals, which Decaisne describes; he refers it to *Photinia*, but the habit foliage and inflorescence are altogether those of *Eriobotrya*.

4. **E. Hookeriana**, Dcne. *Mem. Fam. Pom.* 146; robust, leaves 8–12 in. very shortly and stoutly petioled elliptic- or oblong-lanceolate acuminate sharply coarsely serrate, more or less pubescent beneath, nerves 20–30 pair, panicle tomentose, branches spreading. *Photinia subsessilis*, King in *Herb. Calc.*

Eastern Himalaya; SIKKIM, alt. 6500–8000 ft., J. D. H. BHOTAN, alt. 4–6500 ft. Griffith.

A small tree, with very stout branches. *Leaves* 8–12 by $2\frac{1}{2}$ in., when young thickly covered with rusty tomentose, old glabrate or glabrous, very thickly coriaceous, opaque above with impressed close-set nerves, serrated nearly to the truncate rounded or subacute base; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in., very thick; stipules semi-lunate, very coriaceous. *Panicle* 4–6 in. and as broad, finely softly tomentose, almost woolly. *Flowers* $\frac{1}{2}$ in. diam., white; bracts small, ovate; pedicels short, stout. *Calyx-tube* shortly obconic; lobes rounded, obtuse. *Petals* contorted, orbicular, claw woolly. *Styles* 2, base woolly. *Fruit* $\frac{3}{4}$ in. long, ellipsoid, yellow.

5. **E. dubia**, Dcne. *Mem. Fam. Pom.* 145, excl. some syn.; rather slender, leaves 3–5 in. shortly petioled elliptic-lanceolate or oblanceolate acuminate quite glabrous shining above coarsely sharply serrate, nerves 10–12 pair, panicle softly tomentose or only puberulous, crown of ovary glabrous. *Photinia? dubia*, Lindl. in *Trans. Linn. Soc.* xiii. 104, t. 10; *Wall. Cat.* 668, l. *P. dubia*, Wenzig in *Linnaea*, 1874, 94, excl. synonym. *Cratægus? Shicola*, Ham. in *Don Prodr.* 238. *Mespilus tinctoria*, *Don Prodr.* 238.

Central and Eastern Himalaya; NEPAL, Wallich; SIKKIM, alt. 5–6000 ft., J. D. H. BHOTAN alt. 4000 ft., Griffith.

A small tree, 20–40 ft. *Leaves* thinly coriaceous, not exceeding $1\frac{1}{2}$ in. broad, gradually narrowed at the base into the petiole, which is slender and $\frac{1}{4}$ – $\frac{1}{2}$ in. *Panicles* 2–4 in. long and broad; branches rather slender. *Flowers* not crowded, $\frac{1}{2}$ in. diam., white, shortly pedicelled; bracts short, subulate. *Calyx-tube* short, obconic; lobes rather variable, short, acute or obtuse. *Petals* orbicular, claw slightly woolly. *Styles* 2, glabrous, on the short hemispheric glabrous top of the ovary. *Fruit* $\frac{1}{2}$ in. long, shortly ellipsoid, 1-seeded, eatable.

6. **E. bengalensis**, Hook. f.; rather stout, leaves 4–8 in. long-petioled elliptic or elliptic-oblong or lanceolate acuminate coarsely obtusely serrate or lobulate quite glabrous shining above, nerves 8–12 pair, panicle softly tomentose, crown of ovary woolly. *E. dubia*, Dcne. *Mem. Fam. Pom.* 145, in part; *Kurz, For. Fl. Brit. Burm.* 443. *Mespilus bengalensis*, Roxb. *Cat. Hort. Beng.* 38; *Fl. Ind.* ii. 510. *Photinia dubia*, *Wall. Cat.* 668, 2, 3, 4, and *E.*

Eastern Himalaya; SIKKIM, alt. 4000 ft., C. B. Clarke. KHASIA Mts. and Muku hills, alt. 3–4000 ft. CHITTAGONG, AVA, Wallich; TENASSERIM, Helfer; MALACCA, Griffith, Maingay.—DISTRIB. BHAMO.

A large robust tree. *Leaves* often $2\frac{1}{2}$ and sometimes $3\frac{1}{2}$ in. broad, sometimes acute, obtuse or rounded with coarse lobules or crenatures; petiole stout or slender, $\frac{3}{4}$ – $1\frac{1}{2}$ in., glabrous. *Panicles* 3–5 in. long and broad, branched from the base, branches rather stout. *Flowers* $\frac{1}{2}$ in. diam., white, smelling of hawthorn. *Calyx-tube* obconic; lobes acute or obtuse. *Petals* orbicular, claw slightly woolly. *Styles* 2, base very woolly. *Fruit* $\frac{3}{4}$ in. long, ellipsoid, 1–2-seeded, uneatable.—Confounded by Wallich, myself,

and others with *E. dubia*, but very distinct; a much larger tree, with longer broader petioled leaves with slender petioles; the top of the ovary being woolly also well distinguishes it.

7. *E. angustissima*, Hook. fil.; quite glabrous, leaves erect 2-4 in. very narrow linear-lanceolate narrowed into the short petiole obtuse remotely serrate, panicle small glabrous.

KHASIA Mts. alt. 5000 ft. Simons; Mooshye, and between Myrung and Nunklow, Hook. f. & T.

A very remarkable shrub, 4 ft. high, found by Thomson and myself in but two spots, and there forming a low fastigiate brushwood on river banks, with stout dark branches, and erect rigid leaves, not much exceeding $\frac{1}{2}$ in. in breadth; nerves 8-10 pair, ascending; petiole slender, $\frac{1}{4}$ in. Panicles $1\frac{1}{2}$ in.; branches short, erect, glabrous. Flowers few, $\frac{1}{3}$ in. diam. Calyx pubescent; tube short; lobes rounded. Petals obovate or orbiculate, claw woolly. Styles 3, slender, base and crown of ovary woolly.

** *Petals quincuncial. Styles 5.*

8. *E. elliptica*, Lindl. in Trans. Linn. Soc. xiii. 102; very robust, leaves petioled 6-10 in. obovate or oblong-lanceolate entire or coarsely serrate glabrous beneath, nerves about 20 pair, inflorescence densely clothed with soft spreading wool, flowers sessile, styles 5, fruit small obovoid or globose. Wall. Cat. 667. *E. japonica*, β . *elliptica*, Wenzig in Linnæa, 1874, 100. *Mespilus Cuila*, Ham. in Don Prodr. 238.

NEPAL, Wallich; MISHMI HILLS, Griffith.

Similar in many respects to *E. japonica*, but leaves much broader, glabrous beneath, with glabrous petioles 1-1 $\frac{1}{2}$ in. Flowers sessile or subsessile. Calyx-lobes triangular. Petals orbicular, claw woolly. Styles 5, woolly to the top; stigmas large, spatulate, recurved. Griffith's specimens have fruit, which is nearly globose upwards of $\frac{1}{2}$ in. diam. and 1-seeded.

9. *E. japonica*, Lindl.; branches very robust, and leaves beneath and inflorescence densely softly woolly, leaves subsessile narrowly oblanceolate acuminate remotely serrate woolly beneath, petiole very short, fruit ovoid large intruded at the top. W. & Arn. Prodr. 302; Dalz. & Gibs. Bomb. Flor. Suppl. 32; Wight Ic. t. 226. *Mespilus japonica*, Banks; Roxb. Fl. Ind. ii. 510. (The Loquat.)

Cultivated in many parts of India.

Branchlets as thick as the little finger. Leaves 6-8 by 1 $\frac{1}{2}$ -3 in., thick and stiffly coriaceous; base obtuse or narrowed into the very short stout woolly petiole; nerves 12-15, very prominent beneath. Panicles 3-6 in. long and broad; branches very stout. Flowers $\frac{1}{2}$ in. diam., crowded, fragrant. Calyx-tube short; lobes ovate, subacute. Petals broadly ovate. Fruit 1-1 $\frac{1}{2}$ in. long, rather narrower, yellow, rarely as many as 5-seeded.

IMPERFECTLY KNOWN SPECIES.

E. MACROCARPA, Kurz, For. Fl. Brit. Burm. ii. 443; evergreen, glabrous, leaves 5-6 in., from obovate to oblong-lanceolate shortly subobtusely acuminate quite entire narrowed into the stout $\frac{1}{2}$ - $\frac{2}{3}$ in. petiole coriaceous smooth glossy, fruit subglobose size of a bullet glabrous crowned with the calyx-limb, peduncle 1-3 in. stout simple glabrous axillary in the upper leaves of the thick branchlets.—BURMA, rare in forests on N. E. slopes of Kambala-toung; and Pegu at Yomah, alt. 2-3000 ft., Kurz.

20. *PYRUS*, Linn.

Trees or shrubs. Leaves deciduous, simple or pinnate; stipules deciduous. Flowers white red or pink, in terminal cymes or corymbs; bracts subulate or

linear. *Calyx-tube* urceolate turbinate or obconic, lobes 5 erect or reflexed, persistent or deciduous. *Petals* 5, quincuncially imbricate in bud. *Stamens* 20 or more, filaments sometimes connate at the base. *Disk* annular, or coating the calyx-tube. *Carpels* 2-5, connate and adnate to the calyx-tube, styles 2-5, free or connate below, stigmas truncate; ovules 2 in each cell, basal, collateral, ascending. *Fruit* (a pome) fleshy, 2-5-celled; cells with a membranous or cartilaginous often 2-valved endocarp, 1-2-seeded. *Seeds* when in pairs plano-convex, testa coriaceous; cotyledons amygdaloid:—DISTRIB. N. temp. and cold regions; species 40.

SECT. I. **Malus.** *Leaves* entire. *Ovary* 3-5-celled; styles more or less united below. *Fruit* globose; flesh of uniform consistence; endocarp coriaceous or like parchment.—Flowers fascicled or subumbellate.

1. **P. Malus**, Linn.; Ledeb. *Fl. Ross.* ii. 96; leaves ovate shortly acuminate crenate glabrous above tomentose beneath, calyx densely tomentose lobes persistent, petals pink, fruit large very shortly peduncled. *Roxb. Fl. Ind.* ii. 511; *Brandis For. Fl.* 205; *Wall. Cat.* 7111. *Malus communis*, Desf.; Boiss. *Fl. Orient.* ii. 656; *Dcne. Mem. Fam. Pom.* 153.

Apparently wild in the NORTH WESTERN HIMALAYA, ascending to 9000 ft., and to 11,400 in WESTERN TIBET; cultivated in N. W. India, Central India, the Dekkan, &c.—DISTRIB. from Persia westwards to the Mediterranean.

A tree, rarely exceeding 30 ft. *Branches* and foliage at length glabrous. *Leaves* 2-3 in.; petiole half the length of the blade, tomentose or woolly. *Flowers* 1½-2 in. diam. *Calyx-lobes* broad-ovate, acute, persistent. *Petals* with a tomentose claw. *Styles* 5, united below the middle. *Fruit* globose, intruded at both ends.

2. **P. baccata**, Linn.; Ledeb. *Fl. Ross.* ii. 97; leaves elliptic-ovate acuminate serrulate glabrous, calyx glabrous, peduncles very long, petals white, fruit small globose. *P. baccata* v. *himalaica*, Maxim. *Diag. Dec.* xv. 167; *Wenzig in Linnæa*, 1874, 44; *Brandis For. Fl.* 205; *Wall. Cat.* 681. *Malus baccata*, Desf.; *Dcne. Mem. Fam. Pom.* 154. (The Siberian Crab.)

Temperate Himalaya; from KASHMIR to KUMAON, alt. 6-10,000 ft. (sometimes cultivated), and in BHOTAN, alt. 7500 ft., Griffith. KHASIA Mts., alt. 6000 ft.—DISTRIB. Siberia to Manchuria.

A small tree, trunk short, head rounded. *Leaves* 2-3 in., rarely almost orbicular, young glabrous or as well as the petiole pubescent; petiole half the length of the blade. *Flowers* 1½-2 in. diam., in sessile umbels or fascicles, rarely with the pedicels collected on a short peduncle; pedicels slender, 2-3 in. *Calyx* glabrous or puberulous, without tomentum within; lobes lanceolate, deciduous. *Petals* very variable in breadth. *Styles* 3-5, nearly free, very woolly at their united bases. *Fruit* ½-1 in. diam., red or scarlet, intruded at the base.—The fruit of this is much smaller than in the common form of the plant, and often subpyriform like that figured in Pallas *Flora Rossica*, i. t. x.

3. **P. sikkimensis**, Hook. f.; leaves ovate or ovate-lanceolate acuminate serrulate tomentose beneath, calyx woolly, peduncles very long, fruit small shortly pyriform.

SIKKIM HIMALAYA, alt. 7-10,000 ft., J. D. H. BHOTAN, Griffith.

Very similar to *P. baccata*, but the leaves (which attain 5 by 3 in.) are more acutely serrate, woolly beneath and on the petiole and on the midrib above, the peduncles and calyx are also very woolly. It is marked by Decaisne as a distinct species (of *Malus*), but I suspect it will prove a form of *P. baccata*. The claw of the petals is woolly; the limb broadly obovate-oblong or almost orbicular; the styles are united below the middle into a perfectly glabrous column; the calyx-lobes deciduous; the

stamens about 25; the fruit speckled and very good stewed.—The specks on the fruit are like those of *P. variolosa*, but smaller,

SECT. II. ***Pyrus proper***. *Leaves* entire. *Petals* white, claw glabrous. *Ovary* 5-celled; styles free. *Fruit* globose or pyriform, flesh granular.—Flowers in few-flowered corymbs.

4. ***P. communis***, Linn.; Boiss. *Fl. Orient.* ii. 653; leaves oblong ovate acute crenulate or subentire hardly exceeding the slender petiole, corymbs short, calyx-lobes ovate or lanceolate persistent, fruit pyriform. *Roxb. Fl. Ind.* ii. 510; *Brandis For. Fl.* 203. (The Common Pear.)

Believed to be wild in KASHMIR (*Brandis*); cultivated in the N. W. HIMALAYA, alt. 2–8000 ft., and in WESTERN TIBET to alt. 10,000 ft.—DISTRIB. N. Persia westward to S. Europe,

A tree or shrub, glabrous or with woolly young parts and inflorescence, young often spinous. *Leaves* variable in breadth and in length of point, of young plant lobed. *Corymbs* terminating short shoots. *Flowers* $1\frac{1}{2}$ in. diam. *Calyx*-lobes variable. *Petals* obovate, white. *Fruit* 1–2 inches, gradually narrowed into the peduncle.

5. ***P. Pashia***, Ham. in *Don Prodr.* 236; young parts woolly, leaves ovate or ovate-lanceolate acuminate crenulate the young serrulate, glabrous when old, cymes corymbose or subumbellate woolly, calyx-lobes acute deciduous, petals white and pink, fruit globose warted. *Wenzig. in Linnæa*, 1874, *Décadence Jard. Fruit.*, Le Poirier, t. 7 (*Pirus*); *Kurz, For. Fl. Brit. Burm.* 441. *P. variolosa*, Wall. *Cat.* 680; *Brandis For. Fl.* 204. *P. verruculosa*, Bertol. *Plant. Nuov. Asiat.* ii. 10, t. 2. *P. nepalensis*, Herb. Ham. et. Hort.

Temperate Himalaya from KASHMIR to BHOTAN, alt. 2500–8000 ft. (sometimes cultivated, *Brandis*). KHASIA MTS., alt. 5000 ft. AVA, Wallich.—DISTRIB. Yunan.

A deciduous tree, in a young state like a *Cratægus* with 3 lobed and doubly sharply serrated leaves glabrous or woolly beneath, and often spinescent branches; branches dark, woody. *Leaves* 2–4 in., acuminate, sometimes caudate, glabrous and black when dry; petiole slender, half the length of the blade. *Inflorescence* very variable, usually corymbose with a very short peduncle and woolly, but the peduncle sometimes very thin, or is all but absent when the flowers are fascicled or umbelled; pedicels $\frac{1}{2}$ –2 in., slender in flower, stout in fruit. *Flowers* 1 in. diam. *Calyx*-lobes ovate, acute, usually very woolly, especially externally. *Petals* orbicular-obovate. *Stamens* about 30. *Styles* 3–5, quite free, more or less woolly at the base. *Fruit* very variable in size, $\frac{3}{4}$ – $1\frac{1}{2}$ in. diam., dark yellow-brown, scurfy, covered with raised white spots, austere, eatable when decaying.—A very variable plant, especially in the inflorescence; I was inclined to suppose that Khasia specimens with acutely serrated leaves and longer pedicels were different specifically, but I suspect the leaves were from young trees, and there is every gradation of pedicel from $\frac{1}{2}$ –2 in.

6. ***P. kumaoni***, Dcne. *Jard. Fruit. under Pirus Pashia*; leaves ovate or ovate-lanceolate acute or acuminate crenulate, glabrous, base acute or rounded, cymes corymbose glabrous, calyx-lobes broad rounded glabrous except the woolly margins, fruit globose warted.

Western Himalaya, from KASHMIR to KUMAON, alt. 5–8000 ft., Royle, Strach. & Winterbottom, &c.

Very similar in foliage to *P. Pashia* but at once distinguishable by the more glabrous corymbs and broad rounded calyx-lobes.

7. ***P. Jacquemontiana***, Dcne. *Jard. Fruit. (Pirus)* t. 8; leaves ovate or oblong-lanceolate acute crenulate glabrous, base rounded, corymbs laxly tomentose, lobes tomentose above, young fruit glabrate.

PUNJAB in woods by mountain torrents, *Jacquemont*.

I know this only by the above characters given by its author, who says that it much resembles *P. Pashia*, but is easily recognised by its smooth young fruit; he however does not speak positively of its being a distinct species. The form of the calyx-lobes is not stated.

SECT. III. **Aria.** Leaves simple, entire or margin lobulate. Calyx-lobes persistent. Ovary 2-5-celled, styles 2-5. Fruit pyriform or globose crowned with the calyx-lobes, flesh granular, endocarp membranous.

8. **P. lanata**, *Don Prodr.* 237; leaves broadly oblong margins lobulate lobules serrulate woolly beneath, corymbs densely woolly, petals glabrous within, styles 2-3 woolly all over. *P. kumaonensis*, *Wall. Cat.* 678. *P. Aria*, *Herb. Ind. Or. Hook. f. & Thoms.*; *Brandis For. Fl.* 206 (excl. syn. *P. vestita*). *P. Aria* var. *kumaonensis*, *Maxim. Diagn. Dec.* xv. 173. *Sorbus lanata*, *Wenzig in Linnæa*, 1874, 61.

Eastern temperate Himalaya; from KASHMIR to KUMAON, alt. 8-10,000 ft.

A middle sized tree, with the young parts densely woolly; bark of branches smooth, dark brown, shining. Leaves 5-8 by 2-4 in., acute, glabrous above when old, except often the midrib; lobules of leaf with many serratures; base acute or rounded; nerves 8-12, nearly straight; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. Corymbs short, 2-5 in. broad, terminal and subterminal, much branched. Flowers shortly pedicelled, $\frac{1}{2}$ in. diam., white. Calyx turbinate; lobes short, ovate, acute. Petals narrowly obovate, narrowed into naked claw. Stamens 20. Styles 2-3, densely woolly. Fruit very few in a corymb, or solitary, $\frac{1}{2}$ -1 $\frac{1}{2}$ in. diam., globose and 2-3-seeded, or smaller pyriform and 1-2-seeded.—This differs from *P. Aria* in the lobulate leaves (like those of *P. latifolia*, Poir.) with regularly serrulate lobes, much larger flowers and fewer very large fruits, the latter of which are very variable in size and shape according to the number of seeds ripened. I have not cited *Aria kumaonensis*, Dene., or *A. lanata*, Dene. (*Mem. Fam. Pom.* 162, 163) under this or the following, the species being so much confounded; one of them is the *Sorbus nepalensis* of gardens and *Cratægus (Aria) cuspidata*, Spach. (*Suite Buff.* ii. 106).

9. **P. vestita**, *Wall. Cat.* 679; leaves elliptic acute not or obscurely lobulate serrulate very shortly petioled most densely woolly beneath and on both surfaces when young, corymbs densely woolly, petals woolly within, styles 3-5 woolly at the base only. *P. crenata*, *Lindl. in Bot. Reg.* t. 1655, not of *Don*; *Wenzig in Linnæa*, 1874, 60.

Temperate Himalaya; from GARHWAL to SIKKIM, alt. 9-10,000 ft.

A tree very closely allied to *P. lanata*, but distinguished by the more elliptic and more woolly leaves with rarely marginal lobules, and more numerous nerves. The shorter broader petals woolly within and the styles glabrous except at the very base, are excellent characters. The figure in the 'Botanical Register' if intended for this, is a very bad one in respect of its representing slender petioles and a want of woolly clothing. I do not understand why Lindley identifies it with *Don's P. crenata*, the leaves being serrate and not crenate, and the corymbs compound. Very old leaves have the tomentum on the leaves beneath appressed, polished and silvery.

VAR. *khassiana*; leaves smaller, narrower, very membranous. *P. Aria*, L.? *Hook. f. & T. Herb. Ind. Or.*—Khasia, alt. 5-6000 ft.

SECT. IV. **Sorbus.** Leaves pinnate. Calyx-lobes persistent. Ovary 2-4-celled. Styles 2-5, free. Fruit globose crowned with the persistent calyx; endocarp membranous or coriaceous.

10. **P. Aucuparia**, *Gartn.*; *Ledeb. Fl. Ross.* ii. 100; glabrous or with white woolly down, leaflets 7-12 pair linear-oblong obtuse and apiculate or

oblong lanceolate and acuminate sharply serrate green beneath, petals orbicular. *P. ursina*, *Herb. Strach. & Wint.* No. 5. *Sorbus Aucuparia*, *Linn.*; *Boiss. Fl. Orient.* ii. 657.

Western temperate Himalaya, from KASHMIR to KUMAON, alt. 11,500–13,000 ft. *DISTRIB.* Turkestan and from the Caucasus westward to the Atlantic, and from Siberia to N. China and Japan.

A small tree, young parts with white cottony tomentum which sometimes persists on the petioles and inflorescence. *Leaves* 4–8 in.; leaflets $\frac{3}{4}$ – $1\frac{1}{2}$ in., entire towards the rounded base. *Corymbs* usually quite glabrous. *Flowers* $\frac{1}{3}$ – $\frac{1}{2}$ in. diam., pedicels short. *Calyx* glabrous, lobes broad short rounded or subacute. *Petals* white, orbicular. *Styles* 2–5, quite free, woolly at the base. *Fruit* globose, $\frac{1}{3}$ – $\frac{1}{2}$ in. diam., red.—*Strachey* and *Winterbottom's* specimens have a fine glaucous bloom on the fruit which appears to have been blue like those of *P. foliolosa*, but the specimens want the rusty tomentum of that species.

11. ***P. foliolosa***, *Wall. Pl. As. Rar.* ii. 81, t. 189; *Cat.* 667, *in part*; pubescence on leaves beneath petioles and inflorescence rusty brown, leaflets 10–15 pair linear-oblong acute or obtuse apiculate sharply serrate pale brown when dry beneath, petals orbicular-ovate, style very short. *P. ursina*, *Wall. Cat.* 675; *Brandis For. Fl.* 206. *Sorbus ursina* and *foliosa* (error for *foliolosa*), *Dcne. Mem. Fam. Pom.* 159. *S. ursina*, *Wenzig in Linnæa*, 1874, 75.

Temperate Himalaya, from KUNAWUR to SIKKIM, alt. 9–12,000 ft.

Very near *P. Aucuparia*, but a more robust plant with red-brown tomentum on the petioles inflorescence and midribs of the leaves beneath, at length glabrate; the flowers also are smaller, more densely crowded, with linear bracts intermixed, and have much stouter peduncles and pedicels. *Fruit* small, bluish-red, ovoid, globose or turbinate. *Styles* usually 5.—The flowers in Sikkim specimens are greenish white and rather fetid, but Gen. Munro sends a specimen from Kunawur with red flowers. Wallich describes the fruit as red.—There are two specimens under this name and number in Wallich's Herbarium, one with the lithographed ticket 677 attached has also a MSS. label stating it to have been procured from Gossain Than (a locality in Nepal which Wallich did not himself visit); the other specimen has a similar MSS. ticket stating it to be found at Sheepore by himself; on both tickets he has written 'an ab. *ursina*, *Wall. distincta*?'—Of these the first in no way differs from his three sheets of *P. ursina* (*Cat.* 675); whilst the second is a totally different plant, viz. *P. Wallichii*, mihi. The description in Wallich's 'Plant. As. Rar.' is that of his *foliolosa* (and *ursina*) except in that he describes the tomentum of the young plant as white, whereas it is rusty-red, as he says it is on the fully developed leaves &c. As the *ursina* of Wallich's Catalogue and Herbarium is the *foliolosa* of his Plant. As. Rar., the latter name must replace the former.

12. ***P. microphylla***, *Wall. Cat.* 676; nearly glabrous, slender, leaflets 10–17 pair small linear-oblong acute deeply and acutely serrate, corymbs long-peduncled lax-flowered, petals small orbicular. *Sorbus microphylla*, *Dcne. Mem. Fam. Pom.* 159; *Wenzig in Linnæa*, 1874, 76.

Temperate Himalaya; SIRMORE, *Webb (in Herb. Wall.)*; SIKKIM, alt. 10–14,000 ft., *J. D. H., C. B. Clarke.*

Possibly only a form (or young state?) of *P. foliolosa* or *Aucuparia*, but a very much more slender subsucculent plant with more deeply serrate leaflets, $\frac{1}{2}$ – $\frac{3}{4}$ in. long, very slender flattened petioles, longer peduncles and pedicels and large bluish berries and 5 styles. Wallich's specimens have no flowers, those of Sikkim ones are red, and the globose fruit is white or pale blue. What pubescence is present resembles that of *P. foliolosa*. It is remarkable that no one since Capt. Webb has found this in the Western Himalaya.

13. ***P. Wallichii***, *Hook. fil.*; young parts clothed with white wool, leaflets 5–9 pair 1–2 in. linear-oblong acute or apiculate obscurely serrate

towards the tip, glaucous beneath, corymbs very tomentose compound, petals broadly obovate. *P. foliolosa*, Wall. Cat. 677, in part. *Sorbus foliosa*, Wenzig in *Linnæa*, 1874, 75, excl. synon.

Central and Eastern temperate Himalaya; NEPAL, Wallich. SIKKIM, alt. 6500–9000 ft., J. D. H., &c.

A small tree, young parts densely woolly, old glabrate except the corymb. *Leaves* 4–6 in.; leaflets coriaceous, sometimes perfectly entire, base very unequal-sided, midrib stout; nerves numerous, slender. *Corymbs* 2–3 in. diam.; peduncle and pedicels stout. *Flowers* $\frac{1}{4}$ – $\frac{1}{3}$ in. diam., white. *Styles* 3, glabrous. *Fruit* (unripe) very small, ovoid, $\frac{1}{8}$ in. diam.—A very distinct species.

14. **P. insignis**, Hook. f.; very robust, leaflets 4–6 pair 3–4 in. linear-oblong acutely obscurely crenulate very coriaceous glaucous beneath, fruiting corymbs excessively compound, branches very stout.

SIKKIM HIMALAYA, alt. 8–11,000 ft., J. D. H., C. B. Clarke.

A small very robust tree; branchlets nearly as thick as the little finger, bud-scales rigid, chestnut-brown, shining; young parts clothed with long rather silky rusty brown wool, old glabrous. *Leaves* 6–10 in.; leaflets soon glabrate, apiculate in the sinus between the obscure crenatures, which are incurved in old leaflets, pale and rather glaucous beneath; base unequal-sided; young petioles densely silky. *Flowering corymbs* appearing with the young leaves, densely rufously woolly, with stout peduncle and branches. *Flowers* crowded, $\frac{1}{4}$ in. diam.; bracts linear. *Calyx* obovate, short, teeth triangular. *Styles* 3, glabrous. *Fruiting corymbs* branched from the base, 6 in. long and as broad; branches covered with oblong white spots, pedicels short stout. *Fruit* globose or broadly ovoid, 3-celled, $\frac{1}{3}$ in. diam. (when dry).

SECT. V. **Micromeles** (Dcne. Gen.). *Leaves* simple. *Calyx*-lobes deciduous. *Ovary* 2–3-celled; *styles* 2–3, free or united. *Fruit* globose, umbonate; endocarp membranous or coriaceous.

* *Leaves shortly petioled, narrowed to both ends; nerves very oblique close set nearly straight, very prominent.*

15. **P. Griffithii**, Dcne. Mem. Fam. Pom. 170 (*Micromeles*); leaves 5–9 in. young woolly beneath elliptic acuminate serrulate, corymbs very many-flowered densely woolly, fruit small. *P. sikkimensis* γ. *microcarpa*, Wenzig in *Linnæa*, 1874, 59.

SIKKIM HIMALAYA, alt. 6–9000 ft., J. D. H., C. B. Clarke. BHOTAN, Griffith.

A tree, with stout branches; young twigs and leaves covered beneath with a soft cottony wool that is deciduous in flakes. *Leaves* coriaceous, opaque above, paler beneath; nerves 12–15 pair, slightly curved; petiole $\frac{1}{4}$ in., stout, channelled. *Corymb* 5–6 in. diam., branched from the base, most densely woolly. *Flowers* $\frac{1}{3}$ in. diam., white. *Calyx*-tube obovate, woolly; lobes ovate, membranous, subacute. *Petals* obovate, glabrous. *Stamens* long. *Disk* tumid, 10-lobed, woolly. *Styles* 2, slender, glabrous. *Fruit* size of a pea, 1–2-celled, cells 2-seeded. *Seeds* plano-convex.—Very similar to *Pyrus vestita*.

16. **P. rhamnoides**, Dcne. Mem. Fam. Pom. 169 in part (*Micromeles*); leaves 3–5 in. very young hairy beneath elliptic acuminate serrulate, petiole short slender, corymbs tomentose many-flowered, fruit small not spotted 2-celled. *Photinia polyneura*, King in *Herb. Calc.*

SIKKIM HIMALAYA, alt. 7–9000 ft., J. D. H., C. B. Clarke.

A tree, very young branches and leaves tomentose and hairy, soon glabrous. *Leaves* coriaceous, very variable in breadth, $\frac{3}{4}$ –2 in.; nerves 12–14 pair, very prominent beneath, slightly curved; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Corymbs* branched from the base,

pubescent in flowers, glabrous in fruit. *Flowers* $\frac{1}{2}$ in. diam., white; pedicels slender. *Calyx-tube* obconic, hairy; lobes triangular. *Petals* broadly oblong, glabrous. *Stamens* long. *Disk* tumid, 10-lobed, puberulous. *Styles* 2, slender, united below the middle or free, glabrous. *Fruit* $\frac{1}{4}$ in. diam., smooth, endocarp thin; cells 2-seeded. *Seeds* plano-convex.

** *Leaves more or less ovate (rarely obovate), petiole slender. Disk in the umbo of the fruit tumid or flat not lobed.*

17. **P. khasiana**, Dcne. Mem. Fam. Pom. 169 in part (Micromeles); leaves 4 in. elliptic-obovate rather suddenly acuminate serrate, nerves very oblique nearly straight, fruit $\frac{1}{2}$ in. diam. spotted 4-celled.

KHASIA Mts.; at Nungbree wood, alt. 5000 ft., Griffith.

A tolerably large tree, in foliage more like *P. rhamnoides* than any of the following species, having many nearly straight nerves. The only specimens (Griffith, 2078, 1044 of Posth. Papers, ii. 67) are in old leaf and fruit, which latter Griffith describes as of the size of a cherry; it is constantly 4-celled; the endocarp thick and coriaceous; the cells narrow 1-seeded, the pulp granular, and is 4-angled when dry and has a narrow depressed umbo with a conical centre.

18. **P. granulosa**, Bertol. Piant. Nuov. Asiat. ii. 10, t. 3; leaves ovate-lanceolate long-acuminate serrate, base rounded or acute, nerves 8-10 pair spreading arched, fruits few in a corymb $\frac{1}{2}$ - $\frac{3}{4}$ in. diam. spotted 4-celled. *P. sikkimensis*, Wenzig in *Linnæa*, 1874, 58, in part; Kurz, For. Fl. Brit. Burm. i. 442. *P. Karensium*, Kurz in Journ. Beng. As. Soc., 1872, ii. 306; 1873, ii. 232.

KHASIA Mts. Griffith; near Churra, Myrung and Mamloo, alt. 4-6000 ft., J. D. H. & T. T. MARTABAN, alt. 7000 ft., Kurz.

A shrub or small tree, in a fruiting state perfectly glabrous, branches with oblong white lenticels. *Leaves* 4-5 in., stiff; nerves prominent beneath; petiole 1-1 $\frac{1}{4}$ in. *Fruiting corymb* with smooth branches. *Fruit* with the flesh of large granules, endocarp thickly coriaceous, cells narrow; umbo small depressed with a small conical centre.—Differs from *P. khasiana* in the ovate leaves with arching nerves.

19. **P. polycarpa**, Hook. f.; quite glabrous, leaves ovate-lanceolate long-acuminate serrate, base rounded or acute, nerves 6-8 pair spreading arched, corymbs effuse perfectly glabrous, fruit $\frac{1}{6}$ in. unspotted. *Pyrus*, b. Herb. Ind. Or. H. f. & T.

KHASIA Mts., alt 5-6000 ft., Griffith, Simons, &c.

A small tree, foliage remarkably similar to that of *P. granulosa*, but the nerves fewer, and at once distinguished by the very small unspotted fruit, with only 2 cells both broad, and small seeds with thick plano-convex cotyledons. The only flowering specimen I have is from M. Simons, in it the *corymb* is much branched, perfectly glabrous, and smooth, somewhat warted in fruit.—*Flowers* $\frac{1}{2}$ in. diam.; pedicel slender. *Calyx-tube* rather pyriform; limb expanded; lobes triangular-ovate. *Petals* nearly orbicular, glabrous, concave. *Disk* inconspicuous, glabrous. *Stamens* long, slender. *Styles* 2, united to the middle, quite glabrous. *Fruit* rather ovoid, $\frac{1}{8}$ - $\frac{1}{4}$ in., umbo large for its size, depressed with a conical centre.

20. **P. cuspidata**, Bertol. Piant. Nuov. Asiat. ii. 9, t. 1; young parts flocculent, leaves ovate or elliptic-ovate long-petioled caudate-acuminate serrate, nerves 10-12 spreading arched, corymbs contracted densely warted when in fruit, fruit small not spotted 2- very rarely 3-celled. *Micromeles verrucosa*, Dcne. Mem. Fam. Pom. 169. *Rosacearum*? frutex, Brown in Wall. Cat. 7467.

KHASIA Mts., alt. 4-5000 ft., Wallich, &c.

A large tree, with pale foliage; branchlets stout, studded with oblong lenticels;

twigs and young parts clothed with a flocculent cotton that falls away in white flakes. *Leaves* 3-4 in., rather membranous, pale green, not shining, point very long, coarsely serrate, base acute or rounded; petiole very slender. *Corymb* more rounded than in its allies, white and tomentose when young, more rusty or glabrous when old; branches rather short; covered when fruiting with raised lenticels. *Flowers* $\frac{1}{4}$ in. diam.; pedicels slender. *Calyx-tube* pyriform; limb expanded, glabrous within, teeth triangular, acute. *Petals* obovate, woolly within in bud, claw pubescent. *Stamens* slender. *Disk* glabrous, inconspicuous. *Styles* 2, very slender, united below the middle, glabrous. *Fruit* $\frac{1}{3}$ in. diam., rather pyriform, crown tubular $\frac{1}{4}$ its own diameter, with a deep depression and conical centre.

21. **P. ferruginea**, *Hook. f.*; branchlets leaves beneath and corymbs densely clothed with rusty wool, leaves very shortly petioled broadly elliptic suddenly acuminate serrulate, corymbs few-flowered, styles 3. *Sorbus sikkimensis* var. *ferruginea*, *Wenzig in Linnæa*, 1874, 60.

BHOTAN, *Griffith*.

Branchlets with few lenticels. *Leaves* $2\frac{1}{2}$ -3 in., lower half or one-third quite entire, upper surface sparsely pubescent or glabrate; nerves 6-8 pair, spreading and arching; petiole $\frac{1}{4}$ in., densely woolly. *Corymbs* densely woolly, of few primary subumbellate branches $\frac{1}{2}$ - $\frac{3}{4}$ in., which are twice or thrice divided into erect stout pedicels. *Flowers* $\frac{1}{3}$ in. diam. *Calyx-tube* pyriform; lobes short, triangular, acute, very deciduous. *Petals* obovate, woolly on the face and claw. *Stamens* slender. *Disk* not raised. *Styles* usually 3, glabrous, united to the middle; ovules inserted in the middle of the axis.

22. **P. Thomsoni**, *King MSS.*; glabrous, leaves very shortly petioled, elliptic-lanceolate or oblanceolate acuminate serrate above the middle, corymbs glabrous, styles 2-4, fruit $\frac{3}{4}$ in. diam.

SIKKIM HIMALAYA, alt. 8-10,000 ft., *J. D. H., C. B. Clarke*.

A large tree; branches glabrous, sparingly lenticellate. *Leaves* 3 in., brown when dry, apparently glabrous at all stages; base acute, rarely rounded or obtuse; nerves 8-12 pair, spreading and arched; petiole $\frac{1}{4}$ - $\frac{1}{3}$ in. *Corymb* of few primary subumbellate erect main branches, 1 in. long, di-trichotomously forked. *Flowers* $\frac{1}{3}$ in. diam.; pedicels slender. *Calyx-tube* pyriform; limb expanded; teeth ovate, obtuse. *Petals* obovate, claw woolly. *Stamen* stout. *Styles* stout, united at the middle or base, glabrous; ovules attached in the middle of the axis. *Fruit* with few white spots, crown sunk. *Seeds* tumid.—Young flowering specimens of this were distributed as *Photinia arguta*, Wall., var. ?, and are cited by Decaisne under his *Micromeles verrucosa* (*Pyrus cuspidata*, Bertol.) from which it differs in the glabrous narrow leaves with short petioles serrated only beyond the middle.

DOUBTFUL SPECIES.

P. (MALUS) SIEVERSII, *Ledeb. Fl. Alt. ii.* 222. A Soongarian species, closely allied to *P. baccata*, differing in being branched from the base, is enumerated by Decaisne (Mem. Fam. Pirus) as having been found in Kashmir by Jacquemont.

P. (MICROMELES) CASTANEIFOLIA, *Dene. Mem. Fam. Pom.* 169; "leaves oblong or oblong-lanceolate acuminate base obtuse acutely serrate glabrous, petiole rather long slender, peduncle and pedicels floccose when young, fruit small. *Sorbus sikkimensis*, *Wenzig in Linnæa*, 1874, 58." Eastern Bengal, *Griffith*, No. 2077-1.—I cannot identify this.

P. (SORBUS) SIKKIMENSIS, *Wenzig in Linnæa*, 1874, 58; evidently includes more than one species from Sikkim and the Khasia Mts. Thus, var. *a.*, the Sikkim plant included under this variety, I cannot recognise by the description, though it is of a plant stated to be found by myself; the Khasia one includes *P. granulosa* and *verrucosa*.—Var. *β. oblongifolia*, this I do not recognise though it professes to be a Sikkim discovery of mine.—Var. *γ. microcarpa*, a Sikkim plant, is I suppose *P. Griffithii*, to which

Wenzig doubtfully (and erroneously) refers *P. Nussia*, Don.—Var. δ . *ferruginea* is *P. ferruginea*.

P. CRENATA, Don, *Prodr.* 237; "leaves long-petioled ovate acute crenate glabrous above, young beneath and branchlets white-tomentose, corymbs simply woolly, calyxlobes ovate acute.—Suemba in Upper Nepal, *Hamilton*. Obs. *P. Pollveria* differs in the shorter broader serrate not crenate leaves and in the more numerous flowers."—I do not recognise the above.—Can it be the common pear?

21. *PHOTINIA*, Lindl.

Evergreen small trees or shrubs. *Leaves* coriaceous, quite entire or serrulate; stipules subulate, deciduous. *Flowers* small, corymbose, white. *Calyx-tube* obconic; limb 5-cleft; lobes short, persistent. *Petals* 5, contorted or imbricate in bud, orbicular or obovate, claw glabrous or woolly. *Stamens* 20 or more. *Ovary* with a conical pubescent or woolly crown, 2- rarely 3-celled; styles 2, rarely 3, free, or combined at the base, short; ovules 2, collateral, nearly basal in each cell, ascending. *Fruit* small, globose or ovoid, 1-2-seeded; flesh rather hard; endocarp crustaceous or membranous. *Seeds* obovoid, triquetrous or compressed, nearly as long as the fruit, testa coriaceous.—DISTRIB. Eastern tropical and subtropical Asia; species 7 or 8.

1. *P. Lindleyana*, *Wight & Arn. Prodr.* 302; quite glabrous, leaves elliptic oblong or ovate acute crenulate or entire base rounded, nerves 13-15 pair faint, petiole long stout, flowers $\frac{1}{2}$ in. diam., claw of petal villous, fruit turbinate or subglobose. *Wight Ic. t.* 228; *Dcne. Mem. Fam. Pom.* 141. *P. Notoniana*, *Wall. Cat.* 671, not of *Wight & Arn.* *P. serrulata*, *Lindl. γ. Wenzig in Linnæa*, 1874, 94.

NILGHIRRI HILLS, *Noton, Wight, &c.*

A small tree? everywhere glabrous except the crown of the ovary and claw of the petals; branches stout. *Leaves* 3-6 in., very thickly coriaceous, not shining on either surface, flat; nerves nearly horizontal; petiole $1\frac{1}{2}$ -2 in., cylindric. *Corymbs* 3-5 in. diam., much branched from the base, branches stout. *Flowers* $\frac{1}{2}$ in. diam., pedicelled; bracts subulate. *Calyxlobes* rounded. *Petals* orbicular-obovate, claw distinct. *Styles* 2, very stout, short. *Fruit* $\frac{1}{4}$ in. long, smooth, glaucous; endocarp crustaceous.—Wallich's *P. Notoniana* is only a form of *Lindleyana*, with the crenatures few and confined to near the top of the leaf.

2. *P. Notoniana*, *Wight & Arn. Prodr.* 302 (not of *Wall. Cat.*); leaves elliptic ovate oblong or lanceolate acuminate quite entire base acute or rounded, nerves very many and slender, petiole long ($1-1\frac{1}{2}$ in.), corymbs pubescent or glabrous, flowers $\frac{1}{2}$ in. diam., fruit globose. *Wight Ic.* 991; *Ill. t.* 86; *Dcne. Mem. Fam. Pom.* 141; *Bedd. Fl. Sylv. t.* 192. *P. Blumei*, *Dcne. l. c.* 142. *Eriobotrya integrifolia*, *Kurz, For. Fl. Brit. Burm. i.* 442.

NILGHIRRI and PULNEY MTS., *Wight, &c.* KHASIA MTS., alt. 4-5000 ft. MARTABAN, alt. 7-7200 ft., *Kurz*. CEYLON; Central province, alt. 6-7000 ft.—DISTRIB. Java.

A small tree, glabrous except the inflorescence, which is finely pubescent. *Leaves* $2\frac{1}{2}$ -6 in., very variable, sometimes caudate-acuminate, thickly coriaceous, the numerous nerves very delicate, hardly shining above; petiole $\frac{3}{4}$ -2 in., flat or grooved above. *Corymb* excessively branched, 3-10 in. diam.; branches slender in flower; stout in fruit. *Flowers* pedicelled, white. *Calyxlobes* rounded. *Petals* orbicular, claw glabrous or slightly villous. *Fruit* $\frac{1}{4}$ in. diam., blue, glaucous; endocarp membranous. *Seeds* compressed, radicular end incurved.—I refer *Kurz's* plant here on the authority of his citation of *Beddome*; he describes the leaves as sometimes cuneate-oblong and with a few inconspicuous teeth.

VAR. *ceylanica*; leaves sometimes orbicular, inflorescence quite glabrous. Ceylon, alt. 6-7000 ft.—DISTRIB. Java.—Javanese specimens have sometimes crenate leaves.

VAR. *eugenifolia*; leaves from narrow lanceolate to broadly oblong, corymbs hoary with white pubescence. *P. eugenifolia*, Lindl. in Bot. Reg. sub. t. 1956; Wall. Cat. 670, in part. *P. micrantha*, Dcne. Mem. Fam. Pom. 143.—Khasia Mts.

VAR. *macrophylla*; leaves 7-9 in. ovate-lanceolate caudate-acuminate, petiole 1-2½ in., corymbs quite glabrous. Khasia Mts.

3. **P. integrifolia**, Lindl. in Trans. Linn. Soc. xiii. 103; quite glabrous, leaves oblanceolate acuminate quite entire narrowed into the short ($\frac{1}{4}$ - $\frac{1}{2}$ in.) petiole, corymbs large spreading, flowers $\frac{1}{2}$ in. diam., fruit globose. Wall. Cat. 669; Lindl. in Bot. Reg. under tab. 1956. *Pyrus integrifolia*, Don Prodr. 237.

Central and Eastern Himalaya; from NEPAL, Wallich, and SIKKIM, alt. 4-7000 ft. to BHOTAN, Griffith. KHASIA MTS. alt. 3-4000 ft.

I have great difficulty in distinguishing this from *P. Notoniana* (in the Khasia Mts. especially), its best character is the very short petiole and uniformly oblanceolate smaller leaves 3-5 in. long. In the Himalaya it is very constant in its characters, but in the Khasia Mts. it comes very near small states of *Notoniana*, var. *macrophylla*. Hence though no foliage of allied plants can be more unlike in form than the ordinary states of this plant present, I am in doubt as to their specific differences. *P. integrifolia*, Miquel (Fl. Ind. Bat. i. part i. 387), from Java, appears to be the same plant. The styles are almost invariably two, but three are said to occur. The crown of the ovary is woolly, but of the fruit glabrous.

4. **P. Griffithii**, Dcne. Mem. Fam. Pom. 142; branchlets midrib beneath petiole and inflorescence woolly, leaves oblong-lanceolate acuminate serrulate near the tip, nerves very slender, petiole 1-2 in., flowers $\frac{1}{2}$ in. diam. Pomarc. Griff. Ic. Pl. Asiat. iii. t. 573 (bad); Posth. Papers, ii. 178, No. 921.

BHUTAN HIMALAYA, at Trelagong, Griffith.

A large tree; branchlets rather slender, woolly, pubescence whitish. Leaves 5-7 by 1½-2½ in., much more membranous than in any preceding species, very finely acuminate, serratures minute, rather shining on both surfaces; nerves arched, 25-30 pair; petiole cylindric. Corymbs ample. Flowers shortly pedicelled. Calyx-lobes rounded. Petals obovate; claw woolly. Styles 2-3, woolly and connate below. Ovary with a densely woolly crown.—Griffith describes the calyx-lobes and petals as 5 or 6.

5. **P. mollis**, Hook. f.; branchlets leaves beneath short petiole and inflorescence clothed with white wool, leaves very membranous elliptic or lanceolate acuminate serrulate base acute, corymbs rounded many-flowered, flowers $\frac{1}{2}$ in. diam., styles 2-3 glabrous united at the base.

SIKKIM HIMALAYA, at a low elevation, J. D. H., Gamble.

Tree 20-30 ft. Branches slender, glabrous, with red brown bark and small lenticles; branchlets and other woolly parts white. Leaves 4-5 in., pale when dry, very membranous, serratures fewer and smaller towards the base, rather suddenly acuminate; nerves 6-10 pair, spreading, arched, very slender. Corymbs 2 in. diam., shortly peduncled, branches spreading, rather lax-flowered. Flowers white, pedicelled; bracts minute, linear, caducous, membranous. Calyx woolly; tube hemispheric; lobes rounded. Petals orbicular, retuse; claw very short, glabrous. Stamens not long, slender. Disk not thickened, woolly at the base. Styles slender; stigma 2-lobed. Fruit $\frac{1}{2}$ in. long, ovoid, crowned with the persistent calyx; endocarp thinly crustaceous, septum membranous. Seeds nearly as long as the fruit.

22. **POURTHIÆA**, Dene.

Shrubs or small trees, glabrous or woolly when young. *Leaves* simple, crenate, persistent; stipules minute, subulate. *Flowers* small, white, in few-flowered corymbs, with warted fruit-bearing branchlets. *Calyx-tube* obconic; lobes 5, acute. *Petals* 5, contorted, obovate, oblique and notched, claw glabrous. *Stamens* 20, filaments slender. *Ovary* 2-3-celled; styles 2-3, connate high up, stigma capitate 2-fid; ovules 2 in each cell, collateral, basal, ascending. *Fruit* small, globose or ovoid, 1-2-seeded, flesh granular; endocarp membranous. *Seeds* ellipsoid, plano-convex; testa thickly coriaceous with reticulated grooves on the convex side; cotyledons plano-convex; radicle curved, short, exserted.—DISTRIB. Himalaya, China, Corea, Japan.

1. **P. arguta**, Dene. *Mem. Fam. Pom.* 147. Photinia? *arguta*, Wall. *Cat.* 672; *Lindl. Bot. Reg.* under 1956; *Wenzig in Linnæa*, 1874, 90, *excl. synonym*.

KHASIA Mts., alt. 3-5000 ft., abundant. *BIRMA*, *Griffith*. Foot of the SIKKIM Terai, *Gamble* (var. *Hookeri* only).

I can distinguish but one Indian species of this very abundant Khasian bush, which occurs all over the range; all have white-woolly young leaves and inflorescence, which is thrown off with age, the fruit varies much in size.

VAR. 1. *Wallichii*; leaves $1\frac{1}{2}$ -2 in. coriaceous ovate-lanceolate acuminate quite glabrous in age, nerves 8-10 pair, corymbs subsessile few-flowered sometimes almost capitate, fruit $\frac{1}{4}$ in. diam. globose. *P. arguta*, Dene. *l. c.*

VAR. 2. *Hookeri*; leaves 3-4 in. coriaceous oblong-lanceolate caudate-acuminate, petiole longer, corymbs 2-3 in. long, fruit $\frac{1}{2}$ in. diam. globose. *P. Hookeri*, Dene. *l. c.* 148. Sikkim and Khasia.

VAR. 3. *salicifolia*; leaves 4-5 in. coriaceous narrowly lanceolate caudate-acuminate more persistently woolly beneath, corymb effuse, flowers larger. *P. salicifolia*, Dene. *l. c.* 148.

VAR. 4. *membranacea*; leaves 2-3 in. very membranous ovate-lanceolate acuminate or caudate-acuminate, corymbs of few long branches floriferous at the tip. Khasia, *Griffith* (no number). This is no doubt a lax form growing in woods.

VAR. 5. *latifolia*; leaves 4-5 by $1\frac{1}{2}$ -2 $\frac{1}{4}$ in. rather coriaceous oblong or oblong-lanceolate acuminate more persistently woolly beneath, serratures smaller, corymbs umbelliform, branches $1\frac{1}{2}$ in., flowers longer pedicelled. Hookhoom valley, Birma, *Griffith*.

VAR. 6. *parvifolia*; leaves $1\frac{1}{2}$ -2 $\frac{1}{2}$ in. coriaceous narrowly lanceolate acuminate, corymbs contracted, fruit $\frac{1}{4}$ in. rather ovoid. Khasia Mts. at Jowai, *C. B. Clarke*.

23. **STRANVÆSIA**, Lindl.

Shrubs or small trees. *Leaves* coriaceous, evergreen, quite entire or serrulate; stipules subulate. *Flowers* small, white, in compound many-flowered corymbs. *Calyx-tube* small, obovoid; limb dilated, 5-toothed. *Petals* 5, obovate, usually contorted in bud, claw naked or bearded. *Stamens* 20. *Ovary* 5-celled; styles 5, connate high up; stigma capitate 2-fid; ovules 2 in each cell, basal, collateral, ascending. *Fruit* globose, rather fleshy, 5-celled; endocarp crustaceous, dehiscing loculicidally; cells 1-seeded. *Seeds* ovoid, plano-convex; testa coriaceous, mucilaginous; embryo plano-convex.—DISTRIB. Himalaya and China; species 3 or 4.

1. **S. glaucescens**, Lindl. in *Bot. Reg.* t. 1956; leaves obovate oblanceolate or narrowly lanceolate acuminate or obtuse and apiculate entire or serrulate quite glabrous, calyx and pedicels woolly. *Brand. For. Fl.* 210; *Wenzig*

in *Linnaea*, 1874, 204. *S. glaucescens* and *S. Nussia*, *Dcne. Mem. Fam. Pom.* 178. *Cratægus glauca*, *Wall. Cat.* 673. *Pyrus Nussia*, *Ham. in Don Prodr.* 237. *Cotoneaster affinis*, *Lindl. in Wall. Cat.* 658.

Western and Central Himalaya; KUMAON, alt. 3-7500 ft. NIPAL, *Wallich. KHASIA Mts.*, alt. 4-5000 ft.

A small leafy evergreen tree, very variable in foliage, young parts tomentose in a very early state. *Leaves* in Western specimens often 6 in. long and 2-2½ broad, more obovate than is usual in the Eastern, hardly shining above, paler beneath; in Khasian specimens the leaves are sometimes 4 by ½-¾ in., long-acuminate and curved (var. *angustifolia*, *Dcne.*), always narrowing into the petiole; nerves very slender; petiole ½-¾ in. *Corymbs* 2-4 in. broad; branches slender, hairy or glabrate. *Flowers* pedicelled, ½ in. diam., pedicels woolly. *Calyx* woolly; lobes acute, persistent. *Petals* spreading, usually notched, not oblique. *Ovary* small; crown hardly raised, hairy. *Style*-column woolly below. *Fruit* ½ in. diam., orange yellow, crowned with the incurved calyx-teeth; flesh thin; crown of the crustaceous carpels exserted, glabrous.

24. CRATÆGUS, Linn.

Shrubs or small trees, often spiny. *Leaves* simple lobed or pinnatifid; stipules deciduous. *Flowers* in terminal corymbose cymes, white or red; bracts caducous. *Calyx*-tube urceolate or campanulate; mouth contracted; lobes 5, persistent or deciduous. *Petals* 5, inserted at the mouth of the calyx, imbricate in bud. *Stamens* many. *Carpels* 1-5, adnate to the calyx-tube; styles 1-5; stigma truncate; ovules 2 in each cell, ascending. *Fruit* ovoid or globose, with a bony 1-5-celled stone, or with 1-5 bony 1- rarely 2-seeded stones.—*DISTRIB.* N. temp. regions, chiefly American, extending south into New Granada; species about 50.

1. *C. Oxyacantha*, Linn.; *Ledeb. Fl. Ross.* ii. 88; leaves cuneate or triangular-ovate with a cuneate base pinnatifidly 3-5-lobed rarely pinnate sinus acute, lobes sharply toothed towards the tip, fruit glabrous ovoid, carpels 1-3 wholly adnate to the calyx-tube. *Brandis For. Fl.* 207. *C. ribesius*, *Bertol. Miscel. Bot.* xxii. 14, t. 2. (Hawthorn).

Western temperate Himalaya, from MURREE to KISHTWAR, alt. 6-9000 ft.—*DISTRIB.* Afghanistan and westward to the Atlantic, W. Siberia.

A small tree, 20-30 ft., trunk short, branches spinescent; young shoots and leaves beneath and inflorescence sparsely softly pubescent or glabrate. *Leaves* 1-2 in.; petiole very slender; stipules leafy, upper usually falcate, serrate, lower larger orbicular and cut. *Corymbs* many-flowered. *Flowers* ½ in. diam., white, odorous. *Calyx*-lobes subacute. *Petals* orbicular. *Styles* 1 or 2, slender, glabrous. *Carpels* adnate by their whole length to the calyx-tube, tips pubescent. *Fruit* scarlet, flesh scanty; endocarp of 2-3 bony pyrenes more or less firmly united.—*Boissier* regards the Himalayan plant as *C. monogyna* (itself a var. of *Oxyacantha*) but there are commonly 2 and often 3 styles and carpels.

2. *C. Clarkei*, *Hook. f.*; softly tomentose, leaves oblong pinnate or pinnatifid, base cuneate or truncate, segments oblong toothed at the broad tip, fruit pubescent globose, carpels 5, free above.

KASHMIR, at Hirpoor, alt. 8000 ft., *Thomson, C. B. Clarke.*

Pubescence soft, white, spreading. *Leaves* 2-4 in., opaque above, lower segments often free obovate and spreading, tips rounded or acute; petiole slender; stipules very large, semicircular and falcate, toothed. *Flowers* apparently smaller than in *C. Oxyacantha* and fewer in the corymb, which is clothed with spreading hairs. *Calyx*-lobes persistent, obtuse. *Petals* (from fruiting specimen) orbicular-obovate.

Styles inserted ventrally, free. *Carpels* free for nearly $\frac{1}{3}$ of the upper part from one another and the calyx-tube. *Fruit* green, 5-lobed when dry, $\frac{1}{4}$ in. diam., crowned by the reflexed calyx-lobes; pyrenes separable, free above, faces rough.—The structure of the ovary and fruit is essentially the same as in the following species, but the tops of the pyrenes are not so much protruded.

3. **C. crenulata**, Roxb. *Hort. Beng.* 38; *Fl. Ind.* ii. 509; glabrous, leaves linear-oblong or obovate crenulate obtuse very coriaceous, fruit globose, carpels 5 free above. *Wall. Cat.* 674; *Lindl. in Bot. Reg.* xxx. t. 52. *C. Pyracantha*, Brandis *For. Fl.* 208. *Mespilus crenulata*, Don *Prodr.* 238. *Pyracantha crenulata*, Roem.; *Dcne. Mem. Fam. Pom.* 171.

Temperate Himalaya in dry places from the SIRMOR to BHOTAN (exclusive of Sikkim), alt. 2500–8000 ft.

A large woody rigid spinescent shrub. *Leaves* crowded on short lateral branchlets, 1–2 in., shining, narrowed into the very short petiole; nerves indistinct. *Corymbs* short, many-flowered, glabrous or puberulous; branches slender. *Flowers* $\frac{1}{4}$ – $\frac{1}{3}$ in. diam., white; pedicels slender. *Calyx-tube* hemispheric; lobes obtuse. *Petals* orbicular, claw very short. *Styles* 5, inserted ventrally. *Carpels* 5, free for $\frac{1}{3}$ of their upper part from one another and the calyx-tube. *Fruit* globose, orange-red, crowned with the erect calyx-lobes; pyrenes separable, faces polished, upper $\frac{1}{3}$ free and protruded between the calyx-lobes.—Differs from the European *C. Pyracantha* in the obtuse leaves and smaller flowers and fruit.

25. **COTONEASTER**, Linn.

Shrubs or small trees. *Leaves* quite entire, coriaceous, usually very downy beneath; stipules setaceous, deciduous. *Flowers* small solitary or in axillary or terminal cymes, white or pink, sometimes polygamous. *Calyx-tube* turbinate or campanulate; lobes 5, short, persistent. *Petals* 5, imbricate in bud. *Stamens* 20, inserted at the mouth of the calyx. *Carpels* 2–5, adnate wholly or by their backs only to the calyx-tube; styles 2–5, free, stigma truncate; ovules 2 in each cell, erect, basal, geminate, raphe lateral. *Fruit* small, ovoid globose or turbinate, with 2–5 bony 1-seeded stones.—DISTRIB. Europe, temp. Asia; N. Africa, Mexico; species 15.

A genus distinguishable only by habit from *Cratægus*. The species are very variable and difficult of discrimination.

A. *Leaves* deciduous (subpersistent in *nummularia* and *rotundifolia*); margins not recurved.

* *Leaves* 1–4 in. *Cymes* usually branched and many-flowered.

1. **C. bacillaris**, Wall.; *Lindl. in Bot. Reg.* under t. 1229; a bush or small tree, leaves $1\frac{1}{2}$ –3 in. oblong or obovate or oblong-lanceolate woolly or glabrescent beneath acute or obtuse narrowed into the petiole, cymes short many-flowered puberulous, fruit dark brown globose. *Brandis For. Fl.* 208; *Wall. Cat.* 660. *C. obtusa*, Wall. *in Bot. Reg.* l. c.; *Cat.* 659, in part.

Temperate Himalaya, from WAZARISTAN, alt. 4–8000 ft.; MURREE and KASHMIR, alt. 4–10,000 ft. to NEPAL, SIKKIM? and BHOTAN?. SALT. RANGE, alt. 1500–2500 ft. (*Brandis*).

A common and variable deciduous Himalayan shrub; wood much used for walking sticks, whence its specific name. Of Wallich's *C. obtusa*, I cannot distinguish three of the specimens from *bacillaris* even as a variety; Lindley's character of "cymes congested and branchlets glabrous" in *obtusa*, and "cymes divaricate and branchlets pilose" in *bacillaris*, do not distinguish Wallich's var. The other specimens marked

as *obtus*a are the *C. affinis* of Lindley and differ only in the tomentose undersurface of the leaves and corymbs, which in this respect present every intermediate with *bacillaris*; its leaves are however often smaller rounder and sometimes rounded at the base (*C. rosea*, Edgw.). I am somewhat doubtful of the Sikkim and Bhotan plants here referred to *bacillaris*. I do not remember a black or dark brown fruited large shrubby species in Sikkim, and Griffith's Bhotan specimens are in flower only; one of these has leaves under 1 in. long. The Sikkim specimens doubtfully referred here have the leaves of *affinis* and a young shoot has them sometimes almost orbicular, rounded at the base (as in *rosea*) and 2 in. diam. Except by the dark berries it is difficult to distinguish var. *affinis* from *C. frigida*.

VAR. *affinis*; leaves beneath petioles young shoots and inflorescence more or less woolly or tomentose. *C. affinis*, Lindl. in Trans. Linn. Soc. xiii. 101; Bot. Reg. undert. 1229. *C. obtusa*, Wall. Cat. 659, in part. *C. rosea*, Edgw. in Trans. Linn. Soc. xx. 46. *Mespilus affinis*, Don Prodr. 238.

VAR. *parvifolia*; leaves $\frac{1}{2}$ –1 in. elliptic acute or obtuse, cymes short dense-flowered, flowers smaller. Bhotan, Griffith, alt. 7000 ft.

2. **C. frigida**, Wall. Cat. 657; a large bush or small tree, leaves 3–5 in. oblong or oblong-lanceolate acute narrowed to the base young tomentose beneath, cymes very many-flowered woolly, fruit globose scarlet. Lindl. in Bot. Reg. t. 1229. ? *C. affinis*, Hohen. Plant. Exsicc. Nilg. No. 1575. *C. nepalensis*, Hort.

Central and Eastern Himalaya; NIPAL, Wallich, interior of SIKKIM, alt. 7–9000 ft., J. D. H.

A tree, 20 ft. high, or large bush, deciduous, similar in habit and foliage to *C. bacillaris*, but with far more numerous flowers in a cyme and scarlet berries. Hohenacker's Nilgiri specimens, which I take to be *frigida*, are from a tree cultivated in Lord Elphinstone's garden at Kaittee. Decaisne quotes Jacquemont as having found this, but I suspect that *C. bacillaris* var. *affinis* is the plant intended, as *C. frigida* occurs nowhere in Jacquemont's region of travel.

** Leaves $\frac{1}{2}$ –2 (rarely 4–5) in. Cymes few-flowered or flowers solitary.

3. **C. acuminata**, Lindl. in Trans. Linn. Soc. xiii. 101, t. 9; an erect shrub, twigs leaves beneath and inflorescence pubescent or tomentose, leaves usually 1–2 in. ovate acuminate or acute at length glabrous beneath, cymes 1–5-flowered very short, fruit turbinate scarlet. Brandis For. Fl. 209. R. Roylei or Royleana, Hort. *C. rotundifolia*, Herb. Str. & Wint., not of Wallich. *Mespilus acuminata*, Lodd. Bot. Cat. t. 919.

Temperate Himalaya, from SIRMOR and KUMAON, alt. 4500–12,000 ft., to SIKKIM, alt. 7–13,000 ft.

A deciduous shrub, sometimes 14 ft. high; wood used for walking sticks (like *bacillaris*), the most constant in form of foliage of any Indian species except *Simondsii*, also in their size, about 2 in., though in one of Wallich's specimens they exceeded 5 in. !—The fruit varies from turbinate to subcampanulate. The number of flowers in a cyme varies extremely, Brandis says from 2–10, I find 2–5 the average, but solitary flowers are not uncommon.

4. **C. vulgaris**, Lindl.; Boiss. Fl. Orient. ii. 665; an erect bush, leaves $\frac{3}{4}$ –1 $\frac{1}{2}$ rarely 2 in. broadly ovate acute or obtuse hoary or glabrous above softly tomentose beneath, cymes short few-flowered glabrescent, fruit globose black or red.

WESTERN TIBET and WAZURISTAN, alt. 5–11,000 ft.—DISTRIB. Siberia, Soongaria, Persia Westward to the Atlantic.

Usually a slender erect deciduous shrub, varying much in form of foliage and pubescence of both surfaces; its habit, more ovate leaves, and fewer flowered cymes, best

distinguish it from *C. nummularia*. In lax specimens the cymes have slender peduncles and pedicels and drooping flowers. The character of drooping fruit by which it has been sought to distinguish these two species depends on the length of the peduncle. *Fruit* very variable in size and colour. Specimens apparently of *C. vulgaris*, from Bargil, Kashmir, alt. 10,500 ft. collected by Mr. C. B. Clarke have leaves 2 in. long.

5. *C. multiflora*, Bunge; *Led. Fl. Ross.* ii. 93; an erect slender bush, leaves $\frac{3}{4}$ –2 in. ovate elliptic or obovate acute obtuse or rounded at the tip thin glabrous above, glaucous and glabrous or faintly silky beneath, petiole slender, cymes 3–10-fid on short or long peduncles nearly glabrous. *Dcne. Mem. Fam. Pom.* 174. *Cotoneaster* 6, *Herb. Strach. & Wint.*

KASHMIR, *Jacquemont*; NITI PASS KUMAON, alt. 11,500 ft. *Strach. & Winterb.*—DISTRIB. Altai, Persia, Soongaria.

I refer the Garwhal plant to Bunge's *multiflora* with some hesitation; it closely resembles the Altai and Soongaria plant in its thin pale leaves glaucous beneath, but they are usually ovate and acute whereas in the Altai and Soongarian ones they are orbicular obovate or obovate; there are however leaves on some specimens of the Himalayan plant quite like those of the other in being broadly elliptic and rounded at both ends, and Baikal specimens have all the leaves ovate acute. I have seen but few Indian specimens.

6. *C. nummularia*, *Fisch. & Mey.*; *Boiss. Fl. Orient.* ii. 666; a straggling or prostrate bush with woody often divaricate branches, leaves $\frac{1}{2}$ –1 $\frac{1}{2}$ in. orbicular or obovate obtuse or retuse or apiculate white or densely silkily woolly beneath, cymes woolly very short 2–5-flowered, flowers crowded, fruit small obovoid globose black. *Brandis For. Fl.* 209. *C. Lindleyi*, *Steud.*; *Dcne. Mem. Fam. Pom.* 176.

WESTERN TIBET and KASHMIR, alt. 6–11,000 ft.—DISTRIB. Soongaria, Afghanistan and Westward to Asia Minor.

A smaller subevergreen, more woody rigid species than *C. vulgaris*, with smaller leaves sometimes only $\frac{1}{4}$ in. long, never ovate and often orbicular. *Flowers* small; calyx usually tomentose but sometimes glabrate; fruit black, erect.—Cultivated specimens have orbicular leaves nearly 1 in. diam., and almost glabrous beneath. I do not know upon what grounds Steudel and Decaisne regard the *nummularia* of Loudon which appears to me to be the true plant, as different from that of Fischer.

7. *C. rotundifolia*, *Wall. Cat.* 663; a low rigid horizontally and distichously branched shrub, leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. distichous orbicular or orbicular-obovate mucronate glabrous or sparsely hairy above and beneath, flowers solitary subsessile, fruit turbinate scarlet. *Lindl. in Bot. Reg. under t.* 1229; *Saunders Refug. Bot.* i. t. 54. *C. microphylla*, var. *uva-ursi*, *Lindl. in Bot. Reg. t.* 1187. *C. prostrata*, *Baker in Saunders Refug. Bot.* i. t. 53.

Central and Eastern Himalaya, alt. 9–11,000 ft.; from NIPAL, *Wallich*, to SIKKIM, *J. D. H., &c.*, and BHOTAN, *Griffith*.

A rigid shrub, remarkable for its almost horizontal branches and regular small orbicular mucronate leaves, which are not woolly or downy, but have sparse appressed hairs, they are very coriaceous, often a little recurved, and are subsistent in England; but as in Wallich's specimens they are all but fallen off, this character probably depends on the severity of the winter. Decaisne (*Mem. Fam. Pom.* 176) refers to this *C. nepalensis*, *alpina* and *Roylei* of gardens, but our *Roylei* is certainly *C. acuminata*. Baker's *C. prostrata* from Saunders' garden is identical with specimens of *rotundifolia* from the Hort. Soc. Gardens in Herb. Bentham, and has the peculiar appressed hairs of the twigs and under surface of the leaves of *rotundifolia*, from which I cannot distinguish it.

8. *C. Simondsii*, *Hort.*; *Baker in Saunders Refug. Bot.* i. t. 55; an erect bush with slender branches, leaves $\frac{3}{4}$ in. subdistichous rhombic-orbicular

acuminate glabrous above sparsely silky beneath, nerves distinct, margins subrecurved, flowers solitary or twin subsessile, fruit turbinate scarlet. *C. acuminata*, var. *Simondsii*, *Dcne. Mem. Fam. Pom.* 175.

KHASIA MTS. ?

The origin of this is unknown. It is probably named after Mr. Simons who collected largely in the Khasia Mts. and who may have sent seeds to England from thence or from Bhotan. It is remarkable that it occurs in no Indian Herbarium, but so would be the fact, that except this be a native of the Khasia, that range should possess no *Cotoneaster*. It very nearly resembles *C. rotundifolia*.

B. Leaves persistent, rigid, $\frac{1}{2}$ in. long; margins recurved. Flowers almost always solitary. (See also *C. nummularia*, *rotundifolia* and *Simondsii*.)

9. ***C. microphylla***, *Wall. Cat.* 662 A.; a low ramous woody intricately branched shrub, leaves $\frac{1}{2}$ in. ovate or obovate acute retuse or obtuse glossy above pubescent or tomentose beneath, margins recurved, flowers $\frac{1}{2}$ in. diam., fruit globose scarlet. *Lindl. in Bot. Reg.* t. 1114; *Saunders Refug. Bot.* i. t. 49; *Brandis For. Fl.* 209. *C. emarginata*, *Hoffm. according to Decaisne, Mem. Fam. Pom.* 176. ? *C. buxifolia*, *Baker in Saunders Refug. Bot.* i. t. 52.

Temperate Himalaya, alt. 4-8000 ft. from KASHMIR to BHOTAN;—var. *glacialis* from 9-14,000 ft.

In a dried state it is very difficult to distinguish this from the following, and from single flowered states of *C. buxifolia*. I suspect that the *C. buxifolia* of Saunders' Refugium is a state of this, though it may be a 1-flowered state of *buxifolia*.

VAR. *glacialis*; leaves glabrous and glaucous beneath, flowers smaller often pink. *C. congesta*, *Baker in Saunders Refug.* i. t. 51.

10. ***C. thymifolia***, *Hort.*; *Baker in Saunders, Refug. Bot.* i. t. 50; an almost prostrate woody intricately branched shrub, leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. cuneate-obovate or oblong tip rounded or retuse glossy above pubescent or tomentose beneath, margins recurved, flowers solitary $\frac{1}{2}$ in. diam., fruit small globose scarlet. *C. microphylla*, *Wall. Cat.* 662, B. *Cratægus integrifolia*, *Herb. Ham.*

Temperate and Alpine Himalaya from KASHMIR, *Falconer*, to SIKKIM, *J. D. H.*

This so resembles certain states of *C. microphylla*, that I retain it as a species with great doubt; in habit the two are identical, but *C. thymifolia* has narrower leaves that are never elliptic or ovate or acute, but always broader upwards and rounded or retuse at the tip; the flowers are smaller, but this is not a character of much value. It was distributed with true *microphylla* by Wallich and with *buxifolia* by Strachey and Winterbottom from Nynee Tal.

11. ***C. buxifolia***, *Wall. Cat.* 661; a small rigid intricately branched woody bush, leaves $\frac{1}{2}$ in. elliptic-ovate acute or apiculate dull not shining and often pubescent above densely tomentose beneath, margins recurved, cymes 2-6-flowered tomentose short, fruit globose scarlet. *Wight Ic.* t. 992; *Beddome Fl. Sylvat. Anal. Gen.* xcvi. t. 13, f. 3. *C. affinis*, *DC. Prodr.* ii. 632 (the *Nilghiri plant*). *C. lanata*, *Hort.*; *Regel Gartenfl.* ix. 59.

Western Peninsula, NILGHIRI and PULNEY MTS. ? Temperate Himalaya from SIRMORE, alt. 4-7000 ft. to BHOTAN, alt. 10,000 ft., *Griffith*.

I have under *C. microphylla* stated that it is difficult to distinguish dried single-flowered specimens of this from that plant, though in their ordinary states they are very different, *C. buxifolia* having an opaque and often hoary or hairy upper surface to the leaf, which is more regular in shape, and several-flowered cymes, with smaller flower and fruit. I am in great doubt as to any of the Himalayan specimens referred to this being other than 2-3-flowered states of *microphylla*. The *C. lanata* of Lindley

is a garden state with rather larger leaves and long branches, both due to alteration in habit induced by culture. Decaisne refers Hohenacker's Nilghiri specimen (n. 1154) to *lanata*, saying that it is not Wallich's plant, but Wallich's and Hohenacker's specimens are identical in characters and might have come from the same branch; and there is certainly but one species known from the Nilghiris; he further describes the leaves of *lanata* as deciduous, whereas those of *burifolia* are supposed to be persistent. Decaisne (Mem. Fam. Pom.) gives the synonym of *C. lanata* as a species of Lindley's, but I do not find it alluded to elsewhere, except as a garden name. It is cultivated at Kew, and differs from ordinary *C. burifolia* only in its greater development.

ORDER LII. **SAXIFRAGACEÆ.** (By C. B. Clarke.)

Trees shrubs or herbs. *Leaves* alternate and exstipulate, or stipules adnate to the base of the petiole, or opposite and exstipulate. *Inflorescence* various; flowers hermaphrodite or polygamo-dioecious, the sepals petals and stamens symmetrically regular. *Calyx* more or less adnate to the ovary, sometimes nearly free, sometimes quite inferior; lobes imbricate or valvate. *Petals* 5 or 4, rarely 0, perigynous or epigynous, rarely subhypogynous, imbricate or valvate. *Stamens* inserted with the petals, equalling or double their number, rarely numerous; staminodes or glands sometimes present between the stamens and the ovary. *Ovary* of 2 or 3-5 carpels; usually 2- or 3-5-celled with axile placentæ, less commonly 1-celled with parietal placentæ; styles as many as the carpels, distinct or combined nearly to the summits, stigmas capitate or lateral and subcapitate; ovules numerous, anatropous, erect or pendulous. *Fruit* capsular or berried. *Seeds* numerous or several (solitary in *Polyosma*) albuminous; the albumen rarely scanty or nearly wanting.—**DISTRIB.** Species 540; in the cold or temperate regions of the whole world and in the mountains of the tropics; together with a few genera of tropical trees.

Saxifragaceæ is now extended to contain *Saxifraga* on one side, *Ribes* on another, and the tropical *Itea* and *Polyosma* between; and thus has become very difficult of definition. *Crassulaceæ* are generally recognised by their fleshy habit and distinct carpels. *Rosaceæ* are separated by no absolute line; *Astilbe* in *Saxifragaceæ* touching *Spiræa* in *Rosaceæ*.

TRIBE I. **Saxifrageæ.** *Herbs.*

* *Ovary* 2-celled.

Leaves twice ternate more than a foot long	1. ASTILBE.
Leaves simple	2. SAXIFRAGA.

** *Ovary* 1-celled.

Flowers solitary. Petals 5. Leaves opposite	3. VAHLIA.
Flowers racemose. Petals 5, minute	4. TIARELLA.
Flowers solitary. Petals 0. Leafy small plants	5. CHRYSOSPLENIUM.
Scapes 1-flowered. Petals 5. Staminodes prominent	6. PARNASSIA.

TRIBE II. **Hydrangeæ.** *Shrubs* or trees. *Leaves* opposite, exstipulate, simple. *Stamens* double the number of petals or more numerous. *Ovary* inferior or half-superior.

* *Stamens* 8, 10 or 12.

Filaments linear. Fruit capsular	7. HYDRANGEA.
Petals falling off in a cap. Glabrous	8. PILEOSTEGIA.
Petals expanding. Berry blue	9. DICHROA.
Filaments winged	10. DEUTZIA.

** *Stamens* 20-40 11. PHILADELPHUS.

TRIBE III. **Escalloniæ.** Trees and shrubs. Stamens equalling the petals in number. Ovary inferior or half-superior.

Leaves alternate. Seeds numerous 12. ITEA.

Leaves opposite. Seeds solitary 13. POLYOSMA.

TRIBE IV. **Ribesicæ.** Shrubs. Leaves alternate, simple. Ovary inferior, 1-celled. Seeds immersed in pulp.

Flowers racemose or subsolitary 14. RIBES.

1. **ASTILBE**, Ham.

Erect herbs with a perennial creeping rootstock. Leaves alternate, twice or thrice ternate; leaflets doubly serrate with prominent veins; stipules large, adnate to the petiole, sheathing. Flowers (sometimes polygamous) small, in a terminal panicle, spicate-racemose. Calyx slightly adnate to base of ovary with 5 (rarely 4) imbricate lobes. Petals 5 or 0 (rarely 4) perigynous. Stamens 10 or 5 (rarely 8) perigynous. Carpels 2, united below, narrowed upwards into a short style; stigmas small capitate; ovules numerous axile. Ripe carpels dry, acuminate or acute at the top, divaricating, dehiscing ventrally. Seeds small, narrow, oblong, tailed at both ends.—DISTRIB. Species 3 or 7; from the Himalaya, Java, Mantchuria, Japan and Virginia.

1. **A. rivularis**, Ham. in Don Prodr. 211; flowers green-yellow, petals 0, stamens 5 opposite the sepals, ripe carpels deflexed. DC. Prodr. iv. 51. *Spiræa barbata*, Wall. Cat. 705; Camb. in Jacq. Voy. Bot. t. 58.

TEMPERATE HIMALAYA, from KASHMIR to BHOTAN, alt. 5000–9000 ft., abundant. KHASIA Mts., alt. 4000–6000 ft., very common.

Stem and leaves with long fulvous hairs, especially about base of the petioles. Leaflets 1–4 in., ovate, acuminate, often cordate at the base, generally scabrous on the nerves on both surfaces. Rachis of panicle woolly-pubescent, and brown-villose; pedicels short with a small bract at the base. Sepals green, subglabrous, oblong, obtuse, erect, $\frac{1}{2}$ in. Young carpels but slightly united. Ripe carpels $\frac{1}{2}$ in. long. Seeds numerous.—*Spiræa triternata*, Wall. Cat. 708 is reduced to *Astilbe rivularis* by H. f. & T. in Journ. Linn. Soc. ii. 74, but every Wallichian specimen is referable to *Spiræa Aruncus*, L. which in fruit requires to be carefully distinguished from *Astilbe* by the carpels, suddenly narrowed at top into short divergent beaks, usually 3–4 in number, with few larger and much less tailed seeds. *Astilbe speciosa* Junghuhn (Miq. Flor. Ind. Bat. i. pt. i. 393) differs from *A. rivularis* by the flowers often 4-fid, the stamens 8 or 10, the ripe carpels broader at the base.

2. **A. rubra**, H. f. & T. in Bot. Mag. t. 4959; petals 5 pale pink linear or linear-spathulate twice or thrice the sepals in length, stamens 10, the 5 opposite the petals shorter, ripe carpels suberect.

KHASIA Mts., alt. 4000–6000 ft., Griffith, &c.

Stems and leaves with long fulvous hairs, especially about base of the petioles. Leaflets 1–3 in., ovate, acute, sometimes cordate at the base, generally scabrous on the nerves on both surfaces. Rachis of panicle woolly-pubescent and brown-villose; pedicel short with a small bract at the base. Sepals $\frac{1}{2}$ in., green, subglabrous, oblong, obtuse, erect. Young carpels united for a great portion of their length. Ripe carpels $\frac{1}{2}$ in. long.—*A. japonica*, Morr. & Decne; *A. Thunbergii*, Maxim.; and *A. chinensis*, Maxim., differ by being more slender and less villose.

EXCLUDED SPECIES.

A. Stoliczkai, Kurz in Seem. Journ. Bot. v. 240 with simple leaves, from the North West Himalaya probably does not belong to the genus; may be a *Spiræa*.

2. **SAXIFRAGA**, Linn.

Herbs, mostly small perennials. Radical leaves often rosulate; stem leaves alternate (in Sect. *Porphyron* subopposite), exstipulate, petiole sheathing at base. Flowers corymbose or paniculate or reduced to 3-1; white or yellow, rarely red. Calyx adnate to the ovary at base (rarely free) 5-fid, imbricate. Petals 5, perigynous. Stamens 10 (rarely 5) perigynous. Carpels 2 (very rarely 3-5) united below, narrowed upwards into a style, stigma lateral subcapitate; ovules numerous, axile. Ripe Carpels dry, opening at the top ventrally. Seeds small, ellipsoid in Indian species.—DISTRIB. Species 160, almost all in the Northern Hemisphere; inhabiting cool temperate, and especially alpine, localities.

SECT. I. **Nephrophyllum**. Calyx adnate to the base of the ovary, lobes erect in fruit. Petals white, much exceeding the calyx. Stems erect leafy. Radical leaves petioled, reniform, lobed. Bracts 2, unequal at base of peduncles.—In the Indian species the surculi are represented by bulbils, covered with fulvous hairs, forming a cluster at the base of the stem.

1. **S. odontophylla**, H. f. & T. in Journ. Linn. Soc. ii. 64; no bulbils in the upper axils, radical leaves crenate with 7-12 shallow rounded lobes, lobes of stem-leaves often triangular acute. Wall: Cat. 454, partly. *S. asarifolia*, Sternb. *Saxifrag. Suppl.* t. 24.

WESTERN TEMPERATE HIMALAYA, alt. 10,000 ft.; Kumaon, *Blinkworth*; Kulu, *Edgeworth*; Gurwhal, *Falconer*; Lahul, *Jaeschke*.

Laxly villose, 6-10 in. high. Flowers 3-6. Upper leaves few, sometimes 0. In the ripe fruit the calyx-tube is short campanulate or funnel-shaped; the lobes are ovate-linear, approximate, with acute sinuses.—This species bears a general resemblance to *S. granulata*, but the calyx in fruit is very different. It is more difficult to separate it from *S. sibirica*. Engler (*Monog. Saxifrag.* 99) has taken Sternb. *Saxifrag. Suppl.* t. 25 as the type of *S. odontophylla*, which should rather be referred to *S. sibirica*.

2. **S. sibirica**, Linn.; DC. Prodr. iv. 36; no bulbils in the upper axils, radical leaves with 5-7 acute or obtuse lobes, upper stem leaves often simple entire oblong or ovate acute. Sternb. *Rev. Saxifrag.* t. 25, f. 1; H. f. & T. in Journ. Linn. Soc. ii. 64; Boiss. *Fl. Orient.* ii. 807; Engler *Monog. Saxifrag.* 101. *S. odontophylla*, Wall. Cat. 454, *partim*.

WESTERN HIMALAYA and KASHMIR, alt. 9000-14,000 ft., frequent; Royle, *Falconer*, T. Thomson, &c.—DISTRIB. From Kashmir to the Caucasus and to the Altai.

Stem pubescent, 6-8 in. high. Flowers 1-10. Calyx-tube in the ripe fruit short, campanulate or funnel-shaped; lobes ovate-linear, sinuses narrow. Seeds oblong, subangular, quite smooth, testa minutely reticulate. Flowers and capsules smaller than those of *S. odontophylla*. All the Indian specimens referred to *S. granulata*, Linn. by H. f. & T. in Journ. Linn. Soc. ii. 63 are here reduced to *S. sibirica*. In the ripe fruit of *S. granulata* the calyx is divided only about half way down, the tube is hemispherical, the lobes are oblong distant with rounded sinuses.

3. **S. cernua**, Linn.; DC. Prodr. i. 36; bulbils in the upper axils, flower often terminal solitary all the lower flowers of the raceme being replaced by sessile purple bulbils, or flowers 2-3 pedicelled. Eng. Bot. t. 664; Don in Trans. Linn. Soc. xiii. 364; H. f. & T. in Journ. Linn. Soc. ii. 63; Engler *Monog. Saxifrag.* 106.

WESTERN HIMALAYA and WESTERN TIBET, alt. 14,000-17,000 ft.; N. of Ladak, T. Thomson, C. B. Clarke; Nubra, *Strachey*; Tanglang Pass, *Heyde*.—DISTRIB. Alps of Europe, Temperate and Arctic N. America and W. Asia.

Stem 4-6 in. high. *Radical leaves* reniform, palmately 4-6-lobed; upper leaves 3-1-fid passing into bracts. *Calyx-tube* in the ripe fruit short, campanulate or funnel-shaped; lobes ovate-linear, approximate, with acute sinuses.—Turczanimow judiciously remarks (*Fl. Baikal-Dahur.* i. 454) that the only reason for not treating *S. cernua* as a var. of *S. sibirica* is its much wider geographical range. The very imperfect specimens collected by Strachey and Winterbottom in Kumaon and referred to *S. orientalis*, Jacquem., by H. f. & T. doubtfully in *Journ. Linn. Soc.* ii. 63 are certainly not *S. orientalis* nor any species of the section *Cymbalaria*; they have bulbils in the upper axils and belong perhaps to *S. cernua*, β . *pauciflora*, Sternb.

SECT. II. **Hirculus.** *Sepals* nearly free, in fruit patent or reflexed. *Petals* yellow, often with 2-4 spots near their base. *Stems* erect leafy. *Leaves* entire withering not deciduous, lower petioled, upper sessile more or less stem-clasping.—DISTRIB. All Himalayan; *S. Hirculus* extending thence to Europe and North America.

* *Stem leaves* loosely overlapping each other.

4. **S. palpebrata**, H. f. & T. in *Journ. Linn. Soc.* ii. 67; densely tufted, stems 1-flowered, stem-leaves oblong narrower at the base, calyx half adnate to the ripe fruit, petals obovate. *Engler Monog. Saxifrag.* 119.

SIKKIM, alt. 13,000-15,000 ft.; Tunkra Pass, J. D. H. KUMAON, alt. 13,000 ft., Ralum, Strachey & Winterbottom.

Stems 2-5 in. high. *Leaves* ciliate; the lowest radical leaves spatulate, obtuse or orbicular; cauline $\frac{1}{2}$ in. *Styles* exceedingly short. *Ripe carpels* hardly equalling the sepals. *Seeds* trigonous, ellipsoid, smooth,

5. **S. cordigera**, H. f. & T. in *Journ. Linn. Soc.* ii. 68; tufted, stems 1-flowered, cauline leaves cordate-ovate, calyx slightly adnate to the ripe fruit, the lobes patent, petals obovate. *Engler Monog. Saxifrag.* 119.

SIKKIM and EAST NIPAL, alt. 12,000-15,000 ft.; Yeumtong and Kambachen, J. D. H.; Yakla Pass, C. B. Clarke.

Stems 2-4 in. high. *Leaves* ciliate; lowest radical spatulate, obtuse or orbicular; cauline $\frac{1}{2}$ in. *Styles* exceedingly short. *Ripe carpels* hardly equalling the sepals. *Seeds* ellipsoid, angular, smooth, testa lax somewhat plaited.

6. **S. Lychnitis**, H. f. & T. in *Journ. Linn. Soc.* ii. 68; tufted, stems 1-flowered, calyx little adnate to the ripe fruit, sepals densely brown-pubescent, petals elongate-spatulate 3-nerved. *Engler Monog. Saxifrag.* 120.

SIKKIM, alt. 14,000-16,000 ft., Lama Kongra, J. D. H. KUMAON, alt. 14,700 ft.; Barji Kang Pass, Strachey & Winterbottom.

Glandular-pubescent. *Stems* 1-5 in. high. *Radical leaves* spatulate-ovate; cauline $\frac{1}{2}$ - $\frac{3}{4}$ in., linear-oblong or elliptic. *Petals* $\frac{1}{2}$ -1 in. long. *Styles* very short. *Carpels* hardly equalling the sepals. *Seed* trigonous, ellipsoid, smooth.

7. **S. viscidula**, H. f. & T. in *Journ. Linn. Soc.* ii. 69; stems 3-1-flowered, calyx slightly adnate to the ripe fruit, sepals glandular little pubescent, petals spatulate-oblong 7-5-nerved. *Engler Monog. Saxifrag.* 120.

SIKKIM, alt. 13,000-15,000 ft., J. D. H.

Glandular-pubescent. *Stems* 3-4 in. high. *Radical leaves* spatulate-lanceolate; cauline $\frac{1}{2}$ in., oblong, subacute. *Pedicels* $\frac{1}{2}$ in. long. *Petals* $\frac{1}{2}$ in. long. *Styles* not very short.

** *Upper stem leaves* narrow linear, little overlapping each other; stems 1-flowered.

8. ***S. aristulata***, *H. f. & T. in Journ. Linn. Soc.* ii. 68; tufts mosslike, stems $1\frac{1}{2}$ –3 in. glandular but not woolly-pubescent upwards, leaves with recurved margins and terminated by a deciduous linear awn, petals broadly obovate. *Engler Monog. Saxifrag.* 121.

SIKKIM, alt. 13,000–18,000 ft.; Yeumtong and Lachen, *J. D. H.*

Stem-leaves $\frac{1}{2}$ in., shining, glabrous. *Sepals* glabrous, slightly adnate to the ripe carpels. *Petals* $\frac{1}{4}$ – $\frac{1}{2}$ in. long.

VAR. 2; stem-leaves much larger lanceolate-linear somewhat overlapping each other.—SIKKIM, Samdong, *J. D. H.* This variety approaches *S. brachypoda*, Don.

9. ***S. saginoides***, *H. f. & T. in Journ. Linn. Soc.* ii. 68; tufts mosslike, stems 1 in. woolly-pubescent upwards, leaves striate but hardly with recurved margins rarely terminated by a deciduous awn, petals oblong. *Engler Monog. Saxifrag.* 121.

SIKKIM, alt. 10,000–18,000 ft.; Lachen, &c., *J. D. H.* KUMAON, alt. 13,000 ft.: Ralum, *Strachey & Winterbottom*.

Stem-leaves hardly $\frac{1}{4}$ in. long, glabrous. *Sepals* glabrous, slightly adnate to fruiting carpels. *Petals* scarcely $\frac{1}{4}$ in. long. *Fruit* small. *Seed* trigonous, subglobose, smooth.—Hardly to be distinguished from *S. aristulata*. Moreover Sir J. D. Hooker collected in Sikkim intermediate forms having the woolly pubescent peduncle of *S. saginoides*, with the leaves and stature of *S. aristulata*.

*** *Upper stem-leaves not overlapping each other; flowers corymbose, rarely reduced to one in starved examples.*

10. ***S. latiflora***, *H. f. & T. in Journ. Linn. Soc.* ii. 71; flowers 3–1 large, sepals ovate herbaceous large, radical leaves smaller than the stem-leaves. *Engler Monog. Saxifrag.* 122.

SIKKIM, alt. 13,000 ft.; Kankala, *J. D. H.*

Stems 4–8 in. high, glabrous below, glandular-pubescent above. *Leaves* oblong-elliptic; radical petiolate, glandulose-ciliate; cauline $1\frac{1}{2}$ by $\frac{1}{2}$ –1 in. *Petals* ovate-oblong, naked at the base, a little exceeding the sepals. *Styles* very short. *Capsule* ovate-oblong.—Resembles *S. diversifolia* but has finer flowers.

11. ***S. hirculus***, *Linn.; DC. Prodr.* iv. 44; surculi decumbent, leaves subglabrous radical petioled narrow-spathulate cauline oblong narrowed at both ends, flowers 3–1, petals narrow obovate. *Eng. Bot.* t. 1009; *Don in Trans. Linn. Soc.* xiii. 372; *H. f. & T. in Journ. Linn. Soc.* ii. 69; *Boiss. Fl. Orient.* ii. 808; *Engler Monog. Saxifrag.* 122.

VAR. 1. *typica*; stems 6–12 in. 1–3-flowered, cauline leaves $\frac{1}{2}$ –1 in., sepals strongly deflexed, base often brown-villous externally, petals 2–3 times the sepals golden with red dots and 2 pits at the base, styles very short. Not yet collected in India.—DISTRIB. Arctic regions; Alps of Europe to the Caucasus.

VAR. 2. *indica*; peduncles very brown villous, capsule much shorter oval-oblong, sepals hardly deflexed even on the ripe fruit, petals shorter 1–2 times the calyx, styles often wanting, with no obvious stigmas, but the capsules produce good seed.—North Kashmir to Sikkim, alt. 11,000–17,000 ft., *Falconer, T. Thomson, J. D. H., &c.*

VAR. 3. *hirculoides* (*sp.*) *Decne. in Jacq. Voy. Bot.* t. 78; stems 2–3 in. often very villous upwards; like var. 2 but the petals have no pits or glands at the base and are shorter than sepals, or scarcely exceed them.

Kashmir, *Jacquemont*. Western Tibet, alt. 17,000 ft.; Balch Pass, *Strach. & Winterb.*

VAR. 4. *subdioica*; like var. 3, but the stems are 3–6 in. high, and carry 4–10 shortly corymbose or altogether congested flowers; the stigmas are obscure and some

of the flowers seem functionally male, though in others with no visible stigmas there are perfected seeds. *S. Hirculus*, var. γ . *H. f. & T. in Journ. Linn. Soc.* ii. 69.

Western Tibet; *Falconer*; Lanak Pass, alt. 15–17,000 ft., *T. Thomson*.

12. ***S. nutans***, *H. f. & T. in Journ. Linn. Soc.* ii. 69; pedicels short, flowers 6–12 subracemose nodding, sepals with black glands and densely pubescent. *Engler Monog. Saxifrag.* 124.

SIKKIM, alt. 10,000–12,000 ft., *J. D. H.*

Stem 5–10 in. high, densely glandular-pubescent upwards. *Radical leaves* petioled, oblong, obtuse; *cauline* about 1 in., sessile, broadly oblong. *Petals* pale yellow, spatulate, $1\frac{1}{2}$ times the calyx. *Styles* short.

13. ***S. diversifolia***, *Wall. in Sternb. Saxifrag. Suppl.* t. 22; flowers corymbose rarely 3–2, sepals ovate-oblong small, *cauline* leaves sessile often cordate and amplexicaul, radical leaves long-petioled often large. *Wall. Cat.* 452; *DC. Prodr.* iv. 44; *Hook. Lond. Journ. Bot.* iv. t. 21; *H. f. & T. in Journ. Linn. Soc.* ii. 70; *Engler Monog. Saxifrag.* 125. *S. parnassifolia*, *Wall. Cat.* 451, partly; *Don in Trans. Linn. Soc.* xiii. 405; *DC. Prodr.* iv. 25; *Sternb. Saxifrag. Suppl.* t. 25. *S. Moorcroftiana*, *Wall. Cat.* 453; *Sternb. Saxifrag. Suppl.* t. 24. *S. lysimachoides*, *Klotzsch in. Reis. Pr. Waldem. Bot.* t. 42.

Alpine Himalaya; from KASHMIR to BHOTAN, alt. 9000–17,000 ft., abundant.

Stems 8–18 in. high, leafy, glandular, often finally glabrous. *Radical leaves* long-petioled, narrowed into the petiole or (var. *parnassifolia*) ovate, subcordate; *cauline* $\frac{1}{2}$ –2 in., ovate or broad oblong. *Sepals* at length reflexed. *Petals* with 4 stalked glands at their base, $1\frac{1}{2}$ –2 times the sepals. *Styles* very short. *Capsule* ovate-oblong. *Seeds* angular, testa smooth somewhat plaited.

14. ***S. corymbosa***, *H. f. & T. in Journ. Linn. Soc.* ii. 70; flowers corymbose rarely 3–1, leaves shining generally glabrous, radical leaves long-petioled lanceolate not large, peduncles glandular upwards not villous. *Engler Monog. Saxifrag.* 126. *S. parnassifolia*, *Wall. Cat.* 451, partly.

SIKKIM and EASTERN NIPAL, alt. 11,000–14,000 ft.; Lachoong, &c., Wallanchoon, *J. D. H.*, *C. B. Clarke*.

Stems 3–8 in. high, much less stout than those of *S. diversifolia*. *Stem-leaves* $\frac{1}{2}$ –1 in., oblong or ovate, sometimes sessile and stem-clasping, sometimes narrowed suddenly just above the base. *Petals* obovate, twice the sepals. *Styles* short. *Capsule* ovate; *sepals* at length deflexed. *Seeds* ellipsoid, subtrigonal, smooth.

This differs from *S. diversifolia* in being much smaller with smaller leaves and flowers. The starved 1–3-flowered examples of *S. corymbosa* may be distinguished from the Indian *S. Hirculus* by the peduncles being glandular but scarcely brown-villous.

SECT. III. ***Boraphila*** (as to the Indian species). *Sepals* more or less united, patent or reflexed in fruit. *Petals* white. *Leaves* undivided, dentate or crenate.

15. ***S. strigosa***, *Wall. in Sternb. Saxifrag. Suppl.* t. 22; whole plant strigose, leaves near the base of the stem falsely rosulate, upper leaves small alternate sessile deflexed, calyx in fruit patent nearly free. *Wall. Cat.* 448; *H. f. & T. in Journ. Linn. Soc.* ii. 64; *Engler Monog. Saxifrag.* 136.

Central and Western Himalaya; NIPAL; Gossain Than, *Wallich*; SIKKIM, alt. 9000–14,000 ft.; Lachen, Lachoong, *J. D. H.*; Singalelah, *C. B. Clarke*. BHOTAN, *Griffith*.

Stem 4–8 in. high, somewhat rigid, paniculate upwards; upper axils generally producing hispid bulbils, so that the flowers are only 1–3. Lower subrosulate leaves

1-2 in., sessile, oblong-lanceolate, with one or two acute teeth. *Petals* small, exceeding the sepals. *Styles* short. *Capsule* less than $\frac{1}{4}$ in. long. *Seeds* minute, smooth, elliptic, angular.

16. ***S. pallida***, Wall. in Sternb. *Saxifrag. Suppl.* t. 23; scape 2-6 in. leafless with narrow bracts at the divisions of the corymb or simple, calyx in fruit adnate to base of ovary for one-third its length, lobes finally recurved, petals twice sepals, capsule $\frac{1}{3}$ - $\frac{2}{3}$ in. long. Wall. *Cat.* 450; DC. *Prodr.* iv. 38; H. f. & T. in Journ. Linn. Soc. ii. 65; Engler *Monog. Saxifrag.* 140.

Alpine Himalaya; SIKKIM, alt. 13,000-17,000 ft.; Lachen, Kankala, &c., J. D. H. NIPAL; Gossain Than, Wallich. KUMAON, alt. 14,500 ft.; Barji Kang Pass, Strachey & Winterbottom.

Slightly pubescent, sometimes glabrous. Radical leaves long-petioled, ovate, dentate-crenate. Flowers and fruit very variable in size, sometimes not larger than in the next species. Style hardly any. Seeds ellipsoid, longitudinally striated by 10-12 rows of tubercles.

17. ***S. micrantha***, Edgw. in Trans. Linn. Soc. xx. 50; scape 4-8 in. high leafless (rarely 1-leaved) with leaflike bracts at the lower divisions of the corymb, calyx in fruit shortly adnate to base of ovary, lobes finally recurved, petals hardly exceeding sepals, capsule seldom more than $\frac{1}{2}$ in. long. H. f. & T. in Journ. Linn. Soc. ii. 64; Engler *Monog. Saxifrag.* 141.

Alpine Eastern and Western HIMALAYA, alt. 9000-11,000 ft.; Edgeworth; Dhurm-sala, C. B. Clarke; Gurwhal, Falconer. SIKKIM, alt. 10,000-14,000 ft.; Lachen, Tungu, J. D. H.

Pubescent. Radical leaves long-petioled, ovate, dentate-crenate. Style exceedingly short. Seeds ellipsoid, longitudinally striated by 10-12 rows of tubercles.—This species will perhaps be merged in the preceding when more material accumulates.

SECT. IV. **Microphylla.** Flowers solitary, yellow or white, on leafless peduncles, $\frac{1}{8}$ -2 in. high.—Tufts dense formed by the stems 1-3 in. long, branching and crowded, covered upwards with densely whorled undivided small obtuse leaves about $\frac{1}{4}$ in. long.

18. ***S. imbricata***, Royle Ill. 226, t. 49; uppermost leaves with a perforated whitened pit at their apex, flowers sessile, sepals ovate obtuse glabrous or slightly ciliate pubescent. H. f. & T. in Journ. Linn. Soc. ii. 62; Engler *Monogr. Saxifrag.* 264.

ALPINE HIMALAYA, from SIKKIM to KASHMIR, alt 12,000-17,000 ft., Royle, Jacquemont, J. D. H., &c.

Leaves $\frac{1}{8}$ - $\frac{1}{4}$ in., obovate-elliptic, glabrous or a little ciliate, hardly glandular. Petals narrow, twice the sepals, deciduous; white (C. B. Clarke noted in the field, also Jacquemont and Jaeschke); yellow in the figure of Royle. Fruit less than $\frac{1}{4}$ in. long.—All the examples now referred surely to *S. imbricata* at Kew exhibit some perforated leaves; var. γ . and δ . of H. f. & T. (in Journ. Linn. Soc. ii. 62) must be referred elsewhere.

19. ***S. hemisphærica***, H. f. & T. in Journ. Linn. Soc. ii. 62; uppermost leaves with a broad scarioso lacinated margin, flowers subsessile, sepals ovate obtuse erect in fruit slightly pubescent. Engler *Monog. Saxifrag.* 212.

SIKKIM, alt. 17,000-18,000 ft., Mt. Donkiah, J. D. H.

Lower leaves $\frac{1}{4}$ in., oblong, entire, glabrescent, upper shorter, ciliate. Petals 0 in the fruiting specimens alone collected by Sir J. D. Hooker, probably deciduous as in *S. imbricata*. Fruit less than $\frac{1}{4}$ in. long.

20. **S. perpusilla**, *H. f. & T. in Journ. Linn. Soc.* ii. 72; flowers yellow on glandular peduncles $\frac{1}{4}$ – $\frac{3}{4}$ in. high, uppermost leaves about $\frac{1}{2}$ in. obovate-oblong concave white ciliate on edges otherwise glabrous, sepals ciliate erect in fruit. *Engler Monog. Saxifrag.* 210.

SIKKIM, alt. 16,000–17,000 ft.; Mt. Donkiah, *J. D. H.*

Stems scarcely an inch long. Petals golden, twice the sepals, oblong, persistent. Styles very short. Fruit ovate, subquadrate, shorter than the petals.—The tufts are small, the leaves and sepals very small.

21. **S. microphylla**, *Royle in Herb. Bth. ex H. f. & T. in Journ. Linn. Soc.* ii. 72; peduncles puberulous about $\frac{1}{4}$ in., leaves oblong glabrous, sepals much adnate below erect in fruit, petals 0 or oblong coriaceous equal to the sepals (green-white?). *Engler Monog. Saxifrag.* 210.

WESTERN HIMALAYA, *Royle*. KUMAON, alt. 14,700 ft.; Barji Kang Pass, *Strachey and Winterbottom*.

Still smaller than *S. perpusilla*, with inconspicuous flowers. Ripe carpels acuminate upwards, sometimes united conically to the top.

22. **S. Jacquemontiana**, *Dene. in Jacq. Voy. Bot.* t. 78; flowers golden subsessile or on a glandular peduncle $\frac{1}{2}$ in. long, uppermost leaves obovate-oblong, sepals broad-elliptic glandular-pubescent patent or finally deflexed. *H. f. & T. in Journ. Linn. Soc.* ii. 71; *Engler Monog. Saxifrag.* 211.

Alpine Himalaya, from SIKKIM to KASHMIR, alt. 13,000–18,000 ft.; *Jacquemont, Edgeworth, J. D. H., &c.*

Lower leaves $\frac{1}{2}$ – $\frac{1}{4}$ in., orbicular or elliptic, glabrescent; upper glandular-pubescent or nearly glabrous. Petals $\frac{1}{4}$ in. long, nearly twice the sepals, elliptic, persistent. Fruit ovate, shorter than the petals. Seeds minute, ellipsoidal, smooth, testa reticulated not tuberculate.

VAR. 2. *β. Stella-aurea*; (sp.) *H. f. & T. in Journ. Linn. Soc.* ii. 72; peduncles $\frac{1}{2}$ –2 in.—from Sikkim to Kashmir, alt. 13,500–17,000 ft.; *J. D. H.*

SECT. V. Flowers yellow, on sparsely leafy peduncles 1–3 in. from tufts formed by weak stems clothed upwards with subrosulate undivided spathulate-oblong small leaves $\frac{1}{4}$ – $\frac{1}{2}$ in. long.

23. **S. ramulosa**, *Wall. in Sternb. Saxifrag. Suppl.* t. 26; peduncles glandular-pubescent 1–2-flowered, upper rosulate leaves glabrous rigid oblong often with 1–5 pits on their front margin, sepals glandular-pubescent in fruit much adnate, lobes triangular suberect. *Wall. Cat.* 446; *DC. Prodr.* iv. 21; *Royle Ill.* t. 49 (*bad*); *H. f. & T. in Journ. Linn. Soc.* ii. 62; *Engler Monog. Saxifrag.* 268. *S. glandulifera*, *Jacquem. Journ.*

Central and Western HIMALAYA, from NIPAL to KASHMIR, alt. 8500–12,000 ft.; *Wallich, Jacquemont, Strachey & Winterbottom, &c.*

Stems 2–6 in. long, branches crowded into tufts; branches barren or producing a flower-stem, terminated by rosulate crowded leaves. Rosulate leaves spathulate-oblong, sometimes very small, sometimes $\frac{1}{2}$ in., margins cartilaginous; leaves on the peduncle linear-spathulate or narrow-oblong. Petals obovate, clawed, much exceeding the sepals. Carpels in fruit narrowed upwards.—A species by the texture and perforations of its leaves allied to *S. imbricata*; which differs by its sessile flowers and its less glandular-pubescent sepals.

24. **S. umbellulata**, *H. f. & T. in Journ. Linn. Soc.* ii. 71; flower-stems 2–3½ in., peduncles 1–5 umbelled very glandular, rosulate leaves narrowly spathulate glabrous or slightly ciliate-pubescent. *Engler Monog. Saxifrag.* 222.

SIKKIM, alt. 12,000–14,000 ft.; Tungu, J. D. H.

Rosulate leaves $\frac{1}{2}$ in., cauline $\frac{1}{4}$ in. long, narrow oblong, very glandular-pubescent. Peduncles $\frac{1}{4}$ – $1\frac{1}{2}$ in. Petals nearly double the sepals, golden.

SECT. VI. **Spinulosæ.** Flowers yellow, peduncled, solitary or few. Stems elongate, 2–8 in. long, uniformly leafy; i.e. no whorled leaves either at the base or summit. Leaves $\frac{1}{4}$ – $\frac{3}{4}$ in. long, acute, rigid, often spinulose.

25. **S. brachypoda**, Don in Trans. Linn. Soc. xiii. 378; stem simple 1-flowered glabrous below often bearing bulbils in the upper axils, peduncle glandular-scabrous rarely glabrate, leaves linear-lanceolate shining half stem-clasping glabrous or shortly spinulose on the margin. Don Prodr. 209; Sternb. Saxifrag. Suppl. t. 24; DC. Prodr. iv. 46; H. f. & T. in Journ. Linn. Soc. ii. 66; Engler Monog. Saxifrag. 218. S. glandulosa, Wall. Cat. 442; DC. Prodr. iv. 45.

ALPINE HIMALAYA, from BHOTAN to KUMAON, alt. 9000–13,000 ft., common.

Leaves about $\frac{3}{8}$ in., densely imbricate, ascending or reflexed. Sepals ovate, acute, little pubescent, suberect in fruit. Petals broad, golden, much exceeding the sepals. Styles not much shorter than the ripe carpels. Seeds ellipsoid, subtrigonus, smooth.

26. **S. fimbriata**, Wall. in DC. Prodr. iv. 45; stem simple 1- rarely 2-3-flowered glabrous or sparsely ciliate below often bearing bulbils in the upper axils, peduncle glandular-scabrous, leaves lanceolate shining cordate at base but not stem-clasping, margins prominently spinulose. Wall. Cat. 443; H. f. & T. in Journ. Linn. Soc. ii. 67; Engler Monog. Saxifrag. 218. S. Wallichiana, Sternb. Saxifrag. Suppl. t. 22.

Alpine Himalaya, from SIKKIM to KUMAON, alt. 11,000–14,000 ft.; Wallich, J. D. H., Strachey & Winterbottom.

Leaves about $\frac{3}{8}$ in., densely imbricate, ascending or reflexed. Sepals ovate, obtuse, very glandular-pubescent, suberect in fruit. Petals broad, golden, much exceeding the sepals. Styles not much shorter than the carpels in fruit.—This hardly differs from *S. brachypoda*.

27. **S. filcaulis**, Wall. in Sternb. Saxifrag. Suppl. t. 23; stems glandular-pilose much branched, branches 1-flowered, leaves $\frac{1}{4}$ – $\frac{3}{4}$ in. linear-oblong minutely denticulate. Wall. Cat. 445; DC. Prodr. iv. 46; H. f. & T. in Journ. Linn. Soc. ii. 66; Engler Monog. Saxifrag. 221.

Alpine Western Himalaya, GURWHAL and KUMAON, alt. 10,000–11,500 ft.; Wallich, Falconer, Edgeworth, T. Thomson, &c.

Bulbiferous sometimes in the upper axils. Sepals small, ovate, glandular-pilose, erect in fruit. Petals golden, more than twice the sepals. Styles in fruit little shorter than the carpels.

28. **S. hispidula**, Don in Trans. Linn. Soc. xiii. 380; stems hispid glandular simple 1–3-flowered, leaves $\frac{1}{4}$ – $\frac{1}{2}$ in. long oblong-lanceolate acute entire or often 1–3-toothed hispid on both surfaces. Don Prodr. 210; DC. Prodr. iv. 46; H. f. & T. in Journ. Linn. Soc. ii. 67; Engler Monog. Saxifrag. 222. S. evoluloides, Wall. Cat. 447; DC. Prodr. iv. 46; Sternb. Saxifrag. Suppl. t. 23.

Alpine Himalaya, from BHOTAN to NIPAL, alt. 13–15,000 ft. NIPAL, Gossain Than, Wallich; BHOTAN, Griffith; SIKKIM, Kankola, J. D. H., Jongri, C. B. Clarke.

Rarely bulbiferous in the upper axils. Sepals narrow, ovate, hispid-glandular, erect in fruit. Petals golden, obovate, near twice the sepals. Styles short. Seeds ellipsoid, subtrigonus, smooth.

SECT. VII. **Flagellares.** *Flowers* yellow, on leafy stems 2-8 in high rising from a basal tuft of rosulate leaves; from this tuft spread horizontally leafless thread-like surculi which terminate in rooting buds. *Stem leaves* entire, narrow.

29. **S. Brunoniana**, Wall. in *Sternb. Saxifrag. Suppl.* t. 23; stems corymbosely 1-10-flowered, pedicels long often 1-2 in., leaves linear acute shining, margins spinulose. *Engler Monog. Saxifrag.* 223. *S. Brunonis*, Wall. *Cat.* 444; *DC. Prodr.* iv. 45; *H. f. & T. in Journ. Linn. Soc.* ii. 66.

Temperate Himalaya, from SIKKIM to KASHMIR, alt. 16,000 ft.; Wallich, Jacquemont, T. Thomson, J. D. H., &c.

Glabrous; 2-8 in. high. Rosulate leaves $\frac{1}{4}$ - $\frac{3}{4}$ in.; cauline usually small. *Sepals* elliptic-oblong, small, patent in fruit. *Petals* 3 or 4 times the length of the sepals, oblong-elliptic. *Styles* short. *Seed* ellipsoid, smooth, most minutely papillose.

30. **S. pilifera**, *H. f. & T. in Journ. Linn. Soc.* ii. 66; stems corymbosely 1-4-flowered, pedicels short about $\frac{1}{4}$ in., leaves hardly $\frac{1}{8}$ in. spatulate-linear or oblong, margins not spinulose, petals equalling the sepals. *Engler Monog. Saxifrag.* 223.

SIKKIM, alt. 14-15,000 ft., J. D. H.

Stems 1-3 in. high, pubescent. Leaves $\frac{1}{4}$ - $\frac{1}{2}$ in., cauline pubescent, rosulate, nearly glabrous. *Sepals* much adnate in fruit into a campanulate tube; lobes obtuse, erect. *Styles* short. *Ripe carpels* very small.

31. **S. flagellaris**, Willd. in *Sternb. Saxifrag.* t. 6; stems 2-8 in high corymbosely 1-10-flowered, pedicels 0-2 in., cauline leaves linear-lanceolate pubescent ciliate or subspinulose, petals golden much exceeding the sepals sometimes $\frac{1}{2}$ in. long. *Don in Trans. Linn. Soc.* xiii. 373; *DC. Prodr.* iv. 45; *Ledeb. Ic. Fl. Ross.* t. 321; *H. f. & T. in Journ. Linn. Soc.* ii. 65; *Boiss. Fl. Orient.* ii. 809; *Engler Monog. Saxifrag.* 223. *S. myosotifolia*, Pall. ex *Don in Trans. Linn. Soc.* xiii. 373; *DC. Prodr.* iv. 45. *S. stenophylla*, Royle *Ill.* t. 50; *H. f. & T. in Journ. Linn. Soc.* ii. 65. *S. Hoffmeisteri*, Klotzsch in *Reis. Pr. Waldem. Bot.* t. 41. *S. aurea* and *S. radicans*, Jacq. *Voy. Bot.*; with some others; but *S. aspera*, Willd., sometimes quoted here, does not belong.

Alpine Himalaya, from KASHMIR and KUMAON, alt. 13,500-17,000 ft., common, to SIKKIM, alt. 18,000 ft., Lama Kongra, J. D. H.—DISTRIB. North Asia, Arctic regions and Rocky Mountains.

Stems pubescent upwards. *Sepals* oblong, pubescent, slightly adnate and erect in fruit. *Petals* often with red lines (not dots) near the base. *Styles* short. *Seeds* ellipsoid, smooth, testa reticulate and microscopically punctulate.—This species is called polymorphic, but without very good reason, the following three varieties being distinguished by trivial characters only, and running into each other. The Rocky Mountain var. *setigera* (sp. of Pursh) is more remote by the calyx much adnate to the fruit.

VAR. 1. *typica*; leaves pubescent, margins a little ciliate.

VAR. 2. *mucronulata* (Royle sp.); leaf margins more ciliate or glistening and subspinulose.

VAR. 3. *stenophylla* (Royle sp.); lower leaves and stem less pubescent or nearly glabrous.

SECT. VIII. **Porphyriorum.** *Leaves* sub-opposite, small, often with a pore at the apex. *Flowers* solitary, red or purple.

32. **S. oppositifolia**, Linn.; *DC. Prodr.* iv. 17; rosulate leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. obovate glabrous or the upper ciliate, no disc surrounding the carpels. *Engl.*

Bot. t. 9; *Don in Trans. Linn. Soc.* xiii. 400; *H. f. & T. in Journ. Linn. Soc.* ii. 62; *Engler Monog. Saxifrag.* 276.

WESTERN TIBET, alt. 15–17,000 ft.; Sassar, *T. Thomson*.—DISTRIB. Alps of Europe and Asia, Arctic Regions.

Stems 1–2 in. long, much branched and crowded, forming dense tufts. *Leaves* densely crowded, *Flowering* stems from the ends of the branches, $\frac{1}{2}$ –2 in. long, with decussate opposite (or altogether alternate) leaves. *Sepals* ovate-oblong, nearly glabrous, erect in fruit, adnate to the ovary at the base. *Petals* $\frac{3}{8}$ in. long, obovate-oblong, twice the sepals. *Seeds* ellipsoid, rugulose, minutely papillose.—In *Dr. Thomson's* specimens some flowers have 3 carpels.

SECT. IX. **Bergenia**. *Rootstock* stout. *Leaves* ample, undivided, with a large sheath at the base of the petiole. *Scape* corymbose, 6–18 in. high. *Petals* white or red. *Calyx*-lobes erect in fruit. *Seeds* much larger than in other sections, elongate, subpyramidal, smooth.

33. **S. ligulata**, *Wall. in Asiat. Research.* xiii. 398, with a figure; leaves orbicular or obovate quite entire ciliate, base cordate, pedicels and calyx glabrous, calyx-teeth ovate not narrowed at base, fruit-pedicels cernuous. *Wall. Cat.* 449; *Don in Trans. Linn. Soc.* xiii. 348; *Hook. Exot. Flora*, i. t. 49 (excellent); *Hook. Bot. Mag.* t. 3406 (the sepals too acute, and the leaves too undulate); *DC. Prodr.* iv. 38; *H. f. & T. in Journ. Linn. Soc.* ii. 60.

Temperate HIMALAYA, from BHOTAN to KASHMIR, alt. 7–10,000 ft., common. Khasia Mts., alt. 4000 ft.

Leaves a foot in diam. in Khasia; smaller in Bhotan until 2 in. diam. in Kumaon; glabrous on both surfaces, dotted on the lower. *Petals* $\frac{1}{2}$ –1 in. long, white or rose or purplish, orbicular with a claw of variable length. *Fruit* subglobose. *Styles* very long. *Carpels* sometimes 3.

VAR. 2. *ciliata*; *Royle Ill.* t. 49 (*sp.*); *Hook. Bot. Mag.* t. 4915; *H. f. & T. in Journ. Linn. Soc.* ii. 60; leaves hirsute on both surfaces.—Nipal and Kumaon, alt. 6–8000 ft.; *Royle, T. Thomson, Edgeworth, Strachey and Winterbottom*.

34. **S. Stracheyi**, *H. f. & T. in Journ. Linn. Soc.* ii. 61; leaves obovate scarcely cordate at base, pedicels and calyx pubescent or puberulous, calyx-teeth oblong, often wider above their base, fruit-pedicels generally erect. ? *S. ligulata*, var. γ , *H. f. & T. in Journ. Linn. Soc.* ii. 61; *Lindl. in Bot. Reg.* 1843, t. 65.

KUMAON and KASHMIR, alt. 8000–14,000 ft., common.

Leaves glabrous on both surfaces margin either subentire ciliate, or crenate-serrate. *Petals* white or rose, or (according to a field note of *Dr. Thomson's*) yellow. *Fruit* ovate-lanceolate. *Styles* long.

35. **S. purpurascens**, *H. f. & T. in Journ. Linn. Soc.* ii. 61; leaves glabrous obovate entire, margins undulate, pedicels very pubescent, flowers nodding, calyx-lobes very obtuse. *Hook. Bot. Mag.* t. 5066.

SIKKIM, alt. 10–15,000 ft.; Lachen, *J. D. H.*; Yakla Pass, *C. B. Clarke*.

Leaves 2–3 in. diam., punctate beneath. *Petals* $\frac{3}{4}$ in. long, obovate-oblong. *Styles* long. *Carpels* elliptic-lanceolate. *Fruit* erect.

DOUBTFUL SPECIES.

SAXIFRAGA from Karnag in Tibet, stated to be near *S. diapiensoides* by *Kurz* (*Flora*, 1872, 286) is quite unknown to me. It is not described.

3. **VAHLIA**, Thunb.

Annual or biennial herbs. *Leaves* opposite, entire; stipules 0. *Flowers* axillary, usually geminate, subsessile or pedicelled. *Calyx-tube* entirely adherent to the ovary; lobes 5, valvate, persistent in fruit. *Petals* 5, epigynous. *Stamens* 5, epigynous. *Ovary* inferior, 1-celled, with 2 pendulous many-ovuled placentas; styles 2, stigma capitellate. *Capsule* dehiscing at the apex between the styles. *Seeds* numerous, minute, ellipsoid, smooth.—**DISTRIB.** Species 3; in tropical and subtropical Asia, and in tropical and South Africa.

1. **V. viscosa**, Roxb. *Fl. Ind.* ii. 89; flowers subsessile geminate or solitary in nearly all the upper axils, filaments with a minute hairy scale at the base. *W. & A. Prodr.* 364; *Wight Ic.* t. 563; *H. f. & T. in Journ. Linn. Soc.* ii. 74; *Dalz. & Gibs. Bomb. Fl.* 90; *Oliv. Fl. Trop. Afr.* ii. 383. *V. sessiliflora*, Wall. *Cat.* 7188; *DC. Prodr.* iv. 54. *V. Weldenii*, Reich. *Hort. Bot.* t. 91; *DC. Prodr.* iv. 53. *Bistella geminiflora*, Delile *Centurie Pl. d'Afric.* No. 91, with a figure. *Oldenlandia digyna*, Retz *Obs.* iv. 23.

Dry places of INDIA, from CEYLON to BUNDELKUND and the PUNJAB, frequent.—**DISTRIB.** Persia, Egypt, tropical Africa.

Glandular-pubescent. *Stem* 6–12 in. high, erect or diffuse, branched. *Leaves* $\frac{1}{2}$ –1 in. long, subsessile, oblong, narrowed at both ends, ovate or lanceolate. *Petals* about $\frac{1}{8}$ in. long, white (ex Roxb. yellow), obovate. *Stamens* and *styles* about $\frac{1}{8}$ in. long in the Indian specimens, these parts much larger and the filaments pubescent in the African var. *Weldenii*. *Capsule* about $\frac{1}{8}$ in. diam., subglobose.—This and the succeeding species when in fruit must be carefully distinguished from *Oldenlandia* which has the capsule completely 2-celled. The leaves of *Vahlia* have often a connecting line as if falsely stipulate. *Mitreola* which differs by its single style is also mixed with *Vahlia* in Herbaria.

2. **V. oldenlandioides**, Roxb. *Fl. Ind.* ii. 89; peduncles $\frac{1}{8}$ – $\frac{1}{4}$ in. long from nearly all the upper axils mostly 2-flowered, filaments naked at the base. *W. & A. Prodr.* 364; *Wight Ill.* t. 115; *Ic.* t. 562; *H. f. & T. in Journ. Linn. Soc.* ii. 74; *Oliv. Fl. Trop. Afr.* ii. 384. *V. Oldenlandiæ*, DC. *Prodr.* iv. 54; *Wall. Cat.* 7187. *V. silenoides*, DC. *Prodr.* iv. 54.

Tropical dry portion of the Western Peninsula and CEYLON; *Shuter*, *Perottet*, *Roxburgh*, *Wight*, &c.—**DISTRIB.** Tropical Africa.

Glandular-pubescent upwards. *Stem* 3–12 in. high, erect or diffuse, branched. *Leaves* $\frac{1}{2}$ –2 in. long, subsessile, linear or linear-ovate. *Calyx-lobes* not exceeding the tube. *Petals* about $\frac{1}{8}$ in. long, white, obovate. *Capsule* about $\frac{1}{8}$ in. diam., subglobose.

4. **TIARELLA**, Linn.

Slender erect herbs; root perennial. *Leaves* alternate; radical long-petioled with large stipules adnate to base of petiole; stipules of upper leaves small. *Raceme* terminal, subbracteate. *Calyx* shortly adnate to the ovary; lobes 5, valvate. *Petals* 5, white, or 0. *Stamens* 10, the 5 alternate with sepals sometimes without anthers. *Ovary* 1-celled of 2 carpels ending in two styles; ovules numerous, attached to two nearly basal placentas. *Ripe carpels* very unequal, diverging at top, and dehiscing ventrally. *Seeds* 6–16, near the base of the fruit, ellipsoid, smooth.—**DISTRIB.** Species 5, one Himalayan and Japanese; the other 4 North American.

1. **T. polyphylla**, Don *Prodr.* 210; stem-leaves several all petioled cordate-ovate subpentagonal crenate-serrate, petals small linear or 0, fruit cernuous

glabrous. *Wall. Cat.* 437; *DC. Prodr.* iv. 50; *H. f. & T. in Journ. Linn. Soc.* ii. 74.

Temperate Central and Eastern Himalaya; from BHOTAN to NIPAL, alt. 8–11,000 ft.; *Wallich, Griffith, J. D. H., &c.*—DISTRIB. Japan.

Stem 6–18 in. high, pubescent. *Leaves* pilose on both surfaces, lower long-petioled, blade 1–3 in. diam. *Sepals* $\frac{1}{2}$ in. long, whitish, glandular. *Petals* when present shorter than the sepals. *Ripe carpels* one $\frac{1}{4}$ in. long, the other $\frac{1}{2}$ in.

5. **CHRYSOSPLENIUM**, *Linn*

Weak, succulent herbs, growing in damp or watery places. *Leaves* undivided, petioled; stipules 0. *Flowers* axillary and terminal, short-pedicelled, small, green or yellow, 4-merous in the Indian species, rarely 5-merous. *Calyx-tube* adnate to the ovary; lobes 4, imbricate. *Petals* 0. *Stamens* 8 (or 4), subepigynous. *Ovary* 1-celled. 2-lobed above; styles short; ovules numerous, attached to parietal placentæ alternating with the stigmas. *Capsule* half-superior, dehiscent at top crosswise. *Seeds* small, ellipsoid.—DISTRIB. Species 22; North Europe, Asia (South to the Himalaya) and America; in the Andes to Magellan's Straits.

* *Leaves opposite.*

1. **C. nepalense**, *Don Prodr.* 210; glabrous, branched, or in water tufted, leaves ovate or subcordate obtuse crenate, flowers subsessile, seeds smooth shining chestnut-brown. *Wall. Cat.* 438; *DC. Prodr.* iv. 48; *H. f. & T. in Journ. Linn. Soc.* ii. 72; *Maxim. in Bull. Acad. Petersb. Mel. Biol.* ix. 766.

Temperate Himalaya; from BHOTAN to KUMAON, alt. 7000–10,000 ft., frequent.

A decumbent, weak species, with branches 6–8 in. long, closely resembling *C. oppositifolium*, L., which only differs in having its leaves entire or obsoletely crenate.

Maximowicz (in Bull. Acad. Petersb. Mel. Biol. ix. 767) has founded a new Himalayan species *C. sulcatum*, *Maxim.* on *Wall. Cat.* 438; which differs from *C. nepalense* in having the seeds profoundly 12-sulcate; but the examples of *Wall. Cat.* 438 at Kew exhibit the smooth seeds of *C. nepalense*.

2. **C. trichospermum**, *Edgew. MSS.*; *H. f. & T. in Journ. Linn. Soc.* ii. 73; glabrous, branched, leaves ovate or elliptic obtuse crenate, flowers shortly pedicelled, seeds globose shining chestnut-brown covered with golden 1-celled linear papillæ. *Maxim. in Bull. Acad. Petersb. Mel. Biol.* ix. 767.

Temperate Western HIMALAYA, alt. 7–8000 ft.; *Edgeworth, Madden*; *Dwali*, alt. 8000 ft., in KUMAON, *Strach. & Winterbottom*.

A rather stouter plant than *C. nepalense*, the leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. diam.

** *Leaves alternate*; plant glabrous.

3. **C. alternifolium**, *Linn.*; *DC. Prodr.* iv. 48; stem weak succulent suberect 2–8 in. long, leafless (or 1-leaved) except at the base and the summit, radical leaves long-petioled suborbicular crenate-lobed, flowers subsessile. *Engl. Bot. t.* 54; *H. f. & T. in Journ. Linn. Soc.* ii. 73; *Boiss. Fl. Orient.* ii. 813; *Maxim. in Bull. Acad. Petersb. Mel. Biol.* ix. 760.

SIKKIM, alt. 12,000–15,000 ft.; *Kankola, J. D. H.*—DISTRIB. Alpine and Arctic Europe, Asia and N. America.

Leaves $\frac{1}{4}$ – $\frac{3}{4}$ in. diam., oval or cordate, rounded at the top, floral leaves golden yellow. *Seeds* shining, smooth.

4. **C. carnosum**, *H. f. & T. in Journ. Linn. Soc.* ii. 73; tufted, stems 2–4 in. high erect thick leafy, radical leaves represented by short sheathing

scales, flowers sessile. *C. carnosulum*, Maxim. in Bull. Acad. Petersb., Mel. Biol. ix. 757.

SIKKIM HIMALAYA, alt. 14–15,000 ft., Yeumtong and Kankola 'near the perpetual snow,' J. D. H.

Leaves about $\frac{1}{4}$ in. diam., glossy, very deep green, elliptic, obtuse, crenate-dentate. Flowers lurid. Calyx segments purple.—This may prove only an extreme form of *C. alternifolium*.

5. **C. Griffithii**, H. f. & T. in Journ. Linn. Soc. ii. 74; stems 4–8 in. high suberect, leafy at the summit, radical leaves represented by short sheathing scales, leaves reniform-cordate deeply crenate-lobate, flowers pedicelled. Maxim. in Bull. Acad. Petersb., Mel. Biol. ix. 759.

BHOTAN; Griffith.

Leaves $\frac{1}{2}$ –1 in. broad; lobes 6–16, very obtuse, often $\frac{1}{4}$ in. deep.—Very near *C. nudicaule*, Bunge.

6. **C. tenellum**, H. f. & T. in Journ. Linn. Soc. ii. 73; stems filiform procumbent interlacing leafy, leaves reniform cordate crenate-lobate, flowers scattered pedicelled, seeds smooth shining. Maxim. in Bull. Acad. Petersb., Mel. Biol. ix. 762.

Temperate Western HIMALAYA; Kedarkanta in GURWHAL, Royle; Madhari Pass, in KUMAON, alt. 10,000 ft., Strachey & Winterbottom.

Stems 1–3 in. long. Leaves $\frac{3}{8}$ in. broad, with 4–8 shallow lobes; radical long-petioled.

*** Leaves alternate; plant pubescent.

7. **C. lanuginosum**, H. f. & T. in Journ. Linn. Soc. ii. 74; stem 3–8 in. high erect leafy, corymb loose terminal sparingly leafy, leaves 1–2 in. long elliptic slightly crenate. *C. adoxoides*, Maxim. in Bull. Acad. Petersb., Mel. Biol. ix. 760. Saxifraga adoxioides, Griff. Ic. Pl. Asiat. t. 570.

Eastern Himalaya; BHOTAN, alt. 7500–8000 ft., Griffith. SIKKIM, alt. 7–9000 ft., T. Anderson, C. B. Clarke.

Whole plant pubescent and with brown-red wool. Corymb, when well developed, 2–3 in. across, with leaf-like bracts at a few of the divisions.—Sometimes stunted and more compact.

6. **PARNASSIA**, Linn.

Glabrous perennial scapigerous herbs. Scape angular, 1-flowered; often bearing one leaf in the middle, more rarely naked or with several leaves. Leaves entire, radical long-petioled. Calyx-tube free or adnate to the ovary, the lobes 5, imbricate. Petals 5, white or pale yellow. Stamens 5, perigynous or nearly hypogynous, alternate with 5 large staminodes. Ovary 1-celled; style short with 3–4 (or 5) nearly simple stigmas; ovules numerous attached to the parietal placenta opposite the stigmas. Capsule superior or half-inferior, loculicidally 3–4-valved. Seeds many, obovoid or subcylindric, smooth, testa sometimes lax; albumen hardly any; (in which point *Parnassia* differs from the character of the order Saxifragaceæ and is therefore placed by some authors elsewhere).—DISTRIB. Northern temperate hemisphere, extending south to the mountains of the Indian Peninsula. Species 12.

SECT. I. **Nectarodrosen**. Staminodes ending in numerous long gland-bearing processes. Petals entire.

1. **P. palustris**, Linn.; DC. Prodr. i. 320; leaves cordate at the base, cauline usually solitary, processes of the staminodes 7–21. Eng. Bot. t. 82; Bois. Fl. Orient. ii. 814; Drude in Linnaea, xxxix. 307.

WESTERN TIBET, *Falconer*; Skardo in BALTIKISTAN, alt. 7500 ft. *T. Thomson*, *C. B. Clarke*.—DISTRIB. Subalpine and subarctic regions.

Petals ovate-elliptic with a broad claw. *Stamens* nearly hypogynous. *Carpels* 4. *Capsule* superior or nearly so, oblong-elliptic, much longer than the sepals. *Seeds* cylindric; testa loosely reticulate.

SECT. II. **Fimbripetalum.** *Staminodes* ending in several long gland-bearing processes. *Petals* fimbriate.

2. **P. foliosa**, *H. f. & T. in Journ. Linn. Soc.* ii. 79; stem with 4–8 leaves, staminodes ending in 3 long processes each tipped with a distinctly clubbed gland. *P. foliosa* and *P. Nummularia*, *Drude in Linnæa*, xxxix. 313.

KHASIA MTS., alt. 5000–6000 ft., Moflong to Syung and at Nonkrem, *J. D. H.* and *T. Thomson*.—DISTRIB. West China and Japan.

Stem 8–12 in. high. *Radical leaves* orbicular, deeply cordate. *Sepals* patent or reflexed. *Petals* ovate above a short claw, fimbriated around their whole edge. *Carpels* 4. *Capsule* superior or nearly so, long-ellipsoid, much longer than the sepals.

Drude states he had no specimen of *P. foliosa*. *Kew* possesses both *P. foliolosa* collected by *H. f. & T.*, and *P. Nummularia* collected by *Maximowicz*; the two are identical.

SECT. III. **Nectarotrilobos.** *Staminodes* at the vertex 3- (rarely 5-) lobed, the lobes short or cylindric, not linear. *Stem* 1- (or 0-) leaved.

* *Capsule* triquetrous, superior or nearly so.

3. **P. Wightiana**, *Wall. in W. & A. Prodr.* 35; petals obovate-oblong margins much fimbriate, staminodes 3–5-lobed, lobes cylindric (or in the Nilghiri plant) thickened at the top, capsule 3-celled superior, obcordate. *Wall. Cat.* 3755; *Wight. Ill.* t. 21; *Ic.* t. 945; *Arn. in Hook. Comp. Bot. Mag.* ii. 315; *H. f. & T. in Journ. Linn. Soc.* ii. 80; *Drude in Linnæa*, xxxix. 314. *P. ornata*, *Wall. Cat.* 1247; *Arn. in Hook. Comp. Bot. Mag.* ii. 315. *P. Schmidii*, *Zenker Pl. Ind.* t. 5.

NILGHIRI MTS., alt. 7000 ft. KHASIA MTS., alt. 4500–6000 ft. 'HIMALAYA,' Wallich. KUMAON, sive *H. f. & T. in Journ. Linn. Soc.* ii. 80.—DISTRIB. Yunnan and interior of China.

Stem 8–18 in. high. *Leaves* often $1\frac{1}{2}$ in., reniform or oval, deeply cordate. *Petals* (at least in the Khasia plant) light yellow. *Placentæ* near the base of the capsule. *Seeds* ellipsoid; testa reticulate, not very lax.

4. **P. mysorensis**, *Heyne in W. & A. Prodr.* 35; petals obovate-oblong, margins not or obscurely fimbriate, staminodes 3-lobed, lobes cylindric or dilated upwards, capsule 3-celled superior obcordate. *Wall. Cat.* 3754; *Wight Ill.* t. 21; *Arn. in Hook. Comp. Bot. Mag.* ii. 315; *H. f. & T. in Journ. Linn. Soc.* ii. 80; *Drude in Linnæa*, xxxix. 317.

Eastern Himalaya; SIKKIM, alt. 8000–12,000 ft.; Lachen and Yeumtong, *J. D. H.* Mts. of the Western Peninsula. KHASIA MTS. alt. 3500–5500 ft.

Stem 3–8 in. high. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., reniform, deeply cordate. *Petals* small, white. *Seeds* small, ellipsoid; testa somewhat laxly reticulate.

** *Capsule* half-inferior.

5. **P. nubicola**, *Wall. in Wight Ill.* t. 21; margins of petals not (or slightly) fimbriate, staminodes broadly dilated upwards 3-lobed, capsule $\frac{1}{2}$ in. long obconic below subhemispheric above, style very short or 0. *Wall. Cat.* 1246; *Arn. in Comp. Hook. Bot. Mag.* ii. 315; *H. f. & T. in Journ. Linn. Soc.* ii. 81; *Drude in Linnæa*, xxxix. 315.

Temperate and Alpine Himalaya from SIKKIM to KASHMIR, alt. 6000–12,000 ft., frequent.

Stem 4–18 in. high, subulate with 4–5 ridges under the fruit. *Leaves* 1–2 (sometimes 3) in., ovate or cordate, oblong. *Petals* $\frac{1}{2}$ in. long, white, obovate. *Carpels* and stigmas 3; (Drude says 4 but they are nearly invariably 3 in the Kew plentiful examples). *Seeds* obovoid-ellipsoid, smooth; testa reticulate, not lax.

6. **P. ovata**, Ledeb. in *Mem. Acad. Petersb.* v. 528; margins of petals not (or slightly) fimbriate, staminodes broadly dilated upwards 3-lobed, capsule $\frac{1}{4}$ – $\frac{3}{8}$ in. long obconic below subhemispheric above, style manifest $\frac{1}{32}$ in. long. *DC. Prodr.* i. 320; *Ledeb. Ic. Fl. Ross.* t. 242; *Fl. Ross.* i. 263; *H. f. & T. in Journ. Linn. Soc.* ii. 82; *Drude in Linnæa*, xxxix. 320. *P. Turczaninowii*, *Ledeb. Fl. Ross.* i. 263; *Drude, l. c.* 321. *P. affinis*, *H. f. & T. l. c.* ii. 81; *Drude, l. c.* 317. *P. Laxmanni*, *Pall. in Roem. & Sch. Syst.* vi. 696; *Ledeb. Fl. Ross.* i. 264. *P. trinervis*, *Drude, l. c.* 322.

Temperate and Alpine Himalaya from SIKKIM to KASHMIR, alt. 8000–15,000 ft., frequent.—DISTRIB. Altai Mts.

Stem 3–8 in. high. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., ovate or ovate-oblong, often cordate; cauline usually solitary in the lower half of the stem. *Petals* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, spathulate-obovate. *Carpels* 3, rarely 4. Testa of the seed close (Drude).—This differs from *P. nubicola* by the smaller size of all its parts and the manifest style. *P. cabulica*, Planch in *Herb. Griffith*, differs by the stems being usually leafless. *P. subacaulis*, Kar. & Kir. differs by the leaves being oblong narrowed at their base; it was collected by Dr. Henderson near Yarkand, and appears in his list No. 136 under the name *P. maisorensis*.

7. **P. pusilla**, Wall. ex *H. f. & T. in Journ. Linn. Soc.* ii. 81; margins of petals slightly fimbriate or quite entire, staminodes with a very short claw hardly longer than broad dilated upwards 3-lobed, capsule $\frac{1}{4}$ in. long obovoid-ellipsoid adnate about $\frac{1}{3}$ its length, style manifest $\frac{1}{32}$ in. long. *Wall. Cat.* 1245; *Arn. in Wight. Ill.* p. 45 and in *Comp. Hook. Bot. Mag.* ii. 315; *Drude in Linnæa*, ix. 318.

ALPINE HIMALAYA from SIKKIM to KUNAWUR, alt. 12–15,000 ft., Wallich, J. D. H., Munro, &c.

Stem 1–2 $\frac{1}{2}$ in. long. *Leaves* $\frac{1}{4}$ – $\frac{3}{8}$ in., reniform or ovate-cordate; cauline leaf usually one, often in the upper half of the stem. *Petals* $\frac{1}{4}$ – $\frac{3}{8}$ in. long, obovate. *Carpels* 3. *Seeds* ellipsoid, smooth; testa reticulate not lax.—This species should probably be estimated an alpine var. of *P. ovata*, from which it differs in its stunted size and shorter staminodes.

SECT. IV. **Saxifragastrum.** *Staminodes* cylindric, undivided at the vertex.

8. **P. tenella**, *H. f. & T. in Journ. Linn. Soc.* ii. 80; petals $\frac{1}{2}$ in. long green-white reflexed obovate, capsule $\frac{1}{2}$ in. long obcordate triquetrous. *Drude in Linnæa*, xxxix. 323.

SIKKIM HIMALAYA; alt. 10,000–12,000 ft.; Lachen and Lachoong, J. D. H.

Stem 2–5 in. long, weak. Radical *leaves* $\frac{3}{4}$ in. broad, reniform, margin minutely erose; petiole with adnate fimbriate stipules at the base; cauline usually 1, cordate-ovate. *Staminodes* thick, cylindric, glandulose, clavate at its summit. *Styles* 3, short, but manifest. *Seeds* (immature) of the genus.

7. HYDRANGÆA, Linn.

Large shrubs or trees, in their young state often subscandent with smaller leaves. *Corymbs* terminal, with deciduous bracts. *Flowers* all fertile and small, or the exterior flowers of the corymb sterile apetalous with the calyx-lobes petala-

loid and greatly enlarged. *Calyx*-tube adnate to the ovary, limb 4-5-fid. *Petals* 4-5, valvate. *Stamens* 8-10, subepigynous. *Ovary* inferior; styles 2-4; ovules very numerous, axile. *Capsule* 2-4-celled, dehiscing at the apex between the styles. *Seeds* minute, shortly tailed at each end, very numerous.—**DISTRIB.** Species 33 from Java to the Himalaya and Japan (the centre of the genus), Eastern N. America, Western S. America.

The seeds of *Hydrangea* are described by many authors, as by the accurate Maximowicz, as alate. The seed in its inner coat is a perfectly smooth ellipsoid; the outer coat is a loose long cylindric sack, in the middle of which the nucleus lies; as the seed ripens the empty ends of the sack wither and contract whence results a seed 'tailed at each end.'

* *Fruit truncate at top, petals falling off in a cap, styles very generally not always separate.*

1. **H. altissima**, Wall. *Tent. Fl. Nep.* t. 50; leaves glabrous except tufts of brown hairs in the axils of the main nerves beneath which hairs sometimes are continued along the veins also, stamens 10. Wall. *Cat.* 439; DC. *Prodr.* iv. 14; H. f. & T. in *Journ. Linn. Soc.* ii. 75; Brand. *For. Fl.* 211.

Temperate Himalaya from GURWHAL to BHOTAN, alt. 4000-8000 ft. (10,000 ft. in Sikkim, J. D. H.), frequent.

A spreading shrub, 8-15 ft. high, branchlets glabrous. *Leaves* 3-6 in., ovate-lanceolate, sometimes cordate, sometimes narrow-lanceolate; usually finely (sometimes more coarsely) serrate or entire except near the apex; upper petioles often winged and woolly-hairy. *Corymb* pilose. *Flower-buds* conical, acute, but the calyptra-like corolla by the rapid swelling of the stamens becomes hemispheric before falling. *Sepals* of the radiate flowers usually entire; sometimes waved or slightly toothed. *Capsule* subhemispheric, compressed, broader than long.—*H. scandens*, Maxim., which includes several Japanese species, only differs by having 15 stamens and rather larger buds.

** *Fruit truncate at top, petals expanding.*

2. **H. robusta**, H. f. & T. in *Journ. Linn. Soc.* ii. 76; leaves large ovate or cordate at base adpressedly brown-hirsute on the nerves beneath and minutely tessellated with white hairs along the tessellations but not tomentose, styles normally 2. *H. cyanema*, Nutt. in *Bot. Mag.* t. 5038.

Temperate Eastern Himalaya; SIKKIM and BHOTAN, alt. 5000-8000 ft., frequent; Griffith, J. D. H., &c.

A spreading shrub, 8-15 ft. high; branchlets hairy or pubescent. *Leaves* up to 9 in., from narrow oblong to broad cordate, the base never acute, serrate (usually coarsely), upper surface with scattered hairs, and adpressedly brown pilose along the nerves; upper petioles often winged, sometimes incise-serrate and subtruncate. *Corymb* hirsute. *Sepals* of the radiate flowers sharply serrate or crenate or undulate. *Petals* and stamens blue. *Styles* not rarely 3. *Capsules* subhemispheric, compressed, broader than long.

VAR. *Griffithii*; upper leaves narrowed into the petiole, with scattered bristly hairs on the nerves beneath smooth not tessellated between them.—Eastern Bhotan, Griffith.

3. **H. aspera**, Don *Prodr.* 211; leaves long-lanceolate generally narrowed into the petiole, under surface with grey woolly hair, styles normally 3. *H. f. & T.* in *Journ. Linn. Soc.* ii. 75. *H. vestita* var. *fimbriata*, Wall. *Cat.* 440 β; DC. *Prodr.* iv. 14.

Temperate Himalaya, alt. 6000-7000 ft.; SIKKIM, Lachen, J. D. H.; NIPAL, Wallich; KUMAON, Upper Tola, Strachey & Winterbottom.

Arboreous, sometimes 20 ft. high, branchlets pubescent. *Leaves* 6-8 by 2-3 in.,

upper surface with scattered minute hairs, lower microscopically mealy punctate and densely clothed with long white hairs; petiole of the uppermost leaves not at all or but slightly winged. *Corymb* hirsute. *Sepals* of the radiate flowers usually serrate or toothed, sometimes quite entire. *Styles* not rarely 4, rarely 2. *Capsule* hemispheric, obscurely trigonous or subquadrate.

*** *Capsule* crowned with a disc formed by the base of the normally 3 *styles*, *petals* expanding.

4. **H. vestita**, Wall. Tent. Fl. Nep. t. 49; leaves densely pubescent-tomentose beneath, styles short. Wall. Cat. 440 a.; DC. Prodr. iv. 14, excluding var. β .; H. f. & T. in Journ. Linn. Soc. ii. 75; Maxim. in Mem. Acad. Petersb. x. No. 16. p. 10. H. heteromalla, Don Prodr. 211; DC. Prodr. iv. 15. H. Khasiana, H. f. & T. in Journ. Linn. Soc. ii. 75.

Temperate Himalaya from BHOTAN to KUMAON, alt. 8000–10,000 ft.; frequent. KHASIA Mts., alt. 4500–5500 ft.

Arborescent, 15 ft. high; branchlets hairy. Leaves 4–9 in., ovate or oblong, serrate, base sometimes cordate; upper surface with scattered hairs, lower tessellated and densely clothed with white densely papillose hairs. *Corymb* hirsute. *Sepals* of the radiate flowers entire. *Styles* occasionally 4.

5. **H. stylosa**, H. f. & T. in Journ. Linn. Soc. ii. 75; leaves glabrous, nerves beneath pubescent, styles long subulate.

SIKKIM HIMALAYA, alt. 8000 ft., Lachen, J. D. H.

Branches and branchlets puberulous. Leaves 2 in., serrate, elliptic, narrowed at the base. *Corymb* pilose. *Sepals* of the radiate flowers crenate-dentate.

DOUBTFUL SPECIES.

* **H. ANOMALA**, Don Prodr. 211; DC. Prodr. iv. 15; leaves sinuate-crenate nearly glabrous ovate rounded at the base 4 in., radiate flowers 0.—Nipal.—Of this no specimen exists at Kew. Perhaps it is but a synonym of *H. altissima*. H. f. & T. (in Journ. Linn. Soc. ii. p. 76) reduce it to *Dichroa*, but that has not ovate leaves rounded at the base.

8. **PILEOSTEGIA**, H. f. & T.

A glabrous shrub with the habit of *Viburnum* and decussate branches. Leaves coriaceous, petioled, obovate-oblong, entire, persistent. Panicles terminal. Calyx-tube adnate to the ovary; lobes 4 or 5, imbricate. Petals 4 or 5, valvate, falling off in a cap. Stamens 8 or 10, subepigynous. Ovary inferior, 4–6-celled; style thick, surmounted by a thicker truncate pyramid the 4–6 angles of which are stigmatic; ovules numerous, elongate, pendulous. Seeds (immature) numerous, testa an elongate cylindric sack at the apex of which lies the nucleus.

1. **P. viburnoides**, H. f. & T. in Journ. Linn. Soc. ii. 76, t. ii.; Maxim. in Mem. Acad. Petersb. x. No. 16. p. 18.

KHASIA Mts., alt. 3000–5000 ft.; Griffith; T. Lobb; Nunklow, J. D. H. & Thomson.—DISTRIB. Japan, Formosa.

Leaves 3–5 in. Panicle with a few linear-lanceolate bracts $\frac{1}{2}$ in. long. Flowers small; filaments elongate, $\frac{1}{4}$ – $\frac{3}{8}$ in. long.

9. **DICHRŌA**, Lour.

A shrub. *Leaves* opposite, serrate, lanceolate, persistent. *Panicle* terminal. *Calyx*-tube adnate to the ovary; limb 5-6-toothed. *Petals* 5 or 6, thickish, valvate, blue or purplish. *Stamens* 10 or 12, epigynous. *Ovary* $\frac{3}{4}$ -inferior, 1-celled; styles 3-5; ovules numerous, on 3-5 parietal placentæ formed by the inflexed margins of the carpels. *Berry* $\frac{3}{4}$ -inferior, blue. *Seeds* numerous, small, obovoid; testa with large reticulations.

1. **D. febrifuga**, Lour. *Fl. Cochinch.* 301; *Benth. Fl. Hongk.* 128; *Maxim. in Mem. Acad. Petersb.* x. No. 16, p. 2. *D. cyanitis* and *D. latifolia*, *Miq. Fl. Ind. Bat.* i. 721, 722. *Adamia versicolor*, *Fortune in Journ. Hort. Soc.* i. 298; *Lindl. & Pax. Fl. Gard.* i. t. 5. *A. cyanea*, *Wall. Cat.* 441; *Tent. Fl. Nep.* t. 36; *Pl. As. Rar.* t. 213; *Bot. Mag.* t. 3046; *DC. Prodr.* iv. 16; *H. f. & T. in Journ. Linn. Soc.* ii. 76. *A. chinensis*, *Gardn. & Champ. in Kew Journ. Bot.* i. 311. *Cyanitis sylvatica*, *Reinw. in Blume Bijdr.* 921; *DC. Prodr.* iv. 16.

TEMPERATE HIMALAYA from BHOTAN to NIPAL, alt. 5000-8000 ft., abundant. KHASIA MTS., alt. 4000-6000 ft.—DISTRIB. Java, China, Philippines.

Stems 5-9 ft. high, somewhat virgate. *Leaves* 3-8 in., tapering into the petiole, pubescent or puberulous on the nerves, otherwise glabrous, usually narrow, sometimes obovate-lanceolate. *Petals* $\frac{3}{16}$ in. long. *Berry* finally an intense blue.—The Chinese varieties have larger flowers than the Indian.

10. **DEUTZIA**, Thunb.

Shrubs with opposite branches and stellate pubescence. *Leaves* opposite serrate, ovate or lanceolate, deciduous. *Flowers* white, corymbose in the Indian species. *Calyx*-tube adnate to the ovary; teeth 5, small. *Petals* 5. *Stamens* 10, subepigynous, filaments broadly winged the wing often ending upwards in a tooth on each side. *Ovary* inferior, 3-5-celled; styles 3-5, long; ovules numerous, axile. *Capsule* 3-5-celled, hemispheric or ovoid from a rounded base, truncate at the summit, at length septicidal. *Seeds* minute, numerous, obovoid-ellipsoid; testa reticulate, a little longer than the nucleus, appearing at last as a short stalk at its base, as a point at its summit.—DISTRIB. Species 7, Himalaya to North China and Japan; and one outlier in Mexico.

1. **D. corymbosa**, Br. in *Royle Ill.* t. 46; petals obovate imbricate, calyx teeth short triangular, calyx-tube with scattered stellate hairs, corymbs many flowered, *Wall. Cat.* 3652; *H. f. & T. in Journ. Linn. Soc.* ii. 83, *excluding synonyms in Bot. Reg.; Brand. For. Fl.* 212; *Maxim. in Mem. Acad. Petersb.* x. No. 16, p. 32. ? *D. parviflora*, *Bunge Enum. Pl. Chin.*, p. 30; *Maxim. in Mem. Acad. Petersb.* x. No. 16, p. 33, *with figures*. *Philadelphus (Leptospermum) corymbosus*, *Wall. in Herb.*

TEMPERATE HIMALAYA, from KASHMIR to BHOTAN, alt. 6000-10,000 ft., frequent.—DISTRIB. China, Manchuria, Amurland.

Leaves 1-2 in., oblong or elliptic lanceolate; on the under surface the stellate hairs are often few, sometimes thickly scattered, not matted into tomentum in the mature leaves; under surface sometimes prominently reticulate. *Petals* glabrous or stellately pubescent.—Maximowicz l. c. keeps the Chinese *D. parviflora* still distinct by the puberulous smaller petals, the shorter teeth to the wing of the filament, the leaves more prominently reticulate beneath, &c., none of which distinctions appear to hold in the large Kew collection. The name *corymbosa* can only be preferred to *parviflora* if Brown's naming in Wallich's distribution be reckoned publication.

2. **D. staminea**, Br. in Wall. Pl. As. Rar. 82, t. 191; petals oblong induplicate-valvate, corymbs many-flowered, calyx-tube hoary tomentose with stellate hairs, teeth short triangular. Wall. Cat. 3651; Bot. Reg. xxxiii. t. 13; H. f. & T. in Journ. Linn. Soc. ii. 83; Brandis Forest Fl. 212; Maxim. in Mem. Acad. Petersb. x. No. 16, p. 29. D. Brunoniana, Wall. Cat. 3650. D. corymbosa, Lindl. Bot. Reg. xxvi. t. 5. Leptospermum stamineum and L. scabrum, Wall. in Herb.

TEMPERATE WESTERN HIMALAYA to KASHMIR, alt. 5000-9000 ft., common. The specimens collected by Sir J. D. Hooker in Sikkim and East Nipal and named *D. staminea* should be referred to *D. corymbosa*.

Leaves 1-2 in., oblong- or elliptic-lanceolate, grey tomentose beneath with stellate hairs.

3. **D. macrantha**, H. f. & T. in Journ. Linn. Soc. ii. 84; petals $\frac{3}{4}$ in. long oblong induplicate-valvate, corymb large 8-flowered, calyx-tube with stellate tomentum, teeth linear.

Western Himalaya; KUMAON, alt. 5500 ft.; below Binsur, Strachey & Winterbottom.

Leaves 4 in., elliptic-lanceolate from a rounded base, acuminate, with close scattered stellate hairs on both surfaces.

11. PHILADELPHUS, Linn.

Shrubs with opposite branches. Leaves opposite, deciduous. Calyx-tube adnate to the ovary; lobes 4 (rarely 5), valvate. Petals 4 (rare 5) roundish, convolute in bud. Stamens 20-40, subepigynous, filaments subulate. Ovary inferior, 3-5-celled; styles 3-5, filiform, free or combined at the base; ovules numerous, axile, pendulous. Capsule inferior, corky, 3-5-celled, turbinate from a narrow funnel-shaped base, the summit shortly conical, at length loculicidal. Seeds numerous, oblong, testa loosely reticulated.—DISTRIB. Species 8; central Europe, the Himalaya, Japan and N. America.

1. **P. coronarius**, Linn; var. TOMENTOSUS; leaves hairy beneath, margins densely hairy or glabrous except a few marginal hairs. P. tomentosus, Wall. Cat. 3563; Royle Ill. t. 4; H. f. & T. in Journ. Linn. Soc. ii. 83. P. triflorus, Wall. and P. nepalensis, Loud. ex Maximov. in Mem. Acad. St. Petersb. No. 16, 36. P. coronarius, Brand. For. Fl. 212.

Temperate Himalaya; from KASHMIR to BHOTAN, alt. 5000-9000 ft.; frequent in GURWAL and KUMAON.

Leaves $1\frac{1}{2}$ - $3\frac{1}{2}$ in., ovate-lanceolate, serrate; petiole $\frac{1}{4}$ in. Cymes few-flowered, often with linear bracts $\frac{1}{2}$ in. long; pedicels $\frac{1}{4}$ - $\frac{1}{2}$ in. Calyx-teeth elongate-triangular, acute. Petals $\frac{1}{2}$ - $\frac{3}{4}$ in. long, white. Capsule $\frac{1}{2}$ in. long.—The typical *P. coronarius* (of which *Zeyheri*, *floribundus*, *verrucosus*, *latifolius*, and many others are varieties) is a native of Europe and the East, extending to North China and Japan.

12. ITEA, Linn.

Shrubs or trees. Leaves alternate, petioled, glabrous, glandular-dentate or crenate. Racemes axillary and terminal, long, many-flowered. Calyx-tube adnate to base of the ovary, lobes 5. Petals 5, oblong, perigynous, white, valvate. Stamens 5, perigynous. Ovary $\frac{3}{4}$ -superior, 2-celled; style short, simple; ovules

many, axile. *Capsule* $\frac{3}{4}$ -superior, conical or elongate, many-seeded, splitting through the dissepiments and the style. *Seeds* elongate, testa loose more or less produced at each end.—**DISTRIB.** Species 5, the Himalaya, Indian Archipelago, Japan, Virginia.

1. **I. macrophylla**, Wall. in Roxb. *Fl. Ind.* ii. 419; leaves large rounded at the base, petals closely reflexed on the pedicel between the calyx-teeth, calyx-tube in fruit somewhat campanulate. Wall. *Cat.* 7200; DC. *Prodr.* iv. 6; H. f. & T. in *Journ. Linn. Soc.* ii. 77. Kurrimia?, Wall. *Cat.* 7200.

Subtropical Eastern Himalaya; BHOTAN and SIKKIM, alt. 1000–4000 ft., Griffith, Gamble. KHASIA Mts., alt. 2000–4000 ft., frequent.—**DISTRIB.** Java.

A small tree. *Leaves* often 6 by 3 in., broadly ovate, acute, glandular-denticulate, but sometimes not larger than in *I. chinensis* nor more rounded at the base. *Racemes* 1–3 from several upper axils, usually shorter than the leaves, and like the calyx-tube puberulous. *Capsule* $\frac{1}{4}$ – $\frac{3}{8}$ in. long, the bases of the carpels clearly sunk below the limb of the calyx-tube; the calyx-teeth finally wear off.

2. **I. chinensis**, Hook. & Arn. *Bot. Beech. Voy.* 89, t. 39; leaves usually narrowed at the base, petals erect persistent often appressed to the fruit, calyx-tube in fruit turbinate or conical. H. f. & T. in *Journ. Linn. Soc.* ii. 77; Benth. *Fl. Hongk.* 129.

KHASIA Mts., alt. 4000–5000 ft., Wallich, &c.—**DISTRIB.** China, Hong Kong, Formosa, &c.

A shrub. *Leaves* usually 3 or 4 in., oblong, narrowed at both ends, glandular-denticulate, but sometimes 6 in. by $2\frac{1}{2}$ in. and exactly resembling those of *I. macrophylla*. *Racemes* 1–2 from several upper axils, about as long as the leaves, and like the calyx-tube puberulous. *Capsule* $\frac{1}{4}$ – $\frac{3}{8}$ in., bases of the carpels hardly sunk below the calyx-tube; calyx-teeth persistent, suberect.

3. **I. nutans**, Royle *Ill.* 226; petals erect subpersistent, calyx-tube in fruit hemispherical hairy, racemes solitary terminal elongate much longer than the leaves. H. f. & T. in *Journ. Linn. Soc.* ii. 77; Brand. *For. Fl.* 213.

GURWHAL and KUMAON, alt. 3000–5000 ft., Royle, &c.

A shrub. *Leaves* 3–5 in., elliptic-oblong, acute, glandular-denticulate. *Capsule* $\frac{1}{2}$ in. long; calyx-teeth persistent, erect.

13. **POLYOSMA**, Blume.

Evergreen trees, branchlets petioles and inflorescence pubescent. *Leaves* opposite or subopposite, petioled, acuminate. *Flowers* in terminal racemes (in some non-Indian species solitary) 3-bracteolate. *Calyx-tube* entirely adnate to the ovary; lobes 4, small, persistent. *Petals* 4, epigynous, linear, valvate, white yellowish or greenish expanding by recurving, fugacious, very hairy within. *Stamens* 4, epigynous, filaments hairy. *Ovary* inferior, 1-celled; style columnar, stigma simple; ovules numerous, ascending, on two parietal placentæ which project considerably into the cavity of the ovary. *Fruit* sub-baccate, 1-seeded. *Seed* ascending, subbasal.—**DISTRIB.** Species 6, extending from East Bengal through Malaya to tropical Australia and its islands.

1. **P. fragrans**, Benn. *Pl. Jav. Rar.* p. 196; leaves entire obovate-lanceolate drying green, flowers sessile, fruits (ex Miq.) small globose rostellate. H.

f. & T. in Journ. Linn. Soc. ii. 77; *Miq. Fl. Ind. Bat.* 1, pt. i. 724; *Suppl.* i. 336. *Itea fragrans*, *Wall. in Roxb. Fl. Ind.* ii. 420; *Wall. Cat.* 8472, partly.

SINGAPORE, *Wallich*.—DISTRIB. Sumatra.

Bark of the twigs not lenticellate. *Leaves* 2–4 in., usually pubescent on the nerves on both surfaces. *Lower flowers* on the raceme $\frac{1}{4}$ in. long, quite sessile, yellowish.

2. ***P. integrifolia***, *Blume Bijl.* 659; leaves entire or denticulate, lanceolate narrowed at both ends drying black, flowers shortly pedicelled, fruits $\frac{3}{8}$ – $\frac{1}{2}$ in. long smooth ellipsoid acute at both ends. *Benn. Pl. Jav. Rar.* p. 196; *DC. Prodr.* iv. 276; *Blume Mus. Bot.* i. 260; *H. f. & T. in Journ. Linn. Soc.* ii. 77; *Miq. Fl. Ind. Bat.* i. pt. i. 724; *Suppl.* i. 335. *Itea fragrans*, *Wall. Cat.* 8472, partly. *P. Wallichii*, *Kurz For. Fl. Brit. Burm.* i. 444.

KHASIA MTS., alt. 3000–4000 ft., *De Silva, J. D. H.*, and *T. Thomson*. ASSAM, *Griffith*. MALAY PENINSULA, *Griffith, Wallich, Maingay*. ANDAMANS, *Kurz*.—DISTRIB. Java, Sumatra.

A tree 60 ft. high (*Blume*); bark of the twigs lenticellate. *Leaves* often 6–8 in., usually pubescent on the nerves beneath. *Lower flowers* of the raceme $\frac{1}{4}$ – $\frac{3}{8}$ in. long; pedicels $\frac{1}{24}$ – $\frac{1}{16}$ in.—Very near to *P. ilicifolia*, *Blume* (remarks *Mr. Kurz* in *Journ. As. Soc.*, 1876, pt. ii. 308) but the flowers are smaller and more hairy, the fruit larger, and the leaves longer and more acuminate. In both Var. 1 and Var. 2 the leaves are sometimes very hairy beneath.

VAR. 1. *typica*; leaves quite entire.

VAR. 2. *Wallichii*, *Benn. Pl. Jav. Rar.* p. 196; *Wall. Cat.* 8471; *H. f. & T. in Journ. Linn. Soc.* ii. 77; leaves denticulate.

3. ***P. mutabilis***, *Blume Mus. Bot.* i. 261; leaves leathery narrow-obovate acute drying green-yellow, flowers pedicelled very tomentose, fruit $\frac{1}{4}$ in. long ovoid obscurely rugose ultimately nearly glabrous. *Miq. Fl. Ind. Bat. Suppl.* i. 336. *P. lætevirens*, *Griff. MSS.*

MALAY PENINSULA; Malacca, *Griffith, Maingay*.—DISTRIB. Java, Sumatra.

A tree 22 ft. high, with a thick trunk (*Maingay*); branches and leaves variable in their pubescence (even more than in *P. integrifolia*) from dense woolly to nearly glabrous. *Leaves* 3–4 by 1–1 $\frac{1}{4}$ in., quite entire, rarely obscurely glandular-denticulate: upper surface sometimes softly hairy, sometimes shining and glabrous, lower always hairy. *Pedicels* $\frac{1}{18}$ – $\frac{1}{8}$ in. long, woolly. *Flowers* $\frac{1}{4}$ – $\frac{3}{8}$ in. long. *Fruit* erect on the pedicels, the bracteoles remaining horizontal become very prominent.—*P. lætevirens* *Griff.* is here reduced to *P. mutabilis*, *Blume*, from *Blume's* description only.

14. **RIBES**, *Linn.*

Prickly or unarmed shrubs. *Flowers* often unisexual. *Pedicels* bracteate at the base and 2-bracteolate at the middle. *Calyx* adnate to the ovary with 4–5 epigynous lobes, or the calyx-tube produced above the ovary. *Petals* 4–5, small, epigynous, white yellow red or purple-black. *Stamens* 4–5, epigynous. *Ovary* inferior, 1-celled; styles 2, free or connate, stigmas simple; ovules numerous, on 2 parietal placentas. *Berry* oblong or globose, crowned with the calyx, several-seeded.—DISTRIB. Species 56; temp. Europe, Asia, N. America, and the Andes.

SECT. I. **Grossularia**. *Peduncles* 1–3-flowered. Prickly.

1. **R. Grossularia**, Linn; Wall. Cat. 6835 and in Roxb. Fl. Ind. ii. 515; Eng. Bot. t. 1292; H. f. & T. in Journ. Linn. Soc. ii. 86; Boiss. Fl. Orient. ii. 815; Brand. For. Fl. 213. R. Himalensis, Royle Ill. 225. R. alpestre, DCne. in Jacq. Voy. Bot. t. 75.

Alpine Western Himalaya, from KUMAON to KASHMIR, alt. 9000–12,000 ft.; frequent.—DISTRIB. North and Alpine Europe; the Atlas, Greek and Caucasus ranges.

Prickles usually 3 beneath each axil; stems smooth or with numerous prickly setæ. Leaves suborbicular, obtusely 3–5-lobed, the lobes incise-crenate, somewhat villous beneath. Peduncles usually solitary. Calyx-tube long, produced above the fruit. Berry $\frac{1}{2}$ in. long, oblong, inedible in the Indian plant.

SECT. II. **Ribesia**. Flowers racemed. Unarmed.

* Calyx-tube hardly produced above the fruit.

2. **R. orientale**, Poir. Dict. Suppl. ii. 856; sticky glandular and minutely hairy, leaves round-reniform crenate obscurely 3–5-lobed, bracts $\frac{1}{5}$ in. long, linear often exceeding the pedicels, berry $\frac{1}{5}$ in. long yellow or reddish glandular-pubescent. Boiss. Fl. Orient. ii. 817; Brand. For. Fl. 214. R. leptostachyum, DCne. in Jacq. Voy. Bot. t. 76; H. f. & T. in Journ. Linn. Soc. ii. 86. R. villosum, Wall. Cat. 6832; and in Roxb. Fl. Ind. ii. 514. R. glutinosum, Jacq. Journ.

KASHMIR and BALTISTAN, alt. 8000–12,000 ft.; Jacquemont, Munro, Royle, &c.—DISTRIB. Cabul, Persia, Armenia, Asia Minor and Greece.

A shrub 6 ft. high, polygamo-diœcious. Leaves 1–1 $\frac{1}{4}$ in. diam. Racemes erect, somewhat dense in flower, lax and pendent in fruit. Flowers small, greenish.—R. heterotrichum, Ledeb. Ic. Fl. Ross. t. 235, only differs by the eglandular fruits; and there is a whole series of closely allied species from the Altai to Persia.

3. **R. glaciale**, Wall. in Roxb. Fl. Ind. ii. 513; stem glabrous, leaves glabrous or with scattered hairs above, bracts $\frac{1}{4}$ – $\frac{1}{2}$ in. linear-lanceolate usually much exceeding the pedicels, calyx-segments oblong, berries $\frac{1}{4}$ in. long glabrous or minutely pubescent. Wall. Cat. 6833; H. f. & T. in Journ. Linn. Soc. ii. 88; Brand. For. Fl. 214. R. acuminatum, Wall. Cat. 6834.

TEMPERATE and ALPINE HIMALAYA, from BHOTAN to KASHMIR, alt. 7000–12,000 ft.; common and often epiphytic.

Polygamo-diœcious. Leaves 1–2 in., cordate, 3–5-lobed, crenate-serrate, the middle lobe often elongate; or simple, cordate-ovate, acuminate, sometimes $\frac{1}{2}$ in. long. Racemes pubescent, sometimes elongate. Flowers brownish or pink. VAR. 2. *laciniatum*, H. f. & T. in Journ. Linn. Soc. ii. 87 (sp.), differs by the calyx-segments lanceolate. (The leaves are often not more lacinate than in examples of *R. glaciale*.)

4. **R. desmocarpum**, H. f. & T. in Journ. Linn. Soc. ii. 87; stem glabrescent, leaves softly pubescent beneath, bracts $\frac{1}{5}$ – $\frac{1}{4}$ in. long linear-lanceolate often exceeding the pedicels, calyx-segments ovate-oblong obtuse, berry $\frac{1}{4}$ in. long glandular-pubescent.

SIKKIM and BHOTAN, alt. 8500–10,000 ft.; Griffith; Lachen in SIKKIM, J. D. H.

Diœcious. Leaves 1–4 in., cordate, 3–5-lobed, crenate-serrate, the lobes often elongate. Racemes pubescent, often elongate. Flowers brownish.—Very near *R. glaciale*, Wall., differing chiefly by its very hairy berries.

5. **R. luridum**, H. f. & T. in Journ. Linn. Soc. ii. 87; branchlets and leaves glabrous, bracts $\frac{1}{2}$ in. long, spatulate-oblong much exceeding the pedicels, calyx-lobes lanceolate, berries glabrous small less than $\frac{1}{2}$ in. long.

SIKKIM HIMALAYA, alt. 10,000–12,000 ft.; Lachen, *J. D. H.*

A shrub, 4 ft. high, with erect twigs, polygamo-dioecious. *Leaves* 3–5-lobed, 1 by $1\frac{1}{4}$ in., lobes crenate-serrate. *Racemes* pubescent, erect in fruit, short. *Flowers* subsessile, chestnut. *Calyx-tube* of the flower subcampanulate.—Very near *R. glaciale*; the leaves are in general outline subreniform while those of *R. glaciale* usually have the middle lobe elongate and acuminate.

** *Calyx-tube produced above the fruit.*

6. *R. nigrum*, *Linn.*; *DC. Prodr.* iii. 481; branches and leaves nearly glabrous, racemes pubescent long pendulous, bracts $\frac{1}{16}$ – $\frac{1}{8}$ in. long narrow, berry black. *Eng. Bot.* t. 1291; *H. f. & T. in Journ. Linn. Soc.* ii. 88; *Boiss. Fl. Orient.* ii. 815; *Maxim. in Bull. Acad. Petersb., Mel. Biol.* ix. 222; *Brand. For. Fl.* 215.

Temperate Western Himalaya from KUNAWAR to KASHMIR, alt. 7000–12,000 ft., *T. Thomson.*—DISTRIB. North Europe and North Asia.

Leaves in the Kashmir examples not always punctate beneath. *Racemes* long, pendulous; no solitary peduncle at their base. *Pedicels* long. *Flowers* green.

7. *R. Griffithii*, *H. f. & T. in Journ. Linn. Soc.* ii. 88; leaves pubescent on the nerves beneath, racemes 3–6 in. long flexuose pendent very lax, bracts $\frac{1}{4}$ – $\frac{1}{5}$ in. long linear-lanceolate exceeding the pedicels, berry $\frac{1}{4}$ in. long glabrous red.

Eastern Himalaya; BHOTAN, alt. 7500 ft., *Griffith.* SIKKIM, alt. 10,000–13,000 ft., *J. D. H.*

An erect shrub 8 ft. high. *Leaves* 2–3 in., 5-lobed; lobes acuminate or caudate, sharply serrate. *Calyx-tube* in flower and in young fruit broadly campanulate.

8. *R. rubrum*, *Linn.*; *DC. Prodr.* iii. 481; branchlets glabrous, racemes pubescent elongate pendulous, bracts $\frac{1}{16}$ – $\frac{1}{8}$ in. long lower often broad or obovate, berry red smooth. *Eng. Bot.* t. 1289; *H. f. & T. in Journ. Linn. Soc.* ii. 89; *Boiss. Fl. Orient.* ii. 816; *Maxim. in Bull. Acad. Petersb., Mel. Biol.* ix. 233; *Brand. For. Fl.* 215. *R. Himalayense*, *Dcne. in Jacq. Voy. Bot.* t. 77 (not of *Royle*).

Western Himalaya, from KUMAON to KASHMIR, alt. 8000–12,000 ft., frequent; *Royle, T. Thomson, &c.*—DISTRIB. Alpine Europe, Caucasus, Altai.

Leaves long-petioled, petioles often ciliate at the base, ovate-cordate, 3–5-lobed; lobes acute, crenate-serrate; upper surface glabrous or with scattered hairs, lower glabrous or pubescent. *Pedicels* short. *Calyx-lobes* short, obtuse. *Flowers* large, greenish-yellow.

? VAR.; berries black, leaves glabrous or pubescent beneath, pedicels very short. Kashmir, alt. 9500 ft.; *Levinge.* Karakorum, alt. 11,500 ft., *C. B. Clarke.* Lahul; *Jaeschke in Brand. For. Fl.* 215.

ORDER LIII. CRASSULACEÆ.

Herbs, often with a woody perennial rootstock, or under-shrubs, usually succulent. *Leaves* alternate or opposite, usually simple but divided in *Bryophyllum* and *Kalanchoe*; stipules 0. *Flowers* often cymose, sometimes spicate-racemose in *Cotyledon*, or paniculate in *Bryophyllum*, regular, hermaphrodite or unisexual. *Calyx* 4–5-fid more rarely 6–8-fid, free. *Petals* as many as the sepals, free or connate. *Stamens* hypogynous or upon the petals, as many or twice as many as the petals. *Carpels* usually as many as the petals (fewer in *Triactina* and in a few *Sedums*) with a hypogynous gland or scale at the base of

each; free, or connate below, narrowed upwards into the styles; ovules many on the edges of the carpels (few in *Tillæa*, *Triactina* and some *Sedums*). *Follicles* dehiscing down the inner faces, many-seeded, or 1-few-seeded in *Tillæa*, *Triactina* and a few *Sedums*. *Seeds* albuminous; embryo terete, cotyledons short.—**DISTRIB.** Species 400; spread over nearly the whole globe except Polynesia; rare in Australia and South America; abundant in South Africa; general in the northern hemisphere.

* *Stamens as many as the petals, leaves opposite* (see also *Cotyledon*).

Small herbs with minute axillary sessile flowers 1. *TILLÆA*.
Succulent herbs with flowers in a paniculate cyme 2. *CRASSULA*.

** *Stamens twice as many as the petals*.

+ *Petals connate, at least at the base*.

Calyx shortly 4-fid 3. *BRYOPHYLLUM*.
Calyx 4-partite 4. *KALANCHOE*.
Calyx 5-partite 5. *COTYLEDON*.

†† *Petals free*.

Carpels 5-4 (rarely 3) free or slightly connate 6. *SEDUM*.
Carpels 6-8 7. *SEMPERVIVUM*.
Carpels 3, connate half their length 8. *TRIACTINA*.

1. *TILLÆA*, Linn.

Small glabrous succulent herbs. *Leaves* opposite, entire, flat in the Indian species. *Flowers* minute, axillary, often fasciculate, solitary or cymose, white or red. *Calyx* 4-5-fid. *Petals* 4-5, free or connate at the base. *Stamens* 4-5. Hypogynous scales 4-5 or 0. *Carpels* 4-5, free, narrowed into short styles with minute stigmas; ovules 2 to each carpel in the Indian species. *Follicles* 2-seeded.—**DISTRIB.** A genus of 20 species, widely distributed, scarcely separable from *Crassula*.

1. *T. pentandra*, Royle Ill. 222 (name only); leaves lanceolate-linear acute, flowers sessile in the axils often 2-3-nate, seeds ellipsoid subtrigonus pointed at the end. *Edgw. in Trans. Linn. Soc.* xx. 50; *H. f. & T. in Journ. Linn. Soc.* ii. 90; *Oliv. Fl. Trop. Afr.* ii. 386. *Crassula* (Disporocarpa) Schimper, *Fisch. & Mey. Ind. Sem.* viii. 56.

Subtropical Himalaya, from KUMAON to KASHMIR, alt.*3000-6000 ft., frequent. DECCAN PENINSULA; Mysore, *T. Lobb*; Nilghiris, *Hohenacker*; Concan, *Stocks*.—**DISTRIB.** Tropical Africa, Abyssinia and the Cameroons.

Stems procumbent, branched; internodes shorter than the leaves. *Leaves* $\frac{1}{4}$ - $\frac{5}{16}$ in. long, connate at the base. *Calyx*-segments lanceolate-acuminate, *Petals* elliptic, acuminate, white, not exceeding the sepals. Hypogynous scales cuneate, truncate (ex *C. A. Meyer*).

2. *T. pharnaceoides*, Hochst. in Schimp. *Herb. Abyss.* No. 104; leaves ovate-lanceolate or lanceolate, flowers densely clustered in the axils pedicelled, seeds ellipsoid blunt at the end. *Oliv. Fl. Trop. Afr.* ii. 387; *Bth. & H. f. Gen. Pl.* i. 657. *T. trichopoda*, Fenzl in Boiss. *Fl. Orient.* ii. 767. *Combesia abyssinica*, *A. Rich. Fl. Abyss.* i. 307. *Crassula* (Disporocarpa) *pharnaceoides*, *Fisch. & Mey. Ind. Sem.* viii. 56. *C. campestris*, *Harv. & Sond. Fl. Cap.* ii. 351.

PUNJAB PLAIN; Hushiarpoore, Aitchison; Peshawur, Vicary.—DISTRIB. Persia, Central and South Africa.

Stem decumbent, branched; internodes longer than the leaves. *Leaves* $\frac{1}{8}$ – $\frac{3}{16}$ in. long, connate at the base. *Pedicels* very short or $\frac{1}{4}$ in. long. *Calyx*-segments lanceolate, acuminate. *Petals* shorter than the sepals, united at the base, very acute or hair-pointed. Hypogynous *scales* minute, spatulate (*ex Richard*).—This species is still smaller than *T. pentandra*, its flowers are less than $\frac{1}{20}$ in. long.

2. CRASSULA, Linn.

Herbs, usually with thick branches and leaves. *Leaves* opposite, usually connate, fleshy and with cartilaginous margins. *Flowers* cymose, not large. *Calyx* 5-fid or 5-partite. *Petals* 5, free or connate at the base. *Stamens* 5. Hypogynous *scales* various. *Carpels* 5, narrowed into short thick styles; ovules numerous. *Follicles* 5, many-seeded.—DISTRIB. Species 120, nearly all from the Cape of Good Hope; a few in Abyssinia, one in the Himalaya.

1. *C. indica*, Dene. in Jacq. Voy. Bot. t. 73; glabrous, stem 4–12 in. high leafy, radical leaves rosulate spatulate-obovate, cauline acute, cymes forming a compound panicle. *H. f. & T. in Journ. Linn. Soc.* ii. 90. *Sedum paniculatum*, Wall. Cat. 7227.

KUMAON and GURWHAL, alt. 3000–8000 ft., frequent. BHOTAN, Griffith.

Lower *leaves* 1–1½ in. long, blunt or shortly acute; stem-leaves sessile, subdecurent, usually narrow oblong. *Panicle* sparsely leafy. *Petals* dull rose, scarcely twice the sepals. Hypogynous *glands* small, obovate. *Seeds* very numerous, oblong-ellipsoid, smooth, finely reticulate, quasi-striate.

3. BRYOPHYLLUM, Salisb.

Tall erect herbs, perennials. *Leaves* opposite, crenate. *Flowers* large, pendent, in spreading panicles with opposite branches. *Calyx* with a long inflated tube; lobes 4, short, valvate. *Corolla* with a campanulate tube and shortly 4-fid limb. *Stamens* 8, in two series, inserted on the middle of the corolla-tube. Hypogynous *scales* 4, obtuse. *Carpels* 4, free or connate at the base, attenuated into long styles; ovules very many. *Follicles* 4, many-seeded.—DISTRIB. Species 4, in tropical Africa; one extending through the tropics of the whole world.

1. *B. calycinum*, Salisb. in DC. Prodr. iii. 396; leaves petiolate simple or 3-partite, leaflets oblong or elliptic crenate or subincised-crenate. *Bot. Mag.* t. 1409; Wall. Cat. 7205; Wight in Hook. Bot. Misc. iii. 100, with a figure; W. & A. Prodr. 360; H. f. & T. in Journ. Linn. Soc. ii. 90; Oliv. Fl. Trop. Afr. ii. 390. *B. pinnatum*, Kurz in Journ. As. Soc. 1876, pt. ii. p. 309; Cotyledon rhizophylla, Roxb. Fl. Ind. ii. 456. *C. pinnata*, Lamk. Dict. ii. 141. *Kalanchoe pinnata*, Pers.; Miq. Fl. Ind. Bat. i. pt. i. 728; Dalz. & Gibs. Bomb. Fl. 105.

Tropical plains of INDIA, from the base of the Himalaya to Ceylon and Malacca; universal in Lower Bengal.—DISTRIB. Throughout the tropics of the world; presumed a native of Africa and an introduced plant in Bengal.

Glabrous. *Stems* 1–4 ft. high. *Calyx* 1–1½ in. long, purplish green. *Corolla* globose-octagonal at the base, green, constricted in the middle; the exerted parts reddish-purple. Hypogynous *scales* subquadrate, free or slightly adherent to the carpels. *Fruit* enclosed in the persistent papery calyx and corolla. *Seeds* small, oblong-ellipsoid, smooth, longitudinally obscurely striate.

In the crenatures of the leaves of this plant buds are easily formed which develop, drop off, and at once produce new plants.

4. **KALANCHOE**, *Adans.*

Erect stout perennial herbs. *Leaves* opposite or the upper alternate. *Flowers* large, erect, in many-flowered subpaniculate cymes. *Calyx* 4-partite, or 4-fid half way down. *Corolla* with a flask-shape tube and spreading 4-fid limb, much exceeding the calyx (yellow in the Indian species), persistent. *Stamens* 8, in two series, adnate to the corolla-tube. *Hypogynous scales* 4, linear or oblong. *Carpels* 4, adnate to the base of the corolla-tube, attenuated into long styles; ovules very many. *Follicles* 4. *Seeds* very many, oblong, ellipsoid, with 8-15 longitudinal ribs.—**DISTRIB.** Species 25, chiefly in tropical and South Africa; several in tropical Asia; one in Brazil.

* *Calyx divided not more than half way down.*

1. **K. glandulosa**, *Hochst. in A. Rich. Fl. Abyss. i.* 312; very glandular upwards, branches of panicle subopposite; stem-leaves stem-clasping, calyx very glandular-pubescent. *Oliv. Fl. Trop. Afr. ii.* 396. *K. Ritchieana*, *Dalz. in Hook. Kew Journ. iv.* 346; *Dalz. & Gibs. Bomb. Fl.* 105. *K. heterophylla*, *Herb. Wight. Cotyledon hirsuta*, *Herb. Heyne.*

Mrs. of the DECCAN PENINSULA; *Heyne*; *Wight, Ritchie.*—**DISTRIB.** Abyssinia.

Stem very thick at the base, 1-2 ft. high. *Leaves* obovate, nearly entire, the lowest 4-6 in. long, much tapering at the base, scarcely petioled. *Calyx*-teeth ovate, acute. *Corolla*-tube $\frac{1}{2}$ in. long. *Hypogynous scales* linear.—This species connects *Kalanchoe* with *Bryophyllum*; it has the tubular calyx and subopposite panicle branches of *Bryophyllum*; but the erect flowers, spreading corolla lobes, narrow hypogynous scales and seeds of *Kalanchoe*. The calyx is described as 'vesicular' in fruit; but it is very slightly so either in the Indian or Abyssinian examples.

** *Calyx divided nearly to the base.*

2. **K. spathulata**, *DC. Pl. Grasses, t.* 65; *Prodr. iii.* 395; glabrous, leaves spatulate-oblong crenate, upper distant and becoming very narrow sometimes 3-foliolate, the lowest bracts similar, lower panicle-branches usually opposite, sepals elongate triangular from a broad base. *Haw. in Phil. Mag. Lond. N.S. vi.* 303; *Miq. Fl. Ind. Bat. i. pt. i.* 728. *K. nudicaulis*, *Ham. in Herb. K. crenata*, *Oliv. Fl. Trop. Afr. ii.* 394, partly. *K. varians*, *Haw. in Phil. Mag. Lond. N.S. vi.* 302; *Wall. Cat. 7222*, and *Pl. As. Rar. t.* 167 (not good under the name *K. amplexans*); *H. f. & T. in Journ. Linn. Soc. ii.* 91. *K. acutiflora*, *Kurz in Journ. As. Soc. 1876, pt. ii. p.* 309, omitting the *synonyms*.

TROPICAL HIMALAYA, from **BHUTAN** to **KASHMIR**, alt. 1000-3000 ft.; common. **BURMA**; *Wallich.*—**DISTRIB.** Warm China, Java.

Stem 1-4 ft. high. *Lower leaves* commonly 3-4 (sometimes 10) in. long besides the petiole; upper leaves (with the petiole) often 3-4 in. long by $\frac{1}{2}$ in. broad, frequently sessile. *Corymb* flattish or more rarely elongate, with few scattered linear bracts $\frac{1}{4}$ - $\frac{1}{2}$ in. long. *Flowers* clear yellow, the corolla-tube glabrous. *Calyx* in fruit often as much as $\frac{3}{8}$ in. wide.—This species should probably be united with *K. aegyptiaca* (which hardly differs except by the orange tint of the flowers) and with *K. crenata* as in *Oliv. Fl. Trop. Afr. ii.* 394; but the Indian plant is very constant in its trifling characteristics and habit.

3. **K. floribunda**, *W. & A. Prodr.* 359; upper parts of the stem and cyme with short spreading glandular hairs, lower branches of the cyme usually

alternate, upper branches often long racemiform, sepals oblong acute standing apart at base. *H. f. & T. in Journ. Linn. Soc. ii. 91.* *K. Wightiana*, *Wall. Cat. 7225.* Cotyledon amplexicaulis, *Heyne in Herb. Rottl.*

Mts. of the DECCAN PENINSULA, alt. 2000–7000 ft.; common.

Stem 1–3 ft. high. *Leaves* obovate-elliptic crenate, cauline 2–3 in. long, petiole short. *Cyme* with very many flowers. *Corolla* clear yellow, tube glabrous.

VAR. glabra; cyme often level-topped, the branches perfectly glabrous not at all racemose with numerous approximate small lanceolar bracts $\frac{1}{2}$ in. long, calyx-tube in fruit $\frac{1}{2}$ – $\frac{1}{3}$ in. wide. *K. floribunda*, *Thwaites Enum. 129.* *K. spathulata*, *Wall. Cat. 7224.* Cotyledon heterophylla, *Roxb. Fl. Ind. ii. 456.* *C. corymbosa*, *Herb. Rottl.*—Mts. of the Deccan Peninsula; extending to CEYLON (*Thwaites No. 540*) and Parasnath in BEHAR, alt. 4000 ft. *J. D. H.*—This should perhaps be united with *K. crenata*; it differs from *K. spathulata* by the wider (elliptic) upper leaves, the much narrower capsule, the cyme less paniculate.

4. ***K. grandiflora***, *W. & A. Prodr. 359*; glabrous, leaves broadly obovate crenate, cyme large compound with large green-yellow flowers, sepals ovate-lanceolate. *Wall. Cat. 7226*; *Wight Ill. t. 111*; *H. f. & T. in Journ. Linn. Soc. ii. 91*; *Bot. Mag. t. 5460.*

NILOHIRI and PULNEY Mts., alt. 7000–8000 ft.; *Gardner, Wight, &c.*

Stem, leaves, and panicle often glaucous. *Stem-leaves* 2–3 in. long, subsessile. *Bracts* of cyme $\frac{1}{2}$ – $\frac{3}{4}$ in. long, elliptic, petioled, early deciduous. *Sepals* united at base for a distance often $\frac{1}{2}$ in. or more.—All the well-developed examples of *K. Wightiana*, *Wall. Cat. 7225* belong to *K. floribunda* Var. above; but under *Wall. Cat. 7225* are included several young examples of *K. grandiflora*.

5. ***K. brasiliensis***, *Camb. in Fl. Bras. Merid. ii. 196*; cyme densely glandulose-pubescent, corolla-tube and lobes without very hairy. *Mart. Fl. Brasil. t. 89.* *K. crenata*, *Oliv. Fl. Trop. Afr. ii. 394, partly.*

Mts. of the DECCAN PENINSULA; Tovequary Hill in Belgaum and North Deccan Hills, *Ritchie.*—DISTRIB. Brazil, Tropical Africa.

Stem-leaves $\frac{3}{4}$ in. long, elliptic, short petiolate, crenate. *Petals* hair-pointed (as in the allied Indian species). *Flowers* white ex *Dr. Ritchie's* field note; yellow ex *Cambess. and Oliver.*—If this plant be united with *K. crenata* as proposed by *Britten* in *Oliv. Fl. Trop. Afr. ii. 394* the species here described Nos. 2 to 5 may all be included.

6. ***K. laciniata***, *DC. Pl. Grasses, t. 100*; *Prodr. iii. 395*; leaves pinnatifid-lacinate, the lobes entire subserrate or dentate, sepals lanceolate subpatent. *Wall. Cat. 7221*; *W. & A. Prodr. 360*; *Wight. Ic. 1158*; *Thwaites Enum. 129*; *H. f. & T. in Journ. Linn. Soc. ii. 91*; *Miq. Fl. Ind. Bat. i. pt. i. 728*; *Dalz. & Gibs. Bomb. Fl. 105*; *Oliv. Fl. Trop. Afr. ii. 392.* *K. teretifolia*, *Haw. in Wall. Pl. As. Rar. 53, t. 166*; *Wall. Cat. 7223*; *H. f. & T. in Journ. Linn. Soc. ii. 91*; *Kurz in Journ. As. Soc. 1876, pt. ii. p. 309.* Cotyledon laciniata, *Roxb. Fl. Ind. ii. 456.*

TROPICAL regions of the DECCAN PENINSULA; in BENGAL at Patna, Dacca. BURMA, Wallich. MALACCA, Maingay.—DISTRIB. Yunan, Java, Tropical Africa.

VAR. 1. typica; leaves once pinnatifid, segments $\frac{1}{2}$ –1 in. broad flat incise-crenate sometimes bipinnatifid; cyme-branches and sepals often glabrous.

VAR. 2; leaves 2–3-pinnatifid, segments linear, cyme-branches and sepals pubescent.

K. teretifolia, Wall. does not appear separable from this var. *K. acutiflora*, Haw. in *Andr. Bot. Repos.* t. 560; *Miq. Fl. Ind. Bat.* i. pt. i. 728, probably is not an Indian form; it has white flowers.

5. **COTYLEDON**, Linn.

Herbs, branching or scapigerous. *Leaves* opposite or alternate, fleshy. *Flowers* in spicate racemes or cymose. *Calyx* 5-partite. *Corolla* 5-fid to the base (or in non-Indian species less deeply). *Stamens* 10 or 5, inserted on the corolla. Hypogynous *scales* oblong or quadrate. *Carpels* 5, free, attenuated into filiform styles; ovules very numerous. *Fruit* of 5 many-seeded follicles.—**DISTRIB.** Species 60; in Eastern Asia, Western and Southern Europe and the whole of Africa; also in Mexico.

The genus as it now stands includes such species as are excluded from *Crassula* by their alternate leaves, and from *Sedum* by their spicate racemes or by having only 5 stamens.

* *Stem simple, leaves alternate, spike elongate dense, stamens 10.*

1. **C. spinosa**, Linn. *Sp. Pl.* i. 615; radical leaves rosulate spatulate terminated by a spine, cauline oblong lanceolate flat, pedicels 1-flowered, corolla yellow-white twice exceeding the calyx. Umbilicus spinosus, *DC. Prodr.* iii. 400; *Ledeb. Fl. Ross.* ii. 174. *U. spinosus* and *U. fimbriatus*, *Turcz. Fl. Baikal-Dahur.* i. 432. *Sedum spinosum*, *Thunb. Fl. Jap.* 186.

WEST TIBET; *Falconer* No. 482. BALTISTAN, alt. 10,000–11,000 ft., *C. B. Clarke*. Height 6–15 in. *Leaves* 1–1½ in. long. *Pedicel* ¼ in. long, shorter than its oblong acute bract. *Sepals* ovate, very acute, greatly exceeding the tube of the corolla.

** *Stems several, leaves alternate, cymes small, stamens 5.*

2. **C. Oreades**, *C. B. Clarke*; annual, glabrous, stems branching from the base, branches ascending leafy, leaves on the sterile branches ¼ in. long, rosulate narrow lanceolate aristate, flowers at the summit of the branches 3–1 nodding white. Umbilicus Oreades, *Dene. in Jacq. Voy. Bot.* 62 (*U. luteus*, *Lo. t.* 73, except that the stamens are not ten); *H. f. & T. in Journ. Linn. Soc.* ii. 91.

Alpine Western Himalaya; KASHMIR; Pir Punjal, *Jacquemont*; Marbul Pass, *C. B. Clarke*. GURWHAL, *Falconer*. KUMAON, alt. 14,000 ft.; Shilong, *Strachey & Winterbottom*.

Stems 2–4 in. long, several, curved. *Stem-leaves* like the rosulate leaves but rather smaller. *Sepals* ¼ in. long, oblong, acute. *Petals* a little exceeding the sepals, united at their base only. *Seeds* ellipsoid, microscopically covered with tubercles.—This species has the habit altogether of *Sedum*, but it cannot be put there because it has only 5 stamens; neither can it be put in *Crassula* because *Crassula* has always opposite leaves. Therefore it is put in *Cotyledon*; though in *Cotyledon* the corolla should be tubular, the tube at least equalling the calyx. Similar remarks apply to the next species.

3. **C. spathulata**, *C. B. Clarke*; glabrous, stolon leaves rosulate ½ in. long petioled spatulate, cauline linear-oblong, flowers corymbose shortly pedicelled, sepals ¼–¾ in. long oblong acute nearly equalling the corolla and many times exceeding its tube. Umbilicus spathulatus, *H. f. & T. in Journ. Linn. Soc.* ii. 92.

SIKKIM HIMALAYA, alt. 10,000–12,000 ft., J. D. H.

Stems 3–6 in. high, throwing decumbent stolons from the base. Cauline leaves $\frac{1}{4}$ in. long, sessile. Petals united at base only. Stamens 5. Flowers sometimes 4-merous. Seeds ellipsoid, smooth, tailed.

6. **SEDUM**, Linn.

Succulent herbs. Leaves alternate or rosulate, rarely opposite; entire or lacinate. Flowers cymose, hermaphrodite, or unisexual by abortion. Calyx 5–4-partite. Petals 5–4, free. Stamens 10–8, the alternate ones adnate to the petals. Hypogynous scales quadrate or cuneate, entire or emarginate. Carpels 5–4, free or slightly united at base, narrowed into the styles; ovules very numerous. Follicles 5–4, many-seeded.—DISTRIB. Species 130; mostly in the cold and temperate regions of the northern hemisphere; one species is found in Abyssinia and one in Peru.

SECT. I. **Rhodiola**. Rootstock perennial, thick, suberect, with a crown of scales from the axils of which rise the simple leafy annual stems carrying terminal cymes. Flowers diœcious or polygamous, often 4-merous. Petals in the males often much exceeding the sepals; in the females shorter or narrower. Styles usually short, recurved in fruit. Seeds oblong-ellipsoid, compressed, testa loose produced beyond the end of the nucleus, often as a bent short tail.

* Cymes dense, not carrying bracts on the short branches (though there are frequently bracts at the base of the outer branches).

1. **S. Rhodiola**, DC. Prodr. iii. 401; leaves obovate or broadly oblong often toothed towards the apex, petals yellow, hypogynous scales in the males oblong emarginate. Ledeb. Fl. Ross. ii. 179; H. f. & T. in Journ. Linn. Soc. ii. 95. S. imbricatum, H. f. & T. in Journ. Linn. Soc. ii. 101. Rhodiola imbricata, Edgw. in Trans. Linn. Soc. xx. 47. R. rosea. Linn.; Engl. Bot. t. 508.

ALPINE WESTERN HIMALAYA; from KUMAON to KASHMIR, alt. 12,000–17,000 ft.; frequent.—DISTRIB. The arctic and alpine regions of America, Europe and Asia.

Very glaucous. Rootstock having an odour of roses. Stems 3–15 in., thick. Leaves $\frac{1}{2}$ –1 $\frac{1}{2}$ in. long, imbricated (often very closely) from a narrow or broad base. Cyme densely congested. Sepals narrow oblong. Stamens long, exsert. Carpels in fruit $\frac{1}{2}$ in. long, not narrowed gradually at the base.—The examples of *S. imbricatum* have diœcious (or functionally diœcious) heads; and the carpels have short recurved styles, altogether as in Sect. *Rhodiola*.

2. **S. heterodontum**, H. f. & T. in Journ. Linn. Soc. ii. 95; leaves ovate incise-dentate from a broad or cordate or auriculate base prominently white-margined, flowers rose-coloured? (ex H. f. & T.). S. serratum, Jacquem. Journ.

TEMPERATE and ALPINE WESTERN HIMALAYA, alt. 8000–14,000 ft.; Kashmir, Jacquemont; Kunawur, T. Thomson; Mandala, Cleghorn.

Stems 12–18 in. Leaves loosely imbricate. Cyme very dense, especially in fruit. Otherwise agrees closely with *S. Rhodiola*, of which H. f. & T. suggest it may be a variety.

3. **S. crenulatum**, H. f. & T. in Journ. Linn. Soc. ii. 96; leaves elliptic or broad oblong sessile crenulated, cymes sessile enclosed by the upper leaves and outer leaf-like bracts, sepals purple narrow-oblong, petals rose-coloured.

SIKKIM HIMALAYA, alt. 12,000–18,000 ft.; Yeumtong and Mt. Donkiah, *J. D. H., W. T. Blandford*. KUMAON, alt. 12,000–17,000 ft., Chumpua and Niti Pass, *Strachey & Winterbottom*.

Dried specimens are a ruddy chestnut colour. *Stems* 3–8 in.—Very like *S. Rhodiola*, of which it may be a variety.

**** Cymes** 1- few-flowered (except *S. tibeticum*), or in fruit somewhat lax, branches not bearing leaves (though there may be bracts at their bases).

4. *S. tibeticum*, H. f. & T. in Journ. Linn. Soc. ii. 96; leaves subentire oblong or ovate-oblong, cymes 4–20-flowered not very dense in fruit, flowers often 5-merous, sepals on the fruit triangular-acuminate.

ALPINE WESTERN HIMALAYA, alt. 12,000–16,000 ft.; KUNAWUR (Werang Pass) *T. Thomson*; LAHUL, *Jaeschke*.—DISTRIB. Cabul, *Griffith*.

Glabrous. *Stems* 4–10 in. *Leaves* $\frac{1}{2}$ – $\frac{1}{2}$ in., loosely imbricate, the upper oblong subacute, the lower often ovate. *Petals* rose or purple. *Follicles* and seeds as in *S. Rhodiola*.

VAR. *Stracheyi*, H. f. & T. in Journ. Linn. Soc. ii. 96 (sp.); leaves ovate often toothed. Alpine Western Himalaya, alt. 12,000–17,000 ft., *T. Thomson, Strachey & Winterbottom, Dr. Henderson*.—The leaves sometimes entire, and the upper oblong: it then seems undistinguishable from *S. tibeticum*.

5. *S. quadrifidum*, Pall. ; DC. Prodr. iii. 407; stems 2–5 in. numerous, leaves approximate oblong subterete, cymes 5–1-flowered, flowers red often 4-merous, sepals oblong. *Ledeb. Fl. Ross. ii. 177*; *H. f. & T. in Journ. Linn. Soc. ii. 97*. *S. coccineum, Royle Ill. t. 48*.

ALPINE WESTERN HIMALAYA, alt. 11,000–18,000 ft., from KUMAON to KASHMIR, frequent. SIKKIM, alt. 16,000–18,000 ft., *J. D. H.*—DISTRIB. Arctic Russia and Siberia.

Stems and leaves glabrous or puberulous. *Leaves* $\frac{1}{4}$ in., sometimes very acute. *Petals* usually twice the sepals. Hypogynous scales subquadrate (ex H. f. & T.). *Follicles* with short styles, recurved or sometimes erect, straight.

***** Cymes** lax, branches bearing leaves, or the flowers supported by a leafy bract.

6. *S. Himalense*, Don Prodr. 212; leaves $\frac{1}{2}$ – $\frac{3}{8}$ in. loosely imbricate narrow-obovate or lanceolate often dentate towards the summit, cymes large leafy, sepals lanceolate-linear, petals deep purple twice the sepals, pedicels much thickened under the fruit. *DC. Prodr. iii. 402*; *H. f. & T. in Journ. Linn. Soc. ii. 97*. *S. Himalayanum* and *S. hypericifolium, Wall. Cat. 7236, 7237*.

SIKKIM and NIPAL, alt. 12,000–17,000 ft., frequent; *Wallich, J. D. H., &c.*

Stems 4–14 in., usually puberulous or pubescent, sometimes glabrous. *Petals* lanceolate. Hypogynous scales black-purple, broadly triangular (ex H. f. & T.). *Follicles* $\frac{1}{2}$ in. long, black-purple.—*S. atropurpureum, Turcz.* of Central Asia differs among other things by its compact cyme.

7. *S. bupleuroides*, Wall. Cat. 7229; leaves $\frac{1}{2}$ – $1\frac{1}{2}$ in. long loosely imbricate ovate or ovate-oblong, base cordate or auriculate-bilobate, cymes large leafy, sepals lanceolate-linear, petals lanceolate small black-purple twice the sepals. *H. f. & T. in Journ. Linn. Soc. ii. 98*.

NIPAL; Gossain Than, *Wallich*. SIKKIM, alt. 10,000–14,000 ft.; Tungu, Lachen *J. D. H.*

Stems 6-14 in. high, glabrous, or the cyme puberulous. Hypogynous scales black purple, broadly cuneate-quadrate (ex H. f. & T.).

8. **S. elongatum**, Wall. Cat. 7233; leaves $\frac{3}{4}$ -2 in. long loosely imbricate oblong narrowed at base almost petioled or elliptic sessile, cymes large loose, petals lanceolate black-purple. H. f. & T. in Journ. Linn. Soc. ii. 98.

ALPINE HIMALAYA, from SIKKIM to KASHMIR, alt. 10,000-12,000 ft.

Stems 8-20 in. high, glabrous, as are the leaves. Cymes puberulo-pubescent. Sepals lanceolate-linear. Hypogynous scales broad, cuneate-quadrate (ex H. f. & T.). Follicles scarcely $\frac{1}{4}$ in.

9. **S. fastigiatum**, H. f. & T. in Journ. Linn. Soc. ii. 98; stems numerous, leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. long crowded terete oblong-linear, cymes 3-8-flowered, sepals lanceolate, petals $\frac{1}{2}$ in. long linear twice the sepals.

SIKKIM, alt. 14,000-17,000 ft.; Kankola, Lama Kangra, J. D. H.

Stems 2-5 in., curved, glabrous, as are the leaves. Cymes puberulo-pubescent. Hypogynous scales quadrate. Follicles more than $\frac{1}{4}$ in. long, black-purple.—A species resembling *S. quadrifidum* but larger with larger flowers and fruit.

10. **S. humile**, H. f. & T. in Journ. Linn. Soc. ii. 99; densely tufted, stems 1-2 in. glabrous or minutely pubescent, leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. long, linear or linear-oblong, cymes 1-4-flowered, sepals ovate acuminate, petals lanceolate wider upwards twice the sepals.

SIKKIM, alt. 15,000-16,000 ft.; Yeumtong and Tunkra Pass, J. D. H.

Flowers large for so small a plant. Hypogynous scales broad quadrate (ex H. f. & T.).—This species is distinct from the other Indian species by its sepals.

11. **S. coriaceum**, Wall. Cat. 7238; rootstock thick, stems numerous pubescent, cymes and leaves on both surfaces puberulous, leaves $\frac{1}{2}$ in. flat obovate, cyme with few leaves. H. f. & T. in Journ. Linn. Soc. ii. 99.

NIPAL, Wallich.

Like *S. tibeticum*, var. *Stracheyi*, but wholly puberulous; the leaves obovate and the cymes few-flowered.

SECT. II. Rootstock thick. Flowers hermaphrodite, rarely imperfect. Follicles narrow oblong-lanceolate; style nearly straight, slender, not (or scarcely at all) recurved. Seeds ellipsoid, compressed, testa loose produced beyond the end of the nucleus, often as a short bent tail.

12. **S. asiaticum**, DC. Prodr. iii. 401; stems 6-12 in., leaves 1-1 $\frac{1}{2}$ in. approximate near the cyme linear remotely dentate, cymes dense, flowers yellow, petals lanceolate-spathulate twice the sepals. Wall. Cat. 7239. *S. crassipes*, Wall. Cat. 7234; H. f. & T. in Journ. Linn. Soc. ii. 99. *Rhodiola asiatica*, Don Prodr. 213.

SIKKIM to KASHMIR, alt. 11,000-16,000 ft., frequent; Wallich, Falconer, J. D. H., &c.

Glabrous or the cyme branches minutely puberulous. Hypogynous scales very short, subquadrate (ex H. f. & T.).

VAR. *Wallichianum*, H. f. & T. in Journ. Linn. Soc. ii. 100 (sp.); Hook. Ic. Pl. t. 604; leaves broader more denticulate sometimes subpinnatifid.—H. f. & T. say that this differs by its red flowers; but Sir W. Hooker says that the plants which flowered at Kew had yellow flowers.

13. ***S. linearifolium***, Royle *Ill.* t. 48; stems 3–5 in. and with the leaves glabrous, leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. imbricate narrow oblong or linear entire or toothed, cymes 2–8-flowered, sepals oblong-lanceolate, petals nearly $\frac{1}{2}$ in. long broad-lanceolate. *H. f. & T. in Journ. Linn. Soc.* ii. 100. *S. pauciflorum*, Edgw. in *Trans. Linn. Soc.* xx. 49; *H. f. & T.* 100. *S. mucronatum*, Edgw. in *Trans. Linn. Soc.* ii. 48.

TEMPERATE WESTERN HIMALAYA, alt. 7000–10,000 ft.; GURWHAL, KUMAON, &c.; Royle, Falconer, T. Thomson, &c.

A species easily recognised by the large white petals (but *H. f. & T.* say red?). *Sepals* not ovate in *Var. pauciflorum*, but as in the typical *linearifolium*.—Edgeworth's *S. mucronatum* is identically his *S. pauciflorum* as shown by *H. f. & T.*

VAR. 1. *typica*; leaves dentate.

VAR. 2. *pauciflorum*; leaves little dentate or entire.

14. ***S. trifidum***, Wall. *Cat.* 7230; stems 3–11 in. glabrous, leaves 2–4 in. petioled oblong sinuate-pinnatifid, or 1–2-pinnatifid with linear blunt lobes, cymes branched leafy, sepals narrow-lanceolate, petals linear-lanceolate twice the sepals. *H. f. & T. in Journ. Linn. Soc.* ii. 100. *S. sinuatum*, Royle *Ill.* p. 222; Edgw. in *Trans. Linn. Soc.* xx. 47.

TEMPERATE HIMALAYA from SIKKIM to KASHMIR, alt. 6000–12,000 ft., common on rocks and on trees.

Cymes leafy. *Flowers* pedicelled, pink. *Follicles* when ripe very thin-walled.—A well-marked abundant species in which however the leaves vary between the wide limits given above.

SECT. III. Annuals, or perennials with no thick rootstock. *Flowers* hermaphrodite. *Seeds* obovoid, not compressed, the testa not loose.

* *Follicles* 5, erect in fruit. *Radical leaves* rosulate.

15. ***S. rosulatum***, Edgw. in *Trans. Linn. Soc.* xx. 48; stems 2–4 in., cauline leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. somewhat remote spatulate-obovate or spatulate-orbicular, sepals oblong glabrous rarely minutely pubescent, petals white elliptic or oblong not very acute. *H. f. & T. in Journ. Linn. Soc.* ii. 101. *S. pyriforme*, Royle *Herb.* *Umbilicus radicans*, Klotzsch in *Reis. Pr. Waldem. Bot.* t. 44.

KUMAON to KASHMIR, alt. 5000–9000 ft.; frequent, Royle, Falconer, T. Thomson, Edgeworth, &c.—DISTRIB. Afghanistan.

Stem glabrous, more rarely glandular-pubescent. *Rosulate leaves* $\frac{1}{4}$ – $1\frac{1}{2}$ in. spatulate or elongate obovate. *Cymes* weak, straggling, often subsecund or subscorpioid with long pedicels $\frac{1}{2}$ –1 in. long. *Follicles* small, thin-walled, erect. *Seeds* ellipsoid, somewhat obvoid, smooth, longitudinally striate.

16. ***S. adenotrichum***, Wall. *Cat.* 7231; stems 3–9 in. glandular-pubescent, cauline leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. somewhat remote oblong narrowed below or obovate, sepals oblong minutely pubescent, petals white often with pink stripes lanceolate acute. *H. f. & T. in Journ. Linn. Soc.* ii. 101, excl. *Var. β.*; Edgw. in *Trans. Linn. Soc.* xx. 48; Baker & Saunders *Ref. Bot.* t. 296.

KUMAON to KASHMIR, alt. 3000–8000 ft.; frequent. Wallich, T. Thomson, Strachey & Winterbottom, &c.

Rosulate leaves $\frac{1}{2}$ – $1\frac{1}{2}$ in. spatulate or elongate obovate. *Cymes* lax with pedicels $\frac{1}{4}$ –1 in. long, often with two or more erect elongate branches. *Follicles* thin-walled, erect. *Seeds* obovoid, ellipsoid, smooth, longitudinally striate.—This species may be generally distinguished from *S. rosulatum* by its larger size, stronger cyme, and more

pubescent stem and sepals: but the only absolute distinction appears to lie in the more acute petals.

17. **S. Griffithii**, C. B. Clarke; stems 2-4 in. very weak glabrous, cauline leaves $\frac{1}{4}$ - $\frac{1}{2}$ in. linear, cyme leafy corymbose, sepals narrow oblong, petals white elliptic lanceolate. *S. adenotrichum*, Var. β ., H. f. & T. in Journ. Linn. Soc. ii. 101.

BHOTAN; Griffith.

H. f. & T. probably joined this with *S. adenotrichum* because of the acute petals; but in all other points, especially its weakness and glabrousness, it is nearer *S. rosulatum*. It differs from both in the linear cauline leaves and particularly in the cyme, which is corymbose and somewhat dense, with linear bracts like the cauline leaves.

18. **S. trullipetalum**, H. f. & T. in Journ. Linn. Soc. ii. 102; glabrous, stems 2-4 $\frac{1}{2}$ in., cauline leaves $\frac{1}{4}$ in. imbricate lanceolate-linear acute, cymes dense, petals white-yellow with a very long claw and ovate cordate or lanceolate limb.

TEMPERATE and ALPINE HIMALAYA from SIKKIM to KASHMIR, alt. 11,000-16,000 ft. Rosulate leaves $\frac{1}{4}$ in. long, ovate-lanceolate. Sepals elliptic-lanceolate, acute.

19. **S. Jaeschkei**, Kurz in Seem. Journ. Bot. v. 240; annual, leaves spathulate-oblong acute often rosulate, flowers large golden solitary.

LAHUL, in West Tibet; Jaeschke.

Branches 4-5 in. or less, crowded, simple, or branched from the base. Lower leaves generally densely rosulate; cauline scattered, smaller, narrower, or crowded towards the end of the branches. Flowers solitary at the end of the branches or crowded in dwarf specimens, nearly $\frac{1}{2}$ in. long. Calyx segments $\frac{1}{4}$ - $\frac{1}{2}$ in. long, fleshy, green, similar to and often larger than the leaves. Petals double the sepals, lanceolate, obtuse. Stamens less than half the length of the petals.

The above is closely copied from Mr. Kurz, who evidently possessed better materials than certain scraps transmitted to Kew by Jaeschke and referred by Dr. Thomson to *S. asiaticum*, which has not the elongate leafy branches of the corymb.

There are several points however in which Mr. Kurz' description does not fit the flowering slips (3 in. long) at Kew; Mr. Kurz says that the leaves are shorter than the sepals which are but 3 to 4 lines long; in the Kew examples the leaves on the corymb branches are $\frac{1}{2}$ in. long and more. The Kew slips may however belong to examples of *S. asiaticum* in its first year of flowering.

20. **S. Ewersii**, Ledeb. Fl. Alt. ii. 191; glabrous, stems 4-12 in., cauline leaves $\frac{1}{2}$ -1 in. diam. remote obovate or orbicular opposite or some of the uppermost alternate, cymes usually dense, flowers rose-purple. Ledeb. Fl. Ross. ii. 182, and Ic. Fl. Ross. t. 58; H. f. & T. in Journ. Linn. Soc. ii. 102. *S. Gerardianum*, Wall. Cat. 7235. *S. azureum*, Royle Ill. t. 48. *S. rubrum*, Royle Ill. p. 222; Edgw. in Trans. Linn. Soc. xx. 47.

TEMPERATE and ALPINE HIMALAYA from KUMAON to KASHMIR, alt. 9000-17,000 ft.; frequent.—DISTRIB. Alpine Siberia and Soongaria.

Leaves fleshy, glaucous, entire or sinuate. Cymes sometimes less dense, corymbose with alternate branches. That the flowers are ever blue appears to rest wholly on Royle's figure. Seeds ellipsoid, somewhat obovoid, testa not loose.

** Follicles 3-5, divaricate in fruit.

21. **S. pallidum**, Bieb. Fl. Taur. Cauc. i. 353 and iii. 314; stems 1-5 in. annual solitary cymose at top, carpels minutely squamose-tuberculate, seeds

obovoid finely striate longitudinally. *Ledeb. Fl. Ross.* ii. 185; *H. f. & T. in Journ. Linn. Soc.* ii. 102; *Boiss. Fl. Orient.* ii. 790. *S. Urvillei*, *DC. Prodr.* iii. 408.

PUNJAB PLAIN; Peshawur, *Vicary*; Hurroo and Hassababad, *Aitchison*.—DISTRIB. Afghanistan and thence to Greece.

Glabrous or minutely glandular-pubescent. *Leaves* 1 in., oblong to linear. *Flowers* 5-merous subsessile, white (or rose ex Boissier). *Petals* acute, thrice as long as the triangular acute sepals. *Cyme*-branches minutely glandular, divaricate-recurved in fruit.—A species that has been confounded with *S. multicaule*; it differs in its habitat and is absolutely separate by the seed.

22. ***S. multicaule***, *Wall. Cat.* 7232; glabrous, stem 3-8 in. high usually much divided from the base, carpels not tuberculate, seeds obovoid covered with minute tubercles. *H. f. & T. in Journ. Linn. Soc.* ii. 102. *S. japonicum*, *Sieb. Herb. in Mig. Ann. Mus. Bot. Lugd.-Bat.* ii. 156.

TEMPERATE HIMALAYA, alt. 4000-7000 ft., from KASHMIR to BHOTAN; frequent. —DISTRIB. China and Japan.

Leaves $\frac{1}{2}$ -1 in. long, linear-oblong, acute. *Flowers* subsessile, petals yellow. *Cyme* branches divaricate in fruit, usually elongate, subscorpioid.

23. ***S. perpusillum***, *H. f. & T. in Journ. Linn. Soc.* ii. 103; glabrous, stems 1-2 in. branching crowded, follicles short oblong turgid small, seeds large (therefore few in each carpel) obovoid hispid with elongate papillæ.

SIKKIM, alt. 12,000 ft., *J. D. H.*

Leaves $\frac{1}{2}$ in. long, sessile, oblong or linear. *Cyme* small, leafy. *Flowers* pedicellate, erect. *Sepals* oblong, obtuse. *Petals* white, oblong, a little longer than the sepals. *Follicles* connected $\frac{1}{2}$ their length.—The specimen referred here by *H. f. & T.* collected in the Western Himalaya has different seeds; it is in too imperfect a state for identification.

7. **SEMPERVIVUM**, *Linn.*

Fleshy herbs, often sending up annual flower-stems from a rosette of leaves crowning the perennial rootstock. *Leaves* alternate. *Cymes* paniculate. *Flowers* in the Indian species 8-merous, more rarely 6-8-merous. *Calyx* divided nearly to the base. *Petals* free, or scarcely cohering at the base, oblong-lanceolate. *Stamens* double the number of the petals, free. Hypogynous *scales* small, bifid, united in pairs. *Carpels* equal in number with the petals, free or adnate to the calyx, narrowed upwards into filiform styles; ovules very numerous. *Follicles* many-seeded.—DISTRIB. Species 40, extending from the Canary Islands across South Europe and North Africa to Asia Minor and the Western Himalaya.

1. ***S. acuminatum***, *Dcne. in Jacq. Voy. Bot.* t. 74; leaves mucronate glabrous, pedicels and sepals glabrous or slightly ciliate, sepals oblong-lanceolate acuminate scarcely pubescent, *H. f. & T. in Journ. Linn. Soc.* ii. 92. *S. himalayense*, *Klotzsch in Reis. Pr. Waldem. Bot.* t. 43. *Sedum Moorcroftianum*, *Wall. Cat.* 7228.

ALPINE HIMALAYA, from KUNAWUR to KASHMIR, alt. 10,000-15,000 ft.; WEST TIBET, *Strachey & Winterbottom*, &c.

Stems 4-8 in. high. Rosulate *leaves* 1-2 $\frac{1}{2}$ in. long, obovate-lanceolate or nearly linear; cauline $\frac{1}{2}$ - $\frac{3}{4}$ in., sessile, oblong, acuminate, but little imbricate. *Cyme* somewhat lax. *Petals* glabrous, purple-rose, twice or thrice the sepals. *Seeds* narrow obovoid, striate longitudinally.

2. **S. mucronatum**, *Edgw. in Trans. Linn. Soc. xx. 49*; basal leaves rosulate mucronate ciliate on the edge or glabrous, sepals glandular-pubescent oblong-lanceolate acuminate. *H. f. & T. in Journ. Linn. Soc. ii. 92.*

ALPINE HIMALAYA, from KUMAON to KASHMIR, alt. 10,000-12,000 ft.; KUMAON, *Strachey & Winterbottom*; NITI, *Edgeworth*; GURWHALE, *Falconer*; Kashmir, *Jacquemont*.

Stems 2-6 in. high. *Rosulate leaves* 1-1½ in. lanceolate; cauline sessile, oblong-lanceolate, more or less pubescent. *Cyme* somewhat dense. *Petals* white, scarcely twice the sepals. *Seeds* narrowly obovoid, striated longitudinally, hardly half so big as in *S. acuminatum*.

3. **S. sedoides**, *Dcne. in Jacq. Voy. Bot. t. 74*; basal leaves rosulate oblong-ovate minutely pilose, sepals oblong or somewhat obovate obtuse or at least not acuminate pubescent, carpels distinctly glandular-pilose upwards. *H. f. & T. in Journ. Linn. Soc. ii. 93.* *S. fimbriatum*, *Klotzsch in Reis. Pr. Waldem. Bot. t. 43.* *S. album*, *Edgw. in Trans. Linn. Soc. xx. 49*; *H. f. & T. l. c. 93.*

WESTERN HIMALAYA. Gurwhal, and Pir Punjal KASHMIR, *Falconer*. Kunawur and Kashmir, *Jacquemont*.

Stems 1-3 in. *Rosulate leaves* ¾ in. long; cauline ½-½ in. somewhat densely imbricate, sessile, oblong or elliptic, glandular-pubescent. *Cyme* dense. *Petals* lanceolate (white or rose-white?). *Seeds* narrowly ellipsoid, minutely striate longitudinally.

8. **TRIACTINA**, *H. f. & T.*

A weak succulent herb. *Leaves* alternate and verticillate. *Flowers* yellow, in lax leafy cymes. *Calyx* 5-partite. *Petals* 5, free, yellow. *Stamens* 10. Hypogynous glands 3, linear. *Carpels* 3, connate to the middle; ovules several in each carpel. *Follicles* 3, connate to the middle, divaricate above, 1-seeded.

1. **T. verticillata**, *H. f. & T. in Journ. Linn. Soc. ii. 103.*

SIKKIM, alt. 10,000-12,000 ft.; Lachen, *J. D. H.*; Tumbok, *C. B. Clarke*.

Glabrous. *Stems* 4-10 in. long. *Leaves* ½-1½ in. long, entire, narrowly obovate. *Flowers* subsessile. *Sepals* very small. *Seed* ellipsoid, somewhat obovoid, hispid with elongate papillæ.

This plant by the characters of its carpels and seeds is very closely allied to *Sedum perpusillum* *H. f. & T. H. f. & T. in Journ. Linn. Soc. ii. 90* characterise *Triactina* as having polyspermous follicles; the material collected by Sir J. D. Hooker was scanty, and the subsequent collections of C. B. Clarke have all the follicles 1-seeded.

ORDER LIV. **DROSERACEÆ**. (By C. B. Clarke, F.L.S.)

Herbs; catching insects by means of glandular sticky hairs, or by means of petioled leaves with automatically closing laminae. *Flowers* hermaphrodite, regular. *Calyx* 4-5- (rarely -8-)partite, or sepals free imbricate persistent. *Petals* and *stamens* as many as the sepals, hypogynous or nearly so. *Ovary* nearly free, globose or ovoid, 1-3-celled; styles 5-3, capitate fimbriate or bifid; ovules numerous, on parietal placentæ equal in number to the styles. *Capsule* membranous 5-3-valved, many-seeded. *Seeds* with fleshy albumen; embryo cylindric or minute.—**DISTRIB.** Species 110, spread over nearly all temperate and tropical lands except the islands of the Pacific.

Leaves glandular; cauline 0 or alternate 1. **DROSERA**.
Cauline leaves whorled vesicular glabrous. 2. **ALDROVANDA**.

1. **DROSERA**, Linn.

Perennial herbs, scapigerous or with a leafy stem, glandular-pilose. *Leaves* rosulate or alternate, usually circinate in veneration; stipules 0 or scarious and adnate to the petiole. *Calyx* free from the ovary, 4-8-partite, sepals persistent. *Petals* 4-8, hypogynous or scarcely perigynous, white or rose, withering persistent. *Stamens* as many as the petals, hypogynous or scarcely perigynous. *Ovary* 1-celled with 2-5 styles; ovules parietal, numerous. *Capsule* loculicidally 2-5-valved. *Seeds* numerous, in the Indian species obovoid-ellipsoid with the testa black smooth reticulate not lax.—**DISTRIB.** Species 100, scattered throughout the world except Polynesia; very numerous in Australia.

1. **D. Burmanni**, Vahl. *Symb.* iii. 50; leaves all radical rosulate cuneate-spathulate, stipules equalling half the petiole, scapes 1-3 glabrous, flowers racemose with glabrous pedicels, styles 5 undivided. *Don Prodr.* 212; *DC. Prodr.* i. 318; *Roxb. Fl. Ind.* ii. 113; *Wall. Cat.* 1242; *Wight. Ill.* t. 20 (*the styles incorrect*); *Wight Ic.* t. 944; *W. & A. Prodr.* 34; *Planch. in Ann. Sc. Nat.* ser. iii. vol. ix. 190; *Miq. Fl. Ind. Bat.* i. pt. ii. p. 120; *H. f. & T. in Journ. Linn. Soc.* ii. 82; *Thwaites Enum.* 21; *Dalz. & Gibs. Bomb. Fl.* 12; *Kurz in Journ. As. Soc.* 1876, pt. ii. 310.

Throughout INDIA in the Plains, from CEYLON and Bombay to the base of the HIMALAYA and BURMAH; abundant; ascending to 4000 ft. in the Himalaya, and 8000 ft. in the Deccan.—**DISTRIB.** China and Japan, Malaya, West Africa, Australia.

Leaves $\frac{1}{2}$ -1 $\frac{1}{2}$ in. long. *Scapes* 2-8 in. high; pedicels erect in fruit. *Calyx* minutely papillose.

2. **D. indica**, Linn. *Sp. Pl.* 403; stem decumbent elongate with alternate long linear leaves, racemes leaf-opposed, styles 3 bifid to the base. *DC. Prodr.* i. 319; *Roxb. Fl. Ind.* ii. 313; *Wall. Cat.* 1244; *Wight. Ill.* t. 20 (*the styles incorrect*); *W. & A. Prodr.* 34; *Planch. in Ann. Sc. Nat.* ser. iii. vol. ix. 204; *Miq. Fl. Ind. Bat.* i. pt. ii. p. 120; *H. f. & T. in Journ. Linn. Soc.* ii. 82; *Thwaites Enum.* 21; *Dalz. & Gibs. Bomb. Fl.* 12; *Kurz in Journ. As. Soc.* 1876, pt. ii. 310. *D. Finlaysoniana*, *Wall. Cat.* 3752. *D. serpens*, *Planch. l. c.* 204; *Rheede Hort. Mal.* x. t. 20.

CEYLON and the DECCAN as far north as CHOTA NAGPORE, frequent; BURMA and the MALAY PENINSULA (but not known in the Gangetic Plain).—**DISTRIB.** China, Malaya, Tropical Australia, Africa.

Stems 2-12 in., simple, rarely branched. *Leaves* 1-3 in., very glandular-pubescent, hardly broader than the glabrous petiole. *Racemes* 2-6 in.; pedicels $\frac{1}{3}$ - $\frac{2}{3}$ in. *Sepals* lanceolate, minutely glandulose or nearly glabrous. *Seeds* obovoid; testa prominently reticulated, not scrobiculate nor differing essentially from the seeds of the other two Indian species.

3. **D. peltata**, Sm. in Willd. *Sp. Pl.* i. 1546; stem erect leafy, leaves alternate long petioled lunate peltate, sepals ovate glabrous erose or fimbriate, styles 3 fimbriate. *DC. Prodr.* i. 319; *Sm. Exot. Bot.* t. 41 (*wrong as to colour of the flowers*); *Don Prodr.* 212; *Wight. Ill.* t. 20; *W. & A. Prodr.* i. 34; *Planch. in Ann. Sc. Nat.* ser. iii. vol. ix. 296; *Kurz in Journ. As. Soc.* 1876, pt. ii. 310. *D. lunata*, Ham.; *DC. Prodr.* i. 319; *Wall. Cat.* 1243; *Hook. Ic. Pl.* t. 54; *Planch. l. c.* 296; *Miq. Fl. Ind. Bat.* i. pt. ii. p. 120; *H. f. & T. in Journ. Linn. Soc.* ii. 82; *Thwaites Enum.* 22. *D. gracilis* and *D. foliosa*, *Hook. f.*; *Planch. l. c.* 297, 298. *D. Lobbiana*, Turcz. (*vide Kurz*).

Throughout INDIA. Var. 1 confined to the Malayan Peninsula; var. 2 ascending to 10,000 ft. in the Himalaya, and 8000 in the Nilghiris.—DISTRIB. Malay Archipelago to Australia.

Stems 3–12 in. high, simple or corymbose upwards. *Racemes* subterminal, pedicels $\frac{1}{2}$ – $\frac{2}{3}$ in. long. *Flowers* white. *Seed* as in the preceding species; with a close testa (as Benth. correctly) and not tuberculate, which Planchon says it is. This plant turns very black in drying, but often stains the drying paper purple.

VAR. 1. *typica*; rosulate leaves persistent, sepals very fimbriate. MOULMEIN and SINGAPORE.

VAR. 2. *lunata*; rosulate leaves early deciduous, sepals erose or but slightly fimbriate.

[D. INTERMEDIA of *Herb. Royle* is stated to have been collected in N. W. India; which, as Royle's specimens are *D. peltata typica*, is improbable. *D. intermedia* of W. & A. Prodr. 34 is probably founded on the specimen so named and still preserved in Wight's Herbarium which seems to have been collected, not in India, and by a Dr. Haynes, not Heyne.]

2. ALDROVANDA, Linn.

A weak succulent diaphanous glabrous floating herb in water. *Stems* articulate, with whorls of spatulate-orbicular leaves at the nodes, the laminae $\frac{1}{8}$ – $\frac{1}{4}$ in. diam., contorted, bladderly. *Flowers* peduncled, axillary, solitary. *Calyx* 5-partite. *Petals* 5, hypogynous, connivent in a cap. *Stamens* 5, hypogynous. *Ovary* 1-celled; styles 5 with terminal branching stigmas; ovules numerous, on 5 parietal placentæ. *Capsule* globose, 5-valved. *Seeds* numerous, broad, oblong, testa black shining.

1. *A. vesiculosa*, Linn.; DC. Prodr. i. 319; Reich. Iconogr. Europ. iii. t. 24; H. f. & T. in Journ. Linn. Soc. ii. 83; W. & A. Prodr. 34; Planch. in Ann. Sc. Nat. ser. iii. vol. ix. 304. *A. verticillata*, Roxb. Fl. Ind. ii. 112.

Salt-pans south of CALCUTTA; Roxburgh; T. Thomson; S. Kurz.—DISTRIB. Central Europe and Australia.

ORDER LV. HAMAMELIDÆ. (By C. B. Clarke, F.L.S.)

Trees or shrubs, often with stellate pubescence; prosenchyma of the wood marked with discs as in the *Coniferae*. *Leaves* alternate, petiolate, simple or palmately lobed; stipules 1–2, rarely wanting, deciduous or rarely persistent. *Flowers* hermaphrodite or unisexual, collected into heads, spikes, or close racemes, or spikes. *Calyx* small or 0, adnate to the ovary; free in *Distylium*. *Petals* 0, or 4–5 perigynous or nearly epigynous. *Stamens* 4– ∞ , perigynous, or in *Distylium* hypogynous; anthers dehiscent longitudinally; the valves deciduous in *Loropetalum*. *Ovary* 2-celled; styles 2, separate and ultimately divaricate, persistent (deciduous in *Altingia*); ovules 1– ∞ , axile, pendulous. *Capsule* woody, dehiscent at the vertex across the dissepiment so as to split each style in two, and in some genera also afterwards imperfectly dehiscent through the dissepiment; endocarp often horny separating from the exocarp. *Seeds* 1, or many when usually only the lowest in each cell is perfect.—DISTRIB. Species 30; found in Asia from Persia and the Himalaya to Malaya China and Japan; in North America and in South Africa.

A. Ovules solitary in each cell.

* *Petals* 0.

Ovary half-inferior. Leaves deciduous. Stamens 5-7 . . . 1. *PARROTTIA*.
 Ovary superior. Flowers separate, not in heads . . . 2. *DISTYLIUM*.
 Ovary half-inferior. Leaves persistent. Stamens 8 . . . 3. *SYCOPSIS*.

** *Petals present*.

Petals obovate-spathulate. Anthers blunt. Leaves deciduous. 4. *CORYLOPSIS*.
 Petals 4, linear. Connective horned. Leaves persistent . . 5. *LOROPETALUM*.
 Petals 5, linear. Calyx-tube circumscissile. Leaves persistent 6. *MAINGAYA*.

B. Ovules several in each cell.

Male flowers with a perianth. Leaves cordate-ovate, entire . 7. *BUCKLANDIA*.
 Male flowers without a perianth. Leaves oblong-lanceolate,
 serrate 8. *ALTINGIA*.

1. *PARROTTIA*, C. A. Mey.

Large branching shrubs. *Leaves* alternate, orbicular or oblong, crenate, deciduous; stipules large, early deciduous. *Flowers* hermaphrodite, appearing before the leaves, in capitate heads surrounded by large membranous bracts. *Calyx* half-adherent to the ovary; limb 5-7-fid. *Petals* 0. *Stamens* equal in number and opposite to the calyx-lobes, perigynous; anthers dehiscing by a longitudinal slit. *Ovary* 2-celled; styles 2, soon divaricate, with simple stigmas; ovules solitary in each cell, pendulous. *Capsule* woody; endocarp horny, separating from the exocarp. *Seed* narrowly ellipsoid, testa shining stramineous or scarcely brown.—*DISTRIB.* Species 2, one in Kashmir, one in Persia.

1. *P. Jacquemontiana*, Dcne. in *Jacq. Voy. Bot.* t. 82; anthers less than $\frac{1}{10}$ in. long subquadrate, ovary and fruit with long woolly pubescence. *H. f. & T. in Journ. Linn. Soc.* ii. 85; *Brandis For. Fl.* p. 216, t. xxviii. *Fothergilla involucreata*, Falc. in *Proc. Linn. Soc.* i. 18 (*without description*).

KASHMIR, alt. 5000-9000 ft.; common.

A gregarious bush 6-12 ft. high, closely resembling a hazel; twigs and leaves beneath with stellate pubescence. *Leaves* 2-3 in. diam., blunt, petiole $\frac{1}{2}$ in. long. *Flowers* small, involucrel bracts obovate $\frac{3}{4}$ in. long. *Calyx*-segments narrow, oblong or linear. *Fruit* in harsh spherical heads 1-1 $\frac{1}{2}$ in. diam.

2. *DISTYLIUM*, Sieb. & Zucc.

Small trees. *Leaves* alternate, persistent, coriaceous, entire, oblong-lanceolate; stipules lanceolate, early deciduous. *Flowers* small, in short upright axillary spikes, polygamous, not congested. *Calyx* free, deeply 3-5-fid, imbricate; sometimes wanting. *Petals* 0. *Stamens* 2-8, hypogynous; anthers dehiscing by a longitudinal slit. *Ovary* superior, 2-celled; styles 2, soon distant at base, with capitate stigmas; ovule solitary in each cell, attached near the upper inner angle. *Capsule* woody; endocarp horny, separating from the exocarp. *Seed* narrowly ellipsoid, testa shining, stramineous.—*DISTRIB.* Species 2; one in Khasia, one in China and Japan.

1. **D. indicum**, *Benth. in Herb., Griff.* No. 3377; leaves 3-4 in. more or less stellately pubescent beneath, petiole $\frac{1}{2}$ in., unripe fruit $\frac{3}{8}$ in. long densely stellate tomentose.

KHASIA MTS.; *Griffith.*

Griffith's specimens are all in half-ripe fruit. *Bark* lenticelled, the end of the twigs and stipules with rusty stellate pubescence. *Spikes* 1-3 in. long, with stellate pubescence, each bearing 2-4 fruits, pedicels $\frac{1}{2}$ -1 in. long. The *calyx* seems to have been early deciduous. *Styles* very long.—This species appears near the typical *D. racemosum*, Sieb. & Zucc. but has larger leaves not glabrous and much larger fruits; the ripe fruits in *D. racemosum* do not exceed $\frac{1}{2}$ in. long. *D. racemosum* is a tree 25 ft. high.

3. SYCOPSIS, Oliv.

A tree (or shrub). *Leaves* alternate, petioled, entire, coriaceous, lanceolate; stipules minute, early deciduous. *Flowers* unisexual, in small close axillary spikes, both sexes in the same spike. **MALE**: calyx very small; petals 0; stamens 8 (of which number several appear abortive); rudimentary ovary 2-fid. **FEMALE**: calyx-tube adnate to the ovary for $\frac{3}{4}$ its height; petals 0; ovary 2-celled; styles 2 separate; ovules solitary in each cell pendulous.

1. **S. Griffithiana**, *Oliv. in Trans. Linn. Soc. xxiii. 83 with a figure; Benth. & H. f. Gen. Pl. i. 666.*

KHASIA MTS.; *Griffith.*

Boughs much branched with lenticular bark. *Leaves* 2-3 in. with stellate pubescence when young but soon glabrous; petiole $\frac{1}{2}$ in. long. *Spikes* less than 1 in. stellately pubescent (and with sheathing bracts *Benth. & H. f.*). Young fruits $\frac{1}{8}$ in. diam., white-tomentose with close matted stellate hairs. *Anthers* dehiscent longitudinally.—Specimens imperfect.

4. CORYLOPSIS, Sieb. & Zucc.

Shrubs in habit leaves and inflorescence resembling hazels. *Leaves* alternate, petioled, ovate or oblong, serrate, deciduous; stipules large, deciduous. *Flowers* appearing before the leaves in pendulous racemes, each flower nearly sessile with a large sheathing bract. *Calyx*-tube adnate to the ovary, limb of 5 valvate lobes. *Petals* 5, perigynous, obovate-spathulate. *Stamens* 5, perigynous; anthers separated by a somewhat broad connective, dehiscing longitudinally laterally. *Scales* 5, alternate with the stamens, or 10-15 irregularly placed. *Ovary* half-inferior, 2-celled; styles two, soon divaricate; ovules 1 in each cell, pendulous. *Capsule* woody, endocarp horny, separating from the exocarp. *Seeds* narrowly ellipsoid, testa black shining.—**DISTRIB.** Species 4, extending from East Bengal through China to Japan.

1. **C. Himalayana**, *Griff. in Journ. Asiat. Soc. Bengal, xxiii. 642, with a figure wherein the name is changed to C. grata*; twigs petioles and peduncles stellate-tomentose or pubescent, bracts and calyces silky, racemes dense in fruit. *H. f. & T. in Journ. Linn. Soc. ii. 85.* Hamamelida, *Griff. Ic. Pl. Asiat. t. 633 (excellent).*

KHASIA MTS., alt. 4000-6000 ft., common. BHOTAN, alt. 5000-8000 ft.; *Griffith.*

About 6 ft. high; bark lenticelled. *Leaves* 4 in., round-ovate and acute, or smaller and narrower, often cordate at base with a petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in., plicate, glabrous above, pilose silky or tomentose beneath; nerves straight, parallel, prominent. *Petals* obovate or elliptic, unguiculate, yellow-white.—*C. multiflora*, Hance, from the tea districts of Fokien, hardly differs except that the nerves of the leaves are much fewer and wider apart, and that the petals have a very long claw and round limb.

5. **LOROPETALUM**, Br.

A much branching woody shrub. *Leaves* alternate, oblong, entire, persistent; stipules membranous, soon deciduous. *Flower-heads* peduncled, quasi-terminal, ebracteate, of 6–8 sessile flowers. *Calyx-tube* adnate to the ovary, limb of 4 valvate lobes. *Petals* 4, perigynous, linear, circinate in æstivation. *Stamens* 4, perigynous, filaments very short, connective produced as a horn. Hypogynous *scales* 4, very small. *Ovary* half-inferior, 2-celled; styles 2, distinct, soon divergent; ovules in each cell 1, pendulous. *Capsule* woody, ovoid, endocarp horny, separating from the exocarp. *Seeds* narrowly ellipsoid, testa black shining.

L. chinense, Oliv. in *Trans. Linn. Soc.* xxiii. 459. *Hamamelis chinensis*, Br. in *Abel China*, 375, with a figure; suggesting the new genus *Loropetalum*. DC. *Prodr.* iv. 269; H. f. & T. in *Journ. Linn. Soc.* ii. 85.

KHASIA MTS. alt. 4000–5000 ft.; J. D. H. & T. Thomson.—DISTRIB. South China.

Twigs and inflorescence with much stellate pubescence. *Leaves* 1– $2\frac{1}{2}$ in. long, stellate-hairy on both surfaces (small in the Chinese specimens), acute, from a rounded base; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in. long. *Petals* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, 4 or 5 times the sepals, yellowish. *Anthers* short, the edges of the valves bent in to meet the connective, so that the young stamen has 4 pseudo-cells; the valves open from the connective and soon after drop off altogether.

6. **MAINGAYA**, Oliver.

A tree. *Leaves* alternate, undivided, petioled, persistent; stipules small, deciduous. *Heads* peduncled, quasi-terminal, ebracteate, of about 15 flowers. *Calyx-tube* adherent to the ovary; the limb closed, splitting up on one side a little way from the base and then circumscissile deciduous in a cap. *Petals* 5, perigynous, linear, circinate in æstivation. *Stamens* 5, perigynous, filaments very short, connective produced as a horn. *Scales* about 10, very small. *Ovary* half-inferior, 2-celled; styles 2 distinct, short; ovule 1 in each cell, pendulous. *Capsule* woody, ovoid, endocarp horny, separating from the exocarp. *Seeds* unknown.

1. **M. malayana**, Oliv. in *Trans. Linn. Soc.* xxviii. 517, t. 44.

PENANG; *Maingay*, No. 1871.

A tall tree with rather small stem (ex *Maingay*), glabrous, the innovations peduncles and calyx with stellate hairs. *Leaves* 3–5 in. long, oblong-lanceolate, petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. long glabrous. *Petals* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, 4–6 times the sepals. Dehiscing *capsule* $\frac{1}{2}$ in. long and $\frac{1}{2}$ in. broad.—*Maingay* differs from *Loropetalum* in the 5 not 4 petals, in the habit, but particularly in the calyx-limb circumscissile falling off in a cap before the flower expands.

7. **BUCKLANDIA**, Br.

A tree attaining 80 ft. high. *Leaves* alternate, cordate-ovate, acuminate, entire, long-petioled; stipules solitary or in pairs, large, oblong, coriaceous, deciduous. *Inflorescence* of 2-5-peduncled heads, at first enclosed between a pair of stipules; flowers adnate by their calyces, about 8 in a head, polygamous. *Calyx-tube* adnate to the ovary; limb 5-lobed. *Petals* in the ♂ flower linear-spathulate, fleshy, variable in number; in the ♀ rudimentary. *Stamens* 10-14 (in the ♀ 1 one); filaments long. *Ovary* half-inferior, 2-celled; styles 2, separate, soon divaricate; ovules in each cell 6 in two rows. *Capsule* nearly superior, woody, subglobose, endocarp horny, showing a tendency to separate from the exocarp. *Seeds* in each cell 6, oblong, trigonous; the upper wingless solid, without any embryo, the lower one in each cell winged fertile.

1. **B. populnea**, Br. in Wall. Cat. 7414; Griff. in Asiat. Res. xix. 95, with two plates. *B. populifolia*, H. f. & T. in Journ. Linn. Soc. ii. 86; Kurz Forest Fl. Brit. Burma, i. 445. *Liquidambar tricuspis*, Miq. Fl. Ind. Bat. i. pt. i. 1097 and Suppl. 346, with a figure.

TEMPERATE HIMALAYA, from NEPAL to BHOTAN, alt. 5000-8000 ft., common. KHASIA MTS., alt. 4000-6000 ft., common. BURMAH, Griffith, Kurz.—DISTRIB. Java, Sumatra.

Branches and adult leaves glabrous. *Leaves* 3-8 in. with a cartilaginous edge, quite entire or 3-cuspidate especially in young plants, petiole 1-5 in. glabrous or when young densely silky with brown hairs. *Peduncles* (at least at first) densely brown silky; as are the young ovaries.—The Malayan *Liquidambar tricuspis* does not differ in the smallest point from Himalayan specimens some of which have tricuspidate leaves and sericeous petioles. Cf. Kurz in Flora, 1871, p. 289.

8. **ALTINGIA**, Noronha.

Trees. *Leaves* alternate, petioled, ovate or oblong, glandular-serrate, persistent; stipules deciduous or persistent. *Flowers* in dense heads; heads wrapped by a large bract, males racemose, females solitary. MALE heads a mass of stamens with very short filaments, probably representing numerous achlamydeous flowers. *Anthers* obverse-pyramidal, the valves when young turned in till they reach the connective so that the young stamen is pseudo-4-celled; dehiscing longitudinally. FEMALE heads of 12-20 flowers; calyces confluent, without limb. *Petals* 0 (some rudimentary stamens have been taken for petals). *Ovary* $\frac{3}{4}$ -inferior, 2-celled; styles 2, separate, deciduous; ovules numerous, axile. *Fruit-head* globose, harsh. *Seeds* numerous; lowest 1-2 of each cell winged fertile, the upper without wing or embryo.—DISTRIB. Species 2; extending from East Bengal to China and Malaya.

1. **A. excelsa**, Noronha in Verh. Bat. Genootsch v. 41, ex Benth. & Hook. f. Gen. Pl. i. pt. ii. 669; leaves elliptic-lanceolate acuminate, petiole 1-1½ in. Kurz Forest Fl. Brit. Burma, i. 446. *Sedgwickia cerasifolia*, Griff. in Asiat. Res. xix. 99, with two plates. *Liquidambar Altingia*, Blume Fl. Jav. fasc. xvii. 8, with a figure; H. f. & T. in Journ. Linn. Soc. ii. 86; Miq. Fl. Ind. Bat. i. pt. i. 836. *L. Altingiana*, Blume Bijl. 527.

ASSAM and BHOTAN; *Griffith*. PEGU and MERGUI, *Kurz*.—DISTRIB. Java, Yunan. A tree 60–100 ft. high. *Leaves* 3–4½ in., glabrous on both surfaces, or with tufts of hairs in the axils of the nerves beneath.—The only other species, *A. chinensis*, differs in its thicker leaves, less acuminate, and much more shortly petioled.

ORDER LVI. **HALORAGÆÆ.** (By C. B. Clarke, F.L.S.)

Herbs, either weak aquatics or small land plants. *Leaves* opposite or whorled (or in the Indian species occasionally partly alternate) when submersed often pectinately pinnatifid; stipules 0. *Flowers* axillary, solitary or clustered, sessile less often pedicelled, the whorls often simulating a spike; hermaphrodite or unisexual, always small. *Calyx-lobes* 4 or 0. *Petals* 4 epigynous or 0. *Stamens* 8, 4, or 1 epigynous in the hermaph. flowers. *Ovary* inferior, 4-, 2- or 1-celled; styles 4, 2 or 1, fimbriate or simple; ovules 4, pendulous (or in *Hippuris* 1). *Fruit* small dry or drupaceous, 4–2–1-celled, indehiscent or separating into its carpels; seeds 4 or more rarely 1.—DISTRIB. Species 80, many aquatic; spread over the whole globe.

Terrestrial. Flowers all sessile or subsessile. Stamens 8 . . .	1. HALORAGIS.
Terrestrial. Male flowers pedicelled. Stamens 8	2. SERPICULA.
Aquatic. Stamen 1. Style 1. Ovule 1.	3. HIPPURIS.
Aquatic. Stamens 8 or 4. Styles 4. Seeds 4	4. MYRIOPHYLLUM.
Aquatic or subaquatic. Stamen 1. Styles 2. Seeds 4 . . .	5. CALLITRICHE.

1. **HALORAGIS**, *Forst.*

Branching wiry herbs. *Leaves* opposite, the upper sometimes alternate, toothed, rigid. *Flowers* minute, nearly sessile in the axil of bracts, spicate or racemose, partially unisexual or hermaphrodite. *Calyx-tube* 4–8-ribbed; lobes 4 erect persistent acute valvate. *Petals* 4 coriaceous, often wanting in the ♀. *Stamens* 8 epigynous. *Ovary* 2- or 4-celled with 4 pendulous ovules; stigmas 4 (in the females at least) sessile, feathery. *Fruit* a dry 2–4-celled 2–4-seeded nut; but in the two Indian species by abortion 1-celled 1-seeded.—DISTRIB. Species 40; reaching from Japan and East Bengal to New Zealand; Australia being the centre of the genus; one species found in Juan Fernandez.

1. **H. micrantha**, *Br. in Flinders Voy.* ii. 550; glabrous, leaves ovate acute denticulate, flowers in terminal often subpaniculate racemes. *Benth. Fl. Austral.* ii. 482. *H. tenella*, *Brongn. in Duperr. Voy.* t. 68. *Gonocarpus micranthus*, *Thunb. Fl. Jap.* t. 15; *DC. Prodr.* iii. 66. *Gonicarpus micranthus*, *Koen. & Sims Ann. Bot.* i. 546, t. 12.

KHASIA MTS., alt. 5000–7000 ft., *Griffith, J. D. H. & T. Thomson.* SIKKIM, alt. 8000–10,000 ft., *J. D. H.*—DISTRIB. From Sikkim and Japan across China Malaya and Australia to New Zealand.

A wiry branching herb, stems 4–16 in. *Leaves* ½ in., opposite, very shortly petioled; upper sometimes alternate passing by degrees into the lower bracts. *Flowers* very small; pedicels about ⅓ in. *Petals* thrice the triangular sepals. *Fruit* about ⅓ in. long, shining, glabrous with 8 ribs, 1-celled, 1-seeded.

2. **H. tetragyna**, *Hook. f. Fl. New Zealand*, i. 62; harshly though often minutely scabrous, leaves lanceolate (ovate in the New Zealand form) serrate, flowers in terminal often subpaniculate spikes. *H. scabra*, *Benth. Fl. Hongk.*

139. *Goniocarpus scaber*, *Koen. & Sims Ann. Bot.* i. 547, t. 12; *DC. Prodr.* iii. 66. *G. tetragyna*, *Labill. Fl. Nov. Holl.* i. t. 53.

KHASIA Mts., alt. 5000-6000 ft.; between Nunklow and Myrung, and at Kul-long; *J. D. H. & T. Thomson*.—DISTRIB. China, Malaya, Australia, New Zealand.

A suberect rigid herb 4-10 in. high with many branches. *Leaves* $\frac{3}{4}$ in. in the Khasia examples oblong acute, as in the Chinese; in the New Zealand much shorter often ovate; opposite, the upper sometimes alternate, passing by degrees into the bracts. *Flowers* sessile, very small. *Sepals* triangular with a cartilaginous recurved border. *Petals* twice the sepals, scabrous-pilose on their backs. *Fruit* with 8 (often obscure) ribs, tubercular, scabrous and covered also with most minute white points, 1-celled, 1-seeded.—The Australian specimens agree with those of Bengal in these minute points; and moreover the fruit appears in the Australian specimens uniformly 1-seeded (as stated correctly by Koenig for the Chinese plant) and not 4-seeded (as stated and figured by La Billardiére).

2. SERPICULA, Linn.

Herbs, small, decumbent, branching. *Leaves* opposite or alternate (often on the same plant). *Flowers* monœcious, minute, clustered in the same axils, the females sessile the males pedicelled. MALE: calyx-tube short, lobes 4 ovate acute; petals 4, cucullate; stamens 8; stigmas 4, rudimentary. FEMALE: calyx-tube long, lobes 4 ovate acute; petals and stamens 0; ovary 1-celled; styles 4 spreading with papillose or plumose stigmas; ovules 4, pendulous. *Nut* minute, ovate, 1-seeded, 8-ribbed or smooth.—DISTRIB. Species 2-4 in the marshes of warm Asia, Africa, and America.

1. *S. zeylanica*, *Arn. in Herb.*; suffruticose, leaves linear or linear obovate entire or with 1-3 linear small teeth on each edge, fruit glabrous 8-ribbed tuberculate on the ribs. *S. indica*, *Thwaites partim*, viz. C.P. No. 447, 146. *Haloragis oligantha*, *Arn. Pugillus Pl. Ind. Or.* 18, not of *W. & A. Prodr.*

CEYLON; Adams Peak, *Thwaites*.

Glabrous. *Stems* 6-16 in. *Leaves* $\frac{1}{4}$ - $\frac{3}{4}$ in. opposite and alternate on the same stem, densely approximated. *Pedicels* of the male fl. equalling the leaves. *Stamens* 8. *Fruit* most minutely punctulate between the ribs not pilose.

VAR. *minor*; stems very delicate scarcely 2 in. *S. indica* *Thwaites* β . *minor* No. 146 partly. Ceylon, Central Provinces; *Thwaites*. Appears worthy of specific distinction, but Mr. Thwaites treats it as a variety.

2. *S. indica*, *Thwaites Enum.* p. 123 partly; leaves obovate-oblong or obovate dentate-serrate, fruit with minute glands and very small white hairs, ribs very obscure or generally altogether wanting. *S. brevipes* and *S. hirsuta*, *W. & A. Prodr.* 338. *S. hirsuta*, *Wight. Ic.* 1001; *Arn. Pugillus Pl. Ind. Or.* 18. *Serpicula* sp., *Wall. Cat.* 7488.

CEYLON and Mts. of the DECCAN PENINSULA, alt. 6000-8000 ft., frequent. *Myrsore, T. Lobb*.

Pilose, or sometimes glabrous except the ovary and calyx. *Leaves* $\frac{1}{4}$ - $\frac{1}{2}$ in. usually minutely ciliate on the edges, opposite with the upper ones alternate, or with some lower leaves alternate also; or all opposite. *Pedicels* of the male flowers usually as long as the leaves, often much longer. *Stamens* 8. *Fruit* generally very free from ridges or tubercles.

S. veronicaefolia, Bory of Java; Tulasne in Ann. Sc. Nat. ser. 4. vi. 126, slightly differs from the most glabrous Indian specimens (*S. brevipes* W. & A.) by being quite glabrous, more robust in habit, a brighter red colour, and the fruit more tuberculate.

SERPICULA VERTICILLATA, Roxb. Cor. Pl. t. 164 and Fl. Ind. iii. 578 is Hydrilla verticillata Richard among the Vallisneriæ.

3. HIPPURIS, Linn.

A glabrous water plant, the stems thick, simple, leafy. Leaves in whorls of 4-6-12, linear or oblong. Flowers minute, solitary, sessile in the axils of the leaves; hermaphrodite or unisexual. Calyx-tube subcylindric, limb entire. Petals 0. Stamen 1, epigynous. Ovary inferior, 1-celled; style 1, linear, stigmatose along nearly its whole length; ovule 1, pendulous. Drupe ellipsoid, very smooth, indehiscent, with a thick wall.

1. *H. vulgaris*, Linn. Sp. Pl. p. 6; DC. Prodr. iii. 71; Engl. Bot. t. 763; Boiss. Fl. Orient. ii. 754.

WEST TIBET, alt. 10,000-15,000 ft.; Falconer, T. Thomson, Strachey & Winterbottom.—DISTRIB. Cabul; Dahuria; and in the frigid or cool temperate waters of the whole Northern Hemisphere; also at Magellan Straits.

Leaves in the Tibet specimens about 1 in. 6-10 in the whorl. Flowers in the upper part of the stem that emerges from the water; lowest part of the stem losing its leaves.—In all respects agreeing with the common European type.

4. MYRIOPHYLLUM, Linn.

Herbs, glabrous, their stems floating. Leaves dentate-serrate or pectinate-pinnatifid, rarely entire, whorled in the Indian species except *M. intermedium*. Flowers small, sessile or nearly so, in the axils of floral leaves or in nearly naked spikes; monœcious or hermaphrodite. MALE: calyx-tube short, limb 2-4-fid or 0; petals 2-4; stamens 2-8. FEMALE: calyx-tube deeply 4-furrowed, limb 0 or of 4 minute lobes; petals minute or 0; ovary inferior, 4- or 2-celled; styles 2 or 4, short, usually recurved with plumose stigmas; ovules solitary in each cell, pendulous. Fruit 4-furrowed or separating into 4 or 2 carpels.—DISTRIB. Species 15, found all over the world.

Wight's Herb. No. 942 named *M. indicum* Willd. consisted really of *M. intermedium* DC. and *M. tuberculatum* Roxb. mixed together. The single plate we have illustrating Indian *Myriophyllum* viz. Wight Ill. t. 102 is made up of a stem of *M. intermedium* together with an analysis of the fruit (very good) of *M. tuberculatum*.

Further, the plate of *Haloragis oligantha* Wight Ic. t. 1061 is *M. intermedium* DC., as are Wight's own herbarium specimens of his *Haloragis oligantha*; but not so Arnott's, as see under *Serpicula zeylanica* above.

Lastly, though Wight's Herb. 942 was named *M. indicum*, Willd., Wight's own Herb. No. 1094 is truly *M. indicum* as Arnott quotes it to be in W. & A. Prodr. 339.

1. *M. tuberculatum*, Roxb. Hort. Beng. 12; Fl. Ind. i. 451; spikes in fruit subterminal, floral leaves $\frac{1}{4}$ - $\frac{3}{4}$ in. linear cuneate toothed upwards, fruit $\frac{1}{8}$ in. long, a broad furrow between the acute carpel-backs, both the ridges and the broad furrows carrying pointed small tubercles. Wall. Cat. 6337; DC. Prodr. iii. 69; Miq. Fl. Ind. Bat. i. pt. i. 635. *M. intermedium*, Wight Ill. t. 102 as to the fruit only. *M. indicum*, Griff. Not. iv. 687.

ASSAM and EAST BENGAL. Very common in the jheels, but no specimen from west of Calcutta.

Upper whorls usually of male flowers, lower of female; hermaphrodite flowers

also occur. *Stamens* always 4, but the number is probably not constant. *Stigmas* pink, much fimbriate. *Fruit* looked down upon appears stellate.

2. ***M. indicum***, Willd. *Sp. Pl.* iv. 407; spikes in fruit subterminal, floral leaves $\frac{1}{2}$ in. narrow-lanceolate or linear-lanceolate, upper entire or crenate, fruit scarce $\frac{1}{16}$ in. long but much broader, carpels 4 rounded on the back but separated by wide furrows tubercled and puberulous or finally quite smooth and glabrous. Wall. *Cat.* 6338; DC. *Prodr.* iii. 68; W. & A. *Prodr.* 339; *Miq. Fl. Ind. Bat.* i. pt. i. 634. *M. tetrandrum*, Roxb. *Fl. Ind.* i. 451; *Griff. Notul.* iv. 686; W. & A. *Prodr.* 339; *Miq. l.c.* 634. [*M. indicum*, *Wight Ill.* t. 102 to be altogether excluded.]

ASSAM and BENGAL, in the jheels and canals, common, COROMANDEL coast and CEYLON.

Upper whorls of male flowers, lower of female, intermediate often hermaphrodite. *Stamens* 4. *Stigmas* green, little fimbriate. *Fruit* looked down upon appears stellate.

There is a variety with longer floral leaves, so that the inflorescence is hardly terminal, and with the leaves not quite opposite; but the fruit noway approaches that of *M. intermedium*.

3. ***M. verticillatum***, Linn.; Boiss. *Fl. Orient.* ii. 755; whorls of fruit axillary, floral leaves $\frac{1}{2}$ – $1\frac{1}{2}$ in. pectinate, segments linear, fruit about as long as broad not deeply furrowed or tuberculate. DC. *Prodr.* iii. 68; *Engl. Bot.* t. 218; not Roxb. *Hort. Beng.* 12.

KASHMIR, Falconer, Jacquemont, Thomson (all barren). Ponds above Shapiyon, alt. 7000 ft.; C. B. Clarke.—DISTRIB. Persia, Dauria, North Asia, Europe, North America.

Fruit subquadrate, backs of the carpels rounded, furrows between them broad but shallow.

4. ***M. spicatum***, Linn.; DC. *Prodr.* iii. 68; spikes always terminal, bracts oblong entire shorter than the expanded petals, fruit $\frac{1}{2}$ in. ovoid, backs of the carpels broad flattened furrows very narrow soon becoming deep, carpels more or less tubercled on the back. *Engl. Bot.* t. 83; Gaertn. *Fruct.* t. 68; *Fl. Dan.* iv. t. 681; Boiss. *Fl. Orient.* ii. 755.

KASHMIR, alt. 5000 ft. descending to 1000 ft. along the northern boundary of the Punjab; frequent. KUMAON, alt. 5000 ft.—DISTRIB. Cabul, cold and temperate Northern Hemisphere.

Fruit ovoid, seen from above appears round, the valleys between the carpels being too narrow to be noticed till closely examined. The fruit of the Indian examples is rather larger than that of the European, the backs of the carpels being very flat somewhat corky and thickened; called *M. spicatum* Linn. var. *muricatum* by Maximowicz (*Diagn. Pl.* xv. 183) who quotes correctly *Griff.* No. 2442 (Kew Distrib.).

5. ***M. intermedium***, DC. *Prodr.* iii. 69; fruit axillary, floral leaves $\frac{1}{2}$ –1 in. long alternate solitary or 2–3-nate linear and entire to lanceolate and incise-serrate, fruit very small hardly $\frac{1}{16}$ in. long but less broad, carpels rounded and most minutely scabrous on their backs, furrows shallow. *Miq. Fl. Ind. Bat.* i. pt. i. 634. *M. indicum*, *Wight Ill.* t. 102, the plant only, not the fruit. *M. variæfolium*, Hook. *Ic. Pl.* t. 289. *M. lineare*, Heyne in *Herb. Rottl.* *Haloragis oligantha*, W. & A. *Prodr.* 338; *Wight Ic.* 1061 not of Arn.

NILGHIRI MTS., alt. 7000 ft.; Hohenacker No. 1563, Gardner, Schmidt, Wight. Cuttalam, DECCAN PENINSULA, Rottler. Mayaburam, Sir T. Adam.—DISTRIB. Malaya, Australia, New Zealand, South America.

Leaves in the Indian examples sometimes whorled, more commonly in tufts of 1-3, each tuft placed irregularly round the stem. The Australian *M. variaefolium* has the leaves usually whorled; but the whorls get broken and the Australian examples become thus exactly like the Indian; the fruit is altogether the same.—The correct name of this plant is open to much question. De Candolle's is the oldest, but the accompanying description was drawn up to fit *Hottonia sessiliflora*, Vahl *Symb.* ii. 36 which probably was something altogether different; then a *Myriophyllum* is discovered in India which De Candolle's description very fairly fits, and Hohenacker and others apply it to the Candollean name.

5. **CALLITRICHE**, Linn.

Glabrous slender annual herbs growing in moist places, or their branches floating or submerged. *Leaves* opposite, linear- or obovate-spathulate, entire, the upper ones often rosulate. *Flowers* minute, axillary, unisexual, usually monœcious, solitary, or sometimes one male and one female in the same axil simulating a hermaphrodite flower; achlamydeous; bracteoles white, membranous, linear-oblong, very caducous. **MALE**: stamen 1. **FEMALE**: ovary 4-ridged 4-celled; styles 2, elongate, stigmatose their whole length; ovules solitary in each cell, pendulous. *Fruit* coriaceous, indehiscent, 4-seeded, the 4 carpels at length separating.—**DISTRIB.** Species 1 or 2 found almost all over the globe; but some authors allow 10 or 20 species.

[The distribution of such critical species as these *Callitriches* cannot be safely stated; there are examples collected in Sikkim, alt. 8000-9000 ft., by Sir J. D. Hooker which are probably *C. verna* (and not *C. stagnalis*), but they show no fruit.]

1. **C. stagnalis**, Scop. *Fl. Carniol.* ii. 251; leaves obovate-spathulate, styles subsistent, fruit suborbicular the edges acute keeled but hardly winged. *Koch Syn. Fl. Germ.* 212; *Hegelm. Monogr. Callitrich.* 58. *C. Wightiana*, Wall. Cat. 7008; *W. & A. Prodr.* 339; *Wight Ic.* 1947; *Miq. Fl. Ind. Bat.* i. pt. i. 635.

Indian mountains from the HIMALAYA, alt. 5000-10,000 ft., to the DECCAN, alt. 7000 ft. Ceylon, alt. 5000 ft., *Thwaites*.—**DISTRIB.** Europe. North Asia, Tropical Africa, Malaya, Australia and New Zealand.

2. **C. verna**, Linn.; *Koch Syn. Fl. Germ.* 212; leaves oblong-spathulate, fruit longer than broad the edges not keeled. *Hegelm. Monogr. Callitrich.* 55.

TEMPERATE WESTERN HIMALAYA, alt. 5000-8000 ft., *Edgeworth*; KASHMIR, alt. 7000 ft., *C. B. Clarke*.—**DISTRIB.** Europe. Cold and temperate Asia and North America.

ORDER LVII. **RHIZOPHOREÆ**. (By the Rev. G. Henslow, F.L.S.)

Trees or shrubs. *Leaves* opposite, stipulate (except *Anisophyllea*), usually coriaceous, glabrous; stipules interpetiolar, very caducous. *Flowers* axillary, usually bisexual, surrounded at the base with connate or cupuliform bracts or ebracteate. *Calyx* more or less adnate to the ovary (except *Blepharistemma*); limb produced beyond the ovary, 4-14-lobed; lobes valvate, persistent. *Petals* equal in number to the sepals, entire emarginate 2-fid or lacerate. *Stamens* usually twice the number of petals, in pairs opposite to and embraced by them, rarely indefinite (*Kandelia*); anthers 2-celled, rarely multi-locellate (*Rhizophora*). *Ovary* from 5- to 1-celled by solution of the septa; styles connate (except in

Anisophyllea); ovules usually 2 in each cell, pendulous. *Fruit* coriaceous, mostly indehiscent, 1-celled, 1-seeded. *Seed* pendulous, arillate or not; albumen fleshy or 0; embryo inverted, small if surrounded by albumen, elongated if exalbuminous; radicle macropodous in the tribe *Rhizophoreæ*, perforating the apex of the pericarp and germinating while the fruit still adheres to the tree.—**DISTRIB.** Tropical plants; many sharing with an arboreal vegetation the muddy shores of the estuaries of rivers. Genera 17, species about 50.

TRIBE I. *Rhizophoreæ*. *Leaves* opposite, stipulate. *Ovary* inferior; style single. *Embryo* exalbuminous, macropodous, germinating while the fruit is still on the tree.

Petals 4, entire. Stamens 8. Ovary 2-celled	1. RHIZOPHORA.
Petals 5-6, emarginate. Stamens 10-12. Ovary 3-celled	2. CERIOPS.
Petals 5-6, lacerate. Stamens ∞. Ovary 1-celled	3. KANDELIA.
Petals 8-14, 2-fid. Stamens 16-28. Ovary 2-4-celled	4. BRUGUIERA.

TRIBE II. *Legnotideæ*. *Leaves* opposite, stipulate. *Ovary* half-inferior or superior but adnate to the base of the calyx; style single. *Embryo* immersed in fleshy albumen.

Calyx-tube minutely bracteolate, half-superior, lobes erect	5. CARALLIA.
Calyx-tube ebracteolate, half-superior, lobes reflexed	6. PELLACALYX.
Calyx-tube bracteolate, adnate to the base of the ovary; cells of the ovary 4-ovuled	7. GYNOTROCHES.
Calyx-tube with connate bracteoles, adnate to the base of the ovary, lobes patent; cells of the ovary 2-ovuled	8. WEIHEA.
Calyx-tube bracteolate, adnate to the base of the ovary, lobes erect	9. BLEPHARISTEMMA.

TRIBE III. *Anisophylleæ*. *Leaves* alternate, exstipulate. *Ovary* inferior; styles 4. *Embryo* exalbuminous.

Characters of the tribe	10. ANISOPHYLLEA.
-----------------------------------	-------------------

1. **RHIZOPHORA**, Linn.

Trees. *Branches* marked by leaf-scars. *Leaves* ovate or elliptic, mucronate. *Flowers* rather large, on axillary 2-3-chotomously divided and few-flowered cymes. *Calyx* 4-lobed, surrounded at the base by connate bracteoles. *Petals* 4, entire, inserted on a fleshy disk. *Anthers* subsessile, multi-locellate. *Ovary* 2-celled, half-inferior, projecting beyond the calyx as a fleshy cone; cells 2-ovuled; stigma bifid. *Fruit* coriaceous, ovoid or obconic, crowned with the reflexed limb of the calyx. *Radicle* elongated, clavate, perforating the apex of the fruit and descending from the tree into the mud.—**DISTRIB.** About 5 species; frequent on muddy tropical shores.

1. **R. mucronata**, Lam. Dict. iv. 169; Ill. t. 396, f. 2; peduncles arising from the axils of leaves of the same year longer than the petioles about 3-flowered, flowers pedicellate. Bedd. Fl. Sylv. Anal. Gen. t. xiii. fig. 4; Dalz. & Gibs. Bomb. Fl. 95; Wight Ill. i. 209; Ic. t. 238; Kurz For. Fl. Brit. Burm. i. 447. R. macrorrhiza, Griff. in Trans. Med. Phys. Soc. Calc. viii. 2. R. candelaria, W. & A. Prodr. i. 310; Wall. Cat. 4878. R. Mangle, Linn.; Roxb. Fl. Ind. ii. 459.—Rheede Hort. Mal. vi. t. 34.

Tidal shores from the mouths of the Indus to Malacca and Ceylon.—DISTRIB. Tropical shores of Asia, Africa and Australia.

A large shrub or tree, evergreen. *Leaves* 3–7 by $1\frac{1}{2}$ –4 in., narrowed at the base. *Flowers* more or less drooping. *Calyx-lobes* triangular, narrowing upwards. *Petals* villous, shorter than the calyx-limb, subconnivent, coriaceous; margins involute.—A variety in Malacca, *R. stylosa*, Griff. (sp.) *Notul.* iv. 666; and *Ic. Pl. Asiat.* t. 640, differs according to Griffith from *R. conjugata* in its smaller stature, length of style, smaller radicle, more villous petals and more elongated base of the flowers, but the description shows a closer agreement with *R. mucronata* than with *R. conjugata*.

2. *R. conjugata*, Linn.; *DC. Prodr.* iii. 33; peduncles arising from the axils of (fallen) leaves of the previous year shorter than the petioles mostly 2-flowered, flowers sessile. *R. candelaria*, *DC.* l. c. 32. *R. apiculata*, *Blume Flor. Jav.* i. 91, and *Mus. Bot.* 134; *Wight Ill.* i. 209, t. 3; *Kurz For. Fl. Brit. Burm.* i. 447.

Tidal marshes from the mouths of the Indus to Malacca and Ceylon.—DISTRIB. Tropical shores of Asia and Africa.

Shrubby or arborescent. *Leaves* 4–8 by $1-3\frac{1}{2}$ in., usually more lanceolate than in the preceding species and subacuminate. *Calyx-lobes* ovate. *Petals* glabrous, linear, flat, submembranous. *Stamens* 11–12.

2. CERIOPS, Arn.

Trees. *Leaves* ovate or obovate. *Peduncles* axillary with subcapitate flowers. *Calyx* 5–6-merous, surrounded at the base with connate bracts. • *Petals* 5–6, inserted at the base of a 10–12-lobed fleshy disk, emarginate, appendiculate; lobes of the petals with clavate or capitate bristles. *Stamens* 10–12, filaments inserted between the lobes of the disk slender; anthers 2-celled. *Ovary* 3-celled (at least above), cells 2-ovuled; style short, stigma simple. *Fruit* coriaceous, ovoid, surrounded by the reflexed limb of the calyx, 1-celled, 1-seeded. *Germination* as in *Rhizophora*.—DISTRIB. Species 2 or 3, natives of the tropical shores of the Old World.

1. *C. Candolleana*, Arn. in *Ann. Nat. Hist.* i. 363; calyx 5-cleft, lobes linear acute, petals 5 glabrous emarginate tip with 3–4 capitate bristles. *Blume Mus. Bot.* 142; *Wight Ill.* i. 209; *Ic. t.* 240; *Bedd. Flor. Sylv. Anal. Gen. t.* xiii. fig. 5; *Miq. Fl. Ind. Bat.* i. 590; *Brandis For. Fl.* 218; *Kurz, For. Fl. Brit. Burm.* i. 448. *R. timorensis*, *DC. Prodr.* iii. 32.

Tidal forests, &c., from the mouths of the Indus to Malacca and Ceylon.—DISTRIB. of the genus.

A small shrub or small tree. *Leaves* 2–3 by 1–2 in., obovate, very obtuse, cuneate or attenuate at the base. *Flowers* in rather loose cymes or subcapitate. *Stamens* 10, alternately shorter. *Ovary* half-inferior, 3-celled. *Fruit* small, club-shaped or subovate, surrounded near the base by the reflexed segments of the calyx.

2. *C. Roxburghiana*, Arn. in *Ann. Nat. Hist.* i. 363; calyx 5–6-cleft, lobes subovate subobtuse, petals concave glabrous below setoso-ciliate above towards the apex. *Miq. Fl. Ind. Bat.* i. 591; *Kurz For. Fl. Brit. Burm.* i. 448. *Rhizophora decandra*, *Roxb. Hort. Beng.* 36; *Wall. Cat.* 4875.

Tidal forests from the Sunderbunds to Malacca.—DISTRIB. of the genus.

A dwarf tree or shrub. *Leaves* 1–4 by $\frac{3}{4}$ to 2 in., narrowed at the base, very obtuse, reddish brown beneath, glabrous. *Inflorescence* of small axillary cymes or glomerules. *Peduncle* very short. *Stamens* 10–12.

3. **KANDELIA**, *Wight & Arn.*

A small tree. *Leaves* oblong, obtuse. *Peduncles* axillary, dichotomously branched, few-flowered. *Flowers* rather large, white. *Calyx* 5-6-merous, surrounded at the base by connate bracteoles, adnate to the base of the ovary; lobes linear, valvate. *Petals* 2-fid; lobes multifid, segments capillary. *Stamens* indefinite, filaments slender exserted. *Ovary* 1-celled, prolonged above the calyx into a fleshy cone; stigma 3-lobed; ovules 6, fixed in pairs to a central column. *Fruit* ovoid, girt by the reflexed limb of the calyx, 1-celled, 1-seeded. *Radicle* fusiform, very acuminate. *Germination* as in *Rhizophora*.

1. **K. Rheedii**, *W. & A. Prodr.* i. 310; *Arn. in Ann. Nat. Hist.* i. 365; *Blume Mus. Bot.* 135; *Wight Ill.* i. t. 89; *Hook. Ic. Pl.* t. 362; *Wall. Cat.* 4876; *Bedd. Fl. Sylv. Anal. Gen.* 100, pl. xiii. fig. 6; *Kurz For. Fl. Brit. Burm.* i. 449. *Rhizophora Candel*, *Linn.*; *DC. Prodr.* iii. 32.—*Rheede Hort. Mal.* vi. t. 35.

SUNDERBUNDS and tidal shores of both Peninsulas and Ceylon.—DISTRIB. Malay Islands.

A small evergreen tree. *Leaves* 2-4 by 1-2 in., narrowed at the base, quite entire, dark green above, reddish brown beneath, glabrous. *Peduncles* about 1½ in., erect, twice branched dichotomously. *Fruit* 1 in. long, conic-ovoid.

4. **BRUGUIERA**, *Lam.*

Trees. *Leaves* usually coriaceous, oblong, quite entire. *Peduncles* axillary, recurved, 1-∞-flowered. *Flowers* rather large, coriaceous. *Calyx* 8-14-merous, obconical or campanulate, ebracteate, adnate to the base of the ovary; lobes subulate-lanceolate, valvate. *Petals* oblong, 2-lobed, appendiculate, embracing the stamens which spring elastically from them when mature. *Stamens* 16-28, filaments filiform; anthers linear, mucronate, about as long as the filaments. *Ovary* 2-4-celled, included in the calyx-tube; cells 2-ovuled; style filiform, stigma 2-4-lobed minute. *Fruit* turbinate, coriaceous, crowned with the calyx-limb, 1-celled, 1-seeded. *Germination* as in *Rhizophora*.—DISTRIB. Species about 8 in the tropics of the Old World.

1. **B. gymnorhiza**, *Lamk. Ill.* t. 397; peduncles 1-flowered, calyx about 12-cleft, lobes linear acuminate erect about ¾ in. in length equalling the tube in fruit, petals densely hairy at the base nearly glabrous above 2-lobed with 2-4 bristles on each lobe and 1 in the notch, ovary 3-4-celled. *W. & A. Prodr.* 311; *Brand. For. Fl.* 219; *Miq. Fl. Ind. Bat.* i. 586; *Blume Mus. Bot.* 136; *Kurz For. Fl. Brit. Burm.* i. 450. *B. Rheedii*, *Miq.* l. c. 587; *Blume*, l. c. 136; *Bedd. Fl. Sylv. Anal. Gen. Pl.* xix. fig. 1; *Wight Ic.* t. 239; *Dalz. & Gibs. Bomb. Fl.* 95; *Hook. Ic. Pl.* t. 397. *Rhizophora gymnorhiza*, *Roxb. Fl. Ind.* ii. 460; *Griff. Ic. Pl. Asiat.* t. 645.

Littoral and especially estuarine forests of India from the mouths of the Indus to Malacca and Ceylon.—DISTRIB. Tropical Asia, Australia, Africa and the Pacific.

A large evergreen tree. *Leaves* slightly acuminate, 3-6 by 1½-2½ in.; stipules oblong, very deciduous. *Peduncles* cernuous, shorter than the petioles. *Flowers* about 1 in. diam. *Calyx-tube* almost campanulate, limb 10-14-cleft. *Petals* 10-14. *Radicle* fusiform with about 6 prominent angles, apex obtuse.—A variety (*B. Wightii*, *Bl. sp.*) growing at the mouth of the Ganges and Indian Archipelago only differs apparently from the preceding by the entire margins of the petals being more or less hairy.

2. **B. eriopetala**, *W. & A. in Wight Ill.* i. p. 210; *Ic. t.* 239 B.; peduncles 1-flowered, calyx usually about 10-cleft, lobes linear acuminate about 1 in. exceeding the ribbed tube in fruit, petals with margins densely hirsute with silvery hairs from base to apex lobes somewhat obtuse, one seta on each lobe and one longer in the notch, ovary 3-4-celled. *Wall. Cat.* 2451; *Brand. For. Fl.* 219. *B. Rumphii*, *Blume Mus. Bot.* 138. *B. parietosa*, *Griff. Notul.* iv. 670; *Ic. Pl. Asiat. t.* 641.

MALABAR; at Quilon, *Wight*. MALAYAN PENINSULA, *Griffith*.—DISTRIB. Malay Archipelago, China.

A tree. *Leaves* ovate or oblong, acuminate at both ends. *Calyx-lobes* from 9-14, somewhat triquetrous, suberect in fruit. *Anthers* linear.

3. **B. caryophylloides**, *Blume Mus. Bot.* i. 141; peduncles about 3-flowered, calyx about 8-cleft, lobes linear subacute about $\frac{1}{4}$ in. reflexed and half the length of the tube in fruit, petals ciliate from base to apex nearly erect bifid bearing 3-4 bristles and 1 in the notch, ovary 2-celled. *Miq. Fl. Ind. Bat.* i. 589; *Kurz For. Fl. Brit. Burm.* i. 450. *Rhizophora caryophylloides* *Jack Mal. Misc.* i. 34; *Hook. Bot. Misc.* ii. 80; *Wall. Cat.* 4879; *DC. Prodr.* iii. 32, 8; *Arn. in Ann. Nat. Hist.* i. 368; *Wight Ill. t.* 210. *R. cylindrica*, *Linn. sp.* 635. *Kanilia caryophylloides*, *Blume Mus. Bot.* 141.—*Rheede Hort. Mal. vi. t.* 33.

TIDAL FORESTS OF INDIA, from Malabar to Malacca and Ceylon.—DISTRIB. Malay Archipelago.

A small tree. *Leaves* oblong to oblong-lanceolate, acuminate at both ends, scarcely coriaceous. *Peduncles* shorter or nearly equalling the petioles, 1-5- usually 3-flowered; *buds* subacute, pedicelled. *Calyx-tube* obtuse at the base, not ribbed. *Fruit* about $\frac{1}{2}$ in., urceolate, slightly constricted below the calyx-limb. *Radicle* subclavate, subacute.

4. **B. malabarica**, *Arn. in Wight Ill.* i. 210; peduncles about 3-flowered, calyx about 8-cleft, lobes subobtuse reflexed about $\frac{1}{4}$ in. and half the length of the tube in fruit, ovary 2-celled. *Rhizophora cylindrica*, *Linn. sp.* 635 in part. —*Rheede Hort. Mal. vi. t.* 33.

MALABAR COAST; *Rheede, Wight*.

A tree. *Leaves* herbaceous. *Peduncles* equalling the petioles, 3-flowered. *Buds* obtuse, sessile. *Fruit* about $\frac{1}{2}$ in. long, campanulate, not or scarcely constricted below the calyx-limb. *Radicle* as in the last species but apparently much softer than that of any other.—This may prove to be a variety or subspecies of *B. caryophylloides*.

5. **B. parviflora**, *W. & A. Prodr.* i. 311; peduncles many-flowered, calyx about 8-cleft, lobes lanceolate about $\frac{1}{12}$ in. long erect much shorter than the tube in fruit, petals with 5 bristles, ovary 3-celled, fruit subcylindric about 1 in. long, radicle subcylindric slender truncated. *Miq. Fl. Ind. Bat.* i. 588; *Wight Ill. i.* 210; *Bedd. Fl. Sylv.* 101; *Kurz For. Fl. Brit. Burm.* i. 449. *Rhizophora parviflora*, *Roxb. Fl. Ind. ii.* 641; *Wall. Cat.* 4877. *R. cylindrica*, *Roxb. Hort. Beng.* 36; *Wall. Cat.* 4877. *Kanilia parviflora*, *Blume Mus. Bot.* 140 t. 30; *Dalz. & Gibs. Bomb. Fl.* 95.

Littoral forests, from the SUNDERBUNDS to MALACCA.—DISTRIB. Malayan Archipelago.

A shrub or small tree. *Leaves* oblong or broadly lanceolate. *Peduncles* once or twice trichotomous. *Calyx-tube* tapering at the base, ribbed; lobes very short and rigid.

5. **CARALLIA**, Roxb.

Trees and shrubs. *Leaves* petiolate, ovate or elliptic. *Peduncles* short, rather thick. *Flowers* small, in short 3-chotomous axillary branching cymes, sessile and often crowded. *Calyx-tube* minutely bracteate at the base; limb 5-8-lobed, campanulate; lobes erect, short, valvate. *Petals* 5-8, inserted on the margin of a crenulated disk lining the calyx-tube, clawed, orbicular, 2-fid or entire, subserrate or lacerate at the apex. *Disk* epigynous, 10-16-lobed. *Stamens* inserted with the petals, filaments filiform; anthers small, oblong. *Style* subulate or filiform. *Fruit* small, globose, coriaceous, 1-celled, 1-seeded. *Seed* globose-reniform; testa fibrous; embryo curved.—**DISTRIB.** Species about 7, natives of the Indian Ocean.

1. **C. integerrima**, DC. *Prodr.* iii. 33; leaves quite entire or rarely serrulate towards the apex obovate elliptic or oblong, flowers usually 8-merous cymoso-capitate, petals not embracing the filaments. *Wight Ill.* t. 90; *Benth. in Journ. Linn. Soc.* iii. 67; *Bedd. Fl. Sylv.* t. cxciii.; *Dalz. & Gibs. Bomb. Fl.* 95; *Brand. For. Fl.* 219. *C. ceylanica*, corymbosa and sinensis, *Arn. in Tayl. Ann. Nat. Hist.* i. 371. *C. lucida*, *Kurz For. Fl. Brit. Burm.* i. 451; *Wall. Cat.* 4880; *Wight Ic.* t. 605. *C. timorensis*, *Blume Mus. Bot.* i. 128 (ex char.). *C. octopetala*, *F. Muell. Pl. Aust. Trop. Occid.* *C. symmetrica*, *Blume Mus. Bot.* i. 130. *Pootia cereopsifolia*, *Miq. Pl. Hochst.*

Forests of the outer SIKKIM HIMALAYA, BENGAL, ASSAM, SILHET, BURMAH, both PENINSULAS and CEYLON.—**DISTRIB.** Malay Archipelago, China, Australia.

An evergreen tree with very lucid foliage. *Flowers* small, white. *Berry* globose, size of a peppercorn, usually 1-seeded.—The leaves vary excessively. The Cingalese specimens are often all obovate and very obtuse; in some Chinese and Philippine Islands ones they are narrow-oblong and acuminate; in the majority from the greater part of the area, viz., Ceylon and the Indian Peninsulas, China, the Indian Archipelago and N. W. Australia, they are elliptic-ovate. *Bentham* (*Journ. Linn. Soc.* l. c.) has shown good cause for setting aside Roxburgh's specific name of *C. lucida*.

2. **C. lanceæfolia**, Roxb. *Fl. Ind.* ii. 481; leaves elliptic or oblong regularly serrulate, flowers 6-8-merous subcapitate, petals embracing the filaments. *Wight Ic.* iii. t. 604; *Kurz For. Fl. Brit. Burm.* i. 437; *Wight Ic.* t. 604. *C. confinis*, *Blume Mus. Bot.* i. 129. *C. lucida*, *Roxb. Cor. Pl.* iii. t. 211; *Wight Ic.* iii. t. 605. *C. lanceolaria*, *Wall. Cat.* 4881.

Tropical forests of TENASSERIM, *Kurz*.—**DISTRIB.** Sumatra.

Cymes less crowded than in the last species. *Petals* reniform, crenulate. *Fruit* larger than the preceding, turbinato-globose, 2-3-seeded.

3. **C. calycina**, *Thwaites Enum.* 121; leaves ovate or elliptical quite entire, peduncles rather long dichotomous, cymes slightly branching above the middle.

CEYLON, Singh Rajah forest, between Galle and Ratnapoora, at no great elevation, *Thwaites*.

A great tree. *Leaves* $1\frac{1}{2}$ -3 by $1-1\frac{3}{4}$ in., ovate, shortly acuminate, narrowed at the base, punctate beneath; petiole $\frac{1}{12}$ - $\frac{1}{4}$ in.; stipules about $\frac{1}{2}$ in. very deciduous. *Bracteoles* rounded, refuse, often mucronate, about $\frac{1}{12}$ in. *Flowers* subsessile, $\frac{1}{4}$ in. diam. *Calyx-lobes* 4, equalling the tube. *Petals* broadly cordate, clawed, margin incisinate. *Ovary* 4-celled; stigma crenate.

VAR. β . *Thwaites l. c.*; leaves shorter more rounded and coriaceous. Central Province, alt. 4-5000 ft., *Thwaites*.

6. **PELLACALYX**, Korth.

A small tree, ferruginously pubescent. *Leaves* oblong, minutely serrulate or entire, subsabrous above, rufescent with stellate pubescence beneath. *Flowers* subsolitary or in dichotomously branched glomerules. *Calyx* ebracteolate; limb 5-8-fid, recurved, campanulate above the ovary. *Petals* 2-6, tips lacerate. *Stamens* 10-12, inserted with the petals on the margin of a crenulated disk lining the calyx-tube, filaments short subulate; anthers small. *Ovary* with the ovuliferous part inferior, 5-10-celled; style subulate, stigma discoid, 5-10-lobed; ovules many in each cell, fascicled, pendulous from the axis. *Fruit* pisiform or turbinate, black, fleshy, 5-10-celled, many-seeded. *Seeds* ovoid, testa striated; embryo becoming green, straight, in the axis of the albumen; cotyledons scarcely broader than the terete elongated radicle.

1. **P. axillaris**, Korth in *Van der Hoeve et de Vries Tijdschr.* iii. 20, t. 2; *Benth. in Journ. Linn. Soc.* iii. 75; *Griff. Notul.* iv. 429; *Id. Pl. Asiat.* t. 486 (Cunoniaceæ).

PENANG and MALACCA, Griffith.

Leaves 5-8 by $1\frac{1}{2}$ -3 in., shortly acuminate. *Flowers* small, shortly pedicelled, erect. *Calyx-tube* $\frac{1}{8}$ in. long, densely ferruginously pubescent.

7. **GYNOTROCHES**, Blume.

Small trees and shrubs. *Leaves* oblong; stipules deciduous. *Flowers* small, axillary, fascicled; peduncles jointed in the middle. *Calyx* ebracteolate, 4-5-partite; segments valvate, reflexed. *Petals* 4-5, inserted below the margin of an 8-10-lobed perigynous disk, clawed, spatulate, fimbriate-lacerate. *Stamens* 8-10, inserted in the disk, filaments filiform; anthers small. *Ovary* superior, adhering by a broad base to the calyx, ovoid-globose, 3-6-angled, 3-6-celled; style columnar, furrowed, conical at the base; stigma 3-6-lobed, lobes emarginate recurved; ovules 4 in each cell, ascending, fascicled. *Berry* globose, 4-6-celled, many-seeded. *Seeds* small, obovoid, testa crustaceous wrinkled, albumen fleshy; embryo terete.—DISTRIB. Species 2, natives of the Malay Islands.

1. **G. axillaris**, Miq. *Fl. Ind. Bat.* i. pt. i. 592; *Blume Mus. Bot.* i. 127, t. xxxi.; *Kurz. For. Fl. Brit. Burm.* i. 451. *G. Dryptopetalum*, Blume l. c. *G. reticulata*, A. Gray, *Bot. Amer. Explor. Exped.* vol. i. 607, ex descr. *Dryptopetalum coriaceum*, Arn. in *Ann. Nat. Hist.* i. 372. *Microtropis coriacea*, Wall. *Cat. n.* 4338.

SINGAPORE and PENANG, Anderson, Wallich. MALACCA, Griffith. MOULMEIN, Lobb.—DISTRIB. Malay Archipelago.

Leaves 2-5 in., oblong or elliptic, acuminate, coriaceous. *Flowers* small, numerous, axillary, subdiœcious: male with petals and perfect stamens; ovary often empty; stigma not dilated: female or hermaphrodite flowers with longer pedicels; petals and stamens often smaller, the latter sometimes effete; stigma radially lobed. *Fruit* baccate, $\frac{1}{10}$ - $\frac{1}{8}$ in. diam.

8. **WEIHEA**, Spreng.

Trees or shrubs. *Leaves* oblong, quite entire or obtusely serrate; stipules interpetiolar, oblong, deciduous. *Flowers* in axillary 1- or more flowered peduncles. *Calyx* with connate bracts; limb 4-5-fid, patent. *Petals* inserted under the margin of an obscure disk, clawed, spatulate, fimbriate-lacerate,

longer than the sepals. *Stamens* 16–30, inserted on the margin of the disk; filaments filiform; anthers oblong. *Ovary* superior, 3–5-furrowed, 2–4-celled; style filiform, stigma with 2–4 radiating lobes; ovules 2 in each cell, collateral, pendulous. *Fruit* globose, fleshy, 2–4-celled, septicidally but slowly dehiscing into 2–4 valves; cells 1–2-seeded. *Seeds* arillate, ovoid, subtrigonal; testa coriaceous; embryo straight, cotyledons elliptical, radicle terete.—*DISTRIB.* Species 5, natives of S. and Trop. Africa, Madagascar and Ceylon.

1. **W. ceylanica**, Baill. *Adans.* iii. 38. *Anstrutheria zeylanica*, Gard. in *Calc. Journ. Nat. Hist.* vi. 344, t. 4; *Thwaites Enum.* 121; *Bedd. Fl. Sylv.* t. xciv.

MAISOR and CARNATIC, *Wight, &c.* CEYLON, Galle District, Trincomalee, &c., at no great elevation.

A very much branched shrub or small tree. *Branches* terete. *Leaves* 3–3½ by 1½ in., petioled, glabrous, acuminate, rounded at the base, green and shining above, pale beneath, nerves reticulate prominent on both surfaces; petiole about ½ in. *Peduncles* solitary or in pairs, shorter than the petioles. *Flower-buds* of full size six months before opening. *Calyx-limb* 4-fid; segments ovate, acute, persistent, densely covered with adpressed hairs, valvate. *Petals* 4, hypogynous, cuneate, imbricated in bud. *Stamens* about 30, hypogynous; anthers erect, cordate, obtuse. *Ovary* superior, 3-celled; style simple, persistent. *Berry* thick, spongy. *Embryo* in the axis of fleshy albumen; cotyledons flat, veined; radicle thick, elongated and directed upwards.

9. BLEPHARISTEMMA, Wall.

A shrub? *Leaves* opposite, petioled, membranous, elliptic-oblong, acuminate, crenately-toothed; stipules small, caducous. *Flowers* in 2–3-chotomous many-flowered axillary cymes, polygamo-dioecious. *Calyx-tube* ovoid, ebracteolate; lobes 4, minute, triangular, erect. *Petals* 4, twice the length of the calyx, inserted round a disk at the base of the calyx-tube, clawed; tips lacerate. *Disk* free; of the male, 8-toothed; of the female often cleft. *Stamens* 8, inserted upon the margin of the disk; in the female small, filaments ciliated; anthers small, oblong. *Ovary* obtusely subtrigonal, contracted at the base, ovoid, free, 3-celled; cells 2-ovuled; style of the female flower longer than the calyx, stigma obsoletely 3-lobed. *Fruit* unknown.

1. **B. corymbosum**, Wall. *Cat.* 6320; *Benth. in Journ. Linn. Soc.* iii. 78; *Bedd. Fl. Sylv. Anal. Gen. Pl.* xiv. fig. 2. *Dryptopetalum membranaceum*, Miq. in *Pl. Hohenack.* n. 713.

WESTERN PENINSULA, *Heyne, &c.*

Glabrous, excepting the inflorescence and buds. *Leaves* 1½–2½ in.; stipules lanceolate, membranous, pubescent. *Calyx* minutely roughened above. *Stamens* ciliated like the claws of the petals. *Disk* almost entirely free from the calyx. *Ovary* narrow, empty; style short. *Petals* in the female flowers, shorter. *Stamens* less; anthers small, effete? *Disk* smaller. *Style* longer than the calyx.

10. ANISOPHYLLÆA, Br.

Trees and shrubs, glabrous, young parts silky. *Leaves* exstipulate, dichotomous; alternate ones smaller or minute, and often stipuliform or 0?, oblique, ovate lanceolate or elliptic, with 3–5 main nerves branching from the base, quite entire. *Flowers* minute in axillary simple or fascicled spikes, ebracteate or minutely bracteolate bi- or unisexual. *Calyx-tube* ovoid, adnate to the ovary, terete or ribbed; limb 4-fid, lobes erect. *Petals* 4, small, involute, entire, lobed or lacerate. *Stamens* 8, filaments short, subulate; anthers small, didymous, pro-

bably abortive in the females. *Ovary* inferior, 4-celled; styles 3-4, subulate, erect or recurved, stigmas acute or subcapitate; ovules solitary in each cell, pendulous, anatropous. *Fruit* coriaceous, oblong or pyriform, ribbed or smooth, 1-seeded. *Seed* pendulous, exalbuminous, testa coriaceous; embryo clavate, cotyledons very small or 0, radicle large.—**DISTRIB.** Species 5, natives of Tropical Asia and Africa.

1. **A. zeylanica**, *Benth. in Niger Flora* 342 and 375; leaves broadly ovate-lanceolate acuminate narrowed at the base with about five prominent nerves parting from the base, inflorescence of racemes supra-axillary solitary or geminate. *Thwaites Enum.* 119; *Bedd. Fl. Sylv.* t. 195. *Tetracrypta cinnamomoides*, *Gardn. & Champ. in Hook. Kew Journ.* i. 314 and v. 378, t. 5.

CEYLON; southern and central parts ascending to 1500 ft.

A tree 40-50 ft.; bark smooth; lower branches horizontal, upper suberect; twigs puberulous. *Leaves* glabrous on both surfaces, younger red; pairs opposite in vernation, the smaller squamiform 1-nerved caducous, the larger 5-nerved with involute margins. *Flowers* small, subsessile. *Bracts* minute. *Calyx-limb* superior, 4-cleft; lobes acute, valvate, persistent. *Petals* somewhat fleshy, laciniate, induplicate in aestivation; segments 5, linear-subulate. *Stamens* 8, alternately shorter; filaments subulate, inserted on the calyx; anthers versatile. *Styles* 4, erect, conico-subulate, stigmas capitate.

2. **A. disticha**, *Hook. in Herb.*; leaves rhomboid-oblong inequilateral 5-nerved distichous entire, flowers subsolitary, petals 3-toothed. *Haloragis disticha*, *Jack. in Mal. Misc.* ii. 19; and in *Hook. Journ. Bot.* i. 371.

MALAY PENINSULA; *Jack.* SINGAPORE.—**DISTRIB.** Sumatra

A shrub with rusty hairy branches. *Leaves* in two series, one of large leaves and another of very small stipuliform ones inserted below the insertion of the larger so as to overlap their bases; the larger 1-1½ in., subsessile, nearly glabrous above, beneath with short appressed hairs, the smaller ½ in., similar in shape but more acute. *Calyx-lobes* persistent. *Petals* shorter than calyx, 3-fid. *Stamens* as long as the petals; anthers 2-celled. *Ovary* 4-gonous, ferruginous, 4-celled; styles 4, equalling the stamens; stigmas simple. *Drupe* oblong-ovate, red; stone with 8 longitudinal furrows, 1-seeded.

3. **A. Griffithii**, *Oliver in Trans. Linn. Soc.* xxiii. 460, t. 48; leaves lanceolate or ovate often slightly acuminate, spikes solitary or geminate.

MALACCA, *Griffith.*

Probably a tree. *Leaves* 3-4 by 1-1½ in., petiole $\frac{1}{10}$ -½ in., coriaceous, turning yellow on drying; nerves 3, 1 central, 2 closely parallel to the margin. *Flowers* sessile, somewhat remote. *Calyx-lobes* coriaceous, triangular, valvate. *Petals* shorter than the sepals, coriaceous, broadly quadrate-oblong, entire or scarcely 3-lobed. *Stamens* 8, 4 opposite to and closely embraced by the petals, filaments rather stout; anthers small, rounded or didymous. *Ovary* 4-celled below; styles 4.

4. **A. grandifolia**, *G. Henslow*; leaves oblong acuminate scarcely narrowed at the base 5-nerved quite entire, panicles axillary with subfasciate branches.

PENANG, *Maingay.*

A tree about 50 ft., trunk very stout. *Leaves* large, 3½-10½ in., coriaceous. *Inflorescence* of several somewhat flattened or fasciate branches, forming an irregular panicle; pedicels bearing numerous minute sessile male flowers with a few female possessing rudimentary? stamens; male buds $\frac{1}{4}$ in. in diam., female rather larger. **MALE FL.** Sepals 4, valvate, puberulous; lobes triangular. *Petals* 4, fringed. *Stamens* 8, opposite to and embraced by the petals; filaments short. *Pistil* rudimentary;

styles 4?, minute, densely hairy. FEMALE FL. *Calyx-limb* partially lined with a disk, lobes each bearing a minute rudimentary stamen; anthers dehiscing in bud? *Styles* 4, spreading, subulate, densely hairy. *Drupe* narrowly pyriform, 3 by $1\frac{1}{2}$ in.

ORDER LVIII. COMBRETACEÆ. (By C. B. Clarke, F.L.S.)

Trees, or shrubs often climbers. *Leaves* alternate subopposite or opposite, sometimes ternate, petioled, entire, simple (in *Illigera* 3-foliolate); stipules 0. *Flowers* bracteolate at base, in the tribe *Gyrocarpeæ* cymose; in the *Combretææ* spicate or racemose (the racemes often paniced); not rarely polygamo-monoecious. *Calyx-tube* adnate to the ovary and produced above it (sometimes to a great length), the limb of 4-5 (rarely 4-7) valvate lobes. *Petals* 4-5 or 0 (rarely 6-7). *Stamens* 4-5 or 8-10 on the calyx; in the *Gyrocarpeæ* the filaments have staminodes attached at the base, and the anthers dehisce by recurved lateral valves. *Ovary* altogether inferior 1-celled; style simple, stigma simple or in *Illigera* sinuate almost lobed; ovules 1-7 (usually 2-3) pendulous from the apex of the cell. *Fruit* coriaceous or drupaceous, generally indehiscent, ovate, angular or very commonly winged; in *Calycopteris* and *Gyrocarpus* crowned by the greatly enlarged calyx. *Seed* 1, without albumen; cotyledons in *Terminalia* and others convolute; in *Combretum* and others plano-convex.—**DISTRIB.** Species 240, in the tropics of the whole world; and in S. Africa outside the tropic.

SUBORDER I. Combretææ. *Calyx-lobes* valvate. *Stamens* without glands or staminodes at their base; anthers dehiscing by a longitudinal slit. *Ovules* 2-7, suspended by long funicles. *Flowers* racemose or spicate.

* *Petals* 0. *Calyx-limb* (except in *Calycopteris*) deciduous.

Flowers spiked or racemed. <i>Calyx-limb</i> deciduous	1. TERMINALIA.
<i>Calyx-limb</i> much accrescent on the fruit	2. CALYOPTERIS.
Flowers capitate. <i>Calyx-limb</i> deciduous	3. ANOGEISSUS.

** *Petals* 5-4 (except in *Combretum apetalum*).

† *Calyx limb* persistent.

Leaves alternate. Growing with the Mangroves	4. LUMNITZERA.
--	----------------

†† *Calyx-limb* deciduous.

<i>Calyx-tube</i> above the ovary less than $\frac{1}{2}$ in. long	5. COMBRETUM.
<i>Calyx-tube</i> above the ovary more than $\frac{1}{2}$ in. long	6. QUISQUALIS.

SUBORDER II. Gyrocarpeæ. *Calyx-lobes* valvate or imbricate. *Stamens* with glands or staminodes at their base; anthers opening by recurved lateral valves. *Ovule* 1, suspended by a short funicle. *Flowers* cymose.

Scandent. Leaves 3-foliolate	7. ILLIGERA.
Erect tree. Leaves entire or lobed	8. GYROCARPUS.

1. TERMINALIA, Linn.

Large trees. *Leaves* alternate or subopposite, exstipulate, entire or slightly crenulate, often with glands on the petiole or near the base of the midrib beneath. *Flowers* small spicate, the racemes spikes sometimes paniced, hermaphrodite or the upper flowers on the racemes males; a narrow bract at the base of each

flower, soon deciduous. *Calyx-tube* produced above the ovary with a campanulate mouth, limb of 5 short valvate triangular lobes, deciduous. *Petals* 0. *Stamens* 10 inserted on the calyx-tube; epigynous disc within them densely hairy. *Ovary* 1-celled, inferior; style long, simple; ovules 2 or 3, pendulous from the summit of the cell. *Fruit* ovoid, very various in size, smooth or angular or winged with 2-5 wings, indehiscent, coriaceous. *Seed* solitary, ex-aluminous, cotyledons convolute.—**DISTRIB.** Species 80; in the tropics of the whole world, less numerous in America.

T. angustifolia, Jacq. *Hort. Vindob.* t. 100 *not of Roxb.*; leaves attenuated at both ends lanceolate, with two glands at the apex of the petiole, fruit narrowly 2-winged. *Willd. Sp. Pl.* iv. 970; *DC. Prodr.* iii. 11; *W. & A. Prodr.* 312; *Miq. Fl. Ind. Bat.* i. pt. i. 599. *T. Benzoin*, Linn.; *Spreng. Syst.* ii. 358; *Lamk. Dict.* i. 349; *Wall. Cat.* 3976. *Catappa Benzoin*, Gaertn. *Fruct.* ii. 127, is included in the Peninsula Flora of W. & A., but there is nothing to show that it has ever been found wild in the Deccan.—**DISTRIB.** Central Malayan Islands.

SECT. I. Catappa (including *Myrobalanus*). *Fruit* not winged, ovoid or subcompressed, sometimes showing (especially when dry) two or five obscure lines or ridges.

1. **T. Catappa**, Linn.; *Willd. Sp. Pl.* iv. 967; leaves alternate clustered towards the ends of the branches very short-petioled obovate from a cordate but very narrow base, spikes solitary axillary simple, fruit 1-1½ in. ellipsoid slightly compressed so as to show two ridges. *Roxb. Hort. Beng.* 33 and *Fl. Ind.* ii. 430; *Larck. Ill.* t. 848; *DC. Prodr.* iii. 11; *Wall. Cat.* 3975; *W. & A. Prodr.* 313; *Wight Ic.* 172; *Bot. Mag.* 3004; *Miq. Fl. Ind. Bat.* i. pt. i. 599; *Bedd. Fl. Sylv.* t. 18; *Kurz For. Fl. Brit. Burma*, i. 454. *T. Catappa* and *Badamia*, Tulasne in *Ann. Sc. Nat.* ser. iv. vol. vi. 92. *T. moluccana*, Lamk. *Dict.* i. 349, *not of Roxb.*; *DC. Prodr.* iii. 11; *Willd. Sp. Pl.* iv. 96 excluding the synonym *T. eglandulosa*, Roxb. *T. Myrobalana*, Roth. *Nov. Sp.* 378. *T. subcordata*, Willd. *Sp. Pl.* iv. 968. *T. intermedia*, Spreng. *Syst.* ii. 359. *Juglans Catappa*, Lour. *Fl. Cochinc.* 703. *Catappa domestica*, litorea and *sylvestris*, Rumph. *Herb. Amboin.* i. t. 68. *Badamia Commersoni*, Gaertn. *Fruct.* ii. 97.—*Rheede Hort. Mal.* iv. t. 3, 4.

Wild in the lowlands of MALAYA, and perhaps of the Transgangetic Peninsula; largely planted in all INDIA from the North-West Provinces to Ceylon and Burma, mostly at 0-1000 ft. alt.—**DISTRIB.** Planted in nearly all tropical countries.

Attains 80 ft., with branches in horizontal whorls. *Leaves* 6-8 in., deciduous in the cold season, usually softly hairy when young, when adult hairy or glabrous, with two glandular depressions near the base of the midrib on the under side which are often obscure or wanting; petiole $\frac{1}{4}$ - $\frac{3}{4}$ in. *Spikes* (and innovations) grey or rusty tomentose or pilose, the upper flowers male, the lower hermaphrodite, the bracts minute. *Calyx-teeth* glabrous or nearly so within and without. Young *ovary* glabrous or hairy. *Fruit* finally glabrous.—This species may generally be recognised by the short petiole and the very narrow but cordate base of the leaf.

2. **T. procera**, Roxb. *Hort. Beng.* 33 and *Fl. Ind.* ii. 249; leaves alternate clustered towards the ends of the branches obovate attenuated into a very short petiole, spikes solitary axillary simple, fruit ellipsoid obscurely 5-sided, not in the least compressed. *Wall. Cat.* 3974; *Kurz For. Fl. Brit. Burma*, i. 454. *Terminalia* sp. nov. No. 168, *Kurz. in Journ. As. Soc.* 1876, pt. ii. 130.

ANDAMANS; Roxburgh, Kurz. NICOBARS; Kurz.

Attains 100 ft. with branches in horizontal whorls. *Leaves* 6-12 in., with two glandular depressions near the base of the midrib on the under side which are often

obscure or wanting, glabrous when adult; petiole $\frac{1}{2}$ in. Upper flowers of the spikes male, lower hermaphrodite. Fruit $1-1\frac{1}{4}$ in.—Much resembles *T. Catappa*.

3. *T. foetidissima*, Griff. Notul. iv. 685; leaves alternate clustered towards the ends of the branches, obovate attenuated into the petiole, spikes solitary axillary simple, fruit $1\frac{1}{2}$ in. obovate ellipsoid subacute, compressed with one face convex the other flat.

MERGUI and MALACCA; Griffith. Malacca, Maingay No. 644, 643 $\frac{1}{2}$.

Leaves 6 in., glaucescent reticulate beneath, coriaceous with cartilaginous margin, without glands; petiole 1 in. Flowers all or very nearly all hermaphrodite. Young ovary and bracts very hairy. Calyx-teeth glabrous or nearly so within and without.

Reduced by Mr. Kurz in Journ. As. Soc. 1877 pt. ii. 53, 54, to *T. belerica*; from which it differs so greatly in leaves and fruit that it raises a suspicion whether Mr. Kurz had the true plant of Griffith before him.

4. *T. belerica*, Roxb. Char. Reform.; leaves alternate clustered towards the ends of the branches broadly elliptic narrowed equally at both ends, petiole very long, spikes solitary axillary simple, fruit $\frac{1}{2}-\frac{3}{4}$ in. diam. globular suddenly narrowed into a short stalk smooth covered by a close fulvous tomentum, when dried obscurely 5-angled.

Throughout INDIA; common in the plains and lower hills, extending to CEYLON and MALACCA; not in the desert region of the West of India.—DISTRIB. Malaya.

Attains 60-80 ft. Leaves 3-6 in., deciduous in the cold season, when mature glabrous and generally punctate on the upper surface; the punctations being much more permanent than in the other species (whence Roth's name); petiole $1-1\frac{1}{2}$ in. Bracteoles minute. Upper flowers of the spikes male, lower hermaphrodite. Young ovary always tomentose. Calyx-teeth pubescent within and without. *T. moluccana*, Miq. Fl. Ind. Bat. i. pt. i. 601 differs from *belerica* by its short petioles; the description appears compounded out of two plants.

VAR. 1. *typica*; no glands at the apex of the petiole. *T. belerica*, Bedd. Fl. Sylv. t. 19; *T. eglandulosa*, Roxb. Herb. (wrongly referred in Willd. Sp. Pl. iv. 968); *T. moluccana*, Roxb. Hort. Beng. 33. Fl. Ind. ii. 432; *T. belerica*, W. & A. Prodr. 313 excl. syn. Wall. Cat. 3968; Wight Ic. t. 91; Thwaites Enum. 103; Dalz. & Gibs. Bomb. Fl. 91; Brand. For. Fl. 222; Kurz For. Fl. Brit. Burma i. 455; Rheede Hort. Mal. iv. t. 10. *T. Gella*, Dalz. in Hook. Kew Journ. iii. 227. *T. punctata*, Roth Nov. Sp. 381; DC. Prodr. iii. 13. *Myrobalanus belerica*, Gaertn. Fruct. ii. t. 97.

VAR. 2. *belerica*, Roxb. Hort. Beng. 33, Cor. Pl. t. 198, Fl. Ind. ii. 431; two glands at the apex of the petiole beneath the leaf. DC. Prodr. iii. 12; Miq. Fl. Ind. Bat. i. pt. i. 600.—Circar Mts., Roxb.; also Malaya, if *T. microcarpa*, Decne. Herb. Timor. 129; Miq. Fl. Ind. Bat. i. pt. i. 602; Benih. Fl. Austral. ii. 502 be referred here: the examples in the Kew Herbarium exactly agree but do not show the fruit.

It is remarkable that not one specimen of this typical *belerica* Roxb. exists at Kew; and that both W. & A. (Prodr. 313) and Brandis (Forest Fl. 222) expressly state that they have never been able to discover a single example. The distinction between it and Roxburgh's *eglandulosa* (*moluccana*, Willd. in Fl. Ind.) is indeed trivial; but the absence of the glands seems without exception in the Indian so-called *belerica*; while Roxburgh founded his *belerica* on the single character that it had two glands, thereby differing from his *T. eglandulosa*, which he subsequently renamed *T. moluccana*, Willd., a species made up of two trees.

VAR. 3. *laurinoides*, Miq. Fl. Ind. Bat. i. pt. i. 600; leaves obovate or obovate-elliptic shortly acuminate much thinner than in the typical *belerica*. Mergui; Griffith. Ceylon; Thwaites, Gardner, Col. Walker.—DISTRIB. Java, Malaya. *T. nitens* Presl. Epimel. 214 is very near but has long subsistent bracteoles.

T. bialata is much mixed (in absence of fruit) with *T. belerica*, but may generally be distinguished by the absence of punctations on the leaves.

5. **T. Chebula**, Retz Obs. v. 31; leaves not clustered often subopposite ovate or elliptic usually acute not acuminate and rounded at the base, spikes terminal often panicled, fruit $\frac{3}{4}$ – $1\frac{1}{4}$ in. ellipsoidal or obovoid from a broad base, glabrous more or less 5-ribbed when dry. Roxb. Hort. Beng. 33, Cor. Pl. t. 197, Fl. Ind. ii. 433; DC. Prodr. iii. 12; Wall. Cat. 3967; W. & A. Prodr. 313; Miq. Fl. Ind. Bat. i. pt. i. 601; Dalz & Gibs. Bomb. Fl. 91; Bedd. Fl. Sylb. t. 27; Brand. For. Fl. 223 and t. 29; Kurz For. Fl. Brit. Burma i. 456. T. reticulata, Roth. Nov. Sp. 381; DC. Prodr. iii. 13. T. Aruta, Ham. in G. Don Gen. Syst. ii. 659. Myrobalanus Chebula, Gaertn. Fruct. ii. t. 97. Embryogonia arborea, Teys. & Binn. No. 2160 in Hort. Bog.

Abundant in Northern India from Kumaon to Bengal, and southward to the DECCAN table lands at 1000–3000 ft. alt., and CEYLON, BURMA and the MALAY PENINSULA.—DISTRIB.—Siam, Malaya.

Attains 80–100 ft. Leaves 4–5 in., deciduous in the cold season, more or less hairy when young; petiole about 1 in. often with two glands near its summit. Racemes terminal. Bracteoles conspicuous in the young spikes, exceeding the flowers pubescent, but soon deciduous. Flowers all hermaphrodite. Calyx-teeth hairy within.

VAR. 1, *typica*; adult leaves nearly glabrous beneath or the interstices of the ultimate nerves with minute sunk white tomentum, young ovary shaggy without, calyx-teeth without glabrous.—Deccan, Ceylon, and Burma and Malay Peninsula.

VAR. 2 (*T. citrina* of authors partly) differs from var. 1 only in having the young ovary quite glabrous; it has the ovate fruit and round-based leaves of *T. Chebula*. Common in Northern India from Kumaon to Bengal, and in Chota Nagpore.

VAR. 3; adult leaves very shaggy beneath, fruit much smaller, often only $\frac{3}{4}$ in. Gnarled small trees on the summit of Parasnath in Behar alt. 4000 ft.: but pass by degrees into var. 2 the common form at the base of Parasnath.

VAR. 4, *tomentella*, Kurz For. Fl. Brit. Burma i. 455 (sp.); leaves when young densely coppery-pubescent beneath, when adult pubescent or glabrous beneath, young ovary glabrous, fruit ovoid hardly 1 in. Pegu, up to 2000 ft. alt.; Kurz.—This is reckoned, perhaps rightly, a species by Kurz, but the leaves are less hairy, the fruits less reduced in size than those of the preceding var.

VAR. 5, *gangetica*; Roxb. Hort. Beng. 33 and Fl. Ind. ii. 437 (sp.); adult leaves with brown-red silky hairs on both surfaces. Wall. Cat. 3967 E.; Miq. Fl. Ind. Bat. i. pt. i. 602. Banks of the Ganges; Roxburgh. North-west India, cult. Edgeworth. Very unlike the typical *Chebula* by the brown silky hair which covers the twigs leaves and whole inflorescence. It may be a good species but the fruit is similar to that of *Chebula*.—Roxburgh remarks that this tree ripens its fruit on the banks of the Ganges, a remark he would hardly have made had he thought the tree indigenous. It is therefore likely that *T. gangetica*, Roxb. does not grow wild within the limits of the Indian Flora.

VAR. 6, *parviflora*, Thwaites Enum. 103 (sp.); calyx-teeth pubescent without. T. zeylanica Heurck & Muell. Arg. Obs. Bot. 220. CEYLON; Thwaites.—The flowers are not smaller nor the fruits more acutely ribbed than in some examples of *T. Chebula*.

6. **T. citrina**, Roxb. Hort. Beng. 33, Fl. Ind. ii. 435; leaves subopposite elliptic or oblong acuminate narrowed into the petiole, spikes terminal and lateral often panicled, fruit nearly 2 in. oblong-lanceolar, while fresh obscurely 5-angular. Wall. Cat. 3970; DC. Prodr. ii. 12; Miq. Fl. Ind. Bat. i. pt. i. 602. Myrobalanus citrina, Gaert. Fruct. ii. t. 97; W. & A. Prodr. 313; Brand. For. Fl. 223.

ASSAM, EAST BENGAL, BURMA and TENASSERIM; frequent. MALACCA at Mount Ophir.

Attains 80 ft. Leaves 3-6 in., when adult glabrous shining, the interstices of the nerves beneath with sunk close white tomentum; petiole $\frac{1}{2}$ in. usually with two glands at the top or on the base of the leaf beneath. Bracteoles linear, conspicuous on the young spikes. Flowers all hermaphrodite. Calyx-teeth glabrous without, hairy within. Young ovary glabrous.—The examples from other parts of India than the East referred to *T. citrina* by collectors are in the present enumeration supposed included under *T. Chebula*. *T. citrina* has a straighter stem, a brighter foliage and narrower fruits, but ought perhaps hardly to be reckoned a distinct species.

VAR. 2. *malayana*, Kurz. in Journ. As. Soc. 1876, part ii. 130; petioles longer, fruits smaller. Nicobars; Kurz. Maingay sends a similar form from Malacca No. 643.

SECT. II. **Pentaptera.** Fruit with 5 acute subequal wings. Spikes usually paniced.

7. **T. Arjuna**, Bedd. Fl. Sylv. t. 28; leaves subopposite oblong or elliptic nearly glabrous beneath when adult, spikes usually paniced, fruits 1-2 in. nearly glabrous ovoid- or obovoid-oblong, the wings not very broad their striations curving much upwards. Dalz. & Gibs. Bomb. Fl. 91; Brand. For. Fl. 224. T. Berryi, W. & A. Prodr. 314; Dalz. & Gibs. Bomb. Fl. 92. T. glabra, W. & A. Prodr. 314; Thwaites Enum. 104; Dalz. & Gibs. Bomb. Fl. 91. T. ovalifolia, Rottl. in Herb. Pentaptera Arjuna, Roxb. Hort. Beng. 34 and Fl. Ind. ii. 438; Wall. Cat. 3981; DC. Prodr. iii. 14, Mem. Combr. t. 2. Pentaptera glabra, Roxb. Hort. Beng. 34 and Fl. Ind. ii. 440; Wall. Cat. 3979. P. angustifolia, Roxb. Hort. Beng. 34 and Fl. Ind. ii. 437.

DECCAN, CEYLON and the sub-Himalayan tracts of the NORTH WEST PROVINCES. Very common.

Attains 60-80 ft. Leaves usually 4-6 in. (sometimes 10 in.), suddenly narrowed at the base, often cordate, obtuse or very shortly acute at the apex; petiole rarely more than $\frac{1}{2}$ in., often very short, with two glands near its apex. Bracteoles very small. Calyx-teeth nearly glabrous both within and without. Young ovary very short, covered with crisped brown or rufous hair. Wings of the fruit usually truncate or suddenly narrowed at the top.—Dr. Brandis states that *T. Arjuna* is common in Bengal; it is unknown in east and central Bengal but abounds in Southern Behar, Chota Nagpore and on the Sone—i. e. along the whole northern face of the Deccan table-land.

VAR. 2. *angustifolia* (i. e. *Pentaptera* Roxb. and not *Terminalia angustifolia* Roxb.). Leaves narrow elongate-oblong suddenly narrowed into the petiole. Southern Peninsula and Concan. Wall. Cat. 3971.

8. **T. tomentosa**, Bedd. Fl. Sylv. t. 17; leaves subopposite or uppermost alternate elliptic or ovate glabrous or very hairy beneath when adult, spikes paniced, fruit 1-2 in. glabrous or hoary obovoid-oblong, wings broad striations carried horizontally to the edge. Brand. For. Fl. 225.

DECCAN, CEYLON, and the sub-Himalayan tracts of the NORTH WEST PROVINCES, NIPAL, and SIKKIM, ascending to 4000 ft.; very common. BURMA; Brandis, Kurz.

Attains 80-100 ft. Leaves 4-8 in., petiole $\frac{1}{2}$ in. Flowers often attacked by a Cynips producing numerous galls which simulate fruit. Bracteoles very small. Calyx-teeth without tomentose villous or glabrescent.

VAR. 1. *typica*; leaves cordate or suddenly narrowed into the petiole, adult more or less hairy beneath often very hairy, petiole with two glands near the base of the leaf, young ovary villous, fruit glabrous. T. tomentosa, W. & A. Prodr. 314; Wight Ic. t. 195. T. glabra, var. tomentosa, Dalz. & Gibs. Bomb. Fl. 91? T. alata, Roth Nov. Sp. 379; Kurz For. Fl. Brit. Burma i. 458. T. ovata, Herb. Rottler. T. Chebula, Retz β. minor Huerck & Muell. Arg. Obs. Bot. 219. Pentaptera tomentosa, Roxb. Hort. Beng. 34, Fl. Ind. ii. 440; DC. Prodr. iii. 14, Mem. Combr. t. 1; Wall. Cat. 3978.—Common throughout India.

VAR. 2. *crenulata*; leaves narrowed into the petiole often obovate-elliptic adult nearly glabrous beneath, young ovary glabrous. *T. crenulata*, *Roth Nov. Sp.* 380; *W. & A. Prodr.* 314. Pentaptera *crenulata*, *Roxb. Hort. Beng.* 34, *Fl. Ind.* ii. 438; *DC. Prodr.* iii. 15; *Wall. Cat.* 3978. *P. macrocarpa*, *Wall. Cat.* 3982.—Deccan and the sub-Himalaya; common. Burma; *Kurz. Kurz For. Fl. Brit. Burma* i. 458 states *T. crenulata*, Roth, to be *T. Arjuna* of Beddome and Brandis. But both Beddome and Brandis have stated that *T. crenulata* *W. & A.* is a variety included under their *T. tomentosa*. Kurz has not communicated any example of his *T. crenulata*, nor in his description does he notice the character of the venation of the fruit by which Dr. Brandis has separated *T. Arjuna* and *T. tomentosa*. The synonym *T. crenulata* Kurz remains therefore doubtful. Perhaps as Mr. Thwaites hints *T. Arjuna* (*T. glabra*, *Enum.* 104) and *T. tomentosa* should be made one species.

VAR. 3. *coriacea*; leaves as in *T. tomentosa typica* but beneath with a close hard fulvous tomentum rather than villous, fruit pubescent with minute fulvous hairs. *T. coriacea*, *W. & A. Prodr.* 315. Pentaptera *coriacea*, *Roxb. Hort. Beng.* 34, *Fl. Ind.* ii. 438.—Mountains of the Coromandel Coast; *Roxburgh. Deccan; Herb. Rottler. Malabar Hills; Dr. Ritchie.*

SECT. III. **Chuncoa.** *Fruit* with three very unequal wings, rarely more than $\frac{3}{4}$ in., often much smaller.

9. **T. paniculata**, *Roth Nov. Sp.* 383; leaves oblong or elliptic acute adult nearly glabrous, panicles compound, fruit brown-red villous with one very broad and two narrow wings. *W. & A. Prodr.* 315; *Dalz. & Gibs. Bomb. Fl.* 92; *Bedd. Fl. Sylv.* t. 20; *Brand. For. Fl.* 226. *T. monoptera*, *Roth Nov. Sp.* 382. *T. trioptera*, *Heyne in Herb. Rottl.* Pentaptera *paniculata*, *Roxb. Hort. Beng.* 34, *Fl. Ind.* ii. 442; *DC. Prodr.* iii. 14; *Wall. Cat.* 3980. *Hiptage* sp., *Wall. Cat.* 9029.

MALABAR; lower hills from Bombay to Cochin; common: NILGHIRI and KURG mountains.

A large tree, the innovations rusty-tomentose. *Leaves* 4–7 in., lower subopposite, upper alternate, base cordate, two glands generally present near the base of the midrib beneath; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Spikes* very dense, bracteoles and young ovaries villous. *Fruit* about $\frac{1}{4}$ in. long, with one wing $\frac{1}{2}$ in. broad, the other two wings hardly $\frac{1}{2}$ in. broad.

10. **T. pyrifolia**, *Kurz For. Fl. Brit. Burma* i. 457; leaves crowded towards the ends of the branches oblong- or broadly-lanceolate glabrous, spikes simple, fruit indistinctly brown velvety with two broad wings and one very narrow one. Pentaptera *pyrifolia*, *Presl Epimel. Bot.* 215.

PEGU to TENASSERIM, frequent; *Kurz, Helfer (ex Presl).* PROME; *Maolelland.*

Attains 80 ft.; glabrous except the innovations and spikes. *Leaves* 2–4 in., coriaceous, narrowed into the petiole; petiole $\frac{3}{4}$ –1 $\frac{1}{2}$ in., without glands. *Calyx* densely tawny or brown-pubescent. *Fruit* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, the two lateral wings about $\frac{1}{2}$ – $\frac{3}{4}$ in. broad, chartaceous, rounded and striated.—Mr. Kurz cites as a doubtful synonym *T. javanica*, *Miq. Fl. Ind. Bat.* i. pt. i. 602; the example of which at Kew agrees, but has no fruit.

11. **T. myriocarpa**, *Heurck & Muell. Arg. Obs. Bot.* 215; leaves oblong or elliptic acute, adult nearly glabrous, petiole very short, spikes paniced, fruit yellow shining with two very broad wings and one narrow one. *Kurz For. Fl. Brit. Burma* i. 457. Pentaptera *Saja*, *Wall. Cat.* 3983.

Subtropical valleys in SIKKIM and BHOTAN, alt. 1000–3000 ft., abundant. ASSAM HILLS; *Simons, Griffith.*—DISTRIB. Ava, Bhamo.

Attains 80–100 ft., the innovations pubescent-tomentose. *Leaves* 4–8 in., base obtuse, nerves numerous and very parallel, upper subopposite; petiole about $\frac{1}{4}$ in.,

usually with two glands at its apex. *Spikes* dense, bracteoles and young ovaries villose. Epigynous *disc* with very little or no hair. *Fruits* $\frac{1}{2}$ – $\frac{3}{4}$ in. long, exceedingly numerous, minutely villous, broad wings each $\frac{1}{4}$ in. wide puberulous, the third acute hardly winged.—The top of the tree in flower appears pink, the middle white, from the panicles changing colour.

SECT. IV. *Fruit* large, 1–1 $\frac{1}{2}$ in., with two very broad wings. (Really allied to Sect. *Catappa*).

12. **T. bialata**, Kurz *For. Fl. Brit. Burma* i. 456; leaves clustered near the ends of the branches obovate narrowed into a very long petiole, spikes axillary simple elongate, fruit 2–3 $\frac{1}{2}$ in. wide rusty tomentose. Pentaptera bialata, Roxb. *Hort. Beng.* 34; *Fl. Ind.* ii. 441; *Wall. Cat.* 3986.

BURMA and the ANDAMANS; Maclelland, Kurz.

Attains 80–100 ft. *Leaves* 5 in., glabrous when adult; petiole 2 $\frac{1}{2}$ –3 $\frac{1}{2}$ in. *Spikes* very long, the upper flowers male, the lower hermaphrodite. Young *ovary* and calyx brown-pubescent or tomentose. *Calyx*-teeth hairy within. *Fruit* 1 $\frac{1}{4}$ –1 $\frac{3}{4}$ in. long.

VAR. *cuneifolia*, Wall. *Cat.* 3972; leaves lanceolate rather than obovate, fruit less than 1 in. long and nearly glabrous.—Prome; Wallich. Tenasserim and Andamans; Helfer No. 2182 Kew Distrib.

DOUBTFUL SPECIES.

T. MOLUCCANA, Wall. *Cat.* 3969 consists of leaves generally resembling those of *T. procera*, and a detached fruit which also resembles that of *T. procera*. But the petioles have a thickening simulating an articulation, and M. Planchon has suggested (by a note on the specimen) that the leaves are those of an *Elæocarpus*.

T. ANGUSTIFOLIA, Roxb. *Hort. Beng.* 33 and *Fl. Ind.* ii. 437; a large tree, tender parts hairy, leaves narrow-lanceolate acuminate glandular on the margin at the base, fruit scarcely distinguishable from that of *T. Chebula*, young leaves with much ferruginous hair. *T. travancorensis*, W. & A. *Prodr.* 314. Tinnevely and Travancore, Roxburgh.—No example known and not seen by anyone except Roxburgh; if it be not a variety merely of *T. Chebula*.

T. BENGALENSIS, Roxb. in *DC. Prodr.* iii. 12; leaves alternate obovate obtuse entire glabrous on both surfaces and the petioles without glands. In Bengal.—This species is not known by any authentic specimen and is insufficiently described: it is improbable that it is distinct from all the other known species.

2. CALYCOPTERIS, Lamk.

A diffuse shrub with drooping branches. *Leaves* opposite, shortly petioled, elliptic or ovate, acuminate, entire. *Racemes* dense, axillary, and crowded towards the ends of the branches so as to form large panicles. *Flowers* small, greenish, each with a lanceolate bract. *Calyx*-tube 5-ribbed, produced above the ovary; limb 5-fid, persistent and much enlarged in fruit. *Petals* 0. *Stamens* 10, the five upper ones between the calyx-teeth, the five others alternate with them and lower down on the calyx-tube. *Ovary* 1-celled, inferior; style subulate, simple; ovules 3, pendulous from the top of the cell. *Fruit* narrow ovoid, 5-ribbed, villous, 1-seeded, surmounted by the enlarged calyx. *Cotyledons* convolute.

1. **C. floribunda**, Lamk. *Dict. Supp.* ii. 41 and *Ill.* t. 357; *Brand. For. Fl.* 220. *C. nutans*, Kurz *For. Fl. Brit. Burma* i. 468. *Getonia floribunda*, Roxb. *Cor. Pl.* t. 87 and *Fl. Ind.* ii. 428; *Roth Nov. Sp.* 216; *DC. Prodr.* iii. 15; *Dalz & Gibs. Bomb. Fl.* 91; *Miq. Fl. Ind. Bat.* i. pt. i. 605; *W. & A. Prodr.* 315; *Wall. Cat.* 4013. *G. nutans*, Roxb. *Hort. Beng.* 33 and *Fl. Ind.*

ii. 428; *Wall. Cat.* 4012; *Miq.* l. c.; *DC. Prodr.* iii. 15. *Getonia nitida*, *Roth Nov. Sp.* 217. *Combretum sericeum*, *Wall. in Herb. Calc.*

On hot hills, alt. 500–2500 ft., abundant throughout the DECCAN and from ASSAM to SINGAPORE.

A dense shrub 6–12 ft. high, often gregarious, diffuse with drooping branches, not at all scandent, generally rusty villous; in the variety *nitida* of Roth the upper surface of the leaves is glabrous shining. *Leaves* 2–5 in., not narrowed into the petiole which is $\frac{1}{4}$ – $\frac{1}{2}$ in. *Panicles* often large and then more or less nodding. *Flowers* very like those of *Terminalia* and hardly larger. Base of *stamens* and style pilose or glabrous. *Calyx*-lobes in fruit $\frac{1}{2}$ –1 in. long, broad-lanceolate, becoming more or less papery, sometimes transparent showing conspicuously the veins. *Fruit* itself less than $\frac{1}{4}$ in. long. *Kurz*, in *Journ. As. Soc.* 1877, pt. ii. 59, divides this shrub into two species, viz.:—

1. *C. nutans*; leaves pubescent rarely almost glabrous, longer *stamens* $\frac{1}{4}$ – $\frac{1}{2}$ as long as the *calyx*-lobes.

2. *C. floribunda*; leaves glabrous, longer *stamens* as long as the long bluntish *calyx*-lobes.

3. **ANOGEISSUS**, *Wall.*

Trees or shrubs. *Leaves* alternate or falsely opposite, petioled, entire. *Flowers* in dense globose heads, on axillary peduncles much shorter than the leaves. *Calyx*-tube long attenuated above the ovary, subsistent; limb small with 5 lobes, deciduous. *Petals* 0. *Stamens* 10 in two series. *Ovary* inferior, 1-celled; style filiform, simple; ovules 2 pendulous from the top of the cell. *Fruits* small, coriaceous, compressed 2-winged, packed horizontally into dense heads. *Seed* 1; cotyledons convolute.—*DISTRIB.* Species 5: of which one is Tropical African, the other four Indian.

1. ***A. latifolia***, *Wall.*; *Bedd. Fl. Sylv.* t. 15; leaves broad elliptic obtuse at both ends, peduncles 1 or more from the same axil often branched, bracteoles inconspicuous, ripe fruits shining glabrous the beak as long as the nucleus or longer. *Wall. Cat.* 4015; *Brand. For. Fl.* 227. *Conocarpus latifolia*, *DC. Prodr.* iii. 17; *Roxb. Hort. Beng.* 34 and *Fl. Ind.* ii. 442; *Royl. Ill.* t. 45; *W. & A. Prodr.* 316; *Wight Ic.* t. 994; *Dalz. & Gibs. Bomb. Fl.* 91; *Miq. Fl. Ind. Bat.* i. pt. i. 605. *Andersonia altissima*, *Herb. Madr.*

From the HIMALAYA to CEYLON; very common, ascending to 3000 ft. Not in the Transgangetic Peninsula.

Attains 80 ft., but usually occurs as a small tree; leafless during most of the hot season. *Leaves* sometimes 5 in. with a petiole $\frac{1}{2}$ in., usually much smaller, sometimes acute, never acuminate. Innovations and *peduncles* more or less rusty-pubescent. *Fruit* sometimes $\frac{3}{8}$ in. (excluding the beak) by $\frac{1}{4}$ in. including the wings, usually smaller, more or less rusty-pubescent when young.

VAR. glabra; leaves glabrous beneath.

VAR. villosa; leaves small densely rusty villous on both surfaces. Mysore, C. B. Clarke.

VAR. parvifolia; leaves small ($\frac{1}{2}$ in.) silky pubescent. Central Provinces. *Brandis For. Fl.* 228.

2. ***A. acuminata***, *Wall.*; *Bedd. Fl. Sylv.* t. 16; leaves elliptic or oblong acute at both ends villous or pubescent beneath, peduncles solitary (rarely clustered) very rarely divided, ripe fruits shining glabrous. *Wall. Cat.* 4014; *Brand. For. Fl.* 228; *Kurz For. Fl. Brit. Burma* i. 466. *A. hirta*, *Wall. Cat.* 4016. *Conocarpus acuminata*, *Roxb. Hort. Beng.* 34 and *Fl. Ind.* ii. 443; *W. & A. Prodr.* 316; *DC. Prodr.* iii. 17 and *Mem. Combr.* t. 3; *Miq. Fl. Ind. Bat.* i. pt. i. 605.

VAR 1. typica; leaves usually broad-lanceolate fulvous beneath, peduncles with obovate bracts often leaflike large, fruit very broadly winged (twice as broad as high) with a deflexed pubescent beak much longer than the nucleus. *Andersonia acuminata*, *Herb. Rottl.*

The northern edge of the DECCAN ascending to 3000 ft. *BUNDELKUND*, *Edgeworth*. Mountains above the Circars; *Roxburgh*. *GODAVERY* forests; *Brandis*. North-west India, *Royle*.

A tree, sometimes attaining 60 ft.; trunk rarely straight, when young armed with long spines (*Kurz*). *Leaves* commonly $2\frac{1}{2}$ by 1 in., upper becoming smaller, often obovate, passing into bracts; petiole less than $\frac{1}{4}$ in. *Peduncles* and neck of ovary rusty-tomentose.

VAR. 2. lanceolata, *Wall. Cat.* 4014 F; leaves usually narrow-lanceolate grey beneath, bracteoles on the peduncles small linear very deciduous, fruit winged subquadrate with an erect beak shorter than the nucleus. *Andersonia lanceolata*, *Herb. Rottl.*

PEGU, *TENASSERIM* and *KOOKIE-LAND*.

An erect elegant tree 60-100 ft. high. *Leaves* commonly 2 by $\frac{1}{2}$ in., upper long-lanceolate; petiole scarcely any. *Peduncles* and neck of ovary with dense rusty spreading hairs. *Fruits* sometimes $\frac{1}{4}$ in. broad.

3. **A. phillyrææfolia**, *Heurck & Muell. Arg. Obs. Bot.* 209; leaves narrowly lanceolate narrowed upwards obtuse, peduncles short rarely divided, heads and fruit small, beak about as long as the nucleus. *Wall. Cat.* 8557.

PROME; *Wallich*.

Apparently a shrub or small tree. *Leaves* $1\frac{1}{2}$ in., subsessile, narrowed at base, glabrous or silky beneath. *Peduncles* $\frac{1}{4}$ - $\frac{3}{8}$ in., solitary or clustered, rusty-pubescent, much less shaggy than in *A. acuminata* var. *lanceolata*. *Fruits* about $\frac{1}{16}$ in. broad.—*Kurz*, in *Journ. As. Soc.* 1874, pt. ii. 188, reduces this to *A. acuminata*; but from the example he has communicated to Kew it appears that his *A. phillyrææfolia* is not the plant of *Heurck & Muell.* but *A. acuminata* var. 2 above. The present species however may prove only a more extreme form of *A. acuminata*.

4. **A. pendula**, *Edgw. Cat. Pl. Banda*, p. 47; leaves elliptic or obovate acute or obtuse always narrowed at base, peduncles solitary simple, fruit subquadrate ultimately glabrous, beak much less than half the height of the nucleus. *Brand. For. Fl.* 229. *A. myrtifolia*, *Wall. Cat.* 4017; *Royle Ill.* p. 209.

BUNDELKUND; *Edgeworth*. *NORTH-WEST INDIA*; *Royle*. Common in *RAJPUTANA*; *Brandis*. *DEESA*; *Stocks*.

A gregarious bush or small tree. *Leaves* $\frac{3}{4}$ -1 in., usually glabrous, sometimes silky beneath. *Peduncles* sometimes with an elliptic leaflike bract.—A species which may be distinguished at once by its small leaves.

4. **LUMNITZERA**, *Willd.*

Large glabrous shrubs or small trees, growing in tropical salt marshes along with Mangroves and closely resembling them in habit. *Leaves* clustered towards the ends of the branches, alternate, thickly leathery, subsessile, narrow-obovate, entire or scarcely crenate. *Flowers* in racemes. *Calyx*-tube with two adnate bracteoles near the base, oblong, narrowed at both ends, produced above the ovary; lobes 5 persistent. *Petals* 5, oblong. *Stamens* 10 in two series, or fewer. *Ovary* inferior, 1-celled; style subulate, simple; ovules 2-5 pendulous from the top of the cell. *Fruit* woody, elliptic-oblong, $\frac{1}{2}$ -1 in. including the calyx-limb, longitudinally striate or nearly smooth. *Seed* 1; cotyledons convolute.—*DISTRIB.* Species 2; on the shores of the tropics of the Old World, and of Polynesia.

1. **L. coccinea**, *W. & A. Prodr.* 316; racemes dense terminal sometimes 2 or 3 forming a small corymb, petals scarlet $\frac{1}{4}$ in. *Miq. Fl. Ind. Bat.* i. pt. i. p. 606. *L. littorea*, *Voigt.*; *Kurz For. Fl. Brit. Burma*, i. 469. *L. pentandra*, *Griff. Notul.* iv. 684, and *Id. Pl. Asiat.* t. 644. *Pyrranthus littoreus*, *Jack. Mal. Misc.* ii. 57; *Wall. Cat.* 4018.

MERGUI; *Griffith.* NICOBARS; *Kurz.* MALACCA; *Maingay, Griffith.*—DISTRIB. Malaya, North Australia, Polynesia.

A small tree 20-40 ft. high. *Leaves* 2-3 $\frac{1}{2}$ in. *Stamens* 5-10, usually 7; twice as long as the petals, filaments crimson.

2. **L. racemosa**, *Willd.*; *DC. Prodr.* iii. 22; racemes axillary somewhat dense in flower 2-4 in. long in fruit, petals white very small. *W. & A. Prodr.* 316; *Miq. Fl. Ind. Bat.* i. pt. i. 606; *Dalz & Gibs. Bomb. Fl.* 90; *Tulasne in Ann. Sc. Nat. Ser. iv. vol. vi. p. 103*; *Bedd. Fl. Sylv. Anal. Gen. Pl.* xxi.; *Brand. For. Fl.* 221; *Kurz For. Fl. Brit. Burma* i. 468. *Pyrranthus albus*, *Wall. Cat.* 4019. *Petaloma alternifolia*, *Roxb. Fl. Ind.* ii. 372. *Bruguiera madagascariensis*, *DC. Prodr.* iii. 23.—*Rheede Hort. Mal.* vi. t. 37.

On the coasts of INDIA, CEYLON and the TRANSGANGETIC PENINSULA as on the ANDAMANS and NICOBARS (*Kurz*); general.—DISTRIB. Tropical Africa, Malaya, North Australia and Polynesia, in the Mangrove swamps.

A small tree 20-40 ft. high. *Leaves* usually 2-3 in. sometimes only 1 in. *Stamens* sometimes 5, sometimes 10 (always 10 *Kurz*) about as long as the petals, filaments white. *Racemes* in fruit ascending.

5. COMBRETUM, Linn.

Large shrubs (except *C. nanum*) with long pendent or scandent branches, without spines (except *C. spinescens*). *Leaves* entire, petioled, opposite or more seldom alternate or ternate. *Flowers* polygamo-dicæious, often in paniced spikes or racemes; bracteoles small. *Calyx*-tube constricted above the ovary, shortly or long produced, urceolate, funnel-shaped or tubular; limb 4-5-lobed, deciduous. *Petals* as many as the calyx-lobes (0 in *C. apetalum*) placed on the calyx-limb. *Stamens* twice as many as the petals, inserted in two series with them. *Ovary* inferior, 1-celled; style 1, subulate, simple; ovules 2-5, pendent from the top of the cell. *Fruit* with 4-5 wings angles or ridges, dry, generally indehiscent. *Seed* 1; cotyledons plaited or flat, in a few species convoluted.—DISTRIB. Species 120, common in the tropics of America, Africa, and Asia; also in South Africa, but not in Australia or Polynesia.

SECT. I. **Polvrea**. *Flowers* 5-merous. *Fruit* 5-winged or 5-ridged.

* *Fruit* with 5 membranous wings.

1. **C. decandrum**, *Roxb. Cor. Pl.* t. 59; leaves oblong suddenly acuminate nearly glabrous on both surfaces when adult, panicles large terminal, young ovary densely villose, calyx hardly constricted above the ovary urceolate covered with short hairs within and without. *Roxb. Hort. Beng.* 28 and *Fl. Ind.* ii. 232; *G. Don in Trans. Linn. Soc.* xv. 437; *Wall. Cat.* 4009; *Brand. For. Fl.* 221; *Kurz For. Fl. Brit. Burma* i. 460. *C. Roxburghii*, *Spreng. Syst.* ii. 331. *Polvrea Roxburghii*, *DC. Prodr.* iii. 18; *W. & A. Prodr.* 317. *Pentaptera Roxburghii*, *Tulasne in Ann. Sc. Nat. Ser. iv. vol. vi. 84.*

BENGAL, abundant, alt. 0-3000 ft. North DECCAN plateau very common, less common South. NORTH WEST PROVINCES nearly to the Punjab. TENASSERIM and the ANDAMANS.

An exceedingly large shrub with many branches pendent and subsacandent, conspicuous in flower by the floral leaves (bracts) becoming cream-white. *Leaves* opposite, 4-5 in., somewhat hairy when young, when old glabrous or rarely with tufts of hairs in the axils of the nerves beneath; petiole $\frac{1}{2}$ in. *Racemes* numerous, very villous, in large terminal quasi-panicles, the leaves thereon 2-3 in., becoming petaloid at the time of flowering; bracteoles linear, $\frac{1}{2}$ in., somewhat persistent. *Ovary* sessile. *Calyx* segments lanceolate-subulate, suberect. *Petals* oblong, glabrous, hardly exceeding the calyx or twice as long as the calyx (Kurz). *Disc* covered with short hairs. *Fruit* $\frac{3}{4}$ -1 $\frac{1}{4}$ in., oblong or elliptic, subquadrate, nearly smooth.

2. **C. pilosum**, Roxb. *Hort. Beng.* 28, *Fl. Ind.* ii. 231; leaves oblong-lanceolate adult more or less hairy beneath, panicles terminal the racemes densely fulvous-villous and congested, young ovary fulvous-villous, calyx shortly constricted above the ovary then funnel-shaped hairy within and without. *G. Don in Trans. Linn. Soc.* xv. 434; *Wall. Cat.* 4005; *Kurz For. Fl. Brit. Burma* i. 462. *C. lætum* and *spinescens*, *Wall. Cat.* 4004, 4006. *C. insigne*, *Heurck & Muell. Arg. Obs. Bot.* 247 (from description only).

EAST BENGAL; alt. 0-1000 ft., from SILHET to MERGUI frequent.

A large scandent shrub without thorns, the innovations densely rusty-villous. *Leaves* opposite, 4-8 in., usually when adult with some rusty hair at least on the lower surface (but some of Griffith's specimens are quite glabrous); petiole $\frac{1}{2}$ - $\frac{1}{4}$ in. *Bracteoles* $\frac{1}{2}$ in., narrow-lanceolate, somewhat persistent. *Ovary* sessile. *Calyx*-tube upwards 5-fluted, the segments triangular acute erect. *Petals* narrow-obovate, far exceeding the calyx, with rusty silky hairs on their backs. *Disc* low in the funnel of the calyx with short hair. *Fruit* 1 in., elliptic or circular, usually pubescent, sometimes glabrous.

VAR. 2. *spinescens*; with stout spines at the base of the branchlets, otherwise does not differ. Irrawaddy bank; *Wall. Cat.* 4006. Cachar, Keenan.

Here perhaps belongs the very doubtful species described by Kurz in *Forest Fl. Brit. Burma*, i. 462 under the name *C. ovale*, R. Br., which is said to differ from *C. pilosum* by having the innovations puberulous instead of pubescent. The fruit is unknown. It can hardly be *C. ovale*, R. Br. which considerably differs as see under *C. aculeatum*, *Vent. in Oliv. Fl. Trop. Afr.* ii. 423.

3. **C. apetalum**, *Wall. Cat.* 3990; leaves oblong-lanceolate adult nearly glabrous, panicles terminal large much divided the ultimate racemes long slender distant, young ovary densely pubescent almost tomentose, calyx-tube hardly constricted above the ovary then urceolate pubescent within and without. *Kurz For. Fl. Brit. Burma* i. 460. *C. virgatum*, *Wall. Cat.* 3992.

PEGU; Wallich, Maclelland, Kurz.—DISTRIB. Burma.

A scandent shrub or (ex Kurz) a weak tree 15-20 ft. high. *Leaves* 1-4 in., subopposite, the petiole $\frac{1}{2}$ - $\frac{1}{4}$ in., and midrib beneath usually grey puberulous, sometimes long fulvous hair near the base of the main nerves beneath. *Racemes* long, undulating, very narrow, the flowers though numerous being very small; bracteoles $\frac{1}{2}$ in., linear, exceeding the young ovaries. *Ovary* sessile. *Calyx*-teeth lanceolate, erect. *Petals* 0. *Disc* covered by short hairs. *Fruit* $\frac{3}{4}$ in., elliptic, nearly circular, glabrous, surface between the wings covered with close sessile circular glands.

4. **C. pyriformum**, *Kurz For. Fl. Brit. Burma* i. 464; leaves small ovate to broad-oblong and suborbicular glabrous, spikes puberulous in slender axillary or short terminal panicles, fruits 5- or occasionally 4-winged. *Pentaptera pyrifolia*, *Wall. Cat.* 3985.

PEGU; Kurz.—DISTRIB. Burma.

A scandent shrub, with the habit of *Combretum ovalifolium*, the innovations rusty puberulous. *Leaves* 1 $\frac{1}{2}$ -2 in., opposite or alternate, punctate on the upper surface,

petiole $\frac{1}{2}$ in. *Fruit* $\frac{1}{2}$ – $\frac{3}{4}$ in., glabrous.—Herbarium twigs of this species are much like whole plants of *C. nanum*, but the fruits are hardly half as long.

**** *Fruit with 5 sharp angles.***

5. ***C. trifoliatum*, Vent. Choix t. 58**; leaves lanceolate or elliptic narrowed at both ends glabrous, spikes lateral and terminal often compound rusty-villous, calyx-tube hardly constricted above the ovary then urceolate silky. *G. Don in Trans. Linn. Soc. xv. 439*; *Miq. Fl. Ind. Bat. i. pt. i. 610*; *Kurz For. Fl. Brit. Burma i. 461*. *C. lucidum*, *Blume Bijl. 641*. *C. undulatum* and *C. elegans*, *Wall. Cat. 3993, 4003*. *C. subalternans*, *Wall. Cat. 4008*? *Terminalia lancifolia*, *Griff. Notul. iv. 685*. *Embryogonia lucida*, *Blume Mus. Bot. ii. t. 52*. *Cacoucia*? *trifoliata*, *DC. Prodr. ii. 22*. *C. lucida*, *Hassk. in Flora 1844, p. 607*.

TRANSANGANETIC PENINSULA from PEGU to SINGAPORE, alt. 0–1000 ft., frequent.—DISTRIB. Burma, Java.

A scandent shrub. *Leaves* 2–4 $\frac{1}{2}$ in., opposite, not seldom ternate, sometimes sub-alternate, usually shining, the petiole $\frac{1}{4}$ – $\frac{3}{8}$ in. (and sometimes the midrib) pubescent. *Bracteoles* linear, small, early deciduous. *Ovary* sessile. *Calyx*-teeth lanceolate, erect. *Petals* narrow, little exceeding the calyx. *Disc* and base of the calyx-tube within covered with long hair. *Fruit* about 1 $\frac{1}{4}$ in., and half as broad, shining, black.

SECT. II. ***Tetragonocarpus***. *Flowers* 4-merous. *Fruit* with 4 obtuse or acute ridges, the ridges not expanded into thin papery wings.

6. ***C. tetralophum*, C. B. Clarke**; leaves lanceolate glabrous or nearly so, racemes in subterminal panicles which are ferruginous and covered with scales but only slightly villose, calyx-tube constricted above the ovary then urceolate covered with ferruginous scales, fruit with very acute ridges.

MALACCA, *Griffith* (Kew Distrib. No. 2195)=*Combretum* No. 19 of *Hk. f. & T. distrib.*—DISTRIB. Siam, Borneo.

A scandent shrub. *Leaves* 4–5 in., opposite, shining, often with a little rusty hair along the base of the midrib beneath; young remotely glandular-punctate; petiole $\frac{1}{8}$ – $\frac{3}{8}$ in. *Bracteoles* $\frac{1}{16}$ in., soon deciduous. Constricted part of the calyx-tube nearly as long as the young ovary, the teeth triangular erect covered without by close flat sessile ferruginous glandular scales. *Petals* narrow, hardly exceeding the calyx-teeth. *Disc* and base of the calyx within densely covered by long fulvous hair. *Fruit* $\frac{3}{4}$ –1 in. and half as broad, shining, black.—This species in the fruit and leaves so much resembles *C. trifoliatum* above that it has been mixed with it as a 4-fid variety: but the flowers are altogether different, and there is not one 5-angled fruit on any of the Kew specimens.

7. ***C. tetragonocarpum*, Kurz For. Fl. Brit. Burma i. 461**; leaves elliptic obtuse coriaceous glabrous, spikes robust fulvous-villous axillary solitary and in thin terminal panicles, calyx-tube and ovary rusty-villous, fruit with four thick coriaceous prominent angles.

Swamp forests of PEGU; frequent, *Kurz*.

A glabrous large scandent shrub. *Leaves* 3–5 in., younger remotely glandular-punctate; petiole less than $\frac{1}{4}$ in. *Flowers* small. *Calyx*-tube short; limb cup-shaped with 4 short acute teeth, scaly and pubescent without, densely villous within. *Petals* minute. *Fruit* 1 in. and more, glabrous, pale brown, elliptic-ovate, the angles thick coriaceous sharp prominent and almost winglike, much narrower than the diameter of the nut.

The example of this species communicated to Kew by Kurz exhibits neither fruit nor flowers; the character of the species is therefore copied from Mr. Kurz.

It is evidently allied to *C. tetralophum*; the leaves on Mr. Kurz' specimen are very unlike those of *C. tetralophum*, but in many *Combretums* while the typical leaves are acute lanceolate there may be found on the same shrub lower branches with obtuse obovate leaves. Kurz however says that the calyx-tube in *C. tetragonocarpum* is "short oval," whereas in *C. tetralophum* it is "elongate nearly filiform," so that the two species must be distinct. He has placed this species in his section with 10 stamens and 5-merous flowers: this it is presumed is a slip.

8. ***C. acuminatum*, Roxb. Hort. Beng. 28, Fl. Ind. ii. 228**; leaves opposite ovate-lanceolate to lanceolate adult pubescent or nearly glabrous beneath, racemes scarcely divided axillary and also in sparingly leafy terminal panicles scaly and pubescent, calyx scarcely constricted above the ovary then campanulate, fruit narrowly oblong with four thick bluntish ridges. *Wall. Cat. 3998. C. costatum, Roxb. Hort. Beng. 28 and Fl. Ind. ii. 227; Kurz For. Fl. Brit. Burma i. 465. C. stenopetalum, Heurck & Muell. Arg. Obs. Bot. 225. C. sarcopoterum, Thwaites Enum. 415. C. neurophyllum? Miq. Fl. Ind. Bat. i. pt. i. 608 ex descript.*

TRANSANGANETIC PENINSULA from ASSAM to SINGAPORE, alt. 0-1000 ft., plentiful. CEYLON; *Thwaites, Mrs. Walker. MADRAS PENINSULA? Wight No. 1014* (Wight's specimen is typical *acuminatum* but may have come from Ceylon).—DISTRIB. Malaya to the Philippines.

A large scandent shrub. *Leaves* often 6-8 in., cordate or acute at the base, somewhat densely glandular-punctate beneath, the glands often prominent or becoming scales; petiole often very short, rarely exceeding $\frac{3}{8}$ in. *Bracteoles* minute, soon deciduous. Young *ovary* and calyx-tube scaly, hardly pubescent. *Calyx*-limb campanulate, grooved or fluted (at least in the dried specimens), teeth erect short triangular. *Petals* narrow, small. *Disc* and base of calyx-tube with short hair or nearly glabrous. *Fruit* 1-2 in. about $\frac{1}{2}$ as broad as long, puberulous brown.—In this species, and in some others, in the hermaphrodite flowers before the calyx expands a very small hole appears at the top through which the style is long protruded; subsequently the calyx opens and the stamens are long extruded.

The examples of *C. acuminatum*, *Roxb.* at Kew are abundant, but the name *C. costatum* *Roxb.* does not occur in the Kew Herbarium nor is the fruit described by *Roxb.* It is clear that Mr. Kurz understands by *C. costatum*, *Roxb.* the plant named *C. acuminatum*, *Roxb.* at Kew. It is almost certain that the two species of Roxburgh are but one. The two names are of one date, and in this list the name taken up by Wallich and subsequent Indian botanists is preferred to the name taken up by Mr. Kurz, especially as there is no doubt at all what Roxburgh's *C. acuminatum* was, while a doubt may be still raised about his *C. costatum*.

SECT. III. **Eucombretum.** *Flowers* 4-merous. *Fruit* with 4 papery wings. *Calyx* not long-tubular-campanulate above the constricted portion.

† *Surface of the fruit between the wings covered densely with lanceolate-linear scales $\frac{1}{8}$ - $\frac{1}{4}$ in.* (Subsection *Flagrocarpeæ*).

9. ***C. flagrocarpum*, Herb. Calc.**; leaves opposite elliptic- or ovate-lanceolate adult pubescent and prominently glandular-punctate beneath, racemes rusty-pubescent simple axillary and also crowded towards the ends of the branches, calyx funnel-shaped above the ovary glandular and somewhat pubescent without. *Pentaptera undulata, Wall. Cat. 3984* (not *Combretum undulatum*, *Wall.*). *Combretum* sp. No. 20, *Herb. Hk. f. & T. C. Wallichii, Kurz For. Fl. Brit. Burma i. 465 not of DC.*

NORTHERN and EASTERN BENGAL, ascending the hills to 5000 ft. alt.; very common, extending to Chittagong.—DISTRIB. Upper Burma.

A large scandent shrub. *Leaves* 4-6 in. (always large and generally more than 2 in. broad), even on the upper surface glandular-punctate and pubescent on the nerves, only ultimately becoming glabrous; petiole $\frac{1}{8}$ - $\frac{3}{8}$ in. *Bracteoles* often $\frac{1}{4}$ in., linear, subsistent. *Calyx*-teeth erect, short, triangular. *Petals* obovate, much longer than the calyx. *Disc* and base of calyx within clothed with short hair. *Fruit* 1-1 $\frac{1}{4}$ in. long and as broad, puberulous, brilliantly red or dark brown.

10. **C. Wallichii**, DC. *Prodr.* iii. 21; leaves opposite elliptic or orbicular acuminate adult glabrous beneath with tufts of yellow hair in the axils of the main nerves, racemes rusty-puberulous undivided axillary solitary and approximated almost paniced in the uppermost axils, calyx shortly constricted above the ovary then funnel-shaped or subcampanulate puberulous without. *Wall. Cat.* 3999.

NIPAL; *Wallich*. Interior of SIKKIM, alt. 4000-5000 ft. (Kulhait), C. B. Clarke. A scandent shrub. *Leaves* 2-4 in., glandular-punctate on both surfaces; petiole $\frac{1}{4}$ in. *Bracteoles* minute, fugacious. *Calyx*-tube filled densely with long hairs exsert from the mouth, teeth short triangular suberect. *Petals* small, obovate. *Fruit* $\frac{3}{4}$ -1 by 1 $\frac{1}{4}$ -1 $\frac{1}{2}$ in., rich dark-brown, puberulous.—The tufts of hair are seen in all the axils of the nerves beneath of *C. Wallichii*, in none of *C. flagrocarpum*; also the leaves of *C. Wallichii* are smaller and thinner than those of *C. flagrocarpum*: the constricted part of the calyx-tube of *C. Wallichii* is shorter and the flower within densely filled with fulvous hair; the bracteoles are different.—As to *Combretum Wallichii*, *Hassk. in Flora* 1844, p. 106, and *Mig. Fl. Ind. Bat. i. pt. i. p. 608*, which these authors suggest to be allied to *C. latifolium* or *C. Wightianum*, it can only be said that as they did not possess the fruit of *C. Wallichii* it is impossible to guess to what species their remarks refer.

†† *Surface of the fruit between the wings glabrous, pubescent, or with sessile glands, but not with elongate scales*

11. **C. squamosum**, Roxb. *Fl. Ind.* ii. 231; leaves opposite lanceolate to orbicular-elliptic acute adult glabrous, racemes lateral compound and terminal glabrous but covered with round flat glandular scales, calyx-tube shortly constricted above the ovary then funnel-shaped. *Wall. Cat.* 3987; *Mig. Fl. Ind. Bat. i. pt. i. 607*. *G. Don in Trans. Linn. Soc. xv. 438* (but *flowers not 5-fid*); *W. & A. Prodr.* 317; *Kurz For. Fl. Brit. Burma i. 463*. *C. lepidotum*, *Presl Bemerk.* 142 (see *Kurz in Flora* 1871, p. 289).

NORTHERN and EASTERN BENGAL near the foot of the mountains from NIPAL to CHITTAGONG and thence to SINGAPORE; plentiful.—DISTRIB. Malaya to the Philippines.

A large scandent shrub. *Leaves* 4-6 in. from a broad base, prominently covered with flat circular glandular scales on both surfaces, those on the upper surface sometimes ultimately disappear; upper leaves usually much smaller and narrower, often lanceolate. Axillary racemes usually divided, paniced, but on some branches all undivided; bracteoles subulate, fugacious. *Calyx*-teeth short, triangular. *Petals* obovate, small. *Disc* and base of calyx-tube within clothed with long fulvous hairs which are not exserted. *Fruit* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., sometimes broader than high or not; clothed between the wings with close flat round glands.

VAR. *aureum*, Wall. Cat. 3988. *C. malulæa*, Wall. Cat. 3991; same as the type, but turns a rich brown in drying.

12. **C. quadrangulare**, Kurz in *Journ. As. Soc. Beng.* 1874, pt. ii. 188; leaves subopposite lanceolate or elliptic attenuated into the petiole, racemes lateral compound and terminal covered with round flat glandular scales, flowers small, calyx-tube above the ovary campanulate. *C. attenuatum*, Wall. Cat. 3989.

MOULMEIN, *Wallich*. TENASSERIM, *Helser* No. 2181, *Kew Distrib.*

Whole plant covered with sessile flat circular scales, otherwise glabrous or nearly so. *Branchlets* quadrangular. *Leaves* 3-4 by $1\frac{1}{2}$ in. *Fruit* $\frac{1}{2}$ - $\frac{3}{4}$ in.—Hardly distinguishable from *C. squamosum* Roxb. but by the small flowers and the leaves attenuated at the base. C. Van Heurckii, *Muell. in Heurck & Muell. Arg. Obs. Bot.* 227, may as far as the description goes be this plant but the fruit is not described. Griffith's No. 725 quoted cannot be found at Kew.

13. **C. dasystachyum**, *Kurz Journ. As. Soc. Beng.* 1874, pt. ii. 187; leaves opposite and often ternate elliptic- or obovate-oblong acuminate densely pubescent on the nerves beneath, racemes rarely divided axillary solitary and subterminal 2-4 together, young ovary (and calyx without) glandular and minutely pubescent, calyx-tube distinctly constricted above the ovary then funnel-shaped, fruit large.

PEGU; *Kurz*. CHITTAGONG; *Hk. f. & Th.* ASSAM; *Jenkins*. CACHAR; *Keenan*.

A scandent shrub, the innovations rusty-pubescent or villous. *Leaves* 5-10 in., lower surface puberulo-punctate, upper punctate-scabrous; petiole $\frac{1}{8}$ - $\frac{3}{8}$ in., densely villous. *Racemes* in flower rusty-villous; bracteoles $\frac{1}{2}$ in., linear. *Calyx*-teeth triangular, acute, erect. *Petals* narrow obovate, small. *Disc* and base of calyx densely covered with long fulvous hair. *Fruit* $1\frac{1}{2}$ by 1 in., with scattered small round glands, otherwise glabrous.

14. **C. chinense**, *Roxb. Hort. Beng.* 28, *Fl. Ind.* ii. 230, not of *G. Don*; leaves opposite or ternate obovate or lanceolate adult glabrous, racemes undivided solitary axillary and approximated subterminal, young ovary (and calyx without) glandular and minutely pubescent, calyx-tube distinctly constricted above the ovary then funnel-shaped, fruit $\frac{3}{4}$ -1 in. often bright red when ripe. *Kurz For. Fl. Brit. Burma* i. 463. C. Griffithii, *Huerck & Muell. Arg. Obs. Bot.* 231, *vide Kurz*.

TRANSANGANETIC PENINSULA from ASSAM to TENASSERIM and PENANG; alt. 0-1000 ft. frequent.—*DISTRIB.* China, according to Roxburgh.

A scandent shrub, nearly glabrous. *Leaves* 3-5 in., punctulate on both surfaces; the points often obscure in age; petiole $\frac{1}{8}$ - $\frac{1}{4}$ in. *Calyx*-teeth triangular, erect. *Petals* narrow-obovate, small. *Disc* and base of calyx within densely covered with long fulvous hair. *Fruit* about as broad as high, subglabrous.—There is no example of *C. chinense* Roxb. at Kew; Mr. Kurz has applied that name to var. *ternatum*, and the description fits well.

VAR. *ternatum*, *Wall. Cat.* 4002 (*sp.*); leaves often 3-nate obovate obtuse usually narrowed into the petiole, uppermost sometimes lanceolate.

VAR. 2. *Porterianum*, *Wall. Cat.* 4000 (*sp.*); leaves never 3-nate lanceolate or oblong distinctly acuminate.

15. **C. nanum**, *Ham. in Don Prodr.* 219; leaves opposite or all alternate from round obovate to lanceolate glabrous, racemes undivided subterminal generally few with one greatly elongated, young ovary and calyx without glabrous sparsely glandular punctulate, calyx-tube constricted above the ovary then funnel-shaped, fruit $1\frac{1}{2}$ by 1 in. or somewhat smaller puberulous or subglabrous. *DC. Prodr.* iii. 21; *G. Don in Trans. Linn. Soc.* xv. 429; *Wall. Cat.* 3994. *Brand. For. Fl.* 221.

HIMALAYA TERRAI from SIKKIM to the PUNJAB; *Wallich*, *Royle*, *Edgeworth*, *Vicary*, *Strachey & Winterbottom*, *J. D. H.*

A decumbent low shrub, burnt down annually by the forest fires; branches 6-18 in., glabrous, the racemes minutely pubescent. *Leaves* typically 4 by $3\frac{1}{2}$ in., but often much smaller and narrower, shining, coriaceous, with scattered points on

both surfaces; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Raceme* often subterminal and solitary, 6–7 in. with a peduncle 1–2 in.; bracteoles $\frac{3}{16}$ in., linear-spathulate. *Calyx*-teeth triangular, erect. *Petals* narrow-obovate, far exceeding the sepals. *Disc* and base of calyx within covered by long fulvous hairs.

16. **C. ovalifolium**, *Roxb. Hort. Beng.* 28, *Fl. Ind.* ii. 256; leaves opposite ovate to lanceolate glabrous or nearly so, racemes lateral much divided and terminal, young ovary and calyx without very glandular and slightly pubescent, calyx-tube shortly constricted above the ovary then widely campanulate. *W. & A. Prodr.* 317; *Wight in Hook. Bot. Misc.* iii. p. 86 with a figure; *Dalz. & Gibs. Bomb. Fl.* 90. *C. Heyneanum*, *Wall. Cat.* 4001. *C. Roxburghii* and *C. albidum*, *G. Don in Trans. Linn. Soc.* xv. 429. *C. laxum*, *Roxb. Fl. Ind.* ii. 230. *C. Wightianum*, *Thw. Enum.* 103 in part. *C. Thwaitesianum*, *Heurck & Müll. Arg. Obs. Bot.* 238.

Throughout the DECCAN PENINSULA, common; and in CEYLON.

A large scandent shrub, nearly glabrous. *Leaves* typically $4\frac{1}{2}$ by 3 in., but often shorter and much narrower, shining, quite glabrous or more rarely with some brown hair about the base of the midrib beneath; petiole $\frac{1}{2}$ in. *Bracteoles* minute; buds subglobose, obtuse. *Calyx*-teeth triangular, acute, reflexed. *Petals* narrowly obovate, scarcely exceeding the calyx. *Disc* and base of the calyx within with much long hair. *Fruit* $\frac{3}{4}$ in. long and nearly the same in breadth, dark brown, nearly glabrous. —Mr. Thwaites has sent to Kew (under number 1601, named *C. Wightianum*) two plants, viz., *C. ovalifolium* *Roxb.* and *C. extensum* *Roxb.*; upon which Van Heurck and Müll. Arg. have founded two new species.

SECT. IV. **Quisqualoides**. *Fruit* with 4 membranous wings. *Calyx* constricted above the ovary and then produced into a cylindrical tube $\frac{1}{2}$ – $\frac{1}{5}$ in., terminated by a short campanulate 4-fid limb.

17. **C. extensum**, *Roxb. Hort. Beng.* 28, *Fl. Ind.* ii. 229; leaves opposite ovate or elliptic acute glabrous or nearly so, racemes lateral rarely divided often elongate and terminal subpaniculate, young ovary (and calyx without) puberulo-pubescent, calyx-teeth triangular acuminate reflexed, buds ovate very acute. *Wall. Cat.* 3996; *G. Don in Trans. Linn. Soc.* xv. 422; *Miq. Fl. Ind. Bat.* i. pt. i. 608; *Kurz For. Fl. Brit. Burma* i. 463. *C. rotundifolium*, *Roxb. Fl. Ind.* ii. 226; *Wall. Cat.* 3995. *C. Wightianum*, *Wall. Cat.* 4007; *W. & A. Prodr.* 317; *Wight Ic.* t. 227; *Dalz. & Gibs. Bomb. Fl.* 90. *C. Horsfieldii*, *Miq. l.c.* 609; *Kurz in Flora* 1871, p. 289. *C. platyphyllum*, *Heurck & Muell. Arg. Obs. Bot.* 242; *Kurz in Journ. As. Soc.* 1874, pt. ii. 188. *C. macrostachyum*, *Wall. Cat.* 3997. *C. latifolium*, *Blume Bijl.* 641; *Miq. l.c.* 609. *C. leucanthum*, *Heurck & Müll. Arg. Obs. Bot.* 240. *C. formosum*, *Griff. Notul.* iv. 682, *fide Kurz*. —*Rheede Hort. Mal.* vii. t. 23.

DECCAN PENINSULA. CEYLON. TRANSGANGETIC PENINSULA from SILHET to SINGAPORE.—DISTRIB. Malaya.

A large scandent shrub, glabrous or nearly so. *Leaves* 4–8 (sometimes 10 in.) punctate on both surfaces when young; petiole usually short but sometimes 1 in. *Racemes* very thickly covered with flowers, sometimes short but generally elongate 4–6 in. *Calyx* with a ring of hairs at the base within, but not entirely filled by long hair. *Petals* narrow-obovate, slightly exceeding the calyx. *Fruit* $1\frac{1}{4}$ in. and nearly as broad, puberulo-glandular or nearly glabrous.

18. **C. sundacum**, *Miq. Fl. Ind. Bat. Suppl.* 327; leaves opposite ovate or oblong suddenly acuminate mature nearly glabrous, spikes subglobose dense in ample terminal panicles, young ovary and calyx without punctate-glandular

scarcely pubescent, calyx-teeth triangular acuminate reflexed, buds ovate very acute.

MALACCA, *Maingay* No. 1681.—DISTRIB. Sumatra.

Leaves 3-5 in., punctulate on both surfaces; petiole $\frac{1}{2}$ in. *Calyx* with a ring of hairs at its base within but not densely filled with long hair. *Fruit* 1 in. and nearly as broad, brown, nearly glabrous.—This species so exactly coincides with *C. extensum* in its flowers and fruits that it may be doubted whether it is specifically distinct. The leaves appear smaller and thinner, and the dense heads of flowers at the ends of the branches of a large panicle give it a very different aspect.

EXCLUDED AND DOUBTFUL SPECIES.

COMBRETUM sp. 2. *Griff. Notul.* iv. 682 is probably one of the large *Terminalias*.

COMBRETUM (Sect. *Poivreia*) SEMI-ADNATUM, *Heurck & Muell. Arg. Obs. Bot.* 244; leaves ternate short-petioled elliptic acute at first simply puberulous, racemes axillary long-peduncled dense, flowers long pedicelled, bracteoles adnate to the pedicels for half their length. "In the East Indies."—This must be very distinct from all the known Indian species by its long-stalked ovary; otherwise it might be *C. trifoliatum*.

COMBRETUM OVALE, *Br.* See under 2. *pilosum*.

6. QUISQUALIS, Linn.

Rambling subscandent large shrubs. *Leaves* opposite, oblong or obovate, acuminate, entire. *Flowers* in short spikes, axillary and terminal, white or red. *Calyx*-tube prolonged long and slender above the ovary, deciduous; limb 5-fid. *Petals* 5. *Stamens* 10, short. *Ovary* 1-celled; style filiform, somewhat adherent to the calyx-tube, stigma subcapitate; ovules 3-4, pendulous from the apex of the cell. *Fruit* dry, coriaceous, 5-angled or 5-winged, subindehiscent. *Seed* 1, cotyledons (occasionally 3, *Kurz*) not convolute.—DISTRIB. Species 4, tropical; 3 Indian, 1 African.

Known from *Combretum* Sect. *Poivreia* by the elongate calyx-tube, and from *Combretum* Sect. *Quisqualoides* by the 5-merous flowers and the fruit.

1. *Q. indica*, Linn. *Sp. Pl.* 556; calyx-tube above the ovary $1\frac{1}{2}$ - $2\frac{1}{2}$ in., calyx-teeth triangular acute not acuminate, fruit with very sharp angles scarcely winged. *Lour. Fl. Cochinch.* 336; *Lamk. Ill.* t. 357; *DC. Prodr.* iii. 23; *Roxb. Fl. Ind.* ii. 427; *Wall. Cat.* 4010; *Wight Ill.* t. 92; *W. & A. Prodr.* 318; *Miq. Fl. Ind. Bat.* i. pt. i. 610; *Brandis For. Fl.* 220. *Q. villosa*, *Roxb. Fl. Ind.* ii. 426; *Spreng. Syst.* ii. 331; *DC. Prodr.* iii. 23. *Q. glabra*, *Burm. Fl. Ind.* t. 28. *Q. pubescens*, *Burm. Fl. Ind.* t. 35. *Q. ebracteata*, *Beauv. Fl. Owar.* t. 35. *Q. Loureiri*, *G. Don Gen. Syst.* ii. 667. *Q. sinensis*, *Lindl. in Bot. Reg. N.S.* vol. xxx. t. 15. *Q. longiflora*, *Presl Epinel.* 216. *Quisqualis* sp., *Griff. Notul.* iv. 683.—*Rumph. Herb. Amboin.* v. t. 38.

Throughout INDIA, alt. 0-1000 ft., cultivated: wild probably in the TRANS-GANGETIC PENINSULA.—DISTRIB. Cultivated generally in the tropics, wild in Malaya.

Leaves 4 in., nearly glabrous or in var. *villosa* shortly pubescent beneath; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in., rusty villous as are the innovations. *Spikes* somewhat dense; bracteoles $\frac{3}{8}$ in., usually lanceolate, but variable, generally subpersistent. *Petals* rose or scarlet, oblong or nearly round. *Fruit* $\frac{3}{4}$ -1 $\frac{1}{4}$ by scarcely $\frac{1}{2}$ in., glabrous, black, very acute at the top.

2. **Q. densiflora**, Wall. Cat. 4011; tube of the calyx above the ovary $\frac{1}{2}$ – $\frac{3}{4}$ in., calyx-teeth lanceolate-subulate, fruit distinctly winged. *Miq. Fl. Ind. Bat.* i. pt. i. 611. *S. confertum*, Jack in Hook. *Comp. Bot. Mag.* i. 155; *Miq.* l. c. 611.

PENANG; Wallich. MOULMEIN; Falconer. MALACCA; Griffith. SINGAPORE; Lobb.

Leaves 4–6 in., nearly glabrous; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in., rusty-pubescent. Spikes dense, fulvo-pubescent; bracteoles $\frac{1}{2}$ – $\frac{3}{4}$ in., lanceolate, pubescent, subpersistent. Petals less than $\frac{1}{4}$ in., scarlet. Fruit 1 by $\frac{2}{3}$ in., shining, quadrangular, oblong; the wings narrow but distinct, papery.—This species seems congeneric with *Combretum pilosum* above.

3. **Q. malabarica**, Bedd. Ic. Pl. Ind. Or. t. 155; calyx-tube above the ovary $\frac{2}{3}$ in., calyx-teeth lanceolate-subulate, petals $\frac{1}{2}$ in. and more.

DECCAN PENINSULA; Carcoor Ghat, Wynaad, alt. 1500 ft., Beddome.

A large climber, nearly glabrous, the petioles becoming permanent as rigid spines. Leaves 4–5 in.; petiole $\frac{3}{8}$ in., glabrous. Spikes somewhat few-flowered, minutely grey-puberulous or pubescent; bracteoles $\frac{1}{2}$ in., linear. Petals pink. Fruit unknown.—Much more glabrous than *Q. densiflora*, the bracteoles much smaller, the petals much longer.

7. ILLIGERA, Blume.

Scandent shrubs. Leaves alternate, petioled, with three entire petioluled leaflets. Flowers in elongate lax peduncled cymes; bracteoles 1–3 at the base of each flower. Calyx-tube shortly constricted above the ovary; limb of 5 valvate oblong deciduous lobes. Petals 5, valvate, oblong, alternate with and as long as the calyx-lobes. Stamens 5, epigynous, filament near the base carrying on each side a staminode; anthers dehiscing by lateral valves. Ovary 1-celled; style 1, filiform, ending in a dilated undulate sinuated stigma; ovule 1, pendulous from the apex of the cell. Fruit broadly 2–4-winged (2-winged in the Indian species known) the wings veined. Seed with plane-convex (not convoluted) cotyledons.—DISTRIB. Species 7 or 1, extending from Khasia to Singapore, Malaya and the Philippines: and one aberrant species in Angola having 5 leaflets.

1. **I. Coryzadenia**, Meissn. in DC. Prodr. xv. pt. i. 251; leaflets pubescent on the nerves beneath fulvo-pilose on the midrib above punctate at least while young, staminodes sub-petaloid hooded and enfolded not emarginate. *I. appendiculata*, Blume; Kurz For. Fl. Brit. Burma i. 469. *Coryzadenia trifoliata*, Griff. Notul. iv. 356.

MERGUI; Griffith. TENASSERIM, Helfer (Kew Distrib. No. 4341 partly). ANDAMANS; Kurz.

Stem striate, nearly glabrous. Petiole 2–4 in. petiolules $\frac{1}{8}$ –1 in. (variable as in most of the species), more or less fulvo-pilose; leaflets 2–4 in., oblong or broad-elliptic, suddenly acuminate, usually cordate at base but sometimes acute; the lower leaves often much larger and their leaflets nearly orbicular. Cymes often 6–8 in.; bracteoles minute, ovate, and the calyx without minutely pubescent. Fruit 1 by $2\frac{1}{4}$ in. including the wings, softly minutely pubescent.—Kurz (in Journ. As. Soc. 1877, pt. ii. 59) unites the two species of Meissner, viz., *I. Coryzadenia* and *I. appendiculata*.

2. **I. Kurzii**, C. B. Clarke; leaflets glabrous epunctate very coriaceous with an incurved cartilaginous margin, staminodes subpetaloid hooded and enfolded not emarginate, fruit $2\frac{1}{2}$ – $3\frac{1}{2}$ in. wide 2-winged.

BURMA (Karens); *Kurz*. Mikir Hills, KHASIA; *Simons*. TENASSERIM; *Helfer* (Kew Distrib. No. 4341) partly. MALACCA, *Maingay* No. 649, 650.

Stem striate, nearly glabrous. *Petiole* 2-5 in.; *petiolules* $\frac{1}{2}$ -1 in.; *leaflets* elliptic-lanceolate, those from the lower stem broader sometimes nearly orbicular. *Cymes* often 6-8 in.; *bracteoles* very small, ovate, and as the calyx without minutely pubescent. *Fruit* 1 in. long, the wings brown nearly glabrous with horizontal striations. —If *Meissner's* species are united as proposed by *Mr. Kurz*, this must be regarded as a variety.

3. **I. Khasiana**, *C. B. Clarke*; *leaflets* glabrous with tufts of long yellow hairs in the nerve-axils beneath and sometimes minutely setose on the midrib on the upper surface, *staminodes* not petaloid concave deeply emarginate, *fruit* $2\frac{1}{4}$ in. wide (not quite ripe) 2-winged.

KHASIA; *Griffith* (Kew Distrib. No. 4340); *Churra*, alt. 3000-4000 ft., *J. D. H. & T. Thomson*; *Likinsow*, 2500-3000 ft., *C. B. Clarke*.

Stem striate, nearly glabrous. *Petiole* 2-5 in.; *petiolules* $\frac{1}{2}$ -1 in.; *leaflets* elliptic-lanceolate (no lower leaves preserved). *Cymes* often 6-10 in.; *bracteoles* very small, ovate, and as the calyx without minutely pubescent. *Fruit* 1 in. long and more, the wings brown nearly glabrous with horizontal striations.

DOUBTFUL SPECIES.

I. OBTUSA, *Meissn. in DC. Prodr.* xv. pt. i. 251 founded on *Wight's Herb. No. 394* is said to have *drupes* 5 lines long 4 lines thick, and therefore cannot belong to the genus *Illigera* as at present defined. There is no example in the Kew Herbarium of any *Illigera* from the Deccan Peninsula.

8. **GYROCARPUS**, *Jacq.*

A tall tree. *Leaves* alternate, long petioled, large, entire or lobed, clustered towards the ends of the branches. *Flowers* small, unisexual, very numerous, clustered in large branched cymes without bracts. MALE flowers very numerous; *calyx* 4-7-partite; *petals* 0; *stamens* 4-7, inserted at the base of the calyx with as many alternate clavate glands, *anthers* dehiscing by valves; *ovary* 0. FEMALE or hermaphrodite flowers few; *calyx-tube* adherent to the ovary, limb 2-partite, persistent, enlarging in fruit; *petals* and *stamens* 0; *ovary* 1-celled; *style* 0, *stigma* sessile; *ovule* solitary pendulous from the apex of the cell. *Nut* bony, crowned by the elongate spathulate coriaceous calyxlobes. *Seed* with convolute cotyledons.

1. **G. Jacquini**, *Roxb. Hort. Beng.* 11, *Cor. Pl.* t. 1, *Fl. Ind.* i. 445; *Lamk. Ill.* t. 850; *Bedd. Fl. Sylv.* t. 196; *Kurz For. Fl. Brit. Burma* i. 470. *G. asiaticus*, *Willd. Sp. Pl.* iv. 982; *Wall. Cat.* 968; *Miq. Fl. Ind. Bat.* i. pt. i. 978; *DC. Prodr.* xv. pt. i. 248. *G. americanus*, *Jacq. Pl. Amer.* t. 178. *G. acuminatus*, *Meissn. in DC. Prodr.* xv. pt. i. 248. *G. sphenopterus* and *G. rugosus*, *R. Br. Prodr.* 405.

DECCAN PENINSULA, alt. 0-1000 ft., frequent. BENGAL, rare. MALAY PENINSULA, frequent. —DISTRIB. The tropics of the whole world near the sea.

Attains 60-80 ft. (*Kurz*). *Leaves* (of full-grown trees) 4-5 in. and as broad, broadly ovate, acuminate, entire, generally glabrous, those of young plants often very large deeply lobed and more or less pubescent. *Peduncles* 1-3 in., in the upper axils. *Drupes* $\frac{1}{2}$ - $\frac{3}{4}$ in., ovoid; *calyx-lobes* 2-3 in.

ORDER LIX. **MYRTACEÆ.** (By J. F. Duthie, F.L.S.).

Trees or shrubs, rarely herbs. *Leaves* opposite, seldom alternate or whorled, petioled, simple, entire, rarely denticulate or crenate, 3-nerved or pinnately-nerved and usually with an intramarginal nerve, generally coriaceous and dotted with pellucid glands. *Stimules* if present small and deciduous. *Flowers* regular, very rarely irregular, hermaphrodite or polygamous by arrest, axillary, solitary or in spikes cymes corymbs or heads, naked or with an involucre, often with 2 bracts at the base, white, pink, purple, or yellow, never blue. *Calyx* superior or $\frac{1}{2}$ -superior, limb 4-5-many-fid or -partite, persistent or deciduous, valvate or imbricate, sometimes entire or closed in bud. *Petals* inserted on a disk surrounding the cavity of the calyx, equal in number to the calyx-lobes and alternate with them, rarely 0. *Stamens* usually ∞ , inserted with the petals in several rows, rarely definite and alternate with the petals; filaments free or more or less coherent at the base or in bundles opposite the petals; anthers small roundish with parallel cells bursting longitudinally. *Ovary* inferior or $\frac{1}{2}$ -inferior, crowned by a fleshy disk, 1-celled with 1 or more ovules, or 2-many-celled with ∞ ovules; placentation axile (parietal in *Rhodamnia*); style terminal rarely lateral, smooth or bearded at the summit; stigma undivided. *Fruit* usually crowned with the calyx-limb, either 1-celled and 1-seeded by arrest, or 2-many-celled with loculicidal or septicidal dehiscence; or baccate and indehiscent with the cells many-seeded or 1-seeded by arrest. *Seeds* angular cylindric or compressed; testa hard or membranous, sometimes winged; albumen 0; embryo straight curved or spirally twisted, cotyledons usually short and obtuse sometimes combined into a mass with the radicle, very rarely leafy, radicle often thick close to the hilum.—**DISTRIB.** Tropical and subtropical regions of both hemispheres; species upwards of 1800.

Species of the Australian genus *Eucalyptus* are being successfully cultivated on the Nilghiri hills and in other parts of India. The common Myrtle (*Myrtus communis*, L.) is extensively grown in India, the leaves being used in native medicine; it extends from the Mediterranean region as far as Afghanistan and Beluchistan. Allspice (*Pimenta acris*, Wight), a West Indian tree, is much cultivated for the sake of its aromatic leaves and berries.

Glaphyria sericea, Jack. in Trans. Linn. Soc. xiv. 128, from Penang, may be a species of *Leptospermum* by description only. *Myrtus androsæmoides*, Poir. is *Myonima multiflora*, Ait. A native of Mauritius. *Hiræa Finlaysoniana*, Wall. Cat. 3566 F. is *Decaspermum paniculatum*, Kurz.

A. Fruit capsular.

TRIBE I. Leptospermææ. *Ovary* 2-5-celled. *Fruit* opening by as many valves.

Leaves narrow.

Stamens definite (10 or fewer) free, in one series. *Leaves* alternate. *Flowers* few or solitary in the axils.

1. BÆCKEA.

Stamens ∞ , free, in one series. *Leaves* alternate. *Flowers* few or solitary in the axils.

2. LEPTOSPERMUM.

Stamens ∞ , slightly combined below into bundles opposite the petals and exceeding them. *Flowers* in heads or spikes.

3. MELALEUCA.

Leaves broad. *Stamens* ∞ , united into 5 bundles opposite the petals. *Flowers* in axillary cymes.

4. TRISTANIA.

B. Fruit fleshy.

TRIBE II. **Myrteæ**. Ovary 2- or more-celled (except *Rhodamnia*). Fruit a berry or drupe.

Limb of calyx closed in bud with the lobes subimbricate, rather deeply valvately divided when in flower *4. PSIDIUM.

Limb of calyx 4-5-lobed or -partite in bud, not becoming further divided when in flower.

Ovary 1-celled with 2 parietal placentas. Leaves 3-nerved 5. RHODAMNIA.

Ovary 1-3-celled with double rows of ovules in each cell separated by spurious partitions. Leaves sometimes 3-nerved 6. RHODOMYRTUS.

Ovary 5- rarely 4-celled with 2-6 ovules in each cell. Embryo long and narrow, curved, circular, or spiral, with small cotyledons 7. DECASPERMUM.

Ovary 2-3-celled with several ovules in each cell and without spurious partitions. Embryo thick and fleshy, not divisible, or with 2 thick fleshy cotyledons and a short radicle 8. EUGENIA.

TRIBE III. **Lecythideæ** (Sub-tribe Barringtoniæ). Ovary 2- or more-celled. Fruit indehiscent, hard and fibrous or fleshy. Leaves alternate, not gland-dotted.

Stamens all perfect. Fruit angular, fibrous, 1-seeded . . . 9. BARRINGTONIA.

Outer or inner stamens or both without anthers. Fruit ovoid or globular, fleshy, many-seeded 10. CAREYA.

1. **BÆCKEA**, Linn.

Glabrous heath-like shrubs. Leaves opposite, narrow, pointed, with many pellucid glands. Flowers normally 5-merous, axillary, peduncled, with 2 minute bracts at their base. Calyx-tube campanulate; lobes 5, membranous, persistent. Petals 5, suborbicular. Stamens 10 or fewer, shorter than the petals. Ovary inferior or $\frac{1}{2}$ -inferior, 2-3-celled, with several ovules in each cell. Capsule bursting from above loculicidally. Seeds angular; embryo straight with short cotyledons.—DISTRIB. Species about 50, the greater number Australian, a few in New Caledonia, one only extending into India.

1. **B. frutescens**, Linn.; leaves linear pointed ascending or spreading, flowers axillary shortly peduncled, calyx-lobes roundish petaloid, stamens 10 rarely 8, ovary 3-celled. DC. Prodr. iii. 229; Sm. in Trans. Linn. Soc. iii. 260; Bot. Mag. t. 2802; Blume Mus. Bot. i. 69; Miq. Fl. Ind. Bat. i. pt. i. 406; Benth. Fl. Hongk. 118. B. Cumingiana, Schauer in Walp. Rep. ii. 920. B. chinensis, Gaertn. Fruct. i. 157, t. 31.—Osbeck Itin. 231, t. 1.

Eastern Peninsula; MALACCA, Griffith, Maingay, Cuming, Lobb, Low.—DISTRIB. Sumatra, Borneo, Philippines, S. China.

A slender shrub with rod-like branches. Leaves small, $\frac{1}{4}$ – $\frac{1}{2}$ in. long, flat or somewhat channelled above, convex beneath. Peduncles usually solitary and short with 2 minute bracts at the base. Flowers small, white, 5-merous, occasionally 4-merous. Calyx-tube campanulate.

2. **LEPTOSPERMUM**, *Forst.*

Shrubs, rarely small trees, glabrous or silky-pubescent. *Leaves* alternate, entire, rigid, with 1–3 nerves or nerveless. *Flowers* solitary in the axils of the leaves, or 2–3 together at the ends of the branches, rarely peduncled, sometimes polygamous; bracts broad, scarious, often imbricate, the lower ones soon falling off. *Calyx-tube* broadly campanulate or turbinate, adnate to the ovary below, the free upper part broad; lobes 5. *Petals* 5, spreading. *Stamens* ∞ , in a single series, not longer than the petals; anthers versatile, their parallel cells bursting longitudinally; connective swollen, gland-like. *Ovary* inferior or $\frac{1}{2}$ -inferior, enclosed in the calyx-tube, 5- or more-celled, rarely 3- or 4-celled; style filiform, inserted in a deep depression of the ovary, sometimes short, stigma capitate or peltate. *Capsule* usually exceeding the calyx-tube, opening loculicidally from above. *Seeds* ∞ , linear or winged, often sterile; embryo straight.—**DISTRIB.** Species upwards of 25, chiefly Australian, a few in New Zealand and New Caledonia.

1. **L. amboinense**, *Blume Bijdr.* p. 1100; *Mus. Bot.* i. 68; glabrous or silky on the young parts, leaves linear-lanceolate or obovate obtuse, flowers sessile or nearly so solitary terminal or axillary, ovary 5-celled. *DC. Prodr.* iii. 229; *Miq. Fl. Ind. Bat.* i. pt. i. 404. *L. flavescens*, *Sin. in Trans. Linn. Soc.* iii. 262; *DC. Prodr.* iii. 227; *Bot. Mag.* 2695; *Benth. Fl. Austral.* iii. 104, var. *a.* *Macklottia amboinensis*, *Korth. in Ned. Kruidk. Arch.* i. 196.—*Myrtus amboinensis*, *Rumph. Herb. Amb.* ii. 77, t. 18.

MALACCA; *Griffith, Maingay, Low.*—**DISTRIB.** Indian Archipelago, and from Queensland to Tasmania.

A shrub. *Leaves* 1 in. and smaller, 1–3-nerved or the nerves indistinct, narrowly or broadly oblong or even obovate. *Flowers* sometimes $\frac{1}{2}$ in. across. *Calyx* glabrous, tube broadly campanulate; lobes rather shorter than the tube. *Anthers* attached to a purplish gland-like connective. *Ovary* glabrous, prominent above the calyx-tube, and with a central depression round the style.

2. **L. javanicum**, *Blume Bijdr.* 1100; *Mus. Bot.* i. 68; leaves lanceolate obtuse obscurely 3-nerved tipped with a deciduous mucro, ovary 5-celled. *L. floribundum*, *Jungh. Java* i. 578. *Macklottia javanica*, *Korth. Ned. Kruidk. Arch.* (1847), 196.

MOULMEIN; exposed rocks, alt. 5000 ft., *Lobb.*—**DISTRIB.** Java, Sumatra?

A shrub, $\frac{1}{2}$ –1 ft. high. *Leaves* $\frac{1}{2}$ –1 in. by $\frac{1}{4}$ in., narrowly obovate with silky hairs on the edges and beneath, midrib prominent beneath, lateral nerves soon vanishing upwards. *Flowers* about $\frac{1}{2}$ in. across, few or solitary, axillary. *Calyx-lobes* ovate, obtuse, membranous, deciduous. *Anthers* attached to a dark-coloured gland-like connective. *Style* about $\frac{1}{2}$ in.; stigma capitate. *Capsule* 5-celled, smooth, smaller than in Miquel's specimens from Java.

3. **MELALEUCA**, *Linn.*

Trees or shrubs. *Leaves* alternate, rarely opposite, entire, lanceolate or linear, flat or subterete, 1–3-many-nerved. *Flowers* in heads or spikes, each sessile in the axil of a floral leaf, 5-merous; bracts deciduous. *Calyx-tube* subglobose; lobes 5, imbricate or open. *Petals* 5, spreading, deciduous. *Stamens* ∞ , more or less united at their bases into 5 bundles opposite the petals; anthers versatile, the cells parallel and bursting longitudinally. *Ovary* infe-

rior or $\frac{1}{2}$ -inferior, enclosed in the calyx-tube, usually with many ovules in each cell. *Capsule* opening loculicidally from above by 3 valves. Perfect *seeds* cuneate; embryo straight, cotyledons longer than the radicle.—*DISTRIB.* Upwards of 100 species, all Australian, one of them extending into Tropical Asia.

1. **M. Leucadendron**, *Linn.*; leaves alternate elliptic or lanceolate straight oblique or falcate 3–7-nerved with anastomosing nerves, spikes long interrupted solitary or 2 or 3 together terminal at first and then surmounted by leafy branches, rachis and calyx glabrous or woolly. *Benth. Fl. Austral.* iii. 142; *Kurz in Journ. As. Soc. Beng.* xvi. (1877) pt. ii. p. 61; *For. Fl. Brit. Burm.* i. 472.

TENASSERIM and MERGUI, *Griffith*; MALACCA, *Maingay*, *Cuming*.—*DISTRIB.* Malay Islands to Australia.

A tree, often of large size, with a thick spongy bark peeling off in layers, and pendulous branches; or stunted and with stiff erect branches. *Leaves* often vertical, acuminate acute or obtuse, narrow and 6–8 in., or broader more rigid and 2–4 in. *Flower-spikes* 2–6 in. *Calyx-tube* ovoid; lobes roundish and often scarious at the margin. *Petals* $\frac{1}{2}$ in. *Staminal bundles* under $\frac{1}{2}$ in., each with 5–8 filaments. *Ovules* ∞ , ascending, attached to an oblong placenta. *Fruiting-calyx* about $\frac{1}{2}$ in. in diam. *Seeds* obovoid or cuneate; cotyledons obovate, thick, much longer than the radicle.

The following are the principal varieties of this species, concerning which Mr. Bentham remarks (*Fl. Austral.* iii. 142):—"This species, very widely spread and abundant in the Indian Archipelago and Malayan Peninsula, varies exceedingly in the size, shape and texture of the leaves, in the young shoots very silky-villous or woolly, or the whole quite glabrous; in the short and dense or long and interrupted spikes; in the size of the flowers; in the greenish-yellow, whitish, pink or purple stamens, etc., and at first sight it is difficult to believe that they all can be forms of one species; but on examination none of these variations are sufficiently constant or so combined as to allow of distinct races."

VAR. Leucadendron; spikes glabrous. *Linn. Mant.* 105 and *Suppl.* 342; *Lour. Fl. Cochinch.* 468; *Roxb. Fl. Ind.* iii. 397; *DC. Prodr.* iii. 212; *Wall. Cat.* 3646; *Blume Mus. Bot.* i. 66; *Miq. Fl. Ind. Bat.* i. pt. i. 401. *Myrtus Leucadendron*, *Linn.*—*Rumph. Herb. Amb.* ii. 72, tt. 16, 17, f. 1.—Cultivated in India.

VAR. minor; spikes villous. *M. minor*, *Sm. in Rees. Cycl.* 23; *DC. Prodr.* iii. 212; *Wall. Cat.* 3645; *Blume Mus. Bot.* i. 67; *Miq. Fl. Ind. Bat.* i. pt. i. 403. *M. Cajuputi*, *Roxb. Fl. Ind.* iii. 394; *W. & A. Prodr.* 326; *Miq. l.c.* 403. *M. Leucadendron*, *Lam. Encycl.* 641. *M. viridiflora*, *Gærtn. Fruct.* i. 173, t. 35; *DC. Prodr. l.c.*; *Wall. Cat.* 3647. *M. saligna*, *Blume Mus. Bot.* i. 66. *M. Cumingiana* and *lancifolia*, *Turcz. in Bull. Soc. Mosc.* xx. 164. *Myrtus saligna*, *Gmel. Syst.* 793.—*Rumph. Herb. Amb.* ii. 76.—This appears to be the plant from which the Cajuput-oil of commerce is chiefly obtained.

Miquel (*Fl. Ind. Bat.* i. c.) describes *M. Cumingiana* as specifically distinct, distinguishing it from *M. lancifolia* by the absence of auricles to the staminal bundles; the existence of these however in the latter does not appear to be evident. Mr. Bentham (*Fl. Austral.* i. c.) considers that both of them belong to one of the common Archipelago forms with twin leaves and small flowers.

4. **TRISTANIA**, *R. Br.*

Tall shrubs or trees. *Leaves* alternate or crowded at the summit of the branches, rarely opposite. *Flowers* small, yellow or white, arranged in axillary cymes; bracts deciduous or 0. *Calyx-tube* turbinate campanulate or open, attached below to the ovary; lobes 5, imbricate in æstivation, persistent. *Petals*

5, spreading. *Stamens* ∞ , shorter than the petals, usually united in 5 bundles and opposite to them; anthers versatile, cells parallel and opening longitudinally. *Ovary* inferior or $\frac{1}{2}$ -superior, 3-celled; ovules many in each cell, suspended or horizontal. *Capsule* loculicidally 3-valved. Perfect *seeds* few, linear, cuneate, or winged at the upper part; embryo straight, cotyledons broad, longer than the radicle.—*DISTRIB.* Upwards of 14 species inhabiting the Malay peninsula and islands, New Caledonia, and Australia.

1. **T. Wightiana**, *Griff. MSS.*; leaves alternate shortly petioled oblanceolate acuminate glabrous closely pinnate-nerved, cymes corymbose dichotomous long peduncled terminal and axillary equalling or exceeding the leaves, branches angular pubescent, bracts leaflike, flowers small on short pedicels, staminal bundles 3-androus, capsule very small almost wholly exserted, seeds narrow compressed winged. *T. sumatrana*, *Miq. Fl. Ind. Bat. Suppl.* 308. *Hypericinea pimentifolia*, *Wall. Cat.* 4828.

MALACCA, *Griffith*; *SINGAPORE*, *Wallich, Lobb*; *PENANG*, *Walker*.—*DISTRIB.* *JAVA*, *Sumatra*, *Borneo*.

A shrub. *Bark* reddish-brown. *Leaves* $4\frac{1}{2}$ –6 by 2–2 $\frac{1}{2}$ in., gradually narrowing towards the base, obtusely acuminate or cuspidate, shining above, dull and tawny-coloured beneath, margins revolute, lateral nerves slender uniting in a continuous intramarginal one. Primary and secondary branches of inflorescence very long. *Calyx-tube* broadly campanulate above, spreading or reflexed in fruit, its inner surface and the ovary clothed with pure white pubescence. *Petals* nearly round, glandular. *Style* short. *Seeds* 4–5 in each cell.

2. **T. burmannica**, *Griff. MSS.*; leaves alternate or crowded at the ends of the branches shortly petioled oblong-lanceolate obtuse or obtusely acuminate glabrous or tomentose, cymes axillary few-flowered much shorter than the leaves branches angular pubescent, flowers small yellowish on short pedicels 2 or 3 together with linear bracts at the base, calyx-lobes sub-acute, staminal bundles about 5–7-androus, capsule exserted about $\frac{3}{4}$ its length, seeds $\frac{1}{2}$ in. long winged. *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 61; *For. Fl. Brit. Burm.* i. 474. “*Tristania facie*,” *Griff. Notul.* 648. *Hypericinea micrantha*, *Wall. Cat.* 4829.

TENASSERIM, *Helfer*; *MOULMEIN* and *MALACCA*, *Falconer, Griffith, Wallich*; *PEGU*, *Kurz*.—*DISTRIB.* *JAVA* and *Borneo*.

A shrub upwards of 8 ft. *Bark* grey. Young parts and upper branches of inflorescence pubescent. *Leaves* 2–4 by $\frac{3}{4}$ –1 $\frac{3}{4}$ in., shining above, lighter below or rusty-coloured, coriaceous, margins revolute, dots inconspicuous, lateral nerves slender, prominent, uniting in a continuous looping one near the margin; petiole $\frac{1}{4}$ in. or less. *Cymes* compact, dichotomous. *Petals* nearly round, shining. *Ovary* silky-pubescent; ovules many, suspended. *Capsule* $\frac{1}{2}$ in. *Seeds* compressed.

VAR. tomentosa; leaves ochre-coloured hairy on both surfaces towards the base and along the prominent midrib, cymes nearly sessile compact and densely clothed with yellow tomentum, flowers larger and calyx-tube broader above, style longer, stigma capitate, young capsule rugose pubescent, seeds about 4 in each cell.—“A small tree.” *Tenasserim* mountains, 4000 ft., *C. Parish*. There are no ripe capsules on the single specimen preserved in the Kew Herbarium. Possibly a distinct species.

VAR. ?; leaves longer (2–5 in.), cymes lax, peduncles $\frac{3}{4}$ in., the capsules and seeds however are similar to those of *Wallich's Hypericinea micrantha*; there are no flowers on this specimen.—Near *Moulmein*, alt. 1000 ft., *C. Parish*.

3. **T. merguensis**, *Griff. in Journ. As. Soc. Beng.* 1854, 637; leaves alternate or the upper nearly opposite very shortly petioled or sessile obovate-lanceolate obtuse or obtusely acuminate glabrous, panicles on long peduncles, branches angular pubescent above, bracts leaflike, calyx-lobes oblong rounded

at the apex, staminal bundles 6-10-androus, capsule roundish large exserted nearly $\frac{1}{2}$ in., seeds compressed. *Kurz For. Fl. Brit. Burm.* i. 473. "*Tristania affinis*," *Griff. Notul.* 650; *Id. Pl. Asiat.* t. 636, f. 3. *Melaleuca eugeniifolia*, *Wall. Cat.* 3648. *M. decurrens*, *Wall. Cat.* 3649.

MERGUI, *Griffith*; TENASSERIM or ANDAMAN ISLANDS, *Helpfer*; MALACCA, *Finlayson, Wallich*; Mount Ophir, *Griffith*.—DISTRIB. Borneo. *Cap. Rochardo, Wallich*.

A tree with pendent branches. *Leaves* 2-7 by $2\frac{1}{4}$ in., gradually narrowing towards the base, often retuse at the apex, pinnate-nerved, rusty red beneath, darker above and punctate. Branches of the inflorescence compressed, angular, furrowed, upper part together with the bracts and calyx covered with stiff whitish hairs. *Calyx-tube* rather less than $\frac{1}{2}$ in., broadly campanulate in fruit, its nearly truncate limb spreading or reflexed; lobes obtuse. *Petals* small, transversely oblong with a minute claw at the base. *Filaments* hairy below. *Ovary* pilose; style rather long, stigma slightly capitate; ovules ∞ , pendulous from the apex of the cells. Valves of the capsule transversely wrinkled externally. *Seeds* about 8 in each cell, compressed, $\frac{1}{4}$ in. long.—*Griffith* remarks that the flowers are white and disagreeably scented. In *Wallich's M. decurrens* the blade of the leaf extends to the base, and the leaves are less conspicuously dotted.

4. **T. Maingayi**, *Duthie*; leaves alternate shortly petioled narrowly oblanceolate attenuated at each end obtuse coriaceous glabrous, cymes chiefly from the upper leaf-axils, branches compressed or angular pubescent, flowers sessile 3-4 together, staminal bundles 5-11-androus, capsule rather large about $\frac{1}{2}$ in roundish exserted $\frac{1}{4}$ its length, seeds winged 9-10 in each cell.

MALAYA, *Maingay*; *Kew Distrib.* 767 in part.

Leaves $1\frac{1}{2}$ - $2\frac{1}{2}$ by $\frac{1}{2}$ - $\frac{3}{4}$ in., dark and polished above, rusty-yellow beneath, dotted, margins slightly revolute, nerves not prominent. *Cymes* dichotomously branched; peduncles $\frac{1}{2}$ - $1\frac{1}{2}$ in.; pedicels and calyx covered with light yellow tomentum, lobes rounded at the apex or subacute. *Petals* small, transversely oblong or orbicular, hairy outside. *Filaments* hairy below. *Ovary* pubescent with white hairs. *Capsules* $\frac{1}{2}$ in. in diam.

5. **T. Griffithii**, *Kurz in Pegu Rep. Append. B.* p. 50; leaves crowded towards the ends of the branches lanceolate attenuated at both ends, cymes subaxillary few-flowered, flowers rather large white, capsule scarcely exserted, seeds winged. *Kurz in Journ. As. Soc. Beng.* xvi. pt. ii. p. 61; *For. Fl. Brit. Burm.* i. 474. *T. conferta*, *Griff. Notul.* p. 649; *not of R. Br.*

MERGUI, *Griffith*; PEGU, *Kurz*.

A shrub. *Leaves* coriaceous, pellucid-punctate. Terminal buds with imbricating membranous scales. *Calyx-tube* turbinate; lobes 5, ovate, acuminate, falling off circumscissily at the apex of the fruit. *Petals* round. *Filaments* nearly equal to the petals. *Style* filiform, shorter than the stamens; stigma capitate.—I have not seen specimens.

4*. PSIDIUM, Linn.

Trees or shrubs. *Leaves* opposite, entire, not dotted. *Peduncles* 1- few-flowered; flowers large, white. *Calyx* urceolate or obovate; limb undivided in æstivation, separating valvately into 4-5 lobes when in flower. *Petals* 4 or 5, free. *Stamens* ∞ . *Ovary* 2- or more-celled with many ovules in each cell. *Berry* many-seeded. *Seeds* with hard testa; embryo curved, radicle long, cotyledons short.—DISTRIB. Tropical and subtropical America; about 100 species have been enumerated.

1. **P. Guyava**, Linn.; *Benth. Fl. Hongk.* 120; *Brandis For. Fl.* 232; *Griseb. Fl. Brit. West. Ind.* 241; *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 62; *For. Fl. Brit. Burm.* 1. 476.

Naturalised throughout India.

A small tree, pubescent on the young branches. *Leaves* on very short petioles, ovate or oblong, and usually acuminate, 3-4 in. long, glabrous or nearly so above, softly pubescent beneath and with the principal nerves prominent. *Peduncles* axillary, $\frac{1}{2}$ in., 1-3-flowered; buds ovoid in the adnate part, the free part also ovoid but larger and more or less pointed. *Petals* broad, $\frac{1}{2}$ in. in diameter. *Fruit* globose or pear-shaped.—“Indigenous in Mexico and possibly in other parts of Tropical America, cultivated and naturalised in most tropical countries. In India the Guava is cultivated almost everywhere except in the north-western corner of the Punjab. It often run wild, but there is no ground for supposing that the Guava is indigenous in India. Wood compact, close-grained, takes a beautiful polish.” (*Brandis l.c.*)

VAR. pyrifera, Linn. (sp.); peduncles 1-fl., fruit pyriform. *Roxb. Fl. Ind.* ii. 480.

VAR. pomifera, Linn. (sp.); peduncles usually 2-3-fl., fruit globose or ovoid. *Roxb. Fl. Ind.* ii. 480.

5. **RHODAMNIA**, Jack.

Shrubs or small trees. *Leaves* opposite, 3-nerved, hoary or pubescent beneath. *Flowers* rather small, pedicels short, sometimes very shortly fasciculate or in lax racemes; bracteoles small, deciduous. *Calyx-tube* ovoid or subglobose, not produced beyond the ovary; segments 4, persistent. *Petals* 4, spreading. *Stamens* ∞ , in many series, free; filaments filiform; anthers versatile with parallel cells dehiscing longitudinally. *Ovary* 1-celled with parietal placentation and many ovules; style filiform, stigma peltate. *Berry* globose, crowned with the limb of the calyx. *Seeds* few, reniform, globose or variously compressed, testa hard; embryo horseshoe-shaped, radicle long, cotyledons very short.—*DISTRIB.* About 12? species; 3 in Australia, and the rest natives of Tropical Asia.

1. **R. trinervia**, Blume *Mus. Bot.* i. 79; leaves ovate-oblong or ovate-lanceolate acuminate glabrous or more or less reticulate above prominently 3-nerved from the base often silvery-pubescent beneath, peduncles slender axillary 1- rarely 3-fl. with minute bracteoles under the calyx, berry globose reddish. *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 63; *For. Fl. Brit. Burm.* i. 474; *Benth. Fl. Austral.* iii. 278. *Myrtus trinervia*, Sm. in *Linn. Trans.* iii. 280. *Eugenia?* *trinervia*, DC. *Prodr.* iii. 279; *Bot. Mag.* 3223.

TENASSERIM, *Helper*; MALACCA, *Cuming, Griffith*; SINGAPORE and PENANG, *Walker, Wallich*; NICOBAR ISLANDS, *Kurz.*—*DISTRIB.* Malay Islands and Philippines to Australia.

A small tree or shrub with greyish wrinkled bark and pilose branchlets, young parts and inflorescence often densely silky. *Leaves* variable in size, 4-6 by $1\frac{1}{4}$ - $2\frac{1}{2}$ in., sometimes rugose beneath, shortly petioled, subacute at the base. *Peduncles* varying in length, shorter than the leaves. *Flowers* white, fragrant. *Petals* twice as long as the calyx-lobes, hairy outside. *Stamens* nearly as long as the petals. *Berry* about $\frac{1}{2}$ in. in diam.—I have adopted Mr. Kurz's nomenclature who includes the various forms under the following varieties.

VAR. concolor; leaves green on both surfaces, sparingly pubescent, peduncles 4-7- or fewer-flowered. *R. cinerea*, *Griff. Notul.* 653, not of Jack.; *Kurz in Journ. As. Soc.* l. c. *R. concolor*, *Miq. Fl. Ind. Bat. Suppl.* i. 315. *Myrtus smilacifolia*, *Wall. Cat.* 3629.

VAR. spectabilis; leaves silvery-white beneath or greyish when old, flowers usually

fewer 2 or solitary. *R. spectabilis*, *Blume Mus. Bot.* i. 78; *Miq. l. c.* 479; *Kurz l. c.* *R. cinerea*, *Jack in Mal. Misc.* *Monoxora spectabilis*, *Wight Ill.* ii. 12, t. 97*, f. 5. *R. Nageli*, *Miq. l. c.* *R. subtriflora* and *R. Mulleri*, *Bl. l. c.* 79.

6. RHODOMYRTUS, DC.

Trees or tomentose shrubs. *Leaves* opposite, 5- or 3-nerved. *Flowers* rather large, axillary. *Calyx-tube* turbinate, oblong or subglobose, hardly produced above the ovary; lobes 5 rarely 4, herbaceous, persistent. *Petals* 5, rarely 4, spreading. *Stamens* ∞, free, in many series. *Ovary* 1-2-3-celled with spurious partitions, or divided into numerous 1-ovuled superposed cells; style filiform, stigma capitate. *Berry* drupelike, globose or ovoid, with few or numerous seeds not distinctly superposed in rows. *Seeds* compressed, reniform or nearly orbicular, horizontal, testa hard; embryo curved or spiral, radicle very long, cotyledons small.—*DISTRIB.* 5 species, 4 of them inhabitants of E. Australia, and 1 widely distributed over Tropical Asia, especially throughout the Indian Archipelago as far as China.

1. *R. tomentosa*, *Wight Spicil. Neilgh.* i. 60, t. 71; branches downy above slightly compressed, leaves elliptic or obovate obtuse shortly petioled. 3-nerved hoary on the underside with soft tomentum, peduncles axillary shorter than the leaves 1-3-fl., flowers with 2 ovate bracteoles at the base, calyx tomentose 5-cleft, lobes unequal, berry oval or subglobose 3-celled, seeds compressed forming 2 rows in each cell. *Miq. Fl. Ind. Bat.* i. pt. i. 477; *Benth. Fl. Hongk.* 121; *Redd. Fl. Sylv. Anal. Gen.* t. xiv. *Myrtus tomentosa*, *Ait.*; *DC. Prodr.* iii. 240; *Vahl Symb.* ii. 56; *Blume Bijdr.* 1081; *W. & A. Prodr.* i. 328; *Wight Ill.* ii. 12, t. 97*, f. 3, *lc.* 522; *Roxb. Fl. Ind.* ii. 498; *Wall. Cat.* 3630; *Korth. in Ned. Kruidk. Arch.* i. 197. *M. canescens*, *Lour. Fl. Cochinc.* i. 311.

WESTERN PENINSULA, Pulney Hills, *Beddome*; Nilghiris, *Adam*. EASTERN PENINSULA, MALACCA, *Griffith. Maingay*; SINGAPORE and PENANG, *Thomson, Anderson*. CEYLON, alt. 6-8000 ft., *Walker, &c.*

A shrub, 4-5 ft.; young parts clothed with thick tomentum. Lower leaves in threes, upper ones and those of the branches opposite, 1-2½ in. with 3 or rarely 5 prominent nerves starting from near the base, dark brown above, at length glabrous and shining, hoary beneath and rugose. *Peduncles* about half the length of the leaves, bearing 1-3 large pink flowers ½-¾ in. across. *Petals* downy outside, shortly clawed. *Berry* about the size of a cherry, dark purple, pulp fleshy, sweet and aromatic.—*Col. Beddome* says that this is abundant on the higher mountains in the Madras Presidency, and is known at Ootacamund as "Hill Gooseberry." The fruit is eaten raw, or made into jam called "Thaonty." Its wood is white with pink heart, the grain close and cutting like cheese, but splitting when seasoned; useful for small turnery.

7. DECASPERMUM, Forst.

Shrubs or small trees. *Leaves* opposite, pinnate-nerved. *Flowers* small, in axillary racemes, and sometimes forming terminal leafy panicles, occasionally polygamous. *Calyx-tube* campanulate, scarcely or not at all produced above the ovary; lobes 4 or 5, spreading. *Stamens* ∞, in several series, free, filaments filiform; anthers small, versatile, with parallel cells opening longitudinally. *Ovary* 4- or 5-celled with 2 or very few ovules in each cell; cells often divided by spurious dissepiments; style filiform, stigma peltate. *Berry*

globular, crowned with the calyx-lobes. *Seeds* few, reniform; testa hard; embryo hippocrepiform or circular, with a long radicle and short linear cotyledons.—**DISTRIB.** Species about 4, inhabiting Tropical Asia and Australia, and the Pacific Islands.

Closely related to *Myrtus*.

1. ***D. paniculatum***, *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 61; *For. Fl. Brit. Burm.* i. 475; leaves shortly petioled oblong acuminate suddenly narrowing below, flowers in terminal and axillary panicles often polygamous, calyx-lobes roundish or subacute, ovary 4-celled. *Nelitris paniculata*, *Lincl. Collect. under No. 16*; *DC. Prodr.* iii. 231; *Wall. Cat.* 3627; *Wight Ill.* ii. 12, t. 97*, f. 10, *lc.* 521; *Benth. Fl. Austral.* iii. 279. *N. polygama*, *Spreng. Syst.* ii. 488; *Korth. in Ned. Kruidk. Arch.* i. 197. *N. pallescens*, *Miq. Fl. Ind. Bat. Suppl.* i. 314. *Eugenia polygama*, *Roxb. Hort. Beng.* 92; *Fl. Ind.* ii. 491. *E. cuspidata*, *Wall. Cat.* 3627.

EASTERN BENGAL, KHASIA MTS.; PEGU, *Kurz*; MERGUI, *Griffith*; MALACCA, *Maingay, Cuming*.—**DISTRIB.** Java, Philippines, Australia.

A shrub or small tree; young parts and inflorescence covered with silky pubescence. *Leaves* 2 by about 1 in., abruptly contracted at the base, cuspidate-acuminate, dark and glossy above, paler and often of a reddish colour beneath. *Panicles* ascending, equalling or exceeding the leaves; bracts leaflike, or small and deciduous. *Flowers* small, crowded. *Calyx-tube* more or less clothed with white hairs; lobes usually less hairy or nearly glabrous. *Petals* ciliate. *Style* exserted. *Berry* globose, about $\frac{1}{8}$ in.—This plant varies much in the size of the flowers, the shape of the calyx-lobes, and in the degree of hairiness. I have given *M. pallescens* as a synonym on the authority of *Kurz* (*Journ. As. Soc. Beng.* xl. 57). Some of *Maingay's* Malacca specimens with an abnormally congested leafy inflorescence somewhat resemble *N. leucocoma*.

VAR. khasiana; leaves narrower, panicles long peduncled lax few-flowered, flowers larger, petals $\frac{3}{4}$ longer than the calyx.—Khasia, *Griffith*, *J. D. H. & T. T., Kurz*.

VAR. Finlaysoniana; leaves thicker, panicles shorter than the leaves, calyx-tube densely clothed with white tomentum, lobes all rounded and less hairy, stamens nearly equalling the petals. *N. polymorpha*, *Blume Mus. Bot.* i. 75, t. lx.; *Hiræa Finlaysoniana*, *Wall. Cat.* 7263.—No locality given, *Finlayson, Lobb*.

8. **EUGENIA**, *Linn.*

Trees or shrubs, smooth or rarely tomentose or villous. *Leaves* opposite rarely alternate, coriaceous or membranous, pinnate-nerved. *Inflorescence* centripetal with solitary axillary flowers, or in short racemes (leafless branches), or centrifugal in dense terminal cymes, or in terminal or lateral trichotomous panicles. *Bracts* usually small and deciduous. *Calyx-tube* globose or more or less elongate; lobes 4 rarely 5. *Petals* 4 rarely 5 or more or 0, free and spreading or united in a calyptra. *Stamens* ∞ , in many rows, free or slightly combined into 4 bundles, filaments filiform; anthers small, versatile, bursting longitudinally. *Ovary* 2- rarely 3-celled; style filiform, stigma small; ovules ∞ in each cell. *Berry* drupelike, rarely dry and fibrous, crowned with the persistent calyx-limb. *Seeds* few, globose, variously compressed, testa membranous or cartilaginous; embryo thick and fleshy, radicle short, cotyledons thick more or less united or distinct.—**DISTRIB.** Upwards of 700 species inhabiting chiefly tropical and subtropical America, tropical Asia, a few in Australia and Africa.

SECT. I. **Jambosa.** *Inflorescence* cymose. *Calyx* usually with a thickened staminal disk and 4 conspicuous persistent lobes. *Flowers* showy, usually 4-merous. *Berries* large, turbinate or ovoid. *Seeds* large, with a thick fleshy endocarp. (To p. 481).

* *Flowers lateral, sessile or subsessile, usually from leafless axils.*

1. **E. formosa**, Wall. *Pl. As. Rar.* ii. 6, t. 108; *Cat.* 3609, in part; leaves large opposite or in threes nearly sessile elliptic-oblong obtusely acuminate cordate or amplexicaul at the base, racemes lateral short few-flowered, calyx-tube turbinate narrowed into a long pedicel, lobes unequal, fruit subglobose pendulous crowned with the recurved calyx-limb. *Kurz in Journ. As. Soc. Beng.* xlv. pt. ii. p. 68; *For. Fl. Brit. Burm.* i. 492; *Wight Ill.* ii. 14. *Jambosa formosa*, Walp. *Rep. Bot.* ii. 191; *Blume Mus. Bot.* i. 92; *Miq. Fl. Ind. Bat.* i. pt. i. 412. *J. mappacea*, Korth. in *Ned. Kruidk. Arch.* i. 200.

EASTERN BENGAL and EASTERN PENINSULA, Chittagong, Upper Tenasserim, Moulmein. Banks of Attra R., Wallich.

A lofty tree with wide-spreading branches. *Bark* soft, ash-coloured, marked with the scars of fallen leaves. *Branchlets* alternately compressed or subtrigonal. *Leaves* crowded at the ends of the branchlets, 5- upwards of 16 by 4-4½ in., very coriaceous, shining above, paler beneath; midrib stout; lateral nerves prominent beneath, uniting within the margin. *Flowers* large, purple turning to red, scentless. *Peduncles* fleshy, branches clavate jointed near the middle; bracteoles 2, minute. *Calyx-tube* much produced; lobes spreading, orbicular. *Petals* twice as large as the calyx-lobes, shortly clawed. *Stamens* many, very long. *Ovary* turbinate. *Berry* size of a walnut, 2-celled, smooth, shining, white, insipid. *Seeds* large, rugose, greenish.

VAR. *ternifolia*, Roxb. *Hort. Beng.* 37; *Fl. Ind.* ii. 489 (sp.); leaves in threes. *Wall. Cat.* 3607; *Wight Ill.* ii. 14; *lc.* t. 611; *Blume Mus. Bot.* 92 (*Jambosa*).—SIKKIM, J. D. H.; ASSAM and SILHET, Wallich. PEGU, McClelland.

2. **E. amplexicaulis**, Roxb. *Hort. Beng.* 37; *Fl. Ind.* ii. 483; leaves opposite amplexicaul oblong with a rounded apex, peduncles short lateral 3- or 9-flowered, berries spherical size of a small apple. *Wight Ill.* ii. 14; *lc.* t. 608; *Wall. Cat.* 3612; *Lindl. Bot. Reg.* 1033; *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 68; *For. Fl. Brit. Burm.* i. 493. *Jambosa amplexicaulis*, DC. *Prod.* iii. 287. *J. alba*, var. *amplexicaulis*, *Miq. Fl. Ind. Bat.* i. pt. i. 414; *Blume Mus. Bot.* i. 96.—*J. sylvestris alba*, Rumph. *Herb. Amb.* i. 127, t. 39?

CHITTAGONG, Roxburgh.

A stately tree. *Trunk* tolerably straight, quickly dividing into numerous spreading branches. *Bark* of woody parts brown. *Leaves* 6-8 by 3-4 in. *Peduncles* trifid, each division 3-flowered. *Flowers* large, white, scentless. *Berry* greenish-yellow when ripe.—*Kurz in Journ. As. Soc. Beng.* l. c. refers to specimens in Herb. Brandis collected in Upper Tenasserim as coming very near to this species, and only differing from Roxburgh's figure by having a terminal inflorescence. In the figure given by Rumphius l. c. the leaves are acute at the base.

3. **E. malaccensis**, Linn.; *Lam. Dict.* iii. 196; leaves shortly petioled large ovate or elliptic-oblong attenuated at each end coriaceous glossy, racemes lateral dense shortly peduncled, flowers red, calyx-tube turbinate narrow below, lobes unequal, fruit subglobose or depressed-turbinate crowned with the incurved calyx-lobes. *Roxb. Fl. Ind.* ii. 483; *Wall. Cat.* 3611; *Wight Ill.* ii. 14, t. 98; *Bedd. Fl. Sylv. Anal. Gen.* cx.; *Kurz in Journ. As. Soc. Beng.* xlv. pt. ii. p. 68; *For. Fl. Brit. Burm.* i. 493. *E. macrophylla*, *Lam. l. c.* *Jambosa malaccensis*, DC.; *Korth. in Ned. Kruidk.* (1847) 200; *Bot. Mag.* 4408; *W. & A. MALAYA, Maingay, Griffith. CHITTAGONG (cult.?) J. D. H. & T. T. Tenasserim.—DISTRIB. Malayan Islands.—Many varieties are cultivated in different parts of the world.

A shrub, 6–8 ft. high, with terete-compressed branchlets. Leaves 9–12 by $3\frac{1}{2}$ in., glossy on both surfaces; dots inconspicuous; nerves indistinct above, the primary ones few prominent beneath and uniting more or less distinctly within the margin, sometimes in double loopings; petiole stout, channelled above, $\frac{1}{4}$ – $\frac{1}{2}$ in. Flowers large and handsome. Calyx-tube $\frac{3}{4}$ in.; lobes unequal, rounded, with membranous edges, the larger pair $\frac{2}{3}$ in. long. Petals large, suborbicular, glandular. Stamens numerous, about 1 in. in length. Style long, persistent, nearly equalling the stamens. Fruit large and juicy, very generally eaten, but insipid (Roxburgh).—In a cultivated specimen from Chittagong the leaves are distinctly pellucid-punctate with large glands.

VAR. *purpurea*; fruit ovoid dark purple. *E. purpurea*, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 483; *Wight Ill.* ii. 14; *l. c.* ii. 549. *J. purpurea*, *Wall. Cat.* 3610. *J. domestica*, var. *purpurea*, *Blume Mus. Bot.* i. 92; *Miq. l. c.*—*J. nigra*, *Rumph. Amb.* 125, t. 38, fig. 1?

4. **E. polypetala**, *Wight Ill.* ii. 14; *l. c.* t. 610; leaves ternate linear-lanceolate, peduncles lateral 3–4-flowered, corolla many-petalled. *Wall. Cat.* 3616; *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 69; *For. Fl. Brit. Burm.* i. 493. *E. salicifolia*, *Buch. Cat.* 37. *E. angustifolia*, *Roxb. Fl. Ind.* 490.

SILHET, Wallich; KHASIA Mts., Griffith; CHITTAGONG, Roxburgh.

A small tree. Leaves 4–5 in. by nearly an inch in width, midrib and lateral nerves prominent beneath, uniting close within the margin. Flowers smaller than those of *E. diospyrifolia*. Calyx-tube broad, and rather more than $\frac{1}{2}$ in. long when in flower.—Roxburgh says (l. c.) that this flowers in March and April, and the fruit ripens in June and July; it is readily known by its many (12–16) petals and the ternate leaves. Allied to *Jambosa æmula*, Blume, and *J. media*, Korth

** Flowers terminal and axillary.

† Calyx-tube broadly turbinate.

§ Calyx $\frac{1}{2}$ in. or more in length.

5. **E. diospyrifolia**, *Wall. Cat.* 3617; leaves long and narrow ovate-lanceolate or oblong acutely acuminate cordate at the base and nearly sessile, flowers terminal few, calyx-tube about $\frac{3}{4}$ in. long produced beyond the ovary, lobes very broad.

SILHET, Wallich; KHASIA, Griffith.

Leaves 6–7 by $1\frac{3}{4}$ in. pale coloured and with a yellowish tinge beneath.—Allied to *E. Munronii*, but the lateral nerves of the leaf are much less prominent beneath and do not form by their union such a distinct intramarginal one; the flowers are fewer on shorter peduncles, and the calyx-tube is broader above and not so attenuated below.

6. **E. Munronii**, *Wight Ill.* ii. 14; *l. c.* t. 546; leaves shortly petioled narrowly lanceolate obtusely acuminate somewhat cordate at the base very coriaceous, nerves prominent beneath uniting in a thick waving intramarginal one, cymes terminal, flowers large reddish or white, calyx-tube attenuated

below. *Bedd. Fl. Sylv. Anal. Gen. cix.* *Jambosa samarangensis*, var. *heteromorpha*, *Blume Mus. Bot. i. 96.* *J. alba*, var. *heteromorpha*, *Miq. Fl. Ind. Bat. i. pt. i. 416.*

KHASIA MTS., *Griffith, J. D. H. & T. T.*; KURG MTS., *Munro*; NILGIRIS *Gardner.*

A middling-sized tree, 12–20 ft. in height. *Leaves* 6–9 by $\frac{3}{4}$ –3 in. *Calyx-lobes* somewhat membranous.—Some of the Khasia specimens appear to be intermediate between this and *E. aquea*: the leaves are less attenuated at the apex, and not quite so prominently nerved; the flowers are rather larger than in either, and the calyx not so slender below as in typical examples of this species.

7. ***E. aquea***, *Burm. Fl. Ind. 114*; leaves nearly sessile ovate oblong or ovate-lanceolate often cordate at the base, cymes terminal and from the upper axils shortly peduncled 3–7-flowered, fruit turbinate flattened at both ends. *Roxb. Hort. Beng. 37*; *Fl. Ind. ii. 492*; *Wall. Cat. 3613 & 3614 A. & B.*; *Wight Ill. ii. 14*; *Ic. t. 550*; *Bedd. Fl. Sylv. Anal. Gen. cix.*; *Kurz in Journ. As. Soc. Beng. vol. xvi. (1877) pt. ii. p. 69*; *For. Fl. Brit. Burm. i. 494.* *E. javanica*, *Lam. Dict. iii. 200, in part.* *Jambosa aquea*, *DC., W. & A. Prodr. i. 332 excl. Rumph. t. 39*; *Blume Mus. Bot. 102*; *Miq. Fl. Ind. Bat. i. pt. i. 421*; *Thwaites Enum. 115*; *Berg in Fl. Brazil xiv. pt. i. 378.* *J. madagascariensis*, *Blume Mus. Bot. i. 103?* *Cerocarpus aqueus*, *Hassk. Cat. Hort. Bog. 262*; *Bot. Zeit. (1814) 593.* *Myrtus javanica*, *Blume Bijl. 1084.*—*Rumph. Herb. Amb. i. 126, t. 38, f. 2.*

CHITTAGONG, AVA, PEGU, MARTABAN, and TENASSERIM (apparently only planted, *Kurz*).—CEYLON, ascending to 5000 ft.

A middling-sized tree, 20–30 ft., much-branched, variable in the form of its foliage, the shape of the calyx-tube, and the colour of the flowers. *Bark* smooth, ash-coloured. *Leaves* coriaceous, black-dotted, $1\frac{1}{2}$ –2 $\frac{1}{4}$ by 1–1 $\frac{1}{2}$ in.; midrib prominent below, primary nerves 8–10 on each side forming inconspicuous loops near the margin. *Flowers* large, white, red, or pale purple. *Calyx-tube* turbinate or cylindrical, about 1 in.

8. ***E. densiflora***, *DC. Prodr. iii. 287 under Jambosa*; leaves petioled oblong or oblong-lanceolate rounded at both ends or shortly acuminate the apex coarsely nerved and reticulated, cymes compact terminal, flowers 2 or 3 together on short pedicels, “calyx and petals tinged with clear rose-colour, filaments long rose-coloured” (*Maingay MSS.*), fruit nearly spherical 2-seeded. *E. corymbosa*, *Roxb. Fl. Ind. ii. 497*; *Wight Ic. t. 627?* *Jambosa densiflora*, *Korth. in Ned. Kruidk. Arch. i. 200*; *Blume Mus. Bot. i. 93*; *Miq. Anal. Ind. i. 17*; *Fl. Ind. Bat. i. pt. i. 416.* *Myrtus densiflora*, *Blume Bijl. 1087.*

MALACCA and SINGAPORE, *Maingay, No. 758, 760, 760 $\frac{1}{2}$.*—DISTRIB. Malayan Islands.

Upper branches stout, 4-gonous, with reddish bark peeling off in shreds. *Leaves* from 4 to upwards of 10 $\frac{1}{2}$ by $1\frac{1}{2}$ –3 in., slightly polished above, often conspicuously dotted beneath; midrib stout; primary nerves distinct on both surfaces, prominent beneath and uniting to form two conspicuous intramarginal nerves; petiole $\frac{3}{8}$ in. *Branches of inflorescence* thick and 4-gonous, often articulated and breaking up into cubical segments. *Calyx-tube* turbinate, $\frac{3}{8}$ in.; lobes 4, large, rounded, with membranous edges, opposite pairs equal. *Style* long, persistent. *Fruit* $\frac{1}{2}$ in. in diam., crowned with the persistent calyx-lobes.—Allied to *E. Jambos*, from which it differs in the shape and nerving of the leaves, smaller flowers and more unequal calyx-lobes. The leaves of the Singapore specimens are much smaller and less distinctly punctate below. *Miquel* says (*Fl. Ind. Bat. l. c.*) “seems to be the same as *E. corymbosa*, *Roxb.* (*Wight Ic. ii. 627.*)” but the petals in *Roxburgh’s* coloured fig. No. 1143 are bright yellow.

9. **E. Jambos**, Linn.; leaves narrowly lanceolate acuminate attenuated at the base into a short petiole coriaceous midrib stout nerves prominent below and uniting within the margin in a distinct and continuous one, racemes short terminal, flowers large white, calyx-tube turbinate, berry subglobose crowned with the 4 persistent calyx-lobes. *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 494; *Wall. Cat.* 3615; *Wight Ill.* ii. 14; *Ic. t.* 435 (*vulgaris*); *Bedd. Fl. Sylv. Anal. Gen. cx.*; *Brandis For. Fl.* 233. *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 69; *For. Fl. Brit. Burm.* i. 495. *Jambosa vulgaris*, DC.; *Blume Mus. Bot.* i. 93; *W & A. Prodr.* i. 332; *Bot. Mag.* 3356; *Miq. Fl. Ind. Bat. i.* pt. i. 425; *Berg in Fl. Brazil* vol. xiv. pt. i. 377. *Myrtus Jambos*, Kunth; *Korth. in Ned. Kruidk. Arch.* i. (1846) 200; *Blume Bijdr.* 1085.—*Rumph. Herb. Amb.* i. 123; *Rheede Hort. Mal.* i. 27, f. 17.

Indigenous in the SIKKIM TERAI (*Brandis*); BURMA (cult. only *Kurz*), PEGU, *McClelland*; PENANG, *Wallich*.—DISTRIB. Yunnan to Australia. (Said to be naturalised at Hong Kong).

A moderate-sized tree; branchlets compressed or sub-4-gonous. *Leaves* variable in length, $1\frac{1}{2}$ –2 in. broad; nerves reticulate beneath; midrib stout; petiole short and stout, $\frac{1}{4}$ in. or less. *Calyx-tube* produced above the ovary; lobes round. *Berries* 1–2 in. diam.

VAR. *divaricata*; branchlets stout distinctly 4-gonous, cymes terminal and from the upper axils dense subsessile, branches stout spreading. Penang (Maingay, 735).—This resembles *E. densiflora* in its inflorescence.

10. **E. macrocarpa**, *Roxb. Hort. Beng.* 37; *Fl. Ind.* 497; leaves shortly petioled lanceolate acuminate narrowed at the base rounded or subcordate coriaceous minutely dotted, midrib and nerves very prominent beneath and uniting in conspicuous double marginal loopings, interspaces reticulate, cymes compact terminal and lateral subsessile, flowers sessile, bracteoles persistent at the nodes, calyx-tube turbinate narrow below, limb suboctoid, lobes unequal, berry globose. *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 68; *For. Fl. Brit. Burm.* i. 492; *Wight Ic. t.* 612. *Jambosa macrocarpa*, *Miq. Fl. Ind. Bat. i.* pt. i. 417. *J. coarctata*, *Blume Mus. Bot. i.* 99.

ASSAM and CHITTAGONG, *Wallich*; CACHAR, *Keenan*; MOULMEIN, *Falconer*; MALACCA, *Griffith*, *Maingay* (736 Kew Distrib.); PEGU and MARTABAN, ascending to 2000 ft., *Falconer*, *Brandis*.—DISTRIB. Malay Archipelago.

Branchlets 4-gonous. *Leaves* rarely subalternate, or in threes, 5–10 by $\frac{1}{2}$ –4 in.—In Maingay's Malacca specimens the angles of the branchlets are winged, and the bark is of a reddish colour; the petioles are stout, rather less than $\frac{1}{2}$ in.; calyx-tube $\frac{1}{2}$ in.; style long and persistent. Roxburgh describes the fruit as about the size of an orange, and resembling that of *Dillenia indica*; it is eaten, and ripens in August and September. In Roxburgh's figure a section of the fruit shows it to be 5-seeded. The leaves are drawn too acute. Keenan describes it as being rather a tall tree with short horizontal branches; buds roundish, rosy; the bruised leaves smell like cinnamon, and the stamens are clove-scented. In Griffith's plant the calyx-tube is finely striate, and there is a slight constriction near the middle.

11. **E. javanica**, *Lamk. Dict.* iii. 200; leaves subsessile elliptic-oblong rounded at the apex or obtusely acuminate rounded or subcordate at the base, cymes axillary and terminal shorter than the leaves long-peduncled lax many-flowered, flowers white, berries depressed-turbinate. *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 69; *For. Fl. Brit. Burm.* i. 494. *E. alba*, *Roxb. Hort. Beng.* 39; *Fl. Ind.* ii. 493; *Wall. Cat.* 3614 C. *Jambosa alba*, *Rumph. Herb. Amb.* i. 127, t. 39; *W & A. Prodr.* i. 332; *Wight Ill.* ii. 14; *Ic. t.* 548; *Miq. Fl. Ind. Bat. i.* pt. i. 413 in part. *J. samarangensis*, DC. *Prodr.* iii. 286; *Korth. in Ned. Kruidk. Arch.* i. 201; *Blume Mus. Bot. i.* 95; *Bijdr.* 1084

(*Myrtus*); *Berg in Fl. Brazil* vol. xiv. pt. i. 377. *J. macrophylla*, *DC. Prodr. l.c. in part.*

MALACCA, *Griffith*; ANDAMAN and NICOBAR ISLANDS, *Kurz*.—DISTRIB. Malay Islands.

A tree; trunk rarely straight and soon divided, branchlets terete or terete-compressed. *Leaves* 5-6½ by 1¾-2¾ in., or larger in cultivated examples; nerves indistinct above, slender but prominent beneath and uniting in loops within the margin. *Calyx-tube* turbinate, about ½ in., slender below; lobes 4, rather unequal, membranous at the edges. *Berry* size of a medlar, white or red.—This tree, according to Mr. Kurz, flowers in March and April, and the fruit ripens in May and June.

VAR. *Roxburghiana*, Wall. MSS. (sp.); leaves shortly petioled cordate at the base rounded at the apex, cymes compact terminal. *E. decora*, Wall. *Cat.* 3608. Chittagong.

12. **E. pendens**, *Duthie*; young branches terete, leaves shortly petioled oblong or ovate-lanceolate narrowed below obtusely acuminate subcoriaceous pellucid-punctate, principal lateral nerves prominent beneath and widely separated, cymes terminal and axillary 5-7-flowered, flowers large the lower ones long pedicelled, calyx-tube turbinate.

MALACCA, *Griffith*, 2349, *Maingay*, 747.

"Rather a small tree with pendent branches" (*Griffith*). *Leaves* shining a little on the upper surface, 5-8 by 2-3½ in.; nerves indistinct above prominent beneath, uniting in a distinct looping one within the margin; petiole ¾ in. *Peduncles* equalling the petioles or a little longer; lower pedicels about ½ in. *Calyx-tube* ¾ in.; lobes 4, rounded, with membranous edges, opposite pairs equal, reflexed after flowering. *Petals* large, orbicular. *Style* very long, 1½ in., persistent.

§§ *Calyx* less than ½ in. in length.

a. *Flowers* pedicelled.

13. **E. Wallichii**, *Wight Ill.* ii. 17; *Ic. t.* 536; leaves lanceolate or elliptic-oblong acuminate acute at the base dark and shining above, lateral nerves uniting twice within the margin, cymes corymbose axillary and terminal shorter than the leaves, calyx-tube suddenly contracted at the base lobes prominent persistent, petals frequently expanding before falling, berries oblong. *O. bifaria*, *Colebr. in Wall. Cat.* 3606. *E. præcox*, *Roxb. Fl. Ind.* ii. 488?; *Wight Ic. t.* 619; *Kurz in Journ. As. Soc. Beng.* xlv. (1877) pt. ii. p. 66; *For. Fl. Brit. Burm.* i. 483.

SIKKIM, *J. D. H.*; KHASIA and BHOTAN, *Griffith*; ASSAM, *Masters*; SILHET, *J. D. H. & T. T.*; CHITTAGONG, *Roxburgh, J. D. H. & T. T.*; MERGUI, *Griffith*.

A tree; branchlets stout, quadrangular. *Leaves* 4½ by 1¾ in., coriaceous, rusty-coloured beneath; petiole about ½ in. *Flowers* white. *Calyx-tube* about ¼ in. long. *Stamens* about 4 times the length of the calyx. *Style* long, persistent. *Berry* about ½ in., crowned with the cup-shaped calyx-limb.—In *Roxburgh's* figure of *E. præcox* the inflorescence is more branched and the flowers rather smaller; the leaves are drawn acutely acuminate.

VAR. *lanceafolia*; leaves rounded at the base, petiole much shorter; *E. lanceafolia*, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 494. SILHET FORESTS, *Roxburgh*. CHITTAGONG, *J. D. H. & T. T.*

β. *Flowers* sessile.

14. **E. grandis**, *Wight Ill.* ii. 17; *Ic. t.* 614; leaves large thick hard and coriaceous shining broadly obovate or suborbicular abruptly acuminate or

rounded at the apex narrowed or rounded at the base, nerves prominent beneath or on both surfaces, panicles terminal and axillary not exceeding the leaves, flowers large, calyx-tube turbinate attenuated below, petals free and expanding, berry globose or somewhat pyriform crowned with the large spreading cup-like calyx-limb. *Bedd. Fl. Sylv. Anal. Gen. cvii.*; *Kurz in Journ. As. Soc. Beng. xli.* (1877) pt. ii. p. 67; *For. Fl. Brit. Burm. i.* 489. *E. firma*, *Wall. Cat.* 3603; not of DC. *Jambosa grandis*, *Blume Mus. Bot. i.* 108. *J. firma*, *Blume l. c.* *J. urceolata*, *Korth. in Miq. Fl. Ind. Bat. i.* pt. i. 418 in part. *Syzygium grande*, *Walp. Repert. ii.* 180; not of *Wall. Cat.* 3554. *E. cymosa*, *Roxb. Hort. Beng. 37*; *Fl. Ind. ii.* 492; not of *Lam. S. firmum*, *Thwaites Enum.* 417. *S. montanum*, *Thwaites l. c.* 116.

SILHET, *Wallich*; PEGU, MARTABAN, and TENASSERIM, *Brandis*; MOULMEIN and MERGUI, *Griffith*; MALACCA, *Griffith, Maingay*; SINGAPORE, *Walker*; CEYLON, *Thwaites*, ascending to 4000 ft.—DISTRIB. Borneo, &c.

A large tree. *Leaves* 4-8 by 3-3½ in.; lateral nerves sometimes forming double loopings within the margin; petiole ¾-1 in. *Calyx-lobes* short, rounded, unequal. *Berries* 1 in. to 1½ in.—Blume distinguishes his *J. firma* specifically by the nerves not being impressed on the upper surface, and by the more unequal calyx-lobes. The Ceylon specimens have the leaves very much polished, the lateral nerves more numerous and uniting closer to the margin, the cymes more lax and fewer-flowered. A plant from Amherst named *E. ficifolia*, MSS. in *Herb. Wallich* 3603 B, has the leaves very large and more rounded at the base.

15. ***E. lepidocarpa***, *Wall. Cat.* 3618 in part; leaves broadly ovate or elliptic-oblong abruptly acuminate or rounded at the apex shining above, nerves prominent on both surfaces, interspaces finely reticulate, panicles terminal few-flowered, flowers sessile, calyx ¼ in. campanulate spreading above, petals free and spreading. *Kurz in Journ. As. Soc. Beng. xli.* pt. ii. p. 68. *E. grandis*, var. *lepidocarpa*, *For. Fl. Brit. Burm. i.* 490. *Syzygium palembanicum*, *Miq. Fl. Ind. Bat. Suppl. i.* 313.

PEGU and TENASSERIM, *Brandis*; MALAYA, *Griffith, Maingay*; SINGAPORE, *Wallich*.—DISTRIB. Sumatra.

Branchlets greyish, more or less compressed at the nodes. *Leaves* thick, coriaceous, smaller than those of *E. grandis*; midrib furrowed above, stout beneath; petiole about ¼ in. *Panicle* branches angular, much compressed below the nodes. *Calyx* pedicel-like below; lobes rather unequal, rounded, with membranous edges. *Berries* about ½ in., subglobose, crowned with the cup-like calyx-limb, often prominently ribbed longitudinally.

VAR. *minor*; leaves and flowers smaller, panicles axillary and terminal, flowers crowded in umbel-like heads.—The leaves resemble those of *E. mangifolia* and the inflorescence has more the habit of *E. Wallichii*.—MALAYA, *Griffith* (2416).

15*. ***E. Beddomei***, *Duthie*; leaves crowded broadly ovate abruptly attenuate below very coriaceous polished above, midrib and stout lateral nerves prominent beneath freely anastomosing towards the margin and uniting at some distance from it, inflorescence elongate, branches acutely 4-gonous, petals free.

TINNEVELLY Hills; alt. 5000 ft., *Beddome*.

A large tree. *Leaves* 4½ by 3 in., rounded or emarginate at the apex; petiole ½ in. or less, stout; midrib channelled above. *Flowers* like those of *E. grandis*.

16. ***E. tetraëdra***, *Miq. Fl. Ind. Bat. Suppl. i.* 310 (*Jambosa* ?); branchlets compressed acutely 4-gonous or the older ones subterete, leaves broadly elliptic often folded very coriaceous shining above rusty coloured beneath, nerves prominent on both surfaces, cymes terminal and axillary with divaricate

branches, calyx-tube about $\frac{1}{2}$ in. gradually tapering to the base, lobes 4 prominent, petals free or slightly united, berry ovoid or subglobose size of cherry.

MALACCA, Griffith, Maingay, 732.—DISTRIB. Sumatra.

A large tree. Leaves 3-6 by $1\frac{1}{2}$ -2 $\frac{1}{4}$ in.; lateral nerves uniting close to the margin; petiole $\frac{3}{4}$ in. Branches of inflorescence flattened below the flowers. Calyx-lobes with pale membranous edges.—Kurz in a MS. note on a specimen in the Calcutta Herbarium suspects that this is the *E. tetraëdra* of Miquel, but with some hesitation on account of the terete branchlets. The examination of a more complete series of specimens in the Kew Herbarium enables me to confirm his suspicion.

17. *E. pachyphylla*, Kurz in Journ. As. Soc. Beng. xlii. 332 (1873); For. Fl. Brit. Burm. i. 490; leaves obovate or obovate-oblong more or less cuneate at the base acuminate thick and coriaceous, flowers usually solitary or in threes sessile arranged in short stout terminal 3-chotomous panicles, branches 4-gonous articulate, calyx about $\frac{1}{2}$ in. long obconical attenuate below, lobes 4 rounded persistent.

TENASSERIM, Brandis, alt. 3000 ft. MALACCA; Griffith, Maingay.

A tree. Branchlets white. Leaves 3-4 in., turning dark when dried; lateral nerves slender, prominent, distant; petiole thick, $\frac{1}{4}$ - $\frac{1}{2}$ in.—Flowers in April.

18. *E. tristis*, Kurz in Journ. As. Soc. Beng. vol. xlii. 233 (1873); For. Fl. Brit. Burm. i. 490; leaves elliptic or elliptic-obovate acute at the base obtusely apiculate coriaceous, panicles corymbose terminal sessile, branches short stout, berry size of cherry depressed-globose crowned with the 4-lobed discoid calyx-limb.

TENASSERIM, Brandis.

A tree. Branchlets terete, thick, pale brown. Leaves 4-5 in., opaque; lateral nerves rather distant, stout, prominent. Berry 2- or 1-seeded. Calyx-lobes $\frac{1}{2}$ in. (in fruit) rounded.

†† Calyx-tube hemispherical.

19. *E. hemispherica*, Wight Ill. ii. 14; Ic. t. 525; leaves opposite rarely subalternate petioled ovate-lanceolate or oblanceolate narrowed towards the base acuminate at the apex or often rounded, cymes axillary and terminal solitary or in pairs shorter than the leaves, calyx-tube short semiglobose, disk 4-gonal, petals large orbicular reflexed glandular, berry spherical. Bedd. Fl. Sylv. t. cciii. Stronglylocalyx hemisphericus, Blume Mus. Bot. i. 90. Thwaites Enum. 116.

From S. CANARA TO CAPE COMORIN, at about 3000 ft. alt., KURG MTS., ANAMALLAY AND TINNEVELLY GHATS, Beddome. CEYLON, up to alt. 4000 ft., Thwaites.

A large tree, upper branches subtetragonous. Leaves minutely dotted, 2-6 by $\frac{3}{4}$ -2 in.; nerves inconspicuous above more prominent beneath, and uniting within the margin but not very regularly, with sometimes a second but fainter nerve close to the edge; petiole $\frac{3}{8}$ - $\frac{1}{2}$ in. Inflorescence pyramidal. Peduncles 6-9-flowered. Flowers large, white, varying in size. Berries about 1 in. in diam.—This species varies much in the shape of the leaves and in their appearance when dried. The timber is useful for various purposes.

20. *E. lanceolaria*, Roxb. Hort. Beng. 37; Fl. Ind. ii. 494; leaves shortly petioled narrowly lanceolate, flowers terminal about 15 together corymbose fasciated, berries irregularly round lobate. Wight. Ic. t. 613.

SILHET, "Roxburgh."

A small tree 10-12 ft. in height. Flowers very large, rosy, and somewhat

fragrant. *Fruit* size of small apple, not eaten.—Col. Beddome believes it to be closely allied to *E. hemispherica*. I have not seen specimens.

††† *Calyx-tube* slender, conical or clavate.

§ *Flowers* on long slender pedicels.

21. ***E. bifaria***. Wall. *Pl. As. Rar.* ii. 47, t. 161, not of Wall. *Cat.* 3606; leaves very shortly petioled crowded oblong acuminate rounded at the base shining and convex above, lateral nerves uniting at some distance from the margin in two conspicuous ones, corymbs axillary solitary branched few-flowered, calyx-tube clavate narrowed into a slender pedicel, lobes 4 roundish unequal, berry oval about 1 in. long crowned with the incurved calyx-lobes. *Wight Ill.* ii. 14; *lc.* t. 609. *E. laurifolia*, Roxb. *Hort. Beng.* 92; *Fl. Ind.* ii. 489; Wall. *Cat.* 3605. *Jambosa bifaria*, Miq. *Fl. Ind. Bat.* i. pt. i. 422. *J. laurifolia*, DC. *Prodr.* iii. 287.

SILHET Mts., Wallich.

A tree, quite glabrous; branches terete or alternately compressed, or the ultimate ones obscurely 4-gonous, swollen at the nodes, ashy-coloured. *Leaves* about 5 in., twice or three times longer than the internodes; nerves prominent beneath nearly transverse; petiole terete, $\frac{1}{2}$ in. *Corymbs* rather lax, two or three times shorter than the leaves, shortly peduncled. *Flowers* large, white, on slender pedicels. *Petals* orbicular, shortly clawed, twice as large as the calyx-lobes, minutely crenulate. *Stamens* numerous, long, spreading. *Berry* pendulous, $1\frac{1}{2}$ in. long, yellow.—In some of Wallich's specimens named *E. laurifolia* the corymbs appear to be terminal.

22. ***E. filiformis***, Wall. *MSS.*; leaves petioled rather small nearly ovate with a broad obtuse acumen coriaceous pellucidly dotted, cymes laxly racemose terminal or lateral, flowers solitary on long slender pedicels, calyx-tube turbinate or subcylindrical, lobes nearly equal, berries ovoid or roundish crowned with the 4 reflexed calyx-lobes 2-seeded. *Syzygium filiforme*, Wall. *Cat.* 3580. *S. capillare*, Wall. *Cat.* 3578.

SINGAPORE and PENANG, Wallich; MALAYA, Maingay, Griffith.

Upper branches slender, rod-like, terete, or subcompressed at the nodes. *Leaves* 2-3 by $1\frac{1}{4}$ - $1\frac{1}{2}$ in.; midrib prominent beneath, lateral nerves spreading out nearly at right angles with the midrib; petiole about $\frac{1}{4}$ in. *Pedicels* $1\frac{1}{2}$ in. *Calyx-tube* $\frac{1}{2}$ in. *Berries* $\frac{1}{2}$ in. long by $\frac{3}{8}$ in.—One of Maingay's specimens has a much longer almost cylindrical calyx-tube. Wallich's *E. (Syz.) capillaris* seems to be only a state of *E. filiformis* with thinner narrower leaves, shorter pedicels, and smaller flowers.

23. ***E. Kurzii***, Duthie in *Journ. As. Soc. Beng.* xlii. (1877) pt. ii. p. 68; *Kurz For. Fl. Brit. Burm.* i. 491; leaves more or less broadly lanceolate acute or attenuate at the base obtusely acuminate coriaceous pale beneath, flowers rather small white peduncled arranged in short axillary racemes or at the axils of fallen leaves, calyx-tube clavate-turbinate spreading above, lobes 4 rounded persistent, petals free, berry globose size of pea. *E. cerasiflora*, Kurz in *Journ. As. Soc. Beng.* xlii. (1873) 233; not of Miguel.

SIKKIM, alt. 1-5000 ft., J. D. H.; ASSAM, Jenkins; KHASIA Mts., Kurz; MISHMI, Griffith; CACHAR, Keenan; PEGU and MARTABAN, Kurz.

A large tree 90-100 ft. *Branchlets* white, compressed or subtetragonous. *Leaves* 4-7 in., shining a little on the upper surface; lateral nerves slender but prominent; petiole $\frac{3}{8}$ - $\frac{1}{2}$ in. *Cymes* about 5-flowered. *Calyx-tube* $\frac{1}{2}$ - $\frac{1}{2}$ in., the produced portion $\frac{1}{4}$ in.; lobes $\frac{1}{2}$ in., reflexed after flowering. *Petals* $\frac{1}{2}$ in. *Filaments* slender. *Style* persistent. *Berry* $\frac{1}{2}$ - $\frac{3}{4}$ in., 1-2-seeded, smooth, crowned with the spreading calyx-

limb.—The Assam specimens have smaller flowers and a more slender calyx-tube. No. 2356 of Griffith's collection from E. Bengal? differs from the above in having nearly sessile leaves and flowers. It is probably distinct, but the specimen is too incomplete, and the locality somewhat doubtful.

24. **E. albiflora**, Duthie in *Journ. As. Soc. Beng.* xlv. (1877) pt. ii. 68; *Kurz For. Fl. Brit. Burm.* i. 491; leaves obovate or nearly ovate shortly and bluntly acuminate acute at the base, cymes from the upper axils or terminating older shoots few-flowered shorter than the leaves, calyx-tube narrow and slender below, lobes 4 rounded or subacute, petals united white.

BURMA, alt. 1000 ft., Griffith (2419).

A small tree with terete branchlets. Leaves 3-5 by 2-2½ in., smooth, pale and indistinctly nerved above; lateral nerves rather distant and prominent beneath faintly uniting within the margin, interspaces finely reticulate; petiole ½ in. "Buds white" (Griffith MSS.). Calyx-tube about ½ in. long.

§§ Pedicels shorter and more erect.

25. **E. fusiformis**, Duthie; young branches 4-gonous, leaves petioled obovate-lanceolate cuneate below subcoriaceous pellucid-punctate, lateral nerves rather close, cymes terminal compact branches angular and somewhat winged, flowers 2 or 3 together on short pedicels, calyx-tube narrowly fusiform much produced above the ovary.

MALAYA, Maingay No. 743.

Bark yellowish. Leaves 4½ by 3 in., shining a little above, minutely dotted; midrib and nerves dark-coloured; lateral nerves uniting within the margin; petiole about ¾ in. Calyx-tube ½ in. in length and ½ in. across at the widest part; lobes 4, rounded, reflexed after flowering. Style persistent, exserted portion equalling the calyx-tube.—Closely allied to No. 2236 of Beccari's Borneo plants.

26. **E. læta**, Ham. in *Trans. Wern. Soc.* v. 338 (excl. syn. Rumph.); leaves rather thin shortly petioled ovate-lanceolate attenuated at the base with a longish obtuse acumen pellucid-punctate, primary nerves directed upwards not distinctly uniting within the margin, peduncles terminal and axillary 1-few-flowered often jointed in the middle, calyx-tube long cylindrical tapering to the base, stamens crimson or purple numerous exceeding the large rounded petals, berry ovoid. *Jambosa læta*, Blume *Mus. Bot.* i. 104.

Moist Western Ghat forests from BOMBAY southwards, Hamilton, Beddome, Gibson, Ritchie, Stocks.

A small or middling-sized tree; branchlets terete, Leaves 4-5 by 1½-1¾ in., secondary nerves crossing the primary ones more nearly at right angles with the midrib; petiole ¼ in. Flowers large, 2-3 in. when expanded, crimson or white. Calyx-tube ¾-1 in.; lobes rounded, unequal, reflexed when in flower. Petals white, glandular. Style 1½ in. persistent.—Hamilton's type specimen in the British Museum from Mysore is certainly identical with the Western Ghat specimen named *S. pauciflora* in the Kew Herbarium.

VAR. *pauciflora*, Wight *Ill.* ii. 15; *Ic. t.* 526 (sp.); pedicels solitary from the extreme axils 1-flowered. *Jambosa pauciflora*, Dalz. & Gibs. *Bomb. Fl.* 94. *E. Wightii*, Bedd. *Fl. Sylv. Anal. Gen.* cix.—Courtallum, WIGHT.

27. **E. cylindrica**, Wight. *Ill.* ii. 14; *Ic. t.* 527; ultimate branches terete, leaves shortly petioled ovate-lanceolate acuminate coriaceous minutely pellucid-punctate, primary nerves prominent beneath forming double loops within the margin, cymes terminal or from the upper axils 3-8-flowered shorter

than the leaves, calyx-tube cylindrical tapering to the base constricted near the apex, fruit subspherical urceolate. *Bedd. Fl. Sylv.* t. 202; *Anal. Gen.* cix. *Jambosa cylindrica*, *Thwaites Enum.* 115.

CEYLON, ascending to 3000 ft., *Walker, Thwaites*.

A moderate-sized tree. *Leaves* 4-6 by $1\frac{1}{2}$ - $1\frac{3}{4}$ in. The nervation forms a characteristic feature in this species, the lateral nerves uniting in a double system of intra-marginal loopings, the inner one being situated about half-way between the midrib and the margin; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. *Flowers* large, $\frac{1}{2}$ to nearly 1 in. diam., white, turning to purple. *Calyx-tube* $\frac{3}{4}$ to nearly 1 in. long. *Petals* orbicular, dotted. *Fruit* $\frac{1}{2}$ - $\frac{3}{4}$ in. diam.—*Blume (Mus. Bot. i. 114)* compares this with his *Clavimyrthus virens*; but the latter is distinguished by a more contracted inflorescence and the calyx shorter and less attenuated below.

28. ***E. ramosissima***, *Wall. Cat.* 3604; leaves lanceolate or oblong-lanceolate attenuated towards the base acuminate subcoriaceous pellucid-punctate, cymes axillary and terminal much branched, branches spreading, calyx-tube clavate or narrowly obconical, lobes rounded nearly equal, petals densely glandular. *Clavimyrthus ramosissima*, *Blume Mus. Bot. i. 115*.

SIKKIM, *J. D. H. SILHET, Wallich*. KHASIA Mts., *Griffith*.

A tree; branchlets terete, with a pale yellow bark. *Leaves* 3-4 by about $1-1\frac{1}{2}$ in., shining above, obscurely dotted, with a long acumen, narrowing at the base into a short petiole, reticulate-nerved beneath; midrib prominent; primary nerves few, slender, uniting in a looping one within the margin. *Calyx-tube* $\frac{3}{8}$ in., tapering gradually to the base with nearly straight sides.—This species resembles *Jambosa glabrata* DC. but differs in the less slender and more branched peduncles; the leaves are narrower at the base and the nerves are more prominent.

29. ***E. Helferi***, *Duthie*; upper branches 4-gonous, leaves shortly petioled lanceolate or ovate-lanceolate acuminate coriaceous pellucid-dotted, nerves inconspicuous primaries numerous uniting within the margin, interspaces finely reticulate, cymes terminal and from the upper axils branched shorter than the leaves, calyx-tube clove-shaped $\frac{1}{4}$ in., lobes 4, opposite pairs equal.

MERGUI, *Helfer* (2418). SINGAPORE, *Lobb*.

Bark of upper branches and of inflorescence reddish, deciduous. *Leaves* $3\frac{1}{2}$ -4 by $1-1\frac{1}{2}$ in.; petiole about $\frac{1}{4}$ in.—Allied to *J. Teysmanni*, *Miq.* and *E. ramosissima*; from the latter it differs in having thicker leaves, the primary nerves much closer and less prominent beneath, but with a more distinctly continuous marginal one, branches of the inflorescence more erect, and flowers smaller.

30. ***E. mangifolia***, *Wall. Cat.* 3619; leaves ovate-lanceolate acuminate thick coriaceous nervation prominent on both surfaces interspaces finely reticulate, cymes axillary and terminal corymbose, flowers large numerous, calyx-tube $\frac{3}{8}$ in. dilated above, petals free. *E. reticulata*, *Wight Ill.* ii. 16; *lc.* t. 541.

ASSAM, *Griffith, G. Mann*; SILHET, *Wallich*; KHASIA Mts., alt. 3-4000 ft., *J. D. H. & T. T.*

Branchlets terete. *Leaves* 3-5 by 1-2 in., shining above; lateral nerves uniting close to the margin sometimes in two continuous ones. *Calyx* much produced above the ovary.—This differs from *E. inophylla* in the more prominent nerves of the leaves and in the shape of the calyx. *Miquel (Fl. Ind. Bat. i. pt. i. 435)* speaks of it as being closely related to *Jambosa conferta*, *Korth*.

31. ***E. inophylla***, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 496; leaves shortly petioled ovate-oblong with an acute base obtusely acuminate closely nerved dark above and shining, cymes terminal corymbose, calyx clove-shaped,

lobes 4-5 short obtuse, petals 4-5 distinct, berries pyriform. *Wight Ill.* ii. 17; *Ic. t.* 623. *Syzygium inophyllum*, *DC. Prodr.* iii. 260; *Wall. Cat.* 3600, *in part.* *Jambosa inophylla*, *Miq. Fl. Ind. Bat.* i. pt. i. 433. *Calyptranthes obtusifolia*, *Ham. in Wall. Cat.* 3600 B.

SILHET, *Wallich*; MERGUI, *Griffith*; SINGAPORE and PENANG, *Wallich*.

A tree. *Trunk* straight. Young branches terete-compressed, polished. *Leaves* upwards of $4\frac{3}{4}$ by $2\frac{1}{2}$ in., thickly coriaceous; lateral nerves rather close, spreading transversely; petiole about $\frac{1}{4}$ in. *Calyx* $\frac{1}{4}$ in.—In *Wallich's* specimens (3600) the petals appear to be calyptrate. Although resembling the clove-tree it possesses no kind of fragrance; the large pear-shaped berries are not eatable (*Roxburgh*).

SECT. II. **Syzygium.** *Flowers* small, in compact cymes. *Calyx* without a thickened staminal disk, tube turbinate rarely elongate; limb 4-5-lobed, or truncate. *Petals* usually calyptrate. *Berries* small, globose pyriform or oblong, 1-2-seeded (to p. 500).

* *Cymes* terminal and axillary, rarely from leafless axils (to p. 496).

† *Petals* usually free (to p. 488).

§ *Calyx* short, turbinate or subcylindrical.

‡ *Berries* globose or subglobose.

a. *Lateral nerves* of leaves rather distant.

32. **E. anisosepala**, *Duthie*; leaves ovate-lanceolate acuminate lateral nerves close uniting at some distance from the margin, cymes terminal corymbose, calyx-tube turbinate about $\frac{1}{3}$ in. lobes unequal, petals free or slightly combined.

MALACCA, *Griffith*, *Maingay* 753.

"A very large tree" (*Griff.*); branchlets terete, grey, polished. *Leaves* $3-3\frac{1}{2}$ by $1\frac{1}{4}-1\frac{1}{2}$ in., shining above, dark when dry. *Inflorescence*-branches sharply angled, alternately compressed upwards. Inner calyx-lobes broad and petaloid, appearing to fall early with the corolla, the two outer ones narrower and gibbous below. *Style* long, persistent.—In *Griffith's* plant the inflorescence is more branched and longer than the leaves, and the flowers are smaller ($\frac{1}{8}$ in.).

33. **E. Griffithii**, *Duthie*; leaves ovate or oblong-lanceolate narrowed at both ends coriaceous smooth and shining above, nerves impressed above prominent beneath, cymes terminal or from the upper axils, flowers 2 or 3 together at the ends of long compressed branches, calyx-lobes unequal, petals free thick edges membranous.

MALACCA, *Griffith* 2375.

Branchlets terete. *Leaves* 5-6 by $2-2\frac{1}{2}$ in., shortly petioled; lateral nerves uniting in conspicuous loops at some distance from the margin and with a fainter set near the margin, interspaces reticulate. *Calyx-tube* about $\frac{1}{4}$ in.

34. **E. Thumra**, *Roxb. Hort. Beng.* 92; *Fl. Ind.* ii. 495; leaves broadly ovate or ovate-lanceolate shortly acuminate base subacute dark and shining above reddish beneath, lateral nerves horizontal prominent on both surfaces uniting conspicuously within the margin, cymes terminal and axillary long-peduncled, flowers sessile umbellate, calyx-lobes 4 rounded, petals free, berry spherical or subpyriform. *Wight Ic. t.* 617; *Kurz in Journ. As. Soc. Beng.* vol. xlv. (1877) pt. ii. p. 67; *For. Fl.* i. 488. *Syz. speciosum*, *Wall. Cat.* 3568.

Marshy parts of PEGU forests, *Kurz*. RANGOON, *Maingay*. AMHERST and MOULMEIN, *Wallich*; TENASSERIM, *Helfer*.

Branchlets terete, compressed. *Leaves* 5-8 by $2\frac{1}{2}$ - $3\frac{1}{2}$ in., coriaceous, reticulate beneath; petiole $\frac{1}{4}$ in. Branches of *inflorescence* lax, quadrangular, many-flowered, bracteate.—A specimen in the Kew Herbarium under this name (I can find no type-specimens) is certainly Wallich's *S. speciosum*. Roxburgh's incomplete description and unfinished drawing (No. 2510) as far as they go agree fairly well with this latter. The flowers are sometimes 5-merous.

VAR. *ferruginea*, Wight Ic. t. 554 (sp.); petals 8. *E. octopetala*, *Ham.*—Mergui, *Griffith*.

35. ***E. rubens***, *Roxb. Hort. Beng.* 92; *Fl. Ind.* ii. 496; leaves shortly petioled opposite or subalternate ovate-lanceolate shortly acuminate thinly cartilaginous glossy above finely nerved, panicles terminal and axillary corymbose branches acutely angular ultimate divisions umbelliform, petals free, berry size of small cherry. *Wight. Ill.* ii. 17; *Ic.* t. 630; *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 67; *For. Fl.* i. 488. *Jambosa Wightiana*, *Blume Mus. Bot.* i. 106.

CHITTAGONG forests, *Roxburgh*. TENASSERIM from MOULMEIN to MERGUI, *Griffith, Kurz*.

Large tree; branchlets terete or subcompressed, white. *Leaves* $4\frac{1}{2}$ - $6\frac{1}{2}$ in., turning black or reddish when dried; lateral nerves slender, uniting distinctly within the margin; petiole about $\frac{1}{4}$ in.? *Panicles* on longish peduncles, but falling short of the leaves.—Closely allied to the preceding. The leaves are of a thinner texture, the stamens longer, and the sepals and petals larger (*Kurz*).

b. *Lateral nerves of leaves close.*

36. ***E. cymosa***, *Lam. Dict.* iii. 199; *not of Roxb.*; leaves ovate acuminate finely and closely nerved, cymes axillary and terminal shorter than the leaves, flowers small, calyx-tube campanulate lobes 4, petals free, berry globose size of large pea. *Wight Ill.* ii. 17; *Ic.* t. 555; *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 67; *For. Fl.* i. 486. *Syz. caudatum*, *Wall. Cat.* 3591. *S. vimineum*, *Wall. Cat.* 3593?. *S. concinnum*, *Wall. Cat.* 3582. *S. nelitricarpum*, *T. & B. in. Nat. Tydsch. Ned. Ind.* xxv. *S. cymosum*, *DC. Prodr.* iii. 259; *Korth. in Ned. Kruidk. Arch.* i. 202?. *E. nigrescens*, *Poir. Suppl.* iii. 123?. *E. rhodomelea*, *Commers. in DC. Prodr.* l.c. *Jambosa tenuiscuspis*, *Miq. Fl. Ind. Bat.* i. 431. *Myrtus cymosa*, *Spreng.*; *Blume Bijl.* 1086.

CACHAR, *Keenan*; SILHET and TAVOY, *Wallich*; BURMA, *Griffith*; MOULMEIN, *Helfer*; MALACCA, *Maingay*, *Griffith*; SINGAPORE and PULO DINDING, *Wallich, Kurz*.—DISTRIB. JAVA.

A large shrub or tree. *Leaves* 2-3 in., rounded at the base, smooth and polished above, often glaucous, with a longish slender but obtuse acumen; lateral nerves not very distinct, uniting close within the margin; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Peduncles* equalling the petioles or shorter. "*Berries* slightly depressed at the apex, purple-black when ripe" (*Maingay MS.*).—Wallich's *E. concinna*, which I refer here doubtfully, has the leaves rather longer and more oblong; the petals appear to be free though not expanding; the specimens however are too incomplete for a proper determination.

VAR. *rostrata*; leaves with a long slender acumen more prominently nerved, lateral nerves spreading out towards the margin, petiole longer, calyx nearly truncate.—The leaves which remain green after drying resemble those of *E. verecunda*. *E. rostrata*, *Bedd. MS.*—Anamallays. Perhaps a distinct species.

37. ***E. toddalioides***, *Wight Ill.* ii. 16; *Ic.* t. 542; leaves lanceolate acuminate attenuate towards the base coriaceous pellucid-punctate, cymes lateral

di-tri-chotomous each branch 1-3-flowered, calyx-limb dilated tube contracted not thicker than the pedicel, lobes 4 unequal shallow, petals free but not expanding.

SIKKIM, alt. 4000 ft., *Gamble?* MERGUI, *Griffith in Hb. Wight.*

A small tree. *Branchlets* subterete. *Leaves* 2-3 by 1-1½ in.; lateral nerves many uniting close within the margin. *Flowers* about ¼ in.—Habit of *E. Gardneri* and *E. lissophylla* but the petioles are shorter than those of the former and the inflorescence is different from both.

38. ***E. myrtifolia***, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 490; leaves elliptic-lanceolate acuminate very shortly petioled, nerves not conspicuous close interspaces finely reticulate and punctate, cymes axillary lax on longish peduncles, branches acutely angular, flowers about 3 together small, calyx-tube broadly obconical or campanulate, lobes 4 conspicuous subacute, berry globular. *Wight Ill.* ii. 15; *Ic. t.* 618; *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 67; *For. Fl.* i. 486. *Syzygium myrtifolium*, *DC. Prodr.* iii. 261; *Wall. Cat.* 3571; *Miquel Anal. Ind.* ii. 20; *Fl. Ind. Bat.* i. pt. i. 456. *C. oleina*, *Wight Ill.* ii. 15.

E. Bengal, Griffith; Pegu, McClelland; Singapore, Wallich.—DISTRIB. Sumatra, Borneo.

A shrub or small tree with 4-gonous branchlets. *Leaves* 1¾-3 by ¾-1 in., shining above, often rusty-red beneath. *Cymes* many-flowered, shorter than the leaves. *Petals* free or slightly united. *Style* persistent, exerted portion twice the length of the calyx-tube.—Affords a dark strong wood.

39. ***E. micrantha***, *Thwaites Enum.* 117 (*Syzygium*); leaves ovate or elliptic obtusely acuminate narrow at the base obscurely dotted, cymes about equal to the leaves, flowers small, calyx acutely 4-lobed, petals free, berries red round size of pea. *Bedd. Fl. Sylv. Anal. Gen.* cviii.

CEYLON, central province, alt. 3-5000 ft., *Thwaites, Gardner.*

A moderate-sized tree. *Leaves* 2-4 by ¾-2 in.; petiole ½ to nearly ⅓ in.—In *Wight's* herbarium there are specimens of this named *E. rubicunda* which it resembles in many respects.

40. ***E. acuminatissima***, *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 67; *For. Fl.* i. 487; leaves ovate-lanceolate acutely acuminate pale shining indistinctly nerved above, cymes terminal and axillary lax exceeding the leaves, flowers small, calyx broad above lobes 5, stamens short. *Myrtus acuminatissima*, *Bl. Bijdr.* 1088. *Jambosa acuminatissima*, *Hassk. in Flora* (1849) 592; *Miq. Fl. Ind. Bat.* i. 438. *Syz. altissimum*, *Wall. Cat.* 3588.

MERGUI, *Helfer*; MALACCA, *Maingay*; PENANG, *Porter.*—DISTRIB. Java.

Branchlets terete or subtetragonous. *Leaves* 3-6 by 1¼-2 in.; lateral nerves slender beneath; petiole ¼ in. *Inflorescence*-branches long, angular. *Calyx* saucer-shaped above after flowering. *Petals* only slightly united.—In *Helfer's* plant the lateral nerves unite at some distance from the margin with a second fainter one close to the edge, the inflorescence is more lax and divaricate.

†† *Berries oblong.*

41. ***E. Arnottiana***, *Wight Ill.* ii. 17; *Ic. t.* 999; leaves elliptic-oblong acuminate coriaceous closely nerved, cymes dense from the upper axils branches stout, flowers subsessile in umbels of 8-12, bracteoles long caducous, petals dis-

tinct, berries oblong. *Bedd. Fl. Sylv. Anal. Gen.* cvii. *Syzygium densiflorum*, *Wall. Cat.* 3601; *W. & A. Prodr.* i. 329.

Common on the NILGHIRI and [PULNEY HILLS, alt. 6-7000 ft., *Wight*, &c. ANAMALLAY Mts., alt. 4000 ft., *Beddome*.

A large spreading tree, trunk low; branchlets 4-gonous. *Leaves* 2-3 by 1-1½ in., obscurely dotted, the numerous nerves uniting close within the margin; petiole ½-nearly 1 in. *Flowers* cream-coloured, crimson in bud. *Fruit* dark purple.—Timber valuable (called "Nawal"); the fruit is eaten but astringent (*Beddome*).

VAR. *Benthamiana*, *Wight MSS.* (sp.); leaves almost sessile cordate-amplexicaul upper generally solitary, flowers smaller, petals apparently united.—Nilghiri Mts., *Gardner*. Perhaps distinct.

A specimen in the Kew Herbarium from the Pulney Hills (No. 254 of *Beddome's* collection) I find a difficulty in placing satisfactorily. To the above species it bears a great resemblance but for the elongate calyx-tube.

§§ *Calyx* elongate.

‡ *Flowers* axillary, racemose, calyx ½-1 in. long.

42. **E. Maingayi**, *Duthie*; leaves shortly petioled long oblong-lanceolate acuminate rounded at the base, racemes short axillary or from the leafless axils of the rugged lower branchlets, calyx-tube elongate clavate about $\frac{2}{3}$ in. glandular, lobes 4 rounded deciduous.

MALAYA, *Maingay* 750.

Older branchlets with rugged corky bark, upper stout, terete, reddish. *Leaves* 4½-7½ by 1½-2½ in., indistinctly nerved above, midrib stout beneath; petiole ½ in. *Style* short, acute.—This plant differs from the other members of the section in the rounded base of the leaves; it seems to approach nearest to *E. claviflora*, and has a general resemblance to *E. borneensis*, *Miq. Fl. Ind. Bat. i.* pt. i. 434 (*Jambosa*), but the petioles of the latter are much longer.

43. **E. claviflora**, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 488; leaves lanceolate narrowed at the base obtusely acuminate, corymbs lateral subsessile umbelliform, calyx-lobes rounded, flowers clavate, berries long ovate crowned with the cyathiform base of the calyx-limb. *Wight Ill.* ii. 15; *Ic.* t. 606; *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 65; *For. Fl.* i. 480. *Syzygium claviflorum*, *Wall. Cat.* 3575. *S. longiflorum* *Wall. Cat.* 3572. *S. excavatum*, *Wall. Cat.* 3574.

SIKKIM and KHASIA Mts., alt. 2-4000 ft., *J. D. H. & T. T.*; SILHET and CHITTAGONG, *Wallich*; PEGU, *Kurz*; NICOBAR and ANDAMAN ISLANDS, *Kurz*; TENASSERIM, *Helfer*; SINGAPORE and PENANG, *Wallich*.

A tree. *Leaves* 3-6 by about 1½ in., rather closely nerved. *Berry* about an inch long.—In Chittagong this grows to be a stout useful timber-tree of very considerable size; it flowers in March, fruits in May; fruit eaten (*Roxburgh*). *Wallich's* specimens named *S. excavatum* have very thick coriaceous leaves somewhat revolute at the margin; the berries are $\frac{3}{4}$ in. long including $\frac{1}{8}$ in. of projecting calyx-limb.

44. **E. leptantha**, *Wight Ill.* ii. 15; *Ic.* t. 528; leaves from ovate-elliptic to oblong-lanceolate obtusely acuminate narrowed into a very short petiole, cymes raceme-like arranged on the leafless axils or at the nodes of denuded branches, calyx-tube long narrow clavate, limb with broad shallow teeth or nearly truncate, berry clavate-oblong. *Benth. Fl. Austral.* iii. 283 (*Syz.*); *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 65; *For. Fl.* i. 480. *Syz. suavisimum*, *Wall. Cat.* 3573. *Syzyg. Griff. Notul.* 654.

SIKKIM, foot of hills, *J. D. H. & T. T.*; PEGU, *Kurz*; Rangoon, *Cleghorn*; MOULMEIN, *Falconer*; MERGUI, *Griffith*; AMHERST, *Wallich*; SINGAPORE and PENANG,

Wallich; ANDAMAN ISLANDS, *Helper, Kurz*.—DISTRIB. Malay Archipelago to Australia.

A moderate-sized tree. *Leaves* 4–5½ by 1½ in., pale, finely nerved. *Calyx-tube* about ½ in., finely attenuated towards the base; limb dilated and much produced beyond the ovary. *Berry* about ½ in.

45. **E. Wightiana**, *Wight Ill.* ii. 15; *Ic.* t. 529; leaves elliptic-oblong tapering at each end, peduncles axillary or in racemes on the leafless branches or shoots, calyx elongate clavate repandly 4–5-lobed, petals 12 or fewer by abortion the outer ones occasionally expanding. *E. lanceolata*, *Lam. Dict.* iii. 200; *Wight Ill.* ii. 15; *Ic.* t. 530; *DC. Prodr.* iii. 284; *Bedd. Fl. Sylv. Anal. Gen.* cx.; *W. & A. l. c. (Syz.)*; *Thwaites Enum.* 119 (*Acmena*). *Syzygium Wightianum*, *Wall. Cat.* 3577; *W. & A. Prodr.* i. 330. *Myrtus Sonneratii*, *Spreng. Syst.* ii. 485.

CONCAN, *Stocks*; NILGHIRI AND DINDYGUL MTS., Quilon, *Wight*. CEYLON, ascending to 2000 ft., *Walker, Thwaites*.

A very showy tree when in full blossom (Beddome). *Leaves* 3–5 by 1½ in., pellucid-dotted. *Flowers* nearly sessile.—This varies much in the length of the calyx-tube, and the number of flowers. Its numerous petals give it a relation similar to *E. polypetalata* in the *Jambosa* section.

‡‡ *Flowers in terminal and axillary corymbs. Calyx shorter.*

46. **E. pellucida**, *Duthie*; leaves narrowly oblong or oblanceolate rounded or subacute at the apex finely and closely nerved nerves and dots pellucid, cymes terminal and axillary, flowers crowded at the ends of the longish ascending branches, calyx-tube ½ in. slender below, lobes 4 prominent opposite pairs equal. *E. contracta*, *Wall. Cat.* 3602; *Kurz in Journ. As. Soc. Beng.* vol. xvi. pt. ii. p. 65; *For. Fl.* i. 481, not of *Poir.*

MARTABAN TO TENASSERIM, *Helper* (2406, 2407), *Kurz*.

A shrub; branchlets terete. *Leaves* 2–6 by about 1 in., chocolate-coloured above when dry, paler beneath; nerves rather prominently reticulated; petiole ¼ in. *Cymes* sometimes exceeding the leaves. *Petals* orbicular, free or slightly combined.

VAR. contracta; leaves narrower, lateral nerves directed upwards, cymes mostly axillary and falling short of the leaves. *Syz. contractum*, *Wall. Cat.* 3602; not of *Poir.* in *DC. Prodr.* iii. 259 (*Eug.*).—Attran river, *Wallich*. Mr. Kurz is of opinion that the Martaban specimens with dry blackish and less distinctly-nerved leaves may prove to be distinct, or may be a large and long-leaved variety of *E. cuneata*, *Wall.*

47. **E. zeylanica**, *Wight Ill.* ii. 15; *Ic.* i. 73; leaves ovate- or linear-lanceolate acuminate polished above hard and coriaceous indistinctly nerved densely glandular, cymes axillary and terminal usually compact many-flowered, flowers white conspicuous, calyx-tube elongate-turbinate usually glandular and pruinose, lobes 4–5 conspicuous, petals free or united in a calyptra, berry subglobose white. *Kurz in Journ. As. Soc. Beng.* vol. xvi. pt. ii. p. 65; *For. Fl.* i. 481. *E. spicata*, *Lam. Dict.* iii. 201; *DC. l. c. (Syz.)*. *Bedd. Fl. Sylv.* i. t. 202. *E. glandulifera*, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 496. *Ez. zeylanicum*, *DC. Prodr.* iii. 260; *Wall. Cat.* 3564, in part; *Dalz. & Gibs. Bomb. Fl.* 94. *S. politum*, *Wall. Cat.* 3628. *S. Belluta*, *DC. l. c.* 261. *Acmena zeylanica*, *Thwaites Enum.* 118. *A. parviflora*, *DC. l. c.* 262. *Jambosa bracteata*, *Miq. Fl. Ind. Bat.* i. pt. i. 437. *S. corticatum*, *Wall. Cat.* 3565. *Myrtus zeylanica*, *Linn. Sp. Pl.* 675.—*Rheede Hort. Mal.* v. t. 20.

WESTERN PENINSULA, from CONCAN southwards; SILHET; MALAY PENINSULA to SINGAPORE; PENANG; ANDAMAN ISLANDS, *Kurz*; CEYLON, up to 4000 ft., *Thwaites*.—DISTRIB. Sumatra, Borneo.

A large shrub or moderate-sized tree; young branches often acutely quadrangular or winged. *Leaves* 1-5 in., varying in width from $\frac{1}{2}$ -2 in., rounded or tapering at the base, giving off an aroma when bruised; petiole $\frac{1}{8}$ - $\frac{1}{2}$ in. *Flowers* in clusters of 3-5, shortly pedicelled. *Calyx* and pedicels usually rough with glands. *Petals* soon falling off. *Berry* about the size of a pea.—According to Thwaites the narrow-leaved form is the most abundant in Ceylon.

VAR. laxiflora, Bedd. l. c.; flowers in lax racemes, panicles exceeding the leaves.—In a specimen collected by Col. Beddome on the Tinnevely Hills some of the flowers have the pedicel-like calyx-tube unusually long.

48. ***E. grata***, Wall. Cat. 3586 (*Syzygium*); leaves ovate-lanceolate narrowly acuminate rounded or subcuneate at the base distinctly punctate above glaucous beneath, flowers in dense clusters terminal and axillary, calyx narrowly campanulate smooth, berries black oval or subglobose crowned with the persistent calyx-lobes. *Wight Ill.* ii. 15; *Kurz in Journ. As. Soc. Beng.* vol. xvi. pt. ii. p. 65; *For. Fl.* i. 480. *E. scabrida*, Wall. Cat. 3564 D. *Myrtus quadrangularis*, Ham.

ASSAM, Jenkins, Griffith; KHASIA MTS., Griffith; PEGU, Kurz; MOULMEIN, Wallich; MERGUI, Griffith.

A small tree. *Leaves* 3-5 by 1-2 in., sometimes almost acutely acuminate. *Calyx-tube* tapering below, pruinose, usually quite smooth or longitudinally ribbed when dried. *Berry* about $\frac{1}{4}$ in. long.—The flowers are rather larger than those of *E. zeylanica*, to which it is closely allied.

49. ***E. linearis***, Wall. Cat. 3596 (*Syzygium*); leaves linear-lanceolate acuminate subfalcate indistinctly nerved above, flowers crowded at the ends of the branchlets, calyx campanulate pruinose limb 4-partite, petals free, berry size of a pea crowned with the persistent calyx-lobes.

INDIA? *Herb. Wallich* (without locality).

Leaves 2-3 by $\frac{1}{2}$ - $\frac{3}{4}$ in., conspicuously dotted above; lateral nerves distant, uniting within the margin; petiole about $\frac{1}{4}$ in. *Flowers* larger than those of *E. zeylanica*; pedicels equal in length to the calyx-tube. *Style* nearly twice as long as calyx-tube.—A specimen of this in Rottler's Herbarium is named *Myrtus ruscifolia*, Willd., and is said to come from India.

50. ***E. penangiana***, Duthie; leaves thick elliptic-obovate obtusely acuminate attenuate at the base nerves close indistinct on both surfaces, cymes short crowded towards the ends of year-old branches, calyx-tube narrowly clavate or subcylindrical nearly $\frac{1}{2}$ in. much produced lobes 4 small, petals free.

PENANG, Government Hill, Maingay, 744.

Branchlets terete. *Leaves* $2\frac{1}{2}$ - $2\frac{3}{4}$ by about 1 in., brownish-yellow when dried.—Allied to *E. chlorantha*, and No. 1567 of Beccari's Borneo plants.

A specimen at Kew, collected by Helfer (no locality given), comes near to this. The calyx-tube is rather longer and more spreading above after flowering; the leaves are of thinner texture, and more conspicuously nerved.

51. ***E. skiofila***, Duthie; leaves elliptic-lanceolate with a slender obtuse acumen narrowed at the base subcoriaceous pellucid-punctate, calyx-lobes 4 incurved, petals small free spreading distant, berry red size of a pea.

PENANG, Government Hill, Maingay, in deep shaded ravines.

A small tree, 15 ft. *Branchlets* terete. *Leaves* shortly petioled, $4\frac{1}{2}$ -6 by $1\frac{1}{2}$ -2 in.; midrib rounded beneath; lateral nerves close, inconspicuous above, spreading at right angles and uniting close within the margin. *Calyx-tube* $\frac{1}{2}$ in. *Stamens* short.

52. **E. chlorantha**, *Duthie*; leaves ovate acuminate thick opaque shining nerves numerous close, cymes in short racemes from the upper axils or terminating previous year's shoots, calyx-tube $\frac{1}{4}$ in. cylindrical below, petals free greenish, berry globose about $\frac{1}{2}$ in. crowned with 4 rounded unequal calyx-lobes. *Syz. rigidum*, *Wall. Cat.* 3581; *not of DC. (Eug.)*.

MALACCA, *Griffith, Maingay*, 733; SINGAPORE, *Wallich*.—DISTRIB. Malay Islands.

"A very elegant tree when in flower" (*Maingay-MS.*). *Branchlets* terete. *Leaves* $2\frac{1}{2}$ – $5\frac{1}{2}$ by $1\frac{1}{4}$ –3 in.; midrib impressed above, prominent beneath; primary nerves slender prominent, on both surfaces, uniting in loops within the margin, interspaces finely reticulate. *Calyx-tube* furrowed below. *Petals* $\frac{1}{5}$ in., reflexed. *Filaments* bright red.

53. **E. lineata**, *Blume Bijl.* 1087 (*Myrtus*); *Mus. Bot.* i. 116 (*Clavi-myrtus*); leaves lanceolate-oblong or nearly elliptic obtusely acuminate narrow at the base, cymes axillary and terminal shorter than the leaves, calyx-tube clavate lobes 4, petals free, berry size of large pea crowned with the constricted calyx-limb. *E. corymbosa*, *Wall. Cat.* 3566 F. *Jambosa lineata*, *DC. Prodr.* iii. 287; *Miq. Fl. Ind. Bat.* i. pt. i. 428.

MALACCA, *Maingay* (720), *Griffith* (2390 in part); PENANG, *Jack*.—DISTRIB. Java, Borneo, Sumatra.

A shrub or small tree. *Branchlets* terete. *Leaves* 2– $3\frac{1}{2}$ by 1–2 in., coriaceous, shining above, finely nerved. Extreme branches of inflorescence 3-fl. *Calyx-tube* about $\frac{1}{4}$ in.; lobes about equal, persistent. *Petals* shortly clawed, suborbicular, twice the calyx-lobes.

54. **E. rubricaulis**, *Miq. Fl. Ind. Bat.* i. pt. i. 432 (*Jambosa*); leaves elliptic from an acute base long and obtusely acuminate shining above, smaller nerves and dots pellucid, cymes axillary and terminal, calyx-tube $\frac{1}{4}$ in. obovate-cylindrical, lobes 4, petals free.

TENASSERIM, *Helper*; MALACCA, *Griffith*.—DISTRIB. Java.

Branchlets subterete, reddish. *Leaves* 2–3 by $\frac{3}{4}$ – $\frac{5}{8}$ in., stiffly cartilaginous; midrib prominent beneath, tinged with red; lateral nerves close, distinct beneath, interspaces subreticulate; petiole $\frac{1}{12}$ – $\frac{1}{8}$ in., channelled above. *Flowers* nearly sessile. *Calyx-lobes* ovate, rounded, scarious at the edges. *Anthers* cordate-apiculate.

55. **E. pyrifolia**, *Wall. Cat.* 3584 (*Syzygium*) *not of Desv.*; leaves ovate or oblong-lanceolate with a long obtuse acumen coriaceous dark and shining above, corymbs terminal trichotomous long-peduncled, calyx-tube about $\frac{1}{4}$ in. gradually tapering to the base lobes 4 shallow, petals united, berry oblong. *Syzygium pyrifolium*, *DC. Prodr.* iii. 261 (*Syzyg.*); *Korth. in Ned. Kruidk.* i. 204; *Miq. Fl. Ind. Bat.* i. pt. i. 457. *Calyptranthes pyrifolia*, *Blume Bijl.* 1090.

SINGAPORE, *Wallich*.—DISTRIB. Java.

A tree. *Leaves* $1\frac{1}{2}$ –3 by $\frac{3}{4}$ –2 in.; acumen sometimes $\frac{1}{2}$ in. long; lateral nerves close, conspicuous; petiole about $\frac{1}{4}$ in. *Flowers* sessile, in threes.—*Syz. punctulatum*, *Wall. Cat.* 3583, with less acuminate dull-coloured leaves, nerves less distinct, and more elongate fruit, may perhaps belong here; there are no flowers with the specimens.

56. **E. tumida**, *Duthie*; leaves oblong-ovate or obovate shortly acuminate narrowed at the base closely nerved, cymes terminal and axillary equalling or exceeding the leaves, calyx-tube $\frac{3}{10}$ in. narrow swollen below the middle.

MALACCA, *Maingay*, 755.

Branchlets terete. *Leaves* $2\frac{1}{2}$ – $3\frac{1}{2}$ in., chocolate-coloured above, rusty-yellow

beneath when dried; lateral nerves slender, uniting close within the margin; petiole $\frac{1}{4}$ in. *Panicles* lax, spreading; branches acutely angular. *Calyx* with 4 nearly equal shallow lobes.—The *petals* are probably free, though not expanding. The swollen part of the calyx-tube is occupied by the ovary.

†† *Petals usually united and falling in one piece* (to p. 496).

§ *Cymes terminating the young shoots* (to p. 495).

‡ *Leaves broad, oblong or lanceolate* (to p. 494).

|| *Branchlets 4-gonous*.

57. **E. montana**, *Wight Ic. t.* 1060; young shoots acutely 4-angled, leaves petioled coriaceous lanceolate with a short obtuse acumen to obovate or orbicular obtuse, cymes terminal very numerous corymbose many-flowered branches often leafy, flowers small sessile or subsessile, fruit globose size of a currant. *Bedd. Fl. Sylv. Anal. Gen. cvii.*

NILGHIRI Mts., *Wight, Gardner, Schmidt.*

A very large tree; branchlets winged at the angles. *Leaves* occasionally alternate or subalternate, 5–6 by $2\frac{1}{4}$ in., smooth and shining above; primary nerves prominent beneath, becoming less distinct towards their union within the margin; midrib stout, channelled above; petiole $\frac{1}{4}$ –nearly $\frac{1}{2}$ in. *Peduncles* angled, often very flat and broad. *Flowers* in threes at the apex of each extreme division. *Calyx* obtusely 4-lobed. *Petals* calyptrate. *Fruit* purple, crowned with the calyx.—The wood is used for building purposes, &c.

58. **E. bracteolata**, *Wight Ill. ii.* 15; *Ic. t.* 531; young branches 4-gonous angles subacute, leaves short-petioled elliptic-lanceolate or oblanceolate acute or slightly acuminate at both ends pellucid-dotted, cymes terminal and from the upper axils shorter or not much longer than the leaves, the extreme divisions terminating in a cluster of 6–9 sessile flowers, each division and each flower with 2 small acute bracteoles, calyx-tube conical 4-gonous, limb repandly 4-lobed. *Kurz in Journ. As. Soc. Beng. vol. xlv. pt. ii. p.* 66; *For. Fl. i.* 482.

TENASSERIM, *Griffith, Helfer*; MERGUI, *Griffith*; MALACCA, *Maingay*.

A shrub or small tree. *Leaves* $4\frac{1}{2}$ –7 by $1\frac{1}{2}$ – $2\frac{1}{2}$ in.; midrib rather prominent beneath, primary nerves slender and uniting close within the margin, coriaceous, more or less polished above, dots not conspicuous; petiole about $\frac{1}{2}$ in. Branches of inflorescence with acute angles. *Flowers* conspicuous, white according to Maingay.

59. **E. lissophylla**, *Thwaites Enum.* 117 (*Syzygium*); leaves ovate-lanceolate acuminate quite smooth faintly nerved beneath pellucid-punctate, cymes very often longer than the leaves, calyx-teeth short rounded, berry round size of a pea. *Bedd. Fl. Sylv. Anal. Gen. cviii.*

CONCAN, *Stocks*; NILGHIRI Mts., *Herb. G. Thomson*; CEYLON; forests in the Central Provinces, alt. 3–5000 ft., *Thwaites*.

A moderate-sized tree. *Branchlets* quadrangular. *Leaves* $1\frac{1}{2}$ –3 by $\frac{1}{2}$ to about 1 in.; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in.—This plant much resembles *E. Gardneri*, but can be distinguished by its 4-sided branchlets, narrower leaves and shorter petioles.

60. **E. venusta**, *Roxb. Hort. Beng.* 37; *Fl. Ind. ii.* 491; arboreous with numerous drooping branchlets, leaves shortly petioled oblong or broadly lanceolate obtusely acuminate, panicles axillary rarely terminal shorter than the leaves brachiate ultimate divisions 3-flowered, flowers myrtle-like, calyx 4-toothed, petals 4 orbicular reddish. *Wight Ic. t.* 625; *Kurz in Journ. As. Soc. Beng. vol. xlv. pt. ii. p.* 67; *For. Fl. i.* 487.

TIPPERAH HILLS, *Roxburgh*; PEGU, *Kurz*.

Bark dark brown, smooth. *Ovary* 2-celled.—Wight's figure is copied from *Roxburgh's* (*l.c.* t. 1560) with the addition of a terminal panicle. *Miquel* (*Fl. Ind. Bat. i. pt. i.* 456) compares it with *Syz. Kalahiense*, *Korth*, but the leaves of the latter are smaller and of a different shape. In *Kurz's* specimens the branchlets have white bark.

61. **E. Gardneri**, *Thwaites Enum.* 117 (*Syzygium*); leaves pale green ovate-lanceolate rostrate-acuminate faintly parallel-nerved beneath pellucid-punctate, cymes axillary and terminal shorter than the leaves, calyx obscurely 4-toothed, berry spherical size of a small cherry.

ANAMALLAY and TINNEVELLY GHATS, up to 4000 ft. alt., *Beddome*; CEYLON, Central Provinces, alt. 2–4000 ft. alt., *Thwaites*.

A moderate-sized tree; branchlets terete or subtetragonous. *Leaves* $2\frac{1}{2}$ –4 by 1–1 $\frac{1}{2}$ in.; petiole slender, about $\frac{1}{2}$ in. *Flowers* small. *Petals* cohering and falling together.—Very close to *E. venusta*, *Roxb.*, with which *Mr. Kurz* unites it; the marginal nerves are further from the edge, and the panicles are mostly terminal and more compact.

62. **E. subavenis**, *Duthie*; leaves ovate shortly and obtusely acuminate or retuse narrowed towards the base quite smooth on both surfaces nearly nerveless, cymes longer than the leaves. *E. umbrosa*, *Thwaites Enum.* 118 (*Syz.*), not of *Berg*; *Bedd. Fl. Sylv. Anal. Gen.* cviii.

CEYLON; open grassy places in the Central Provinces, alt. 5–6000 ft., *Thwaites*.

A moderate-sized tree, very much branched; ultimate branches 4-angled. *Leaves* 1–2 in. by $\frac{1}{2}$ –nearly an inch in width; petiole about $\frac{1}{8}$ in.—This differs from *E. lissophylla* in the shape and nervation of the leaves; the inflorescence is similar in both (*Thwaites*).

63. **E. valdevenosa**, *Duthie*; leaves large elliptic acuminate petioled, midrib very prominent beneath, lateral nerves uniting to form a conspicuous marginal one interspaces finely and sharply reticulate, cymes terminal lax, calyx-tube gradually tapering to the base quadrangular lobes shallow, berry globose size of a small cherry crowned with the slightly projecting calyx-limb. *E. elliptica*, *Wall.* 3587 (*Syz.*); not of *Lam.* nor *Smith*.

PENANG, *Wallich*; MALACCA, *Maingay* (723 & 762).

A tree, about 15 ft. high (*Maingay*); branchlets tetragonous. *Leaves* 8–13 by 3–4 $\frac{3}{4}$ in.; primary nerves $\frac{1}{3}$ – $\frac{1}{2}$ in. apart; marginal nerves double; petiole $\frac{1}{4}$ in. or more. Branches of inflorescence angled and winged. *Calyx-tube* about $\frac{1}{2}$ in. *Petals* falling together. *Style* persistent.

64. **E. scoparia**, *Wall. Cat.* 3594 (*Syzygium*); branchlets virgate 4-gonous leaves shortly petioled ascending elliptic-lanceolate acuminate minutely and densely glandular lateral nerves inconspicuous, cymes ascending lax few-flowered, flowers small, calyx squarrose very shortly 4-lobed, corolla calyprate, stamens short, fruit small spherical.

SINGAPORE, *Wallich*.

Leaves $2\frac{1}{2}$ –2 $\frac{3}{4}$ by $\frac{3}{4}$ –1 in., reddish-brown above and yellowish beneath when dried, margins slightly revolute; petiole $\frac{1}{4}$ in. *Berry* crowned with the remains of the calyx-limb, wrinkled in drying. *Style* short, persistent in the pit formed by the produced calyx-limb.—Resembles *Syzygium avene*, *Miq. Fl. Ind. Bat. Suppl. i.* 312, and perhaps not specifically distinct.

||| *Branchlets terete.*

¶ *Calyx-limb almost trunca.*

a. *Calyx-tube shortly turbinate.*

65. **E. crenulata**, *Duthie*; leaves broadly ovate-oblong or suborbicular very thick and coriaceous shortly obtusely acuminate crenulate, nerves close prominent on both surfaces, cymes terminal corymbose main branches long, calyx-limb truncate, petals united in a thick calyptra.

MALACCA, *Maingay*, 739.

Branchlets terete. *Leaves* $4\frac{1}{2}$ –6 by 3–4 in., dull, black-dotted; midrib stout; lateral nerves uniting close within the margin, interspaces reticulated. *Cymes* exceeding half the length of the leaves. *Bracts* small at the base of the flowers and at the joints of the inflorescence-branches. *Calyx-tube* about $\frac{1}{4}$ in., turbinate, much produced above the ovary.—The foliage very much resembles that of *E. grandis*.

66. **E. venulosa**, *Wall. Cat.* 3585 (*Syzygium*); leaves ovate or broadly obovate obtuse or shortly acuminate attenuated below into a short petiole very coriaceous polished above, nerves slender but prominent on both surfaces, flowers in terminal corymbs, branches lax spreading exceeding the leaves, calyx-tube obconical $\frac{1}{3}$ – $\frac{1}{2}$ in. limb nearly entire, corolla calyptrate, fruit subspherical crowned with the circular rim of the calyx-limb.

MALACCA, *Wallich, Maingay* 741, &c.; SINGAPORE, *Wallich, Walker*.

Bark grey; *branchlets* terete. *Leaves* $1\frac{1}{2}$ –3 by 1–2 in.; primary nerves uniting close within the margin, interspaces reticulate, dots inconspicuous; petiole about $\frac{1}{2}$ in. Main branches of *inflorescence* 1–2 in. *Berry* about $\frac{1}{2}$ in. in diam., longitudinally furrowed.—In *Maingay's* plant, which I would refer here, the corolla is rather more exserted in bud.

67. **E. caryophyllæa**, *Wight Ill.* ii. 15; *Ic. t.* 540; leaves shortly petioled obovate spatulate rarely ovate-lanceolate obtuse or with a short blunt acumen attenuated to the base, cymes terminal corymbose laxly trichotomous, flowers small about $\frac{1}{10}$ in., fruit globose size of a pea. *Bedd. Fl. Sylv. Anal. Gen.* cviii. *Eugenia corymbosa*, *Lam. Dict.* iii. 199; *DC. Prodr.* iii. 284. *Syzygium caryophyllæum*, *Gaertn. Fruct.* i. 166, t. 33; *DC. Prodr.* iii. 260; *Wall. Cat.* 3563; *W. & A. Prodr.* i. 329; *Miq. Anal. Ind.* i. 25; *Fl. Ind. Bat.* i. pt. i. 454; *Thwaites Enum.* 117. *Calyptranthes caryophyllata*, *Pers. Ench.* 4. *Myrtus caryophyllata*, *Linn.—Rheede Hort. Mal.* v. t. 27.

S. CANARA, *Law*; TRAVANCORE, *Wight*; CONCAN, *Stocks*; NILGHIRI Mts., *Kurz, G. Thomson*; CEYLON up to 3000 ft. alt., *Walker, Thwaites*.—DISTRIB. Borneo.

A large shrub, or middling-sized tree; *branchlets* terete. *Leaves* 3–4 by about $1\frac{1}{2}$ in., subcoriaceous, dark above (when dried), rusty-red beneath, inconspicuously dotted. *Calyx* shortly turbinate, lobes 4 shallow.—A distinct species though varying considerably in the foliage. The fruit is eaten.

68. **E. frondosa**, *Wall. MS.*; leaves ovate-lanceolate with a long obtuse acumen cuneate at the base polished above lateral nerves slender prominent on both surfaces, cymes axillary and terminal shorter than the leaves, calyx-tube about $\frac{1}{2}$ in. narrow below suddenly enlarging above lobes very shallow, petals united. *Syz. venosum*, *DC. Prodr.* iii. 260; *Mém. Myrt.* t. 17; *Wall. Cat.* 3590.

NIPAL, *Wallich*.

Branchlets terete. • *Leaves* 3–4 by about $1\frac{1}{2}$ in., subcoriaceous; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in.—Habit of *E. mangifolia* but smaller in all its parts.

69. **E. areolata**, *DC. Prodr.* iii. 260 (*Syzygium*); *Mém. Myrt.* t. 18; leaves elliptic cuneate at the base acuminate subcoriaceous nerves reticulate marginal double, peduncles paniculate axillary and terminal 2 or 3 times shorter than the leaves, buds globose, calyx quite entire, corolla calyptrate.

NIPAL, Wallich.

Very nearly related to *E. frondosa*.—There are specimens in the Kew Herbarium, probably belonging to this species, fastened down on the same sheet with it, in which the leaves have dried of a fresher tint, and the difference in the nervation is considerable; the flowers also are rather larger.

b. *Calyx-tube slender and tapering.*

70. **E. khasiana**, Duthie; leaves narrowly lanceolate acuminate at both ends nerves and dots pellucid, cymes from the upper axils or terminal lax, flower-buds pyriform $\frac{1}{8}$ in., limb of calyx truncate.

* KHASIA MTS., Griffith, J. D. H. & T. T.

Branchlets terete. *Leaves* 3-4 by 1 in., smooth and shining above, finely reticulate between the lateral nerves which unite close within the margin; petiole $\frac{1}{8}$ in. *Inflorescence*-branches long and slender, acutely quadrangular. *Calyx* spreading above after flowering.

71. **E. oblongifolia**, Duthie; leaves oblong acuminate narrowed towards the base nerves rather close slender but prominent on both surfaces, cymes terminal corymbose much branched shorter than the leaves, calyx-tube $\frac{1}{4}$ in. or less gradually tapering to the base limb truncate, petals calyptrate.

MALACCA, Maingay (746).

Branchlets terete or subtetragonous; bark greyish. *Leaves* 3-4 $\frac{1}{2}$ by 1 $\frac{1}{4}$ -1 $\frac{3}{4}$ in., shining a little above, lateral nerves uniting close within the margin, interspaces reticulate. *Inflorescence*-branches sharply 4-angular, compressed towards the nodes. *Filaments* slender; anthers small.

72. **E. expansa**, Wall. Cat. 3567 (*Syzygium*); leaves shortly petioled ovate or oblong-lanceolate obtusely acuminate subcoriaceous, cymes axillary or terminating previous year's shoots, flowers small crowded at the ends of the long peduncles, calyx nearly truncate.

PENANG, Wallich.

Young branches subterete, compressed at the nodes. *Leaves* 3-6 by 1 $\frac{1}{2}$ -2 in., polished a little above; lateral nerves slender, raised on both surfaces, uniting within the margin, interspaces reticulate; petiole $\frac{1}{2}$ in. *Calyx-tube* $\frac{1}{2}$ in., gradually tapering to the base. *Fruit* not seen.

¶¶ *Calyx-limb 4-5-lobed.*

73. **E. cordifolia**, Wight Ill. ii. 16; Ic. t. 544; leaves sessile cordate amplexicaul ovate or ovate-lanceolate obtuse or obtusely acuminate, cymes corymbose terminal and axillary much shorter than the leaves, berry nearly round crowned with the cup-like calyx-limb. *E. androsæmoides*, Bedd. Fl. Sylv. Anal. Gen. cvii.; not of DC. *Syzygium cordifolium*, Thwaites Enum. Pl. Zeyl. 116. *Calyptanthus cordifolia*, Moon Cat.

CEYLON; Ambagamowa and Ratnapoora districts, up to 3000 ft., Thwaites.

A very large handsome tree; branchlets terete. *Leaves* 6-8 by about 3 in., often larger, thick and coriaceous, polished above; midrib stout and prominent beneath; lateral nerves usually not very distinct, sometimes forming double loopings within the margin. *Calyx-tube* about $\frac{1}{2}$ in.; lobes 4. *Petals* calyptrate. *Berries* subglobose, about an inch in diameter.—*E. androsæmoides* of Wight's Herb. is *E. obovata*, Wall.

74. **E. subdecussata**, Wall. Cat. 3589 (*Syzygium*); leaves ovate or very shortly petioled oblong-lanceolate cordate at the base subacute thick and

coriaceous midrib keeled beneath lateral nerves indistinct, cymes terminal corymbose branches stout angled compressed and flattened upwards, flowers crowded, calyx-tube shortly obconic obscurely 5-lobed, petals calyptrate.

SINGAPORE, in very dense woods, *Wallich*; Government Hill, PENANG, *Maingay*, 740.

A tree, about 15 ft. high (*Maingay*). *Branchlets* terete-compressed. *Leaves* $2\frac{1}{2}$ –4 by $1-1\frac{3}{4}$ in., smooth and polished above; lateral nerves slender beneath, uniting close to the margin, interspaces laxly reticulate. *Flowers* red and white (*Maingay*). *Calyx-tube* about $\frac{1}{8}$ in., squarrose. *Bracts* triangular. *Fruit* size of a small cherry.

75. **E. colorata**, *Duthie*; leaves very shortly petioled elliptic or oblong-obovate rounded or subcordate at the base rather acutely acuminate very thick and coriaceous, cymes terminal, branches stout alternately compressed shorter than the leaves, flowers crowded in compact corymbs, petals united, calyx about $\frac{1}{3}$ in. with 5 shallow lobes.

MALACCA, *Maingay*, 749.

Branchlets terete, reddish-brown. *Leaves* $4-5\frac{1}{2}$ by $1\frac{1}{2}$ to $2\frac{1}{4}$ in.; midrib angled beneath, tinged with red; nerves indistinct above, slender beneath, uniting close within the margin, interspaces reticulate.

76. **E. revoluta**, *Wight Ill.* ii. 17; *Ic. t.* 534; leaves lanceolate with a small obtuse point to ovate or broadly obovate and obtuse coriaceous margins often revolute, cymes terminal longish peduncled, flowers sessile congested at the ends of the branchlets, fruit spherical reddish size of a small cherry. *Bedd. Fl. Sylv. Anal. Gen.* cvii.; *not of Berg.* *Syzygium revolutum*, *Thwaites Enum.* 117.

NILGHIRI MTS., *Hb. Hohenacker*. CEYLON, in the Central Provinces, alt. 3–6000 ft. (Adam's Peak), *Walker*, *Thwaites*, &c.

A moderate-sized tree; branchlets terete or obscurely 4-gonous. *Leaves* shortly petioled, variable in size, polished above, dull and glaucous beneath. *Calyx* 4–5-toothed. *Petals* free, or cohering and falling off as a lid.—The Nilghiri specimens have the leaves smoother above and more conspicuously dotted, the nervation is not so prominent beneath. There is a small-leaved form of this in Wight's Herbarium collected in Ceylon by Col. Walker, and called *var. parvifolia*; the leaves are about 1 by $\frac{1}{2}$ in.

77. **E. oblata**, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 493; leaves oblong or broadly lanceolate acuminate finely nerved, panicles terminal and axillary shorter than the leaves, petals united in a calyptra, berries round or transversely oval size of a cherry. *Wight Ill.* ii. 15; *Ic. t.* 622; *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 67; *For. Fl.* i. 488. *S. oblatum*, *Wall. Cat.* 3569. *S. pulchellum*, *Wall. Cat.* 3566 *in part.* *Jambosa pulchella*, *Miq. Fl. Ind. Bat.* i. pt. i. 422. *E. comosa*, *Wall. Cat.* 3566 D; *l. c.* 3600 C (*under E. inophylla*).

ASSAM, *Jenkins*; KHASIA MTS., SILHET, CHITTAGONG, PEGU, and MARTABAN to TENASSERIM; PENANG and SINGAPORE, *Wallich*.—DISTRIB. Yunnan.

A tree; branchlets terete, reddish-brown. *Leaves* 3–4 in., often with a long slender point, shining above, turning dark when dried; petiole $\frac{1}{4}$ – $\frac{3}{8}$ in. *Cymes* trichotomous, on long peduncles. *Flowers* rather large, sessile. *Calyx-tube* about $\frac{1}{4}$ in., gradually tapering to the base; lobes 4 or 5, unequal, persistent. *Stamens* numerous, long; anthers with an apiculate connective.

78. **E. lævicaulis**, *Duthie*; leaves ovate-lanceolate acuminate nerves close uniting very near the edge, cymes terminal and axillary short contracted branches ascending, calyx-tube about $\frac{1}{3}$ in. turbinate lobes 5, fruit roundish or flattened at both ends size of a cherry.

MALACCA, Maingay, 753-2.

Branchlets terete, polished. Leaves 3-4 by $1-1\frac{1}{2}$ in., chocolate-coloured and shining above, rusty-red beneath when dry; petiole $\frac{1}{4}$ in. Calyx-lobes distant. Style long, persistent.—Allied to *E. oblata*, but with smoother branchlets and narrower more contracted inflorescence.

79. *E. sylvestris*, Moon in Wight Ill. ii. 15; Ic. t. 532; leaves glabrous from lanceolate with an obtuse point to obovate or spatulate obtuse coriaceous, cymes corymbose crowded terminal or from the extreme axils on long peduncles, flowers small, calyx $\frac{1}{10}$ in., fruit spherical black-purple. Bedd. Fl. Sylv. Anal. Gen. cvii. Syzygium sylvestre, Thwaites Enum. 116. Calyptanthus Jambolana, Moon Cat. p. 39.

CEYLON; common up to an elevation of 3000 ft., Walker, Thwaites.

A very large tree; branchlets terete. Leaves about 4 by $1\frac{1}{2}-2\frac{1}{2}$ in., shining above, rusty-coloured beneath, and minutely and densely punctate, closely nerved, the lateral nerves horizontal and uniting close within the margin, margins somewhat revolute; petiole $\frac{1}{2}-\frac{3}{4}$ in.—In Wight's figure the leaves are drawn too acute.

80. *E. assimilis*, Thwaites Enum. 116 (Syzygium); leaves petioled ovate-lanceolate or obovate more or less abruptly acuminate narrow at the base rarely rounded, cymes crowded at the ends of the branchlets half as long as the leaves, berries spherical. Bedd. Fl. Sylv. Anal. Gen. cvii.

CEYLON; up to alt. 5000 ft., Thwaites.

A moderate-sized tree. Leaves 2-5 by $1\frac{1}{4}-2$ in.; petiole $\frac{1}{8}$ —nearly $\frac{1}{2}$ in. Peduncles obtusely 4-sided. Flowers rather large, about $\frac{1}{2}$ in. in diam. Petals falling in one piece.—Differs from *E. Arnottiana* in the larger leaves and flowers, the united petals, and in the shape of the fruit; the nervation of the leaves is less close, and the marginal nerve is more distant from the edge.—A variety of this with larger leaves and flowers is also found in Ceylon.

81. *E. Neesiana*, Wight Ill. ii. 15; Ic. t. 533; leaves nearly sessile oblong-lanceolate obtusely acuminate subcoriaceous pellucid-punctate, cymes terminal and from the upper axils laxly corymbose, berry subglobose. Bedd. Fl. Sylv. Anal. Gen. cvii. Syzygium Neesianum, Arn. in Act. Acad. Nat. Cur. xviii. 355 (1836); Thwaites Enum. 117. Calyptanthus cordifolia, Moon Cat.

CEYLON; up to 3000 ft. alt., Thwaites, Gardner.

A good-sized tree. Branchlets terete. Leaves 3-4 by $1-1\frac{1}{2}$ in. Pedicels half the length of the shortly turbinate calyx. Flowers small. Petals free or falling in one piece. Berry $\frac{5}{8}$ in., crowned with the circular calyx-throat and the incurved acute lobes.

82. *E. microcalyx*, Duthie; leaves nearly sessile ovate or elliptic-obovate obtuse or shortly acuminate polished above nerves faintly impressed above prominent beneath, cymes terminal and axillary often exceeding the leaves, bracts small acute persistent, flowers very small, calyx-tube short subcylindrical $\frac{1}{10}$ in. or less lobes 4 distant subacute nearly equal, petals united.

MALACCA, Griffith, Maingay, 727 & 731.—DISTRIB. Bornéo?

Branchlets subterete. Leaves 2-4 $\frac{1}{2}$ by $1\frac{1}{4}-2\frac{1}{4}$ in., dark above when dried, reddish beneath; lateral nerves uniting some way within the margin. Bracts often in threes.—In Maingay's No. 727 the leaves are less distinctly nerved, the lateral nerves faintly unite close within the margin, and the flowers are rather smaller. No. 335† of Beccari's Borneo may perhaps be referred to this species. Habit of *E. olivifolia*.

†† *Leaves suborbicular.*

83. ***E. cyclophylla***, *Thwaites MSS. (Syzygium)*; leaves shortly petioled or nearly sessile broadly ovate to nearly orbicular very thick and coriaceous margins revolute, cymes terminal not exceeding the leaves, branches stout 4-gonous, berries nearly spherical crowned with the remains of the 4-fid calyx-limb.

CEYLON; Adam's Peak, *Thwaites* (C.P. 3915).

Leaves 2½–3 in. by 2 in., margins broadly and irregularly recurved in the dried specimens, black-dotted above, not glaucous beneath; midrib very stout; marginal nervation double. *Berry* about the size of a pea.—This differs from *E. revoluta* in the rounder more coriaceous leaves, shorter petioles, and the stouter inflorescence branches.

84. ***E. sclerophylla***, *Thwaites Enum.* 118 (*Syzygium*); leaves small sessile very coriaceous obovate or nearly round cordate at the base glabrous above nerved beneath, midrib thickened towards the base, cymes about equal to the leaves, berries spherical size of a small cherry.

CEYLON; Central Provinces, alt. 6–8000 ft., Adam's Peak, *Thwaites*.

A moderate-sized tree; branchlets 4-gonous. *Leaves* ½–1 in. dull. *Berries* crowned with the cup-shaped calyx-limb, turning black.

85. ***E. rotundifolia***, *Wight Ill.* ii. 17; leaves shortly petioled orbicular obtuse or obscurely acuminate subcordate at the base or attenuated coriaceous glossy and nerveless above, cymes terminal sessile few-flowered, berry spherical size of a small cherry. *Bedd. Fl. Sylv. Anal. Gen.* cviii. *Syz. rotundifolium*, *Arn. in Act. Acad. Nat. Cur.* xviii. 335; *Thwaites Enum.* 118.

CEYLON; Central Provinces, alt. 6–8000 ft., *Gardner, Thwaites*.

A small tree or shrub; young branches 4-gonous. *Leaves* ½–¾ in. long, nerved beneath, margins revolute. *Calyx* obovate, shortly 5-toothed. *Berries* red turning to black.—Closely allied to the preceding species, differing chiefly by its petioled glossy leaves.

86. ***E. calophyllifolia***, *Wight Ill.* ii. 17; *Ic.* t. 1000; leaves shortly petioled obtuse ovate obovate or orbicular very coriaceous, cymes terminal corymbose short-peduncled many-flowered, fruit ovoid or oblong. *Bedd. Fl. Sylv. Anal. Gen.* cvii. *Syz. calophyllifolium*, *Thwaites Enum.* 118.

NILGHIRI, *Wight, Adam, Gardner*; Sisparah, *Wight*. CEYLON, Adam's Peak, alt. 6–7000 ft., *Thwaites*.

A large spreading tree with a fine umbrageous head; young branches 4-gonous. *Leaves* glabrous, about 1 by ¾ in., reticulated beneath when dry, not dotted. *Calyx* repandly 4-toothed. *Petals* orbicular, falling together in one piece. *Fruit* succulent dark purple, edible.

87. ***E. oligantha***, *Thwaites Enum.* 118 (*Syzygium*); leaves small ovate obtusely and shortly acuminate or retuse narrowed towards the base faintly nerved dotted, heads terminal few-flowered shortly peduncled. *Bedd. Fl. Sylv. Anal. Gen.* cviii.

CEYLON; Ambagamowa district, alt. 3–5000 ft., *Thwaites*.

A small tree; upper branches 4-gonous, angles winged. *Leaves* ½–nearly 1 in. by ¼–½ in., shortly petioled. *Bracts* equal to about half the calyx-tube. *Calyx-tube* campanulate, much produced; lobes 4, rather conspicuous. *Berries* spherical, red turning black, size of a pea.

††† *Leaves narrow.*

88. **E. olivifolia**, *Duthie*; leaves small shortly petioled spathulate obovate or lanceolate obtuse shining above dull beneath and densely glandular, lateral nerves few directed upwards, cymes about equal to or shorter than the leaves, flowers small shortly pedicelled. *S. spathulatum*, *Thwaites Enum.* 118; *not of Berg (Eug.)*; *Bedd. Fl. Sylv. Anal. Gen.* cviii.

CEYLON, alt. 3–5000 ft., *Thwaites*.

A small tree. *Leaves* 1–1 $\frac{3}{4}$ by $\frac{1}{2}$ – $\frac{3}{4}$ in. *Berries* spherical, red turning to black, size of a pea.—This plant differs from *E. rubicunda* in the direction of the lateral nerves, and in the shape of the calyx-tube, which becomes more suddenly narrowed towards the base.

89. **E. rubicunda**, *Wight Ill.* ii. 15; *Ic. t.* 538; leaves shortly petioled narrow oblong attenuated at both ends obtuse coriaceous pellucid-punctate, primary nerves close, cymes terminal corymbose longer than the leaves, flowers minute, calyx repandly 4-lobed shortly turbinate. *Bedd. Fl. Sylv. Anal. Gen.* cviii.; *Dalz. & Gibs. Bomb. Fl.* 94. *Syzygium rubicundum*, *W. & A. Prodr.* 330. *S. salicifolium*, *Wall. Cat.* 3597; *not of Graham*.

TINNEVELLY DISTRICT, common up to 3000 ft. alt., *Beddome*.

A small tree, or large shrub; branchlets 4-gonous. *Leaves* 2 $\frac{1}{2}$ –3 by about $\frac{1}{2}$ in.; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in.—The leaves are narrower and more prominently nerved than in *E. lissophylla*, from which however Col. Beddome believes it to be not specifically distinct.

90. **E. cuneata**, *Wall. Cat.* 3598 (*Syzygium*); leaves narrow obovate-lanceolate obtuse tapering below into a short petiole lateral nerves horizontal, cymes from the terminal axils exceeding the leaves, flowers small, calyx-tube narrowly turbinate $\frac{1}{5}$ – $\frac{1}{4}$ in. truncate above, petals calyptrate, berry size of a pea.

SILHET, *Wallich*; E. BENGAL, *Griffith*; KHASIA MTS., 3–5000 ft., *J. D. H. & T. T.*

Branchlets 4-gonous. *Leaves* about 1 $\frac{3}{4}$ by $\frac{1}{2}$ in., smooth above, reticulate beneath. *Inflorescence* often leafy.

§§ *Cymes terminating previous year's branches.*

91. **E. papillosa**, *Duthie*; under surface of leaves young branches and pedicels clothed with rusty-coloured scurf, leaves large subsessile and somewhat amplexicaul obovate-oblong midrib and nerves very prominent beneath, cymes crowded at the extremities of year-old branches, calyx clove-shaped.

MALAY PENINSULA, *Maingay*, 737.

Branchlets terete or subtrigonous, stout. *Leaves* 7–9 by 3 $\frac{3}{4}$ in.; lateral nerves uniting conspicuously within the margin, dark above when dry, reddish beneath. *Inflorescence*—branches long, stout, compressed upwards. *Bracts* 2 at the base of each flower. *Calyx-tube* $\frac{1}{4}$ in.; lobes 4, prominent, subtriangular, obtuse, reflexed. *Petals* falling together.—One of Beccari's Borneo plants No. 2521, with larger leaves and flowers, has a similar clothing of reddish scurf.

92. **E. pustulata**, *Duthie*; leaves oblong acuminate narrowed below subcoriaceous nerves whitish prominent beneath distant uniting conspicuously within the margin, cymes terminating year-old branches, sepals acute, petals falling in one piece.

MALACCA, *Maingay*, (751).

Branchlets terete; rough with prominent glands, especially the upper branches, and the midribs and nerves of the leaves. *Leaves* 4 $\frac{1}{2}$ –7 by 1 $\frac{1}{4}$ –2 $\frac{1}{4}$ in., indistinctly

nerved above; midrib rounded beneath. *Inflorescence*-branches short, stout, 4-angular. *Flowers* about $\frac{1}{4}$ in.

93. ***E. brachiata***, Roxb. *Hort. Beng.* 37; *Fl. Ind.* ii. 488; leaves abruptly ovate or elliptic tip rounded or very shortly acuminate, panicles axillary or from the leafless axils much branched shorter than the leaves, flowers minute, calyx-tube obconic about $\frac{1}{12}$ in. lobes 4 shallow, corolla calyptrate, berry spherical. *E. odorata*? *Wight Ill.* ii. 16; *not of DC. (Syz.)*. *Syzygium brachiatum*, *Miq. Fl. Ind. Bat.* i. pt. i. 460. *E. cinerea*, *Kurz in Pegu For. Rep. Append. B.* p. 50; *For. Fl.* i. 483. *S. cinereum*, *Wall. Cat.* 3576. *S. ribesioides*, *Wall. Cat.* 3553 A.

PEGU, *Kurz*; MERGUI, *Griffith*; AMHERST and PENANG, *Wallich*.—DISTRIB. Amboina.

A tree. *Branchlets* terete or subtetragonous; bark white. *Leaves* $2\frac{1}{2}$ –6 by $1\frac{1}{4}$ –3 in., shortly petioled, glossy above, paler beneath; nerves finely impressed above, prominent beneath. *Bracts* ovate, acute, persistent. *Flowers* sessile in clusters of 6–9. *Berries* purplish to black.—The leaves of Wallich's specimens are much broader at the base than those of Wight. In Wallich's *S. ribesioides* the leaves are broader and less acuminate, the peduncles are shorter and the branchlets whiter.

94. ***E. verecunda***, *Wall. Cat.* 3579 (*Syzygium*); leaves ovate with a long point, nerves close reticulate, petiole about $\frac{1}{2}$ in., corymbs lax about half the length of the leaves, flowers very small, calyx with 4 shallow distant lobes broadly expanding above after flowering, petals calyptrate.

MALACCA, *Griffith*; PENANG, *Wallich*.

Branchlets terete, compressed at the nodes. *Leaves* $2\frac{1}{2}$ by 1 – $1\frac{1}{4}$ in., pale yellow; petiole midrib and margin tinged with orange.—Wallich was inclined to connect this with his *S. concinnum*; the latter however differs by having shorter petioles, the leaves less distinctly reticulated, larger flowers, free petals, and the calyx-tube more gradually tapering to the base.

** *Cymes lateral, mostly from the scars of fallen leaves.*

† *Petals free.*

95. ***E. nitida***, *Duthie*; leaves broadly ovate or oblong tip rounded or shortly acuminate polished above coriaceous, primary nerves few prominent beneath and uniting at some distance from the margin, cymes lateral chiefly from the leafless axils, calyx-tube spreading and recurved after flowering lobes prominent subpersistent, petals ?.

MALAY PENINSULA, *Maingay*, 728.

Branchlets terete, reddish-brown. *Leaves* 3 – $3\frac{1}{2}$ by 2 in., black and shining above, rusty-red beneath, dots inconspicuous not pellucid, nerves indistinct above; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in.—Herbarium specimens resemble *E. brachiata*, but the flowers are larger, and the leaves broader and more shining.

96. ***E. polyantha***, *Wight Ill.* ii. 17; *Ic. t.* 543; leaves obovate or oblanceolate obtusely acuminate at the base dark and shining above rusty-red beneath dots not pellucid, cymes short many-flowered axillary and from the leafless axils, flowers small, calyx rather deeply 4-lobed, petals free and expanding. *Not of Wall. Cat.* 3603; *not of Miq. (Syz.)*. *E. lucidula*, *Miq. Fl. Ind. Bat.* i. pt. i. 444. *Myrtus cymosa*, *Blume Bijl.* 1086, *not of Spr. (ex Miquel l. c.)*.

TENASSERIM, *Helper*; MOULMEIN and MERGUI, *Griffith*.—DISTRIB. Java.

A slender tree, upwards of 80 ft. (*Griffith MS.*). *Branchlets* 4-gonous. *Leaves* the same size as those of *E. balsamea*, which it resembles in habit. *Petals* white.

97. **E. malabarica**, *Bedd. Fl. Sylv.* t. 199; *Anal. Gen.* cvii.; leaves obovate-spathulate or quite obcordate rarely oblong marginal looping inconspicuous, cymes from the old wood below the leaves rarely in the lower axils very short, flowers numerous very small bracteolate, calyx-tube with 4 indistinct triangular lobes, petals opening separately, fruit spherical about $\frac{1}{4}$ in.

Western Peninsula, WYNAAD, jungles, 2-4000 ft. alt., *Beddome*.

A middling-sized tree. *Branchlets* terete. *Leaves* 2-5 by 1-2 $\frac{3}{4}$ in., minutely dotted beneath; petiole $\frac{1}{3}$ - $\frac{1}{2}$ in. *Cymes* about $\frac{1}{2}$ in. *Calyx-tube* more or less truncate in age, about $\frac{1}{12}$ in. diam. *Petals* orbicular with a slight claw, pointed, very soon deciduous.

98. **E. conglomerata**, *Duthie*; leaves obovate or oblanceolate rounded at the apex or shortly and obtusely acuminate tapering gradually to the base margins revolute, flowers from the leafless axils in dense sessile or subsessile clusters, calyx-tube broadly campanulate lobes 4 rounded persistent, petals free.

MALAYAN PENINSULA, *Maingay*, 745.

Bark of older branchlets grey; upper branchlets subtetragonous. *Leaves* 3-4 by 1-1 $\frac{1}{2}$ in., sometimes subfalcate, coriaceous, dark and shining above, rusty-red beneath, minutely black-dotted; midrib stout beneath, lateral nerves few, prominent beneath and uniting distinctly in loops within the margin; petiole about $\frac{1}{2}$ in. *Bracts* oblong, obtuse. *Filaments* short, stout.—Resembles No. 3326 of Beccari's Borneo plants, but the flowers are larger and the peduncles longer in the latter.

†† *Petals united*.

§ *Leaves alternate*.

99. **E. alternifolia**, *Wight Ill.* ii. 16; *Ic.* t. 537; leaves alternate sub-orbicular thick and coriaceous, cymes lateral longish-peduncled corymbose dense sometimes congested near the apex of year-old branches, fruit subspherical size of a cherry. *Bedd. Fl. Sylv.* t. 198.

KURNOOL, CUDDAPAH, and N. ARCOT districts, *Teddome*; BALAGHAUT, *Wight*. ASSAM, Nagari Hills.

A large tree. *Branchlets* terete. *Leaves* 3-8 in., rounded at the apex or rather suddenly obtusely acuminate, dark green and shining above paler beneath, minutely dotted; primary nerves numerous, uniting close within the margin; petiole 1 in. or more. *Flowers* yellowish-white, sweet-scented. *Calyx* viscid and shining, entire or with 4 very minute teeth. *Petals* calyptrate.

§§ *Leaves opposite*.

100. **E. tetragona**, *Wight Ill.* ii. 16; branchlets stout acutely 4-gonous, leaves ovate-oblong or nearly oval thick and coriaceous, lateral and marginal nerves very prominent beneath, cymes from the lower leafless axils shorter than the leaves, fruit globose size of a large pea. *Syzygium tetragonum*, *Kurz in Journ. As. Soc. Beng.* vol. xlv. pt. ii. p. 66; *For. Fl.* i. 484; *Wall. Cat.* 3550. *S. ficifolium*, *Wall. Cat.* 3558. *S. rameum*, *Wall. Cat.* 3595.

SIKKIM, *J. D. H.*; BHOTAN, *Griffith*. KHASIA MTS., *J. D. H.* & T. T. SILHET, *Wallich*. AVA, *Kurz*.—DISTRIB. Yunnan.

A large tree; branchlets with the angles often winged. *Leaves* 5-6 $\frac{1}{2}$ by 2 $\frac{1}{2}$ in., attenuated at each end, dots minute but not pellucid; petiole about $\frac{1}{2}$ in. *Calyx-tube* narrow below, suddenly enlarging at the throat; lobes small, rounded. *Petals* calyptrate.—The flowers are sweet-scented according to Wallich.

The branchlets are not so acutely 4-gonous in Wallich's *S. ficifolium* and *S. rameum*, and the leaves of the former are broader.

101. **E. occlusa**, *Miq. Fl. Ind. Bat.* i. pt. i. 460 (*Syzygium*); leaves on longish petioles elliptic obtusely acuminate acute at base coriaceous shining above paler beneath, lateral nerves distant indistinctly uniting within the margin, flowers rather large in condensed lateral panicles, calyx-tube broad above and with a truncate margin.

NICOBAR ISLANDS, *Kurz.*—DISTRIB. Java.

Branchlets terete or subcompressed upwards, light brown or whitish. *Leaves* 2–4 in., varying in width, rusty-brown when dried; midrib furrowed above; petiole about 1 in. *Panicles* shorter than the leaves, branches divaricate or subdeflexed. *Buds* globose. *Calyx-tube* upwards of $\frac{1}{4}$ in.—The calyx and corolla are apparently fused together in the calyptrate operculum. Under this species Mr. Kurz refers *E. cerasoides*, Roxb., *E. polyantha*, Wight, and the specimens 2394 & 2395 of Griffith's and Helfer's collection.

102. **E. operculata**, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 486; leaves broadly ovate or elliptic rounded at the apex or obtusely acuminate narrowed below lateral nerves few distant prominent becoming fainter towards the margin, panicles from leafless axils lax divaricate, berry globose or ovoid. *Wight Ic.* t. 552; *Brandis For. Fl.* 234; *Kurz For. Fl.* i. 483. *E. cerasoides*, *Roxb. Hort. Beng.* 92; *Fl. Ind.* ii. 488; *Wight Ic.* t. 615; *Miq. Anal. Bot. Ind.* i. 27; *Fl. Ind. Bat.* i. pt. i. 443; *Kurz in Journ. As. Soc. Beng.* vol. xlvii. pt. ii. 66; *For. Fl.* i. 484. *Syzygium nervosum*, *DC. Prodr.* iii. 260; *Mem. Myrt.* ii. 16; *Wall. Cat.* 3551 A & B; 3553 B & C (under *E. ribesoides*); *Benth. Fl. Hongk.* 119; *Thwaites Enum.* 417; *Miq. Fl. Ind. l. c.* 460; *Bedd. Fl. Sylb. Anal. Gen.* cvi. *S. costatum*, *nodosum*, and *angolanum*, *Miq. Fl. Ind. l. c.* 448. *Calyptranthes mangiferifolia*, *Hance in Walp. Ann.* ii. 629. *C. costata*, *Ham. in Wall. Cat.* 3556. *C. grandis* and *C. Tatna*, *Ham. in Wall. Cat.* 3554, 3555.

SUB-HIMALAYAN forests from the JUMNA to ASSAM, ascending to 2000 ft. OUDH and GORAKHPUR forests, CACHAR, CHITTAGONG, PEGU, *Kurz.* CEYLON, up to 3000 ft.—DISTRIB. Indian Archipelago and S. China, Yunnan.

A large tree; branchlets subterete or 4-gonous. *Leaves* 3–8 by 2–4 in., subcoriaceous, dots often black (in the dried specimens), rarely pellucid; primary veins 8–12, curving into a rather faint intramarginal vein; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Inflorescence* often thyrsoidal. *Peduncles* long, acutely angled. *Flowers* small, greenish, in threes, nearly sessile, odorous. *Calyx* campanulate, with short obtuse lobes, or nearly truncate. *Petals* united and falling in one piece, calyptra often apiculate. *Berry* $\frac{1}{4}$ – $\frac{1}{2}$ in., rugose, juicy. The wood is used for building and for agricultural implements. The fruit is eaten.

VAR. *Paniala*; berries oval. *E. Paniala*, *Roxb. Fl. Ind.* ii. 489. *Wight Ic.* t. 616; *Kurz For. Fl.* i. 483. *Syz. Panealla*, *Wall. Cat.* 3557? *Calyptranthes cuneata*, *Ham.*?—Chittagong, Roxburgh; Silhet, Wallich; Pegu, Rangoon, McClelland.—There is no fruit with Wallich's and Hamilton's specimens. Flowers in April, fruit ripens in June.

VAR. *obovata*, *Kurz. For. Fl.* i. 482; leaves obovate or oblanceolate, cymes more compact. *Syz. obovatum*, *Wall. Cat.* 3552, not of DC. *S. vastum*, *Wall. Cat.* 3561. *S. polyanthum*, *Thwaites*; not of *Wight*.—Silhet, Chittagong, Rangoon, Wallich; Ava, Griff.

103. **E. Stocksii**, *Duthie*; leaves elliptic-obovate rounded or obtusely acuminate at the apex indistinctly nerved dots not pellucid, cymes axillary and from the leafless axils half the length of or equalling the leaves, flowers small, petals calyptrate.

CONCAN, *Stocks*. WYNAAD, *Beddome*.

A lofty tree; branches acutely 4-gonous. *Leaves* 4–6 by $1\frac{3}{4}$ –3 in., thin; lateral nerves few slender below curving upwards and becoming faint towards the margin.

Peduncles 1-2 in. *Flowers* about $\frac{1}{2}$ in. *Calyx-lobes* 4, rounded or subacute.—Habit of *E. balsamea*, but the cymes are much longer peduncled and the leaves are not pellucid-punctate.

104. **E. balsamea**, *Wight Ill.* ii. 16; leaves ovate or ovate-lanceolate narrowed below acuminate subcoriaceous pale pellucid-punctate, lateral nerves prominent widely separated, cymes lateral short compact, flowers small, berry round. *Kurz in Journ. As. Soc. Beng.* vol. xlvi. pt. ii. 66; *For. Fl.* i. 485. *Syz. balsameum*, *Wall. Cat.* 3592. *Memecylon floribundum*, *Wall. Cat.* 4113.

SIKKIM, alt. 2000 ft., *J. D. H. & T. T.*; E. BENGAL, *Griffith*; PEGU, *Kurz*; SILHET, *Wallich, J. D. H., & T. T.* ASSAM, *Masters*.—DISTRIB. Yunnan.

Branchlets subterete or obscurely 4-gonous. *Leaves* 3-5 by 1-1 $\frac{1}{2}$ in.; petiole $\frac{3}{8}$ in. *Inflorescence*-branches compressed, angular. *Calyx-tube* truncate. *Petals* united, or sometimes becoming free.

VAR. angustifolia; leaves narrowly elliptic-lanceolate, $\frac{1}{2}$ - $\frac{3}{4}$ in. wide.—Khasia Mts., 2000 ft., *J. D. H. & T. T.*

105. **E. fruticosa**, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 487; shrubby, leaves broadly oblong to oval acuminate finely nerved, flowers small in dense lateral panicles, berries small ovoid. *Wight Ic.* t. 624; *Kurz in Journ. As. Soc. Beng.* xlvii. pt. ii. 66; *For. Fl.* i. 485. *S. fruticosum*, *DC. Prodr.* iii. 260; *Mem. Myrt.* t. 19; *Vall. Cat.* 3559 in part.

SILHET and CHITTAGONG, *Roxburgh, Wallich*; PEGU, *Kurz*; TENASSERIM, *Helfer*.

A large shrub or small tree. *Leaves* variable as to size, very similar to those of *E. Jambolana*; petiole shorter. *Panicle*-branches divaricate, acutely angular. *Calyx* very short. *Corolla* calyptrate. *Berries* size of pea.—Resembles *E. polyantha*, *Wight*, in its inflorescence.

106. **E. Jambolana**, *Lam. Dict.* iii. 198; leaves ovate or oblong obtuse or more or less acuminate coriaceous closely nerved, panicles lateral below the leaves rarely axillary or terminal, calyx shortly turbinate limb truncate or obscurely 4-lobed, petals calyptrate, berry olive-shaped to globose purple from size of a pea to a pigeon's egg. *Ham. in. Wern. Soc. Trans.* v. 342; *Roxb. Fl. Ind.* ii. 484; *Wight Ic.* t. 535; *Benth. Fl. Austral.* iii. 283; *Bedd. Fl. Sylv.* i. t. 197; *Brandis For. Fl.* 233; *Kurz in Journ. As. Soc. Beng.* vol. xlvii. pt. ii. 67; *For. Fl.* i. 485. *Syz. Jambolanum*, *DC. Prodr.* iii. 259; *Wall. Cat.* 3560; *W. & A. Prodr.* i. 329; *Dalz. & Gibs. Fl. Bomb.* 93. *E. frondosa*, *Wall. Cat.* 3560 G; not 3590. *E. Moorei*, *F. Muell. Fragm.* v. 33. *Calyptranthes Jambolana*, *Willd. Sp. Pl.* ii. 975. *C. capitellata*, *Ham. in Wall. Cat.* 3560 B.

Common (wild or cultivated) and generally distributed throughout India in both peninsulas and in Ceylon; from the plains to 4-5000 ft.—DISTRIB. Malay Archipelago to Australia.

A tree, usually of considerable size with a thick and rather crooked trunk. *Leaves* 3-6 in., extremely variable in shape, smooth and shining, the numerous nerves uniting within the margin; petiole $\frac{1}{2}$ -1 in. *Cyme* short and compact or laxly paniculate. *Flowers* numerous, about the size of those of *E. operculata* or much smaller, sweet-scented. *Berries* often obliquely oblong.—The wood is whitish, close-grained, and durable; the bark affords brown dyes, and a kind of gum kino. The fruit is often eaten. *Roxburgh* mentions a variety having fruit of a superior quality; and as large as a pigeon's egg; probably the result of cultivation.

VAR. caryophyllifolia; leaves ovate-lanceolate with a long acumen, calyx shortly 4-toothed, berry globose size of a large pea. *E. caryophyllifolia*, *Lam. Dict.* iii. 198; *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 486; *Wight Ic.* ii. 553. *E. calyptrata*, *Roxb. Ic.* 1142? *Syz. caryophyllifolium*, *DC. Prodr.* iii. 259; *Wall. Cat.* 3562 partly, & 3551; *C. Thwaites Enum.* 116. *S. Jambolanum*, var. *microcarpum*, *Thwaites Enum.* 417; *Wall. Cat.* 3562 C. *Syz. lateriflorum*, *Royle*. *Myrtus Cumini*, *Linn.*: exclude

syn. *Rumph. & Burm.*—*Pluk. Alm.* t. 274, 2. *Rheede Hort. Mal.* v. t. 29. *Rumph. Herb. Amb.* i. t. 41.

VAR. *obtusifolia*, leaves obtuse, berries oblong. *E. obtusifolia*, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 485; *Wight Ic.* t. 520. *Jambolifera pedunculata*, *Gaertn. Fruct.* i. 78, t. 36.—*Rumph. Herb. Amb.* i. t. 42. The emargination in the leaves of *Rumphius'* figure is an error.

107. ***E. tenuis***, *Wall. Cat.* 3570 (*Syzygium*); leaves ovate or ovate-lanceolate obtusely acuminate narrowed at the base coriaceous pale pellucid-punctate lateral nerves slender close interspaces finely reticulated, panicles from the leafless axils dense, calyx-tube broadly campanulate much produced lobes 4 shallow. *Calyptranthes tenuis*, *Ham. MSS.*

SUKANAGHAR, *Hamilton.*

Leaves $2\frac{1}{4}$ – $2\frac{3}{4}$ by 1 – $1\frac{1}{2}$ in.; margins slightly revolute; midrib slender, orange-coloured as well as the edges of the leaves; petiole about $\frac{1}{2}$ in. *Peduncles* $\frac{3}{4}$ in. or less. *Corolla* calyptrate. *Style* persistent, exserted.—The leaves have a close resemblance to those of *E. verecunda*.

108. ***E. Heyneana***, *Wall. Cat.* 3599 (*Syzygium*); leaves narrowly oblong or elliptic obtusely acuminate narrowed at the base into a short petiole finely and closely nerved, cymes lateral from the scars of fallen leaves rarely axillary, calyx-lobes unequal, petals united, berries oblong. *Calyptranthes Danca*, *Ham. in Herb.* *E. salicifolia*, *Grah. Cat. Bomb. Pl.* 73; not of *DC.*; not of *Berg.* or *Wall. Cat.* 3597 (*Syz.*); *Wight Ill.* ii. 16; *Ic.* t. 539; *Dalz. Bomb. Fl.* 24 excl. *syn. Wall.*; *Bedd. Fl. Sylv. Anal. Gen.* cix.

WESTERN PENINSULA; beds of rivers in BERAR; BOMBAY GHATS and CONCAN, *Stocks*; CANARA, *Ritchie*; COORG, *Heyne*; SAGOR, *Vicary*.

A small tree or shrub. *Leaves* 3–5 by $\frac{3}{4}$ –1 in., pellucid-punctate. *Cymes* lax, much branched. *Flowers* small, white. *Berries* $\frac{1}{2}$ in. or more in length, crowned with the cup-like calyx-limb.

E. salicifolia of Wight's Herbarium is certainly the *E. Heyneana* of Rottler's and Wallich's herbaria. Wallich's *E. salicifolia* is *E. rubicunda*, W. & A., a plant having very much the habit of this, but with the inflorescence terminal. The wood is used for rafters (Beddome).

VAR. *alternans*; cymes from the axils of the upper leaves. *S. alternans*, *Miq. in Herb. Hohenacker*.—Concan and Canara, *Stocks*, *Hohenacker*. The leaves are very like those of *E. pellucida*.

SECT. III. ***Eueugenia***. *Flowers* solitary or in fascicles. *Petals* distinct. (To end.)

* Young parts and inflorescence fulvous or silvery pubescent. (To p. 504.)

† *Staminal disk* broad.

109. ***E. Jossinia***, *Duthie*; leaves shortly petioled obovate-spathulate obtuse cuneate below coriaceous glabrous, peduncles axillary solitary or crowded at the end of the branches 1-flowered, pedicels and calyx rusty-pubescent, calyx-limb 4-lobed persistent, berry about the size of a sloe. *E. cuneata*, *Heyne in Wall. Cat.* 3625, not of *Wall. Cat.* 3598; *Bedd. Fl. Sylv. Anal. Gen.* cxii. *Jossinia indica*, *Wight Ill.* ii. 12, t. 122; *Ic.* t. 523; *Blume Mus. Bot.* i. 122; *Miq. Fl. Ind. Bat.* i. pt. i. 468.

SEVAGHERRY HILLS, TINNEVELLY DISTRICT, *Wight*, *Beddome*; COURTALLUM, *Wight*.

A small tree or shrub. *Leaves* 1 – $1\frac{3}{4}$ by $\frac{1}{2}$ – $\frac{5}{8}$ in., revolute at the edges; nerves inconspicuous above. *Peduncles* $\frac{3}{4}$ in. long. *Calyx-tube* subglobose; lobes rather unequal. *Petals* hairy, $\frac{3}{8}$ in. long.

110. **E. floccosa**, *Bedd. Fl. Sylv.* t. 200; young branches densely floccose, leaves ovate or suborbicular sometimes lanceolate obtuse densely floccose at length glabrous except on the ribs minutely dotted beneath coriaceous, edges revolute, flowers terminal in very short few-flowered cymes or solitary and large, calyx coriaceous densely pilose furnished at the base with 2 large bracteoles, petals exceeding the calyx-lobes white hairy at the back, fruit large size of a pigeon's egg densely woolly crowned with the persistent calyx-lobes.

S. TINNEVELLY GHATS above Calcad, 3-4000 ft., *Beddome*.

A large and beautiful tree. *Leaves* very thick, 3-5 by 2-3½ in.; nerves quite inconspicuous except in dried specimens, penninerved, with the usual marginal looping or occasionally 3-nerved at the base, the two lateral nerves not prominent; petiole densely floccose, ½-¾ in. *Flowers* about 1 in. diam. *Disk* large, subglobose, woolly.

111. **E. codyensis**, *Munro in Wight Ill.* ii. 13; leaves short-petioled ovate-oblong or obovate tapering towards the base shortly obtusely acuminate, flowers nearly sessile clustered in terminal heads at the extremities of short abortive branches or axillary and solitary or few together, fruit globose 1-2-seeded.

NILGHIRI and KURG MTS., *Munro*.

A shrub with stout terete branchlets; young parts clothed with white pubescence. *Leaves* 1½-2½ by ¾-1½ in., coriaceous, glabrous, shining above; dots minute, pellucid; lateral nerves slender, prominent, uniting within the margin; petiole ¼-½ in. *Calyx-tube* campanulate, silky-pubescent; lobes 4, broad, persistent, ciliate. *Petals* oblong, twice the length of the calyx. *Berries* about ¼ in. in diameter.—Judging from the specimen in Wight's Herbarium it seems to be closely allied to *E. elliptica*, Lam., of which it is perhaps only a variety; the leaves are rather longer petioled and the flowers larger.

Allied to this is *E. buxifolia*, Lam., a native of the Mauritius.

112. **E. lucida**, *Lam. Dict.* iii. 203; young parts and inflorescence covered with light-coloured cottony pubescence, leaves petioled broadly obovate or nearly orbicular revolute at the edges very coriaceous, flowers large solitary in the axils or collected 3 or 4 together at the ends of the former year's branches each with 2 small subacute bracts, calyx-lobes rounded unequal. *Jossinia lucida*, *DC. Prodr.* iii. 237. *E. cotinifolia*, *Jacq. Obs.* iii. 3 t. 53 *in part.* *E. hypoleuca*, *Thwaites MSS. C.P.* 3864 & 3865; *Bedd. Fl. Sylv. Anal. Gen.* cxii. *Myrtus cotinifolia*, *Spreng. Syst.* ii. 481 *in part.* *M. Commersonii*, *Spreng. l.c.* 479.

CEYLON; Wattakelle Hill, 5000 ft. alt., *Thwaites*.—DISTRIB. Bourbon, Mauritius.

Leaves 1½-2 by 1-1½ in.; nerves indistinct above, slender beneath and uniting within the margin; petiole about ¼ in. *Flowers* upwards of an inch in diam. *Pedicels* ½ in. or less. *Calyx-tube* ¼ in. "Fruit obovate or globose glabrous crowned with the obtuse calyx-lobes" (*Decandolle, l.c.*).

113. **E. macrosepala**, *Duthie*; leaves petioled ovate or oblong-lanceolate subacute at the base obtusely acuminate or sometimes rounded at each end coriaceous, flowers lateral from leafless axils sessile solitary or in pairs each with 2 linear pilose bracts equalling or exceeding the calyx-tube, calyx-lobes 4 long narrowly lanceolate acute exceeding the obtuse petals.

N. CANARA, *Stocks*.

Upper branches stout, terete or compressed at the nodes; bark brownish. *Leaves* 3-4½ by 1½-1¾ in., shining a little above and of a reddish tinge; nerves inconspicuous above, slender but prominent beneath uniting within the margin. *Calyx-lobes* clothed with long spreading white hairs. *Petals* ovate, pilose at the back and ciliate at the margin. *Stamiferous disk* not so broad and square as in *E. elliptica*, Lam.

114. **E. calcadensis**, *Bedd. Ic. Pl. Ind. Or.* 35, t. 162; *Fl. Sylv. Anal. Gen. cx.*; young parts rusty-pubescent, leaves opposite or subalternate elliptic to subobovate obtuse very rugose on the upper surface but glabrous in age except the channelled midrib, peduncles axillary solitary about equal to the petioles 2-rarely 1-flowered, flowers showy white, ovary 2-celled with numerous ovules.

Calcad Hills in S. TINNEVELLY, up to 2000 ft., *Beddome*.

A small tree. *Leaves* $2\frac{1}{2}$ –3 by $1-1\frac{1}{4}$ in., coriaceous, not dotted; nerves inconspicuous above slightly prominent beneath, the primary ones joining within the margin; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Pedicels* $1-1\frac{1}{4}$ in., with a subulate bract at the base of each. *Flowers* $1-1\frac{1}{2}$ in. in diam., with 2 small linear bracts at the base. *Calyx-lobes* rounded. *Petals* oblong ciliate $\frac{1}{2}$ – $\frac{3}{4}$ in. long. *Disk* suborbicular, densely woolly, covering the whole of the top of the ovary at the apex of the calyx-tube. *Stamens* inserted all over the disk.

†† *Staminal disk not enlarged.*

§ *Flowers pedicelled.*

115. **E. bracteata**, *Roxb. Hort. Beng.* 37; *Fl. Ind.* ii. 490; young parts and inflorescence rusty-pubescent, leaves shortly petioled ovate-oblong tapering or cuneate at the base obtusely acuminate glabrous when old coriaceous shining pellucid-dotted, peduncles axillary short 1-flowered solitary or 2–3 together or in fascicles with 2 small bracteoles under each flower, berry globose 1–2-seeded. *DC. Prodr.* iii. 264; *W. & A. Prodr.* i. 331; *Wight Ill.* t. 13; *Thwaites Enum.* 114; *Blume Mus. Bot.* i. 87 (*in part*); *Bedd. Fl. Sylv. Anal. Gen. cx.* *Myrtus bracteata*, *Willd. Sp. Pl.* ii. 969. *M. coromandeliana*, *Kön. MSS.* *M. rusciifolia*, *Willd. l. c.* 970; *DC. l. c.* 241; *Spreng. l. c.* 482. *M. latifolia*, *Heyne in Roth. nov. sp.* p. 232 (*not of Aubl.*). *M. Heynei*, *Spreng. l. c.* 482; *DC. l. c.* 241.

SILHET and Plains of S. India, especially near the sea; MADRAS, *G. Thomson, Wight, Hunter*; ANAMAILAY Mts., up to 3000 ft. alt., *Beddome*; CEYLON, Jaffna, *Gardner*.

A shrub or small tree. *Leaves* $1\frac{1}{2}$ –2 by about $\frac{3}{4}$ in. *Calyx-lobes* broad, unequal, reflexed after flowering. *Petals* ovate-oblong, twice as long as the calyx-lobes, pubescent at the back, margins ciliate.

VAR. Roxburghii; leaves broader, petioles longer, flowers larger. *E. Roxburghii*, *DC. Prodr.* iii. 271; *Wall. Cat.* 3621 (*in part*); *Hook. Journ. Bot.* i. 66, t. cxxiv.; *Miq. Fl. Ind. Bat.* i. pt. i. 441 (*in part*); *Blume Mus. Bot.* i. 87 (*in part*). *E. zeylanica*, *Roxb. Hort. Beng.* 92; *Fl. Ind.* ii. 490 *excl. syn.* *Willd.*; *W. & A. Prodr.* i. 331; *Arn. in Act. Acad. Nat. Cur.* xviii. 336 (1836). *E. Willdenowii*, *Wight Ill.* ii. 13; *l. c.* t. 545; *not of DC.*; *Thwaites Enum.* 114; *Bedd. Fl. Sylv. Anal. Gen. cx.*: *not of Wall. Cat.* 3623. *Myrtus littoralis*, *Roxb. in E. I. C. Mus.* t. 151. *M. spicata*, *Ham.*—Plains of S. India and in Ceylon.

Rottler's specimens in the Kew Herbarium, and those of Arnott from Ceylon named *E. zeylanica* have the leaves upwards of $4\frac{1}{2}$ in. long. In Wight's figure the peduncles are incorrectly represented as 2-flowered.

VAR. fasciculata; leaves $2\frac{1}{2}$ –3 in., flowers fascicled more erect peduncles shorter. *E. fasciculata*, *Wall. Cat.* 3622; *Blume Mus. Bot.* i. 87.—SILHET, *Wallich*.

116. **E. Rottleriana**, *W. & A. Prodr.* i. 331; much branched, young shoots petioles peduncles and calyx covered with rusty-silky tomentum, leaves very narrow lanceolate tapering at both ends obtuse glabrous on both surfaces except when young pellucid-dotted, peduncles axillary or somewhat lateral 3–4 together or sometimes solitary filiform scarcely one-fourth the length of the leaves, bracteoles 2 under the calyx, calyx-segments 4 triangular ovate obtuse, petals 4 much longer than the calyx villous on the margin. *Wight Ill.* ii. 13; *l. c.* t. 100; *Bedd. Fl. Sylv. Anal. Gen. cx.*

Southern provinces of the WESTERN PENINSULA, *Wight*, *Beddome*; Courtallum, *Wight*.

A small tree or shrub. *Leaves* 1-2 by $\frac{1}{4}$ - $\frac{1}{2}$ in.; petiole $\frac{1}{4}$ in. or less.—*Col. Beddome* mentions two distinct forms, the one with leaves 1-1 $\frac{1}{2}$ by $\frac{1}{4}$ in., the other 2 in. by $\frac{1}{4}$ in. The former coming very near *E. Willdenowii* (of *Wight*).^a

117. **E. terpnophylla**, *Thwaites Enum.* 114 & 417; young parts and inflorescence rusty-pubescent, leaves lanceolate or oblong-lanceolate with a long acumen narrowing towards the base lateral nerves uniting at some distance from the margin, berry spherical usually 1-seeded. *Bedd. Ic. Pl. Ind. Or.* 67, t. 283; *Fl. Sylv. Anal. Gen.* cxi.

CEYLON; up to no great elevation, *Thwaites*.

A middling-sized tree; branchlets terete. *Leaves* 2 $\frac{1}{2}$ -5 by $\frac{1}{2}$ -2 in., membranous, faintly reticulate; lateral nerves prominent beneath, 5-8 on each side marginal often double; petiole $\frac{1}{4}$ - $\frac{3}{4}$ in. *Peduncles* axillary and terminal, short, few-flowered; pedicels about equalling the petioles. *Petals* white, twice as long as the rounded calyx-lobes. *Berry* downy, size of small cherry.

118. **E. xanthocarpa**, *Thwaites Enum.* 416; young branches and buds clothed with rusty pubescence, leaves elliptic-lanceolate obtusely acuminate glabrous acute at the base, midrib channelled above primary nerves prominent, pedicels axillary fasciculate rusty-pubescent about equalling the petioles, berry 1-4-seeded nearly spherical rusty-pilose tuberculate. *Bedd. Fl. Sylv. Anal. Gen.* cxi.

CEYLON; near the coast between Galle and Colombo, *Thwaites*.

A low tree. *Leaves* 2 $\frac{1}{2}$ -4 by 1-1 $\frac{1}{2}$ in.; petiole $\frac{1}{4}$ in. *Berries* $\frac{1}{4}$ - $\frac{1}{2}$ in., ochraceous.—Differs from *E. terpnophylla* in having more numerous primary nerves, in their being less prominent beneath, and uniting closer to the margin; and in the ochraceous berries which are often 2-4-seeded (*Thwaites l. c.*).

119. **E. rufo-fulva**, *Thwaites Enum.* 416; young parts covered with short reddish or tawny pubescence, leaves lanceolate acutely acuminate glabrous above (except when young) shining hairy covered beneath with short adpressed reddish or tawny tomentum at length glabrous, peduncles axillary fasciculate 1-3-flowered about equal to the petioles, calyx with small subulate bracteoles. *Bedd. Fl. Sylv. Anal. Gen.* cxi. *E. terpnophylla*, var β , *Thwaites l. c.* 114.

CEYLON, near Avishavelle, *Thwaites*.

A tree, 30-40 ft. *Leaves* 4-5 by 1-1 $\frac{1}{2}$ in. or much narrower in some of Mr. *Thwaites'* specimens; petiole about $\frac{1}{4}$ in. *Calyx-lobes* unequal, obtuse or subacute. "Differs from *E. terpnophylla* by the leaves being pilose beneath, and the primary nerves anastomosing nearer the margin" (*Thwaites l. c.*).

120. **E. argentea**, *Bedd. Fl. Sylv. Anal. Gen.* cix.; leaves ovate-elliptic to lanceolate with a long narrow acumen rounded at the base silvery pubescent beneath, peduncles filiform axillary pubescent, bracteoles 2 filiform exceeding the calyx-lobes persistent, fruit spherical sparingly clothed with short adpressed hairs.

S. INDIA, Wynaad, alt. 3000 ft., *Beddome*.

A small tree or shrub. *Leaves* 4-5 $\frac{1}{2}$ by 1 $\frac{1}{4}$ -1 $\frac{1}{2}$ in.; nerves rather prominent beneath, lateral spreading nearly at right angles from the midrib and running into a regular looped nerve near the margin. *Peduncles* 1 in. long, from the old axils or axillary. *Flowers* $\frac{1}{2}$ to nearly $\frac{1}{2}$ in. across. *Fruit* about the size of a large cherry, black when dry, crowned with the persistent calyx-lobes.

§§ *Flowers sessile or subsessile.*

121. **E. floccifera**, *Thwaites Enum.* 115; leaves oblong-lanceolate acutely acuminate, young parts and inflorescence densely clothed with yellow tomentum, pedicels axillary short clustered, calyx-lobes 4 lanceolate much longer than the tube. *Bedd. Fl. Sylv. Anal. Gen.* cxi.

CEYLON; Reigam Corle, at no great elevation, *Thwaites*.

A small tree; *branchlets* terete. *Leaves* acutely acuminate, 4-8 by 1-2 in., at length glabrous; primary nerves rather prominent beneath, joined into a marginal looping one; petiole $\frac{1}{4}$ - $\frac{1}{3}$ in. *Petals* white, equalling the calyx-lobes, $\frac{1}{3}$ in.

122. **E. fulva**, *Thwaites Enum.* 115; leaves elliptic or oblong abruptly and shortly acuminate rounded at the base smooth above prominently nerved beneath young parts and inflorescence clothed with yellow tomentum, flowers axillary and cauline small sessile crowded. *Bedd. Fl. Sylv. Anal. Gen.* cxi.

CEYLON; Pasdoon Corle, at no great elevation, *Thwaites*.

A small tree with terete branchlets. *Leaves* coriaceous, 4-6 by $2\frac{1}{4}$ -3 in., the young ones rusty-tomentose beneath; petiole about $\frac{1}{2}$ in.

123. **E. rivulorum**, *Thwaites Enum.* 115; leaves rather large lanceolate acuminate narrow at the base covered very slightly beneath with fulvous pubescence at length glabrous, flowers rather large sessile axillary and cauline, calyx-lobes 4 pilose externally rounded equalling the tube. *Bedd. Fl. Sylv. Anal. Gen.* cxi.

CEYLON; banks of streams in the Singherajah forest between Galle and Ratnapoora, at no great elevation, *Thwaites*.

A small tree with terete branchlets. *Leaves* 10-14 by 3-4 $\frac{1}{2}$ in.; midrib stout longitudinally striated; principal nerves very prominent below and uniting to form a conspicuous intramarginal one; petiole about $\frac{1}{2}$ in. *Petals* oblong, pale purple, $\frac{1}{3}$ - $\frac{1}{2}$ in.

124. **E. insignis**, *Thwaites Enum.* 416; young parts covered with white fugacious down, leaves rather large glabrous oblong acuminate smooth above ribs channelled paler beneath, primary nerves about 12 prominent anastomosing near the margin, interspaces smooth, flowers axillary and on the branches few sessile small, calyx with white hairs or floccose, fruit spherical. *Bedd. Fl. Sylv. Anal. Gen.* cxi.

CEYLON; Galpara in the Reigam Corle, *Thwaites*.

A low branching tree. *Leaves* 6-8 by 2-3 $\frac{1}{2}$ in., rather acute at the base; petiole $\frac{1}{2}$ - $\frac{2}{3}$ in. *Calyx-lobes* $\frac{1}{2}$ in. *Petals* rather longer than the calyx, ciliate. *Fruit* clothed with white hairs or floccose.

** *Whole plant nearly glabrous.*

† *Flowers sessile.*

125. **E. decora**, *Thwaites Enum.* 115; leaves oblong acuminate rounded at the base glabrous shining above paler beneath minutely reticulate, flowers sessile crowded axillary and cauline, berries transversely oblong 2-seeded. *Bedd. Fl. Sylv. Anal. Gen.* cxii.; not of *Wall. Cat.* 3608.

CEYLON; Galle, at no great elevation, *Thwaites*, *Champion*.

A small tree; young branches terete. *Leaves* 4-5 by about 2 in.; petiole $\frac{1}{2}$ in. *Flowers* white. *Berries* red or nearly black, $\frac{1}{2}$ by $\frac{2}{3}$ in.—*Champion's* single specimen from Galle has only one flower terminating a lateral branch; the calyx-tube is spa-

ringly clothed with adpressed hairs, the lobes large unequal rounded and ciliate, the petioles are glandular and ciliate at the edges.

†† *Flowers pedicelled.*

126. **E. amoena**, *Thwaites Enum.* 114; leaves sessile ovate-lanceolate acuminate cordate at the base or subamplexicaul glabrous coriaceous, flowers often terminal subfasciculate, pedicels much shorter than the leaves. *Bedd. Fl. Sylv. Anal. Gen.* cxi. *E. Mooniana*, *Wight. var. β.*, *Thwaites Enum.* 114.

CEYLON, Kokool Corle and Delosbage District, up to 1500 ft., *Thwaites*.

A small tree; branchlets terete. *Leaves* 2-6 by $1\frac{1}{2}$ -2 $\frac{1}{4}$ in.; nerves inconspicuous above, more prominent beneath and uniting in a distinct marginal nerve with often a second fainter one nearer the edge. *Pedicels* $\frac{1}{2}$ - $\frac{3}{4}$ in. *Bracts* ovate, acute. *Petals* 4, oblong, white, about $\frac{1}{4}$ in. in length, longer than the roundish calyx-lobes.—Some of Mr. Thwaites' specimens, and which he considers to be merely a state of this species, have the leaves much thinner, broader at the base, and with rather different nervation, the pedicels are shorter, and the calyx-lobes sometimes acute.

127. **E. Mooniana**, *Wight Ill.* ii. 13; *Id.* ii. 551; not of *Gardner in Hook. Journ. of Bot.* ii. 352 (1843); shrubby, glabrous or the young shoots puberulous, leaves short-petioled ovate acuminate tapering at the base, peduncles axillary solitary or 2 together 1-flowered, flowers small, calyx-tube ventricose oblong, lobes 4 reflexed pointed, fruit globose or oblong size of cherry. *Thwaites Enum.* 114; *Bedd. Fl. Sylv. Anal. Gen.* cx.

Courtallum, *Wight*; NILGHIRI HILLS, *Hb. Hohenacker*; SEVAGHERY HILLS, *Wight*; CONCAN, *Stocks*; CEYLON, up to 4000 ft., *Thwaites*.

A most variable species in the shape of the leaves and the length of the petioles and flower-stalks. *Leaves* $1\frac{1}{2}$ -2 $\frac{1}{2}$ by $\frac{3}{4}$ -1 $\frac{1}{2}$ in.; acumen short and obtuse, or prolonged to a fine point. *Pedicels* about $\frac{1}{2}$ in., axillary or from the old wood below.—It approaches *E. uniflora*, but the leaves are thicker and the pedicels are less slender.—Col. Beddome says (l.c.) "I have another species allied to this which may prove to be new (specimens imperfect) the peduncles are several-flowered."

VAR. gracilis; leaves longer, fruit oblong. *E. gracilis*, *Bedd. in Trans. Linn. Soc.* xxv. 217; *Fl. Sylv. Anal. Gen.* cx.—Anamallay Hills.

E. UNIFLORA, *Linn.*; *Miq. Fl. Ind. Bat.* i. pt. i. 441; leaves nearly sessile ovate sublanceolate glabrous rather thin and pellucid-punctate, pedicels axillary usually solitary and 1-flowered shorter than the leaves, calyx-lobes 4 reflexed, berries globose, torulose. *E. Willdenowii*, *DC. Prodr.* iii. 265; *Spreng. Syst.* ii. 480 (*Myrtus*); *Wall. Cat.* 3623. *Syzyg. Michelii*, *Lam. Dict.* iii. 203; *DC. Prodr.* iii. 263. *Myrtus braziliensis*, *Linn. Sp. Pl.* 471. *Plinia rubra*, *Linn. Mant.* 243. *P. pedunculata*, *Linn. f. Suppl.* 253. *E. zeylanica*, *Willd. Sp. Pl.* ii. 963.

A native of S. America, becoming naturalised in Ceylon and parts of India.

VAR. subcordata; leaves slightly cordate at the base. *W. & A. Prodr.* i. 331; *Wight Ill.* ii. 13.

128. **E. mabæoides**, *Wight Ill.* ii. 13; shrubby, leaves short-petioled obovate-spathulate rigid glabrous shining above densely glandular, flowers on short pedicels axillary solitary or clustered on leafless branches, calyx-tube ventricose, limb 4-parted, berry spherical size of small cherry. *Thwaites Enum.* 114; *Bedd. Fl. Sylv. Anal. Gen.* cxi.

CEYLON; Central Provinces 4-7000 ft. alt., *Moon*, *Gardner*, *Thwaites*.

A shrub; much branched. *Leaves* resembling those of *Maba burxifolia*, $\frac{1}{2}$ -2 by $\frac{1}{2}$ -1 $\frac{1}{4}$ in.

129. **E. microphylla**, *Bedd. Fl. Sylv. Anal. Gen.* cx.; glabrous in all its parts, young branches angled and winged, leaves opposite occasionally alter-

nate thickly coriaceous linear obtuse nerves inconspicuous, peduncles axillary solitary shorter than the leaves 1-flowered, fruit size of large grain of pepper.

Banks of rivers, Asamboo Hills, TRAVANCORE, 4-5000 ft. alt.

A small tree, much branched and very dense. *Leaves* $\frac{1}{3}$ - $\frac{1}{2}$ by $\frac{1}{8}$ - $\frac{1}{4}$ in., bright red, quite glabrous when young, prominently black-dotted; petiole $1\frac{1}{2}$ in.—I have seen no specimens.

130. **E. Thwaitesii**, Duthie; young parts pilose, leaves shortly petioled firm ovate obtuse rather abruptly acuminate subacute at the base, pedicels axillary fasciculate twice as long as the petioles, flowers small, berry spherical glabrous shining. *Bedd. Fl. Sylv. Anal. Gen.* cxii. *E. concinna*, *Thwaites Enum.* 416; *not of Phil. in Linnæa* xxviii. 640; *Bedd. Fl. Sylv. Anal. Gen.* cxii.

CEYLON, Ambagamowa District, *Thwaites*.

A tree; branchlets terete. *Leaves* sparingly pilose, at length glabrous, 3-5 by $1\frac{1}{2}$ - $2\frac{1}{2}$ in.; petiole nearly $\frac{1}{4}$ in. *Pedicels* about $\frac{1}{2}$ in. or more. *Calyx-lobes* unequal. *Petals* ciliate, downy outside. *Berries* red, about $\frac{1}{2}$ in. in diameter.

131. **E. singampattiana**, *Bedd. Ic. Pl. Ind. Or.* 65. t. 273; leaves ovate or ovate-oblong retuse or subacute subcordate at the base coriaceous deep green above very pale beneath quite glabrous, flowers white in very short terminal crowded racemes, calyx and bracts slightly pubescent.

SINGAMPATTY HILLS, TINNEVELLY GHATS, moist forests, alt. 3000 ft., *Beddome*.

A small dense tree. *Leaves* about 3 by $1\frac{1}{2}$ -2 in.; primary nerves numerous, forming a continuous looping one near the margin. *Flowers* about $\frac{1}{2}$ in. across. *Petals* prominently nerved.

DOUBTFUL AND EXCLUDED SPECIES.

E. CARYOPHYLLATA, *Willd.* (the Clove-tree) is a native of the Molucca Islands and not indigenous in India.

E. SP. (No. 2420 of Griffith's Herbarium) is too imperfect for description.

E. PULCHELLA, *Roxb.* is a native of the Molucca Islands.

E. WYNAADENSIS, *Bedd. in Mad. Lit. Soc. Journ. ex Ic. Pl. Ind. Or.* 35, t. 161; *Fl. Sylv. Anal. Gen.* cx.; young parts and inflorescence densely fulvo-tomentose, leaves oblong-lanceolate with a long blunt acumen quite glabrous on both surfaces when old, peduncles supra-axillary, calyx-lobes lanceolate acuminate a little longer than the corolla, bracts 2 linear much longer than the flowers, stamens inserted round the edge of the disk, ovary 2-celled, ovules pendulous from the apex about 4 in each cell.

WESTERN PENINSULA; Wynaad, alt. 2-3000 ft., *Beddome*.

A small tree or shrub. *Leaves* 3- $3\frac{1}{2}$ by 1 - $1\frac{1}{4}$ in., rather thin; lateral nerves indistinct above, slender beneath and uniting into a continuous one within the margin; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Peduncles* $\frac{1}{2}$ in. *Fruit?*—This is probably, as Col. Beddome suggests, the type of a new genus intermediate between *Pimenta* and *Eugenia*. The materials at my disposal are too incomplete for the preparation of a proper generic description. The above is compiled from Col. Beddome's description of the plant.

SUBTRIBE **BARRINGTONIÆ.** (By C. B. Clarke.)

9. **BARRINGTONIA**, *Forst.*

Trees. *Leaves* alternate, crowded towards the ends of the branches, entire or slightly crenate-serrate, pinnate-nerved, not dotted. *Flowers* in elongated terminal and lateral racemes, less often in interrupted spikes; bracts small, deci-

duous. *Calyx-tube* scarcely produced above the ovary; lobes 2-4 valvate, or 3-5 imbricate. *Petals* 4, rarely 5, much imbricate, somewhat adnate at the base to the staminal tube. *Stamens* very many, in several series, connate shortly into a tube at the base; filaments filiform, long, all bearing anthers. *Ovary* inferior, 2-4-celled, crowned with an annular disc; style long, simple, stigma small; ovules 2-8 in each cell, pendulous. *Fruit* fibrous or somewhat berried, globose ellipsoid or quadrangular, crowned with the calyx, by abortion 1-seeded. *Seed* ovoid or ellipsoid, without albumen; embryo large, exhibiting two layers, cotyledons nearly obsolete.—*DISTRIB.* Species 20; in tropical Asia, Africa, Australia and Polynesia, often near the sea.

SECT. **Butonica**, *Juss.* (gen.). *Calyx* valvate, 2-3- (rarely 4-) lobed. (BARRINGTONIA, AGASTA and BUTONICA of Miers).

* *Leaves entire.*

1. **B. speciosa**, *Forst. Char. Gen. Pl.* 76, t. 38; leaves large obovate, petals 2-2½ in. *Linn. f. Suppl.* 312; *DC. Prodr.* iii. 288; *Roxb. Fl. Ind.* ii. 636; *Wall. Cat.* 3632, excl. B.; *Blume Bijl.* 1096; *W. & A. Prodr.* 333; *Wight Ic.* t. 547; *Miq. Fl. Ind. Bat.* i. pt. i. 485; *Miers in Trans. Linn. Soc. ser. ii. Bot.* i. 56, t. 10; *Kurz For. Fl.* i. 496. *B. asiatica*, *Kurz in Journ. As. Soc.* 1877, pt. ii. 70. *B. ? macrophylla*, *Miq. l. c.* 491. *Mammea asiatica*, *Linn. Sp. Pl.* 731. *Agasta splendida*, *asiatica* and *indica*, *Miers l. c.* pp. 60-64, tt. 11, 12.

CEYLON, *Thwaites* (Southern DECCAN PENINSULA probably not wild ex *Beddome*); ANDAMANS, *Kurz*; SINGAPORE, *T. Anderson*; on sea-coasts.—*DISTRIB.* The shores of Malaya, Australia and Polynesia.

Tree 30-50 ft., glabrous. *Leaves* often 15 by 7 in., obtuse, narrowed at the base, quite entire, sessile. *Raceme* short, erect; lower pedicels with a leaf-like bract, upper bracts much smaller. *Calyx* closed over the bud; lobes 2, 1½ in., oblong. *Petals* white. *Ovary* 4-celled; ovules about 6 in each cell. *Style* often exceeding 4 in. *Fruit* 3 by 3 in., quadrangular or nearly ovoid, by abortion 1-seeded.—*Mr. Miers* finds a second genus on a drawing of Forster which represents the fruit as 4-celled. But the drawing appears to be taken from the fruit of *B. speciosa*, the very anomalous embryo having misled Forster to sketch in faintly four septa.

** *Leaves crenate-denticulate.*

2. **B. racemosa**, *Blume*; *DC. Prodr.* iii. 288; racemes pendulous pedicels ½-¾ in., calyx-tube in the bud broadly funnel-shaped segments 2-3, fruit ovoid. *Roxb. Fl. Ind.* ii. 634; *Wall. Cat.* 3634; *W. & A. Prodr.* 333; *Wight Ic.* t. 152, including fruit; *Bot. Mag. t.* 3831; *Dalz. & Gibs. Bomb. Fl.* 94; *Kurz For. Fl.* i. 496. *B. speciosa*, *Wall. Cat.* 3632 B. *B. alba* and *rubra*, *Miq. Fl. Ind. Bat.* i. pt. i. 487. *Eugenia racemosa*, *Linn. Sp. Pl.* 673. *Stravadium album* and *rubrum*, *DC. Prodr.* iii. 289. *Butonica racemosa* and *alba*, *Miers in Trans. Linn. Soc. ser. ii. Bot.* i. 65, 66, t. 13, fig. 1-17. *B. rubra* and *inclyta*, *Miers l. c.* pp. 70, 71, t. 14, fig. 1-3, 19.—*Rheede Hort. Mal.* iv. t. 6.

On sea-coasts. CONCAN; *Stocks*. QUILON, *Wight* No. 1064. From the SOONDERBUN to MALACCA; *Wallich*, *Kurz*, *Griffith*, *Mainagay*. ANDAMANS; *Kurz*.—*DISTRIB.* Malaya and Polynesia.

An evergreen tree attaining 50 ft., glabrous. *Leaves* 10 by 3 in., cuneate-oblong, lightly crenate-denticulate; petiole ½-¾ in. *Racemes* 12-18 in., pendulous, flowers distant, pedicels ¼-½ in. *Calyx-lobes* ⅓ in., ovate. *Style* often 1½ in. *Fruit* 1½ by 1½ in., ovoid, obscurely quadrangular below when quite ripe; in ripening attaining

nearly its full length before one-third its full breadth; in Maingay's examples nearly ellipsoid: exocarp very thick, fibrous.

3. **B. ceylanica**, *Gardn. MS.*; racemes pendulous pedicels $\frac{1}{2}$ – $\frac{7}{8}$ in., calyx-tube in the bud broadly funnel-shaped segments 4 at first rounded rather than ovate. *B. racemosa* var. β , *Thwaites Enum.* 119. *Butonica ceylanica*, *Miers in Trans. Linn. Soc. ser. ii. Bot. i. 77.*

CEYLON, south of the island abundant; *Thwaites*.

Treated by Mr. Thwaites as a var. of *B. racemosa*, and after specific separation by *Miers l. c.* reduced to *B. racemosa* again by *Kurz in Journ. As. Soc.* 1877, pt. ii. 70. *Butonica intermedia*, *Miers l. c.* from New Caledonia differs by calyx-lobes 2–3. ovate.

4. **B. conc. dea**, *Griff. Notul* 656, *lc.* 635, 636 fig. 1; racemes suberect, calyx-tube in the bud campanulate somewhat urn-shaped, fruit ovoid with 8 wing-like descending processes from the base. *Kurz For. Fl. i.* 497. *B. alata*, *Wall. Cat.* 3633. *Butonica alata*, *Miers in Trans. Linn. Soc. ser. ii. Bot. i. 70*, t. 14, fig. 10–15.

MOULMEIN; *Wallich*. Coast forests of TENASSERIM; *Kurz. MALACCA*; *Griffith*.

An evergreen shrub or small tree (*Kurz*), glabrous. *Leaves* 7 by $2\frac{3}{4}$ in., oblong, narrowed downwards, at the very base cordate, crenulate-serrulate or nearly entire; petiole $\frac{1}{2}$ in., thick. *Raceme* 4 in., lax, but erect; pedicels $\frac{1}{4}$ – $\frac{3}{4}$ in., glabrous (or somewhat puberulous, *Kurz*). *Calyx-tube* broad at the base, the 8 descending processes often manifest in the bud as figured by Griffith. *Calyx-lobes* usually 2, $\frac{3}{8}$ in., ovate. *Petals* and *style* as in *B. racemosa*. *Fruit* $1\frac{1}{4}$ by 1 in., conically ovoid, broadest at the very base and there 8-winged; wings produced downwards in 8 semi-cordate processes.—Mr. Miers l. c. has asserted that Griffith's figures are mixed, and that part of them refer really to *B. alba*, *Miers*: but *Kurz* has rectified this in *Journ. As. Soc.* 1877, pt. ii. 70. Griffith's figures agree more closely with the material than do Miers's.

SECT. **Stravadium**, *Juss. (gen.)*. *Calyx* lightly imbricate, 3–5- (usually 4-) lobed. (STRAVADIUM and DOXOMMA of Miers).

* *Ovary* 2-celled, whole calyx less than $\frac{1}{2}$ in. (STRAVADIUM, Miers).

5. **B. acutangula**, *Gaertn. Fruct.* ii. 97, t. 101; leaves short-petioled cuneate-elliptic, racemes elongate pendulous, fruit quadrangular oblong equally narrowed towards and subtruncate at each end. *Roxb. Fl. Ind.* ii. 635; *W. & A. Prodr.* 333; *Miq. Fl. Ind. Bat. i.* pt. i. 488; *Dalz. & Gibs. Bomb. Fl.* 95; *Bedd. Fl. Sylv.* t. 204; *Brand. For. Fl.* 235; *Kurz. For. Fl. i.* 497. *Eugenia acutangula*, *Linn. Sp. Pl.* 673. *Stravadium acutangulum*, *Miers in Trans. Linn. Soc. ser. ii. Bot. i.* 80. *S. rubrum*, *Wall. Cat.* 3635. *S. obtusangulum*, demissum, *Rheedii*, *globosum*, *Miers l. c.* pp. 81, 82, 86 with syn., and probably (from the descriptions) several others of which examples authenticated by Mr. Miers have not been seen.—*Rheede Hort. Mal.* iv. t. 7.

Throughout INDIA from the HIMALAYA to CEYLON and SINGAPORE very common; no tree is more plentiful in the plain of BENGAL.—DISTRIB. Malaya; and North-West Australia (if *Stravadium gracile* Miers be considered the same species as by *Bth. Fl. Austral.* iii. 288).

Attaining 30–40 ft., glabrous. *Leaves* 5 by 2 in., minutely denticulate-crenate, narrowed into the petiole $\frac{1}{2}$ – $\frac{1}{4}$ in. *Racemes* often 1 foot, glabrous, rachis not succulent; pedicels 0– $\frac{1}{4}$ in. *Calyx-tube* in the bud very short, funnel-shaped; lobes $\frac{1}{2}$ in., roundish, not longer on the fruit. *Petals* $\frac{1}{2}$ in., pink. *Filaments* long, usually red. *Fruit* $1\frac{1}{2}$ by $\frac{1}{2}$ – $\frac{3}{4}$ in., broadest in the middle, angles broad, rounded.—“Indian Oak” of the English denizens.

VAR. *pubescens*, sp. Miers, l. c. 83 (Stravadium); leaves pubescent on the nerves beneath, racemes and pedicels often more or less pubescent. Deccan Peninsula; frequent.

** Ovary 4-celled, whole calyx more than $\frac{3}{8}$ in. (DOXOMMA, Miers).

† Petiole short usually less than $\frac{1}{2}$ in.

6. **B. augusta**, Kurz in Journ. As. Soc. 1873, pt. ii. 233; For. Fl. i. 498; leaves cuneate-obovate, flowers sessile, calyx-tube in the bud acutely 4-winged. Stravadium augustum, Wall. Cat. 3637. Doxomma angustatum, Miers in Trans. Linn. Soc. ser. ii. Bot. i. 105, excl. quotations of Jack and Helfer. D. magnificum, Miers l. c. 106.

MOULMEIN and TAVOY; Parish. AMHERST; Wallich. TENASSERIM; Kurz.

An evergreen tree 30–50 ft. Leaves 14 by 7 in., narrowed to the base, minutely serrulate or nearly entire, glabrous; petiole $\frac{1}{2}$ in. Raceme sometimes 3 ft., always elongate with a thick rachis, pendulous; bract to each flower $\frac{1}{2}$ in., ovate or lanceolate, caducous. Calyx total length $\frac{1}{2}$ in., minutely white-tomentose. Petals $\frac{3}{4}$ in., ovate, white (Parish). Fruit (half-ripe) 1 in., ellipsoid, somewhat obovoid, quadrangular, wings 4, narrow.

7. **B. Helferi**, C. B. Clarke; leaves linear-oblong, pedicels $\frac{1}{5}$ in., calyx-tube in the bud funnel-shaped. Doxomma angustatum, Miers in Trans. Linn. Soc. ser. ii. Bot. i. 105, partly.

TENASSERIM and ANDAMANS; Helfer (Kew Distrib. No. 2426).

Leaves 20 by 4 in., narrowed to the base, minutely serrulate or nearly entire, glabrous; petiole $\frac{1}{4}$ in. Raceme exceeding 1 ft., pendulous, glabrous or minutely puberulous. Calyx total length $\frac{1}{2}$ in., obscurely puberulous; tube in the bud terete or very obscurely quadrangular; whereas in *B. augusta* (to which Helfer's plant is referred by Miers) the wings are broad sinuous even in the bud.

†† Petiole long, usually more than $\frac{1}{2}$ in.

8. **B. pterocarpa**, Kurz in Journ. As. Soc. 1873, pt. 234; For. Fl. i. 498; leaves obovate-lanceolate petiole often 1 in., spike 20 in. pendulous, flowers sessile, calyx-tube in the bud 4-winged. [The syn. D. magnificum Miers, quoted by Kurz in Journ. As. Soc. 1877, pt. ii. 70, does not belong.]

PEGU and MARTABAN to TENASSERIM; Kurz No. 3021.

An evergreen tree, 30–50 ft. glabrous. Leaves 10 by 3½ in. (attain 16 in. ex Kurz), acute, attenuated at the base, minutely serrulate or nearly entire. Rachis of spike thick, glabrous or obscurely puberulous. Calyx total length $\frac{5}{8}$ in., tube obscurely puberulous, distinctly 4-winged in the bud but much less so than in *B. augusta*. Fruit (ex Kurz) 2 in. oblong, quadrangular, angles with narrow but thick wings, fibrous-fleshy.—This seems very near *B. augusta*, as Mr. Kurz states.

9. **B. macrostachya**, Kurz For. Fl. i. 498, including *B. pendula* Kurz l. c.; leaves lanceolate petiole 1–3 in., spike 20 in. pendulous, flowers sessile, calyx-tube in the bud quadrangular or nearly terete. *B. cylindrostachya*, Griff. Notul. iv. 655. *B. sarcostachys*, Miq. Fl. Ind. Bat. i. pt. i. 490. Stravadium acuminatum, Wall. Cat. 3636. Careya macrostachya, Jack in Mal. Misc. i. 47. *C. pendula*, Griff. Notul. iv. 661. Doxomma pendulum, cylindrostachya, acuminatum, sarcostachys and macrostachyum, Miers in Trans. Linn. Soc. ser. ii. Bot. i. 99, 100, 102, 104, t. 15, fig. 9–15.

MERGUI; Wallich, Griffith, Parish. MALACCA; Griffith, Maingay No. 763.—DISTRIB. Malaya to Borneo.

An evergreen glabrous tree 30-40 ft. *Leaves* 12 by $3\frac{1}{2}$ in., much narrowed at either end, minutely crenulate-dentate; petiole longer than in the other species and dilated at the base. *Spike* with thickened rachis, glabrous or scarcely puberulous; bracts subulate, small, caducous. *Calyx* total length $\frac{3}{4}$ -1 in., tube quadrangular, not winged in the bud. *Petals* high red, filaments white. *Fruit* $2\frac{1}{4}$ by $1\frac{1}{2}$ in., ellipsoid, equally tapering to each end, roundish but with 4 distinct ribs.—Kurz has reduced all the synonyms above except *Careya pendula* of Griffith, of which he appears to have possessed no example and which he supposed to differ by having the flowers pedicelled. But in Griffith's *Careya pendula* the flowers are sessile or subsessile, and it does not appear to differ in any way from *Barringtonia macrostachya*.

10. **B. rigida**, C. B. Clarke; leaves long-petioled lanceolate, spikes 2-3 in. rigid erect sub-tomentose. *Doxomma rigidum*, Miers in *Trans. Linn. Soc. ser. ii. Bot. i. 104*.

MALACCA; Maingay, No. 767.

Leaves 12 by $3\frac{1}{2}$ in., glabrous, acute at each end, entire or very nearly so; petiole $1\frac{1}{2}$ in., not dilated at the base. *Spikes* from axils not close to the end of the branches, rusty brown. *Fruits* $\frac{7}{8}$ by $\frac{1}{2}$ in., sessile, approximated, erect, with 4 obtuse angles, nearly equally wide their whole length, subtruncate at apex and base, fibrous.—This species is quite unlike all others of the section: the fruits are more like those of sect. *Stravadium*, but Miers has satisfied himself that they contain 3 abortive cells: flowers unknown.

10. CAREYA, Roxb.

Trees or very small shrubs. *Leaves* alternate, crowded towards the ends of the branches, membranous, slightly crenate-serrate, pinnate-nerved, not dotted, narrowed at the base, sessile or petioled. *Flowers* large, in racemes or interrupted spikes. *Calyx*-tube campanulate or funnel-shaped, hardly produced above the ovary; lobes 4, ovate, imbricate. *Petals* 4, imbricate. *Stamens* very many, in several series, slightly connate at the base; filaments filiform, innermost and outermost without anthers. *Ovary* inferior, 4-5-celled, crowned by an annular disc; style long, simple, stigma small; ovules very many on axile vertical placentas, in two rows in each cell. *Fruit* large, globose, fibrous, crowned with the calyx; dissepiment absorbed or obscure. *Seeds* numerous, lying in pulp, ellipsoid; albumen 0; embryo large, cotyledons obsolete.—**DISTRIB.** Species 3; confined to India.

1. **C. herbacea**, Roxb. *Cor. Pl. iii. 13, t. 217*; *Fl. Ind. ii. 638*; a small undershrub, leaves cuneate-oblong or obovate serrulate. *DC. Prodr. iii. 295*; *Wall. Cat. 3638*; *Wight Ic. t. 557*; *Brand. For. Fl. 237*; *Kurz For. Fl. i. 499*; *Miers in Trans. Linn. Soc. ser. ii. Bot. i. 96*.

Teraï of the HIMALAYA and KHASIA Mts., alt 0-1000 ft.; from KUMAON to CHITTAGONG; extending throughout dry jungles in the plain of Bengal; not rare: especially in sun-grass Teraï jungles annually burnt in the dry season.

Rootstock woody, perennial; herbaceous leafy flowering shoots 6-8 in. *Leaves* 7 by $2\frac{1}{4}$ in., obtuse, long attenuate at the base, glabrous or obscurely puberulous; petiole $0\frac{1}{2}$ in. *Flowers* 1-2 rarely several on each shoot, terminal; peduncles $\frac{1}{2}$ - $1\frac{1}{2}$ in. grey puberulo-pubescent; bracts 2, $\frac{1}{2}$ - $\frac{3}{4}$ in., linear, at the base of the calyx; flower subarticulated within the bracts. *Calyx* total length $\frac{3}{4}$ in.; tube campanulate, terete; lobes ovate, obtuse. *Petals* 1- $1\frac{1}{4}$ in., greenish-purple, elliptic. *Fruit* 1- $1\frac{1}{2}$ in. diam., globose, crowned by the persistent calyx and often by the style.—*Careya herbacea*, Griff. *Notul. iv. 660* is a confused description only partly referring to the present plant; perhaps mixed in the editing, as Miers suggests.

2. **C. arborea**, *Roxb. Cor. Pl.* iii. 14, t. 218; *Fl. Ind.* ii. 638; a tree, leaves obovate or oblong, spikes about 3-flowered, petals obtuse. *DC. Prodr.* iii. 295; *Wall. Cat.* 3640; *W. & A. Prodr.* 334; *Wight. Ill.* 99, 100; *Dalz. & Gibs. Bomb. Fl.* 95; *Bedd. Fl. Sylv.* t. 205; *Brand. For. Fl.* 236; *Kurz For. Fl.* i. 499; *Miers in Trans. Linn. Soc. ser. ii. Bot.* i. 97.—*Rheede Hort. Mal.* iii. 38.

Throughout INDIA, alt. 0–4000 ft.; from the Himalaya to Travancore and Tenasserim: no example from Ceylon.

Attaining 30–60 ft. *Leaves* 12 by 6 in., oblong or orbicular, obtuse or shortly acuminate, narrowed at the base, crenate-denticulate, glabrous; petiole 0–1 in. *Spikes* 3–8 in.; flowers usually few, sessile; bracts 3, unequal. *Calyx* total length $\frac{3}{4}$ –1 in., terete, campanulate, obscurely pubescent; lobes ovate, obtuse. *Petals* $1\frac{1}{2}$ in., white, elliptic. *Filaments* red. *Ovules* in two rows in each cell of the ovary (*Kurz*). *Fruit* $2\frac{1}{2}$ by 2 in., globose, surmounted by an enlarged mouth having a depressed pit at the vertex within the calyx-teeth. *Seeds* $\frac{3}{8}$ – $\frac{1}{2}$ in., ellipsoid.—Dissepiments of the fruit permanent, at least sometimes. *C. orbiculata*, *Miers l. c.* i. 98 t. 16, fig. 6–8 (founded on Griffith's example Kew Distrib. No. 2428 collected at Mergui) has the ovary slightly verrucose, apparently from the attack of some insect.

3. **C. sphaerica**, *Roxb. Fl. Ind.* ii. 636; a tree, leaves obovate or orbicular, spikes many-flowered, petals acute white. *Wall. Cat.* 3639; *Wight Ic.* t. 147, 556; *Kurz For. Fl.* i. 500; *Miers in Trans. Linn. Soc. ser. ii. Bot.* i. 97, t. 16, fig. 9–15.

Mountains of CHITTAGONG, *Roxburgh*.

This is very doubtfully separable from the preceding species: *Roxburgh* says that in each cell of the ovary the ovules are in six rows (not in two as in *C. arborea*). Mr. *Kurz* does not appear to have seen the tree, and closely follows *Roxburgh*. Neither Col. *Beddome* nor C. B. *Clarke* have ever distinguished *C. sphaerica* alive. Mr. *Miers* has set aside in the herbarium (as *C. sphaerica*) examples collected as *C. arborea* by *Wallich*, *Rottler*, *Ritchie* and J. D. H., so that none of these could have distinguished the tree in the field.

11. **PLANCHONIA**, *Blume*.

Trees. *Leaves* alternate, crowded towards the ends of the branches, membranous, crenulate, pinnate-nerved, without dots. *Racemes* short, terminal; flowers greenish-yellow or white. *Calyx-tube* turbinate, scarcely produced above the ovary; lobes 4, imbricate. *Petals* 4, imbricate. *Stamens* very many, in several series, slightly connate at the base, innermost without anthers. *Ovary* inferior, 3–4-celled, crowned by an annular disc; style long, simple, stigma small; ovules many in each cell. *Fruit* (ex *Miers* and *Kurz*) large, 3–1-celled, fibrous, ovoid, crowned by the calyx. *Seeds* several, ellipsoid, lying in pulp; albumen 0; embryo horseshoe-shaped, cotyledons short.—DISTRIB. Species 2, extending from the Andamans to Australia.

1. **P. littoralis**, *Van Houtte in Fl. des Serres* vii. 25; glabrous, leaves obovate-oblong, flowers greenish on very short thick pedicels. *Miers in Trans. Linn. Soc. ser. ii. Bot.* i. 94; *Kurz For. Fl.* i. 500. *P. littoralis*, *Miers l. c.* *Pirigarda valida*, *Blume Bijdr.* 1096. *Gustavia valida*, *DC. Prodr.* iii. 290; *Hassk. in Flora*, 1844, 595.

ANDAMANS, in the evergreen coast-forests; *Kurz*.

An evergreen tree 40–60 ft. *Leaves* 7 by $3\frac{1}{2}$ in., obtuse or scarcely acute, much narrowed at the base, denticulate; petiole $\frac{1}{8}$ – $\frac{1}{2}$ in. *Raceme* short, terminal; flowers middle-sized. *Calyx-tube* $\frac{1}{4}$ in., top-shaped, obsoletely 8-angled; segments $\frac{1}{2}$ in., ovate, rounded. *Petals* 1 in., obtuse, reflexed. *Filaments* $1\frac{1}{2}$ in., purple.—(Description chiefly copied from *Kurz*).

DOUBTFUL GENUS.

Leucymmaea, Presl. *Epimel Bot.* 211, a genus supposed by Kurz to come next *Planchonia*, has opposite leaves and branches, and is probably stipulate (from Presl's description): at all events it cannot be allied to *Planchonia*.

ORDER LX. MELASTOMACEÆ. (By C. B. Clarke.)

Herbs or shrubs, more rarely trees, sometimes climbers. *Leaves* opposite or rarely whorled, generally petioled, entire or nearly so, often palmately 3-5-7-nerved from near the base to the apex (usually pinnate-veined in *Memecylon*); stipules 0. *Flowers* spiked panicled or corymbed, rarely solitary or clustered, regular, hermaphrodite. *Calyx-tube* united by vertical walls to the ovary, rarely nearly free; limb usually 4-5- (sometimes 3- or 6-) lobed, sometimes truncate, rarely falling off in a cap. *Petals* as many as the calyx-lobes, contorted in the bud, on the margin of the calyx-limb. *Stamens* as many or more than (frequently twice as many as) the petals, inserted with them; alternate stamens often shorter sometimes rudimentary, filaments bent inwards in the bud; anthers opening at the summit by one or two pores, rarely by slits down the face; connective often appendaged near the base by bristles tubercles or a spur. *Ovary* 4-5- (rarely 3- or 6-) celled (in *Memecylon* 1-celled); style simple, filiform, rarely short; ovules very many (except in *Memecylon*); placentas in the *Melastomeæ* axile, in the *Astro-niææ* parietal, in *Memecylon* free central. *Fruit* included in the calyx-tube, capsular or berried, breaking up irregularly or by slits through the top of its cells. *Seeds* minute, very many (in *Memecylon* one only); albumen 0; cotyledons short (or in some of the *Memecyleæ* long thin convolute).—DISTRIB. Species 1800, tropical with a few subtropical; very many in America, many in south-east Asia, a few in Africa and Polynesia.

SUBORDER I. **Melastomeæ.** *Ovary* 3-6- (usually 4-5-) celled. *Ovules* very many, on placentas radiating from the axis. *Seeds* very many. *Anthers* opening by a single terminal pore (rarely by 2).

TRIBE I. **Osbeckiæ.** *Seeds* curved through half a circle, minutely punctate.

Stamens all alike. Fruit capsular	1. OSBECKIA.
Stamens all nearly alike. Fruit a berry	2. OTANTHERA.
Stamens very unequal	3. MELASTOMA.

TRIBE II. **Oxysporeæ.** *Seeds* straight, oblong or cuneate, raphe often excurrent. *Ovary* with the vertex usually free conical. *Petals* more than 3. *Inflorescence* not scorpioid. *Fruit* capsular.

* *Inflorescence* terminal (see also *Ochthocharis*).

Panicles broad showy.	4. OXYSPORA.
Large climber. Flowers umbellate	5. KENDRICKIA.
Panicles narrow. Flowers minute	6. ALLOMORPHIA.

** *Inflorescence* axillary, stamens equal, flowers minute.

Stamens 4	7. BLASTUS.
Stamens 10	8. OCHTHOCHARIS.
Stamens 8	9. ANERINCLEISTUS.

TRIBE III. **Sonerileæ.** *Seeds* straight, oblong or cuneate, often angular, raphe sometimes excurrent. *Ovary* flattened or depressed at the vertex. *Fruit* capsular.

- Petals 3. Inflorescence scorpioid 10. SONERILA.
 Petals 4. Flowers nearly sessile 11. SARCOPYRAMIS.
 Petals 4. Flowers in a long-peduncled head. 12. PHYLLAGATHIS.

TRIBE IV. **Medinilleæ.** *Seeds* straight, cuneate or obovate, often angular. *Connective* often appendaged near the base. *Fruit* baccate.

* *Longer stamens having two long bristles attached to the base of the connective in front.*

- Cymes lateral 13. MARUMIA.
 Panicles terminal 14. DISSOCHÆTA.

** *Longer stamens having the connective at base variously appendaged but not with two long bristles in front.*

- Four vertical plates on the ovary 15. ANPLECTRUM.

*** *Stamens equal or nearly so.*

- Connective at base without bristles behind 16. MEDINILLA.
 Connective at base with bristles behind 17. POGONANTHERA.

SUBORDER II. **Astronieæ.** *Ovary* 4-5-celled; ovules very many on parietal nearly basal placentas. *Seeds* very many. *Anthers* short opening by slits. *Fruit* baccate.

- Calyx-tube smooth. Panicles terminal 18. ASTRONIA.
 Calyx-tube verrucose. Cymes small 19. PTERNANDRA.
 Calyx-tube with scales. Flowers solitary or clustered . . . 20. KIBESSIA.

SUBORDER III. **Memecyleæ.** *Ovary* 1-celled; ovules about 9 on a basal short free central placenta. *Stamens* equal; anthers short, opening by pores or short slits. *Berry* 1-seeded.—*Leaves* usually pinnate-nerved.

- Stamens 8 21. MEMECYLON.

1. OSBECKIA, Linn.

Herbs or shrubs, mostly erect and setose; branches commonly tetragonous. *Leaves* opposite or sometimes ternate, entire, subcoriaceous, 3-7-nerved. *Flowers* terminal, solitary capitate or paniced, purple mauve or white, often bracteate. *Calyx-tube* ovoid, carrying stellate hairs or pectinate scales; limb 5- or 4-fid, usually stellately hairy (in *O. aspera* and *O. Rheedii* with simple hairs). *Petals* 5-4. *Stamens* 10 or 8, equal or subequal; anthers oblong, truncate attenuate or beaked; connective not produced at the base, slightly swollen or with two tubercles. *Ovary* inferior, 4-5-celled, more or less adherent to the calyx, setose at the apex; style long, simple; ovules very numerous on placentas radiating from the axis. *Capsule* opening by 4-5 pores in its free vertex. *Seeds* very many, curved through half a circle, covered with minute elevated points.—**DISTRIB.** An eminently Indian genus; 29 out of the 32 species being found in India, two in Malaya, one in Australia; and one Indian species extending also to China and North Australia.

[With regard to the following generally accepted sections of *Osbeckia* founded primarily on the 4-fid or 5-fid flowers it should be premised that several *Osbeckias* which have the flowers normally 4-fid carry also a few 5-fid flowers on the same plant; and that sometimes a strong plant may produce all or nearly all the flowers 5-fid. This occurs eminently in *O. crinita* and in *O. cupularis*.]

SECT. I. **Amblyanthera**. *Perianth* normally 4-merous. *Anthems* not beaked. *Herbs* or small shrubs.

1. ***O. truncata***, *Don ms.*; *W. & A. Prodr.* 322; hairs on the stem patent, flowers capitate often with two or four leaves close under the head, bristles on the apex of the ovary 16–20, fruit $\frac{1}{3}$ – $\frac{1}{5}$ in. broad 8-ribbed ovoid-oblong. *Wight Ic.* t. 375; *Triana in Trans. Linn. Soc.* xxviii. 53. *O. muralis*, *Naud. in Ann. Sc. Nat. Ser.* 3. xiv. 56. *O. Leschenaultiana*, *Dalz. & Gibs. Bomb. Fl.* 92. *O. zeylanica*, *Steud. in Herb. Hohenack.* No. 577.

Throughout the DECCAN PENINSULA, alt. 0–4000 ft.; extending plentifully to CHOTA NAGPORE. EAST BENGAL, Mudhopoor; *C. B. Clarke*.

Stems 4–16 in., annual, 4-angled. *Leaves* 1 in., elliptic, subacute, 3-nerved, hairy on both surfaces, drying yellow; petiole $\frac{1}{12}$ in. *Bracts* ovate or oblong, glabrous on their backs. *Calyx-tube* and teeth with stalked stellate hairs; teeth erect, subsistent. *Petals* less than $\frac{1}{4}$ in., purple. *Capsule* occasionally 5-celled.

VAR. Kurzii; plant scarcely 2 in. with very small leaves and flowers, capsule ovoid ribs altogether obscure.—Parasnath Summit, Behar, alt. 4200 ft.; *Kurz*.

2. ***O. cupularis***, *Don ms.*; *W. & A. Prodr.* 323; flowers subcapitate often with two or four leaves close under the head sometimes more lax, bristles on the apex of the ovary very numerous, fruit rarely less than $\frac{1}{4}$ in. broad obscurely many-ribbed ovoid. *Naud. in Ann. Sc. Nat. ser.* 3. xiv. 61; *Triana in Trans. Linn. Soc.* xxviii. 55. *O. brachystemon*, *Naud. l. c.* 57 and xiii. t. 7, f. 1; *Triana l. c.* 63. *O. truncata*, *Arn. in Hook. Comp. Bot. Mag.* ii. 308; *Naud. l. c.* 57. *O. confertiflora*, *Naud. l. c.* 59. *O. Leschenaultiana*, *Wight Ic.* t. 996; *Thwaites Enum.* 104 partly; not of DC. *O. Wightiana*, *Benth. in Wall. Cat.* 4074 (not in *Wall. Cat.* 4060).

Mountains of the southern part of the DECCAN PENINSULA and of CEYLON; *Wight* No. 1148 and 1095 (and No. 1093 with 4-fid and 5-fid flowers). Mysore; *Lobb.* Bababoodun Hills; *Law.* Nilghiris; *Hohenacker* No. 963 (named *O. Leschenaultiana*). (MERGUI? *Herb. Griffith*). Ceylon; *Gardner*.

Annual and biennial, drying yellow. *Stems* 8–20 in., tetraginous, glaucous upwards, with simple ascending often closely-adpressed hairs. *Leaves* 1–2 in., elliptic, subacute, 3- (or sub- 5-) nerved, hairy on both surfaces; petiole $\frac{1}{3}$ – $\frac{1}{4}$ in. *Bracts* ovate or oblong, glabrous on their backs. *Calyx-tube* and teeth with stalked stellate hairs; teeth patent subsistent. *Petals* $\frac{3}{8}$ – $\frac{3}{4}$ in., dark-purple or nearly white.

VAR. erythrocephala, *Naud. in Ann. Sc. Nat. ser.* 3. xiv. 58. *O. Leschenaultiana*, *Thwaites Enum.* 104.—Ceylon, alt. 6000 ft.; *Thwaites* No. 1576 and 284, *Gardner, Walker*.—Turns black in drying; stem below with deflexed hairs; stellate hairs about the inflorescence a rufous-brown; fruit sometimes large somewhat glaucous and slightly produced at the vertex; flowers in this variety seem always 4-fid.—*Triana* distinguishes (under the name *O. cupularis*) *Wight's* No. 1093 which has sometimes 5-fid flowers, the stamens 8, 9 or 10, from *Wight's* No. 1148 which he takes as *O. brachystemon*: but the two seem identical. Mr. *Thwaites* makes but one species here. *Triana* arranges the main sections of *Osbeckia* according as the flowers are 4-fid or 5-fid; he thus places *O. cupularis* in the 5-fid section at a great distance from *O. brachystemon*; then he says (under the head of *O. Leschenaultiana*) that *O. cupularis* has 4-fid flowers. *O. Leschenaultiana* is the name generally found in herbaria for this variable species, but *Triana* is right in saying that DC. meant by *O. Leschenaultiana* a very different plant.

3. **O. parvifolia**, Arn. in *Hook. Comp. Bot. Mag.* ii. 308; stems glabrous or with scattered small hairs, flowers few pedicelled with lanceolate bracts $\frac{1}{2}$ – $\frac{1}{4}$ in. but not with large floral leaves, fruit $\frac{1}{2}$ in. broad ovoid obscurely ribbed. *Naud. in Ann. Sc. Nat. ser.* 3. xiv. 58; *Triana in Trans. Linn. Soc.* xxviii. 53. *O. Leschenaultiana*, *Thwaites Enum.* p. 104, partly. *O. zeylanica*, *Bot. Reg. t.* 565.

CEYLON, *Walker No.* 332.

Small, woody, procumbent, with the habit of Thyme. *Leaves* $\frac{1}{4}$ – $\frac{3}{8}$ in., ovate-subacute, nearly sessile, shortly setose on both surfaces, drying black. *Calyx-tube* and teeth with stalked stellate rufous hairs; teeth suberect, subpersistent.—Mr. Thwaites treats this also as a var. of *O. cupularis*, and it has all the appearance of being an alpine form of that plant.

4. **O. Rheedii**, *Thwaites Enum.* p. 104; stiffly shrubby, scabrous, leaves rigid 3-nerved harshly scabrous on both surfaces or glabrous above, flowers 1–4 clustered, calyx-tube with adpressed simple hairs, teeth long-lanceolate with erect simple hairs.

CEYLON; *Wight, Walker, Thwaites.*

Small, woody, much branched. *Leaves* 1 in., elliptic or oblong, narrowed at both ends; petiole $\frac{1}{2}$ in. *Petals* $\frac{2}{5}$ in., pale purple. *Fruit* $\frac{1}{5}$ – $\frac{1}{4}$ in. broad, ovoid, truncate.—Mr. Thwaites states the flowers 4-fid, as they are in all the Kew examples; Triana puts the species in his section *Asterostoma* with 5-fid flowers without explanation. The plant differs from *Asterostoma* in the smaller flowers and (what is of more importance) in the anthers which are truncate at top and altogether those of section *Amblyanthera*.

SECT. II. **Genuinæ**. Flowers normally 4-fid, not large. *Calyx* campanulate, not produced or produced into a short neck in the fruit. *Anthers* beaked.

5. **O. chinensis**, *Linn.*; *Roxb. Fl. Ind.* ii. 224; leaves broadly oblong or linear suddenly narrowed at the base, flowers capitate, fruiting calyx-tube with few (or none) adpressed pectinate scales soon smooth shining. *Lour. Fl. Cochinch.* 228; *DC. Prodr.* iii. 141; *Bot. Mag.* t. 4026; *Triana in Trans. Linn. Soc.* xxviii. 53. *O. angustifolia*, *Don Prodr.* 221; *DC. Prodr.* iii. 142; *Wall. Cat.* 4067; *Pl. As. Rar.* t. 251; *Naud. in Ann. Sc. Nat. ser.* 3. xiv. 69. *O. japonica*, *Naud. l. c.* 70. *O. glabrata*, *Wall. Cat.* 4071. *O. myrtifolia*, *Blume Mus. Bot.* i. 51. *O. linearis*, *Blume Mus. Bot.* i. 51, with fig.; *Wall. Cat.* 4969, partly; *Miq. Fl. Ind. Bat.* i. pt. i. 519; *Naud. l. c.* 70 and xiii. t. 7, fig. 4. *O. zeylanica*, *Naud. l. c.* 71. *O. decora*, *Wall. Cat.* 4070. *Tristemma angustifolium*, *Blume Bijl.* 1079; *DC. Prodr.* iii. 144.

HIMALAYA TERAI FROM KUMAON TO BHOTAN, up to 4000 ft. alt. Abundant in NORTH AND EAST BENGAL including ASSAM and KHASIA and thence to SINGAPORE. Also in CHOTA NAGPORE, alt 2000–4000 ft.—DISTRIB. Through China and Malaya to Japan and North Australia.

Stems 2 ft., branches descending, tetragonous, with adpressed hairs. *Leaves* commonly 2 in., narrow-oblong, sometimes 6 in., long-linear, in the Parasnath variety elliptic-oblong from a subcordate base, acute, 3–5-nerved, hairy on both surfaces; petiole less than $\frac{1}{2}$ in. *Bracts* ovate, on the back glabrous or with a few scattered hairs. *Calyx-teeth* lanceolate, glabrous, not keeled on the back, ciliate on the margin; hairs at their tips not spreading stellate. *Petals* $\frac{1}{2}$ in., mauve. *Anthers* with a beak about half their own length. Bristles on the apex of the ovary about 16. *Fruit* $\frac{1}{2}$ in. wide (or much larger in the Parasnath variety), ovoid, with a short neck, often glabrous, sometimes with few or several bristles, calyx-limb never persistent; in the Pegu examples the neck is much prolonged widened at the top.—The figure *Bot. Mag.* t. 4026 rejected by Bentham and Triana, admitted by Naudin, is the true plant: the anther is drawn too long-beaked for *O. octandra* to which Triana refers it, and the accompanying text states the anthers to be “longish beaked”; also the plant is stated to

have been imported from China where *O. chinensis* is common, *O. octandra* unknown. Triana appears to have rejected the figure because it shows 5 petals; the accompanying text states the calyx to be 4-5-fid. Now there are several instances of normally 4-fid *Osbeckias* having some or many 5-fid flowers; but there is no recorded instance of a normally 5-fid *Osbeckia* producing 4-fid flowers. The *Bot. Reg. t. 542* is an inferior figure, but from similar reasoning is probably *O. chinensis* also.

6. *O. capitata*, Benth. in Wall. Cat. 4072; leaves ovate acute from a broad or cordate base subsessile, flowers capitate, calyx-segments lanceolate rounded on the back ciliate. Naud. in Ann. Sc. Nat. ser. 3. xiv. 68; Triana in Trans. Linn. Soc. xxviii. 53. *O. glauca*, Naud. l. c. *Osbeckioidea*, Griff. Ic. 639.

EAST BHOTAN, Tassangsee, alt. 4500 ft.; ex Griffith Journ. KHASIA Mts., alt. 4000-5000 ft.; plentiful.

A perennial herb 8-20 in., branched from the base; branches tetragonous, with adpressed bristles. Leaves 1 in., hairy on both surfaces, 3-9-nerved, nerves deeply sunk on the upper surface in the dried specimens. Bracts ovate, acute, hairy on the back. Calyx-tube sometimes densely covered with clustered bristles, often with pectinate bristle-bearing scales at the apex only, sometimes even when young altogether glabrous. Petals $\frac{1}{2}$ in., mauve. Anthers with a beak more than half their own length. Bristles on the apex of the ovary about 16. Fruit ovoid, $\frac{1}{2}$ in. wide, often glabrous, sometimes more or less bristle-bearing; neck short, calyx-limb never persistent.

7. *O. zeylanica*, Willd. Sp. Pl. ii. 300; leaves oblong or elliptic narrowed at both ends, petiole $0\frac{1}{4}$ in., flowers capitate, calyx-tube with spreading stellately hairy scales persistent on the fruit. Pluk. t. 173, f. 4; Roxb. Fl. Ind. ii. 223; Wall. Cat. 4069; W. & A. Prodr. 322; Miq. Fl. Ind. Bat. i. pt. i. 519; Thwaites Enum. p. 104; Triana in Trans. Linn. Soc. xxviii. 53. *O. serialis*, Naud. in Ann. Sc. Nat. ser. 3. xiv. 67. *O. debilis*, Naud. l. c. 65.

TROPICAL DECCAN PENINSULA, Wight No. 1143; Bababoodun Hills, Malabar; Law. CEYLON; Thwaites.

Erect, annual, 3-15 in.; branches ascending, tetragonous, with adpressed bristles or nearly glabrous. Leaves $\frac{3}{4}$ - $1\frac{1}{4}$ in., hairy on both surfaces. Bracts very narrow. Calyx-segments keeled on their backs, often setose, ciliate on the margin, with stellate prominently-spreading bristles at their tips. Petals $\frac{3}{8}$ in., purple-mauve. Anthers with a beak more than half their own length. Bristles on the apex of the ovary about 16. Fruit $\frac{1}{2}$ - $\frac{1}{5}$ in. broad, ovoid-oblong, calyx-limb deciduous.

VAR. *Helperi*; neck of fruit more produced upwards with 8 ribs, pectinate scales on the lower half of the fruit placed in three whorls encircling it horizontally.—Tennasserim and Andamans, Helfer. Wallich, No. 4069 partly.—*O. zeylanica* is united with *O. chinensis* Linn. by Kurz in Journ. As. Soc. 1877, pt. ii. 74

SECT. III. **Ceramicalyx.** Shrubs or stout herbs. Perianth normally 4-merous. Calyx campanulate produced in fruit into a long or short neck or altogether truncate. Anthers large, produced into a very long beak.

8. *O. hispidissima*, Wight Ic. t. 1612; stems with reflexed strong bristles $\frac{1}{8}$ - $\frac{3}{8}$ in., bracts to the pedicels round many extra ones without pedicels, calyx-segments oblong obtuse glabrous on the back strongly ciliate. Triana in Trans. Linn. Soc. xxviii. 53.

MYSORE; Wostara, Cleghorn. DECCAN PENINSULA; Munda Rani, Wight No. 1100.

Suffrutescent, erect; branches stout, tetragonal. Leaves 4-6 in., lanceolate, narrowed at both ends, with strong bristles scattered on both surfaces or in one specimen nearly glabrous, nerves 3 strong and 2-4 faint; petiole $\frac{1}{2}$ - $\frac{5}{8}$ in. Corymbs about 5-flowered; flowers dark crimson (Wight). Calyx-tube with scattered penicillate

bristle-bearing scales. *Anthers* with a beak much longer than half their length, with two tubercles at the base. Bristles on the apex of the *ovary* more than 50. *Fruit* $\frac{1}{4}$ – $\frac{1}{3}$ in. broad, urn-shaped, entirely without neck; scales permanent, calyx-segments deciduous.

9. *O. stellata*,¹ *Wall. Cat.* 4062; branches with short adpressed rigid hairs, calyx-tube most densely covered with stellate white yellow or brown hairs, teeth stellate hairy, neck of the fruit short or not exceeding half the length of the fruiting ovary dilated at the top. *DC. Prodr.* 142 as to var. a.; *Bot. Reg. t.* 674; *Hook. Exot. Fl. i. t.* 37; *Don Prodr.* 221, partly. *O. crinita*, *Naud. in Ann. Sc. Nat. ser. 3. xiv.* 72; *Smith in Wall. Cat.* 4062; *Kurz in Journ. As. Soc.* 1877, pt. ii. 75. *Melastoma crinita*, *Roxb. Fl. Ind.* ii. 402.

HIMALAYA TERAI from KUMAON to BHOTAN, common; ascending the hills to 5000 ft. alt. CHITTAGONG; *Roxburgh*.—DISTRIB. Canton.

Shrub 4–6 ft.; branches tetragonal. *Leaves* 3 in., lanceolate, 5-nerved, with short hairs on both surfaces or in hot moist valleys glabrous, narrowed or subcordate at the base; petiole $\frac{3}{8}$ in. *Flowers* large, rose-purple, clustered or in somewhat close corymbs; bracts ovate, acute, not very hairy on the back. *Calyx-tube* so densely clothed with hairs as to have a woolly appearance and texture. Bristles on the apex of the *ovary* about 20. *Fruit* $\frac{3}{4}$ by $\frac{1}{2}$ in. including the short neck, ovoid-oblong, densely woolly.—*Don's* description of *O. stellata* says the flowers are 4–5-fid; as 5-fid flowers are not known in our *O. stellata* but are frequent in our *O. crinita*, *Don* probably included under one name both our species. *Naudin's* descriptions of *O. stellata* and *O. crinita* only differ in assigning the long-necked fruit to *O. stellata*; therefore *Naudin's O. stellata* is our *O. crinita*. As *Triana* gives no descriptions or remarks, but quotes both *Wall. Cat.* 4062 and *Naudin's O. stellata* as one species, it cannot be guessed which of the two forms *Triana* took as *O. stellata*. The real distinction between *O. crinita* and *O. stellata* lies in the extreme thick woolliness of the covering of the calyx-tube in our *O. stellata*: consequently Sir J. Smith has written on the original *Wall. Cat.* 4062 (type spec.) "*Osbeckia? nov. sp. (crinita)*." Sir W. J. Hooker states (*Exot. Fl. i. c.*) that he changed the name from *O. crinita* to *O. stellata* and got *Don* to accept the name *O. stellata*. Subsequently Mr. Bentham gave the name *O. crinita* to the next species which has a less hairy calyx.

10. *O. crinita*, *Benth. in Wall. Cat.* 4066; branches with spreading hairs, calyx-tube with many stellate rufous-brown hairs teeth stellate hairy, neck of the fruit (in *Wall. Cat.* 4066 typical example not quite ripe) equalling or exceeding the fruiting ovary much longer than its own breadth. *O. stellata*, *Don Prodr.* 221, partly. *O. stellata* var. β , *DC. Prodr.* iii. 142. *O. stellata*, *Naud. in Ann. Sc. Nat. ser. 3. xiv.* 72.

SIKKIM and BHOTAN, alt. 4000–8500 ft., abundant. KHASIA Mts., alt. 3000–6000 ft. MOULMEIN, alt. 7000 ft.; *Parish*.

Shrub 4–8 ft., much branched. *Leaves* 2–4 in., lanceolate or elliptic-lanceolate, bristly on both surfaces, narrowed or subcordate at the base; petiole $\frac{1}{8}$ – $\frac{3}{8}$ in. *Flowers* large (generally smaller than those of *O. stellata*), 4-fid and not infrequently 5-fid, purple or pure white, in somewhat close corymbs; bracts ovate, acute, usually very hairy on the back. Bristles on the apex of the *ovary* about 20. *Fruit* $\frac{3}{4}$ in. including the neck, ovoid, suddenly narrowed into the cylindric neck, often nearly glabrous.—The bushes of *O. crinita* at Darjeeling have usually a few 5-fid flowers at the summits of the branches: and there is a large-flowered white variety at 4000 ft. alt. which has all the flowers 5-fid. *O. speciosa*, *Herb. Hook. (not Don)* is a low-level form with spreading hairs on the stem but the stellate hairs of the calyx white or yellow not rufous.

11. *O. rostrata*, *Don Prodr.* 221; stem quadrangular glabrous or with scattered patent hairs, corymb compound large, fruit ovoid suddenly narrowed into a long cylindric neck. *DC. Prodr.* iii. 143; *Triana in Trans. Linn. Soc.* xxviii. 53; *Kurz in Journ. As. Soc.* 1877, pt. ii. 74. *O. ternifolia*, *Don Prodr.*

221; *DC. Prodr.* iii. 142; *Wall. Cat.* 4058. *O. pulchella*, *Wall. Cat.* 4059; *Naud. in Ann. Sc. Nat. ser. 3. xiv.* 73. *O. campestris*, *Wall. Cat.* 4063; *O. longicollis*, *Wall. Cat.* 4065. *Melastoma pulchella*, *Roxb. Fl. Ind.* ii. 403.—*Melastomaceæ*, *Griff. Ic.* 638.

In the swamps at the foot of the Himalaya, from NIPAL to BURMA; abundant in NORTH and EAST BENGAL including ASSAM at 500–1000 ft. alt.; and (ex J. D. H.) ascends the hills to 4000 ft. alt.

Erect, 4–8 ft., virgate, hardly divided except towards the corymb. *Leaves* 3–8 in., 5-nerved, often in whorls of three, broadly lanceolate, glabrous or with long hairs scattered on both surfaces; petiole $\frac{1}{2}$ – $\frac{1}{3}$ in. *Corymb* often with elongated branches; bracts ovate, glabrous or little hairy. *Calyx* when young glabrous or somewhat densely stellate hairy. *Petals* rose-purple. Bristles on the apex of the ovary 0 or about 20. *Fruit* $\frac{1}{2}$ in., generally glabrous finally, sometimes with scattered stellate hairs.—A species easily recognised by its habitat (Terai- or rice-swamps), its erect undivided stem and its rose-purple flowers. It varies greatly in hairiness.

VAR. 1. *pulchella*, Benth.; stem leaves calyx and apex of ovary absolutely glabrous.

VAR. 2. *longicollis*, Wall.; stem with hispid patent scattered bristles, leaves bristly-hairy on both surfaces, young calyx somewhat densely stellate-hairy, fruit with scattered stellate hairs.

VAR. 3. *O. marginulata*, Wall. Cat. 4064; stem and capsule with ascending hairs.—Burma.

SECT. IV. *A shrub. Perianth* large 4-merous. *Anthers* without beaks.

12. *O. gracilis*, *Bedd. in Trans. Linn. Soc.* xxv. 216; erect, slender, nearly glabrous, leaves $2\frac{1}{2}$ –3 in. narrow lanceolate 3-nerved bristle-hairy on both surfaces, petiole $\frac{1}{2}$ – $\frac{1}{3}$ in., peduncles with 2–3 large flowers, calyx-tube with a few remote bristles lobes ciliate ended by a bunch of bristles, anthers without beaks. (Resembling *O. longicollis* Wallich i.e. *O. rostrata* above).

DECCAN PENINSULA; Anamallay Mts.; alt. 4000 ft., Col. *Beddome*.

This species (only known from Col. *Beddome*'s description here copied) is referred by *Triana* (*Trans. Linn. Soc.* xxviii. 54) to his section *Ceramicalyx*, which has very long beaks to the anthers. Col. *Beddome*'s plant seems really nearer *O. octandra* DC. below.

SECT. V. *Asterostoma. Shrubs. Perianth* large 5-merous. *Anthers* attenuate upwards not beaked.

[The series of species following from No. 12 to No. 19 inclusive is quite unbroken: the flowers, anthers, fruit and hairs on the ovary are much the same in all. The species are separated by minute or trifling characters only; *Triana* makes more than the following eight, *Thwaites* less, out of the same material.]

13. *O. buxifolia*, *Arn. in Hook. Comp. Bot. Mag.* ii. 309; leaves $\frac{1}{2}$ in. subsessile ovate obtuse 3–5-nerved rufous woolly beneath nearly glabrous striolate above, calyx-teeth $\frac{1}{4}$ – $\frac{1}{3}$ in. long-lanceolate acute rufous-villous without. *Naud. in Ann. Sc. Nat. ser. 3. xiv.* 63; *Thwaites Enum.* p. 105; *Triana in Trans. Linn. Soc.* xxviii. 54.

CEYLON, alt. 6000–8000 ft.; *Walker, Gardner, Thwaites*.

Small, woody, branched; branches and innovations rufous shaggy. *Flowers* 1–3, clustered at the end of the branches. *Fruit* campanulate, truncate, rufous-hairy.

VAR. 1. *typica*; hairs on the calyx-tube with a long stem standing at right angles to the surface of the tube very stellate.

VAR. 2. *minor*, *Thwaites* No. 2618; hairs on the calyx-tube simple villous adpressed, flowers smaller than in the type.

14. **O. aspera**, Blume in *Flora*, 1831, p. 474; leaves oblong-lanceolate or elliptic-acute sparsely hairy on both surfaces or nearly glabrous beneath except on the nerves, calyx-tube strigose or sparingly clothed with pectinate bristle-bearing scales, segments $\frac{1}{5}$ in. ovate-oblong obtuse ciliate with a few clustered but scarcely stellate bristles on the top. *W. & A. Prodr.* 323 (excl. syn. *O. glauca* Benth.); *Wight Ic.* 377; *Thwaites Enum.* p. 105 (as to var. α . and β . only); *Naud. in Ann. Sc. Nat. ser. 3. xiv.* 74; *Triana in Trans. Linn. Soc.* xxviii. 54. *O. Kleinii*, Arn. in *Hook. Comp. Bot. Mag.* ii. 309; *Triana l. c.* *O. minor*, *Triana l. c.* 55. *Melastoma asperum*, Linn.; *DC. Prodr.* iii. 145 (omitting syn.).

DECCAN PENINSULA; *Wight*. CEYLON; at no great elevation, *Thwaites*.

A low shrub, woody below; branches often elongate, adpressedly scabrous. *Leaves* 1-2 in.; petiole $\frac{1}{8}$ - $\frac{1}{4}$ in. *Corymbs* usually 3-6-flowered. *Calyx-lobes* much longer than broad. *Fruit* $\frac{1}{4}$ - $\frac{1}{3}$ in. broad, campanulate, truncate.—*Triana* founded his new sp. *O. minor* on Mr. Thwaites' No. 1569; and does not state in what particulars the species differs from *O. aspera*, *O. Kleinii* and *O. glauca*; but they must be very minute.

VAR. 1. *typica*; no stellate hairs on the calyx.

VAR. 2. *Kleinii*; several or very few stellate hairs on the calyx-tube, hairs at the summits of calyx-lobes clustered but hardly stellate.

15. **O. glauca**, Benth. in *Wall. Cat.* 4073; leaves elliptic narrowed or obtuse at either end softly hairy on both surfaces, calyx-tube with scattered small stellate hairs teeth $\frac{1}{12}$ in. obtuse glabrous on the back ciliate with one stellate hair at the summit. *Triana in Trans. Linn. Soc.* xxviii. 54. *O. aspera*, *Bot. Mag.* 5085.

TRINCOMALEE, TRAVANCORE, QUILON are the localities on the examples of *Wall. Cat.* 4073.

Small, woody, branching; branches adpressedly hairy, glaucous upwards. *Leaves* 1-1½ in.; petiole $\frac{1}{8}$ - $\frac{1}{4}$ in. *Calyx-lobes* much broader than long. *Fruit* $\frac{1}{4}$ - $\frac{1}{2}$ in. broad, campanulate, truncate.—With larger flowers and more silky hairs than *O. aspera*.

16. **O. Walkeri**, Arn. in *Hook. Comp. Bot. Mag.* ii. 309; leaves elliptic narrowed at both ends margins not recurved hairy on both surfaces, calyx-tube adpressedly fulvous-hairy teeth narrowly lanceolate or linear uniformly fulvous-hairy without cilia or stellate hairs. *Thwaites Enum.* p. 105; *Triana in Trans. Linn. Soc.* xxviii. 54, excl. var. β . *Bechetii*.

CEYLON; alt. 6000-8000 ft.; *Walker, Gardner, Thwaites* No. 1571.

A small shrub; branches hispid. *Leaves* 1 in., 3-nerved; petiole $\frac{1}{2}$ in. *Flowers* 1-3, in terminal clusters. *Calyx-tube* with small clustered substellate hairs. *Fruit* $\frac{1}{8}$ - $\frac{3}{8}$ in. broad, campanulate, truncate.—This species is close to *O. burifolia*, Arn. from which it differs by the petioled leaves without recurved margins, and by the adpressed hairs on calyx-tube. But *Thwaites'* specimen No 2618 has leaves with recurved margins and adpressed hairs on the calyx-tube: and is called *O. burifolia* β . *minor* by *Thwaites*, *O. Walkeri* β . *Bechetii* by *Triana*.

17. **O. Wightiana**, Benth. in *Wall. Cat.* 4060; silkily hairy towards the ends of the branches, leaves 5-7-nerved softly hairy on both surfaces elliptic or oblong usually acute, flowers 1-5 clustered, calyx-tube densely covered with pectinate scales fringed by long bristles, teeth $\frac{1}{2}$ in. ovate-oblong obtuse covered with simple or somewhat clustered hairs. *W. & A. Prodr.* 323; *Wight Ic.* 998; *Naud. in Ann. Sc. Nat. ser. 3. xiv.* 63; *Triana in Trans. Linn. Soc.* xxviii. 54.

DECCAN PENINSULA, Southern Mountains. CEYLON, alt. 3000-5000 ft., *Thwaites* (No. 1570 var. δ).

A branched shrub. *Leaves* $1\frac{1}{2}$ – $3\frac{1}{2}$ in.; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in. *Fruit* $\frac{1}{3}$ in. wide, campanulate, truncate.—United by Mr. Thwaites with *O. aspera* above, from which it differs by the more pectinate-scaly calyx, and hardly by any other character.

18. ***O. Leschenaultiana***, DC. *Prodr.* iii. 142; flowers 1–5 clustered with much rufous hair, leaves subsessile ovate obtuse or elliptic acute usually somewhat rounded at the base, calyx-tube densely clothed with stalked stellate rufous hairs teeth $\frac{1}{4}$ in. oblong obtuse with clustered bristles. *Triana in Trans. Linn. Soc.* xxviii. 54. *O. Gardneriana*, *Wight Ic.* 997.

NILGHIRI Mts., alt. 6000–8000 ft., frequent.

A branched shrub; stem usually patently hairy. *Leaves* 1– $1\frac{1}{2}$ in., 3–5-nerved, hairy on both surfaces. *Fruit* $\frac{1}{3}$ in. wide, campanulate, truncate.

19. ***O. rubicunda***, Arn. in *Hook. Comp. Bot. Mag.* ii. 309; branches scabrous-pilose, leaves elliptic or elliptic-oblong acute 5-nerved hairy on both surfaces petiole $\frac{1}{8}$ – $\frac{1}{4}$ in., flowers 1–5 clustered, calyx-tube densely covered with stalked stellate hairs teeth lanceolate acute covered with simple and clustered bristles. *Naud. in Ann. Sc. Nat. ser. 3.* xiv. 62; *Triana in Trans. Linn. Soc.* xxviii. 54.

CEYLON: *Wight, Walker, Gardner.*

A branched shrub. *Leaves* 1–2 in., usually rounded at the base. *Calyx-teeth* $\frac{1}{4}$ in. *Fruit* $\frac{1}{3}$ in. wide, campanulate, truncate.—Triana reduces here *O. elliptica*, Naud. l. c.: but Naudin says his *O. elliptica* has short triangular calyx-teeth: while *O. rubicunda* only exists as a species upon its lanceolate acute calyx-teeth. Thwaites is probably right in referring *O. elliptica* Naud. to *O. cupularis* var. *erythrocephala* above.

20. ***O. reticulata***, Bedd. in *Trans. Linn. Soc.* xxv. 216; branches densely clothed with adpressed hairs, leaves ovate acute petioled densely hairy on both surfaces and also alveolate-reticulate beneath, flowers 1–3 clustered, calyx-tube with large densely clustered bunches of hairs teeth short oblong-obtuse densely ciliate scabrous and with a large terminal substellate hair. *O. alveolata*, Bedd. *Ic.* t. 168.

DECCAN PENINSULA; Anamallay Mts., above 6000 ft. alt.; *Col. Beddome.*

A branched shrub. *Leaves* 1–4 in., round or subcordate at the base, 5–9-nerved; petiole $\frac{1}{2}$ –1 in. *Fruit* $\frac{1}{3}$ in. broad, campanulate, truncate.

21. ***O. Moonii***, *Thwaites Enum.* p. 105; procumbent, rooting from the nodes, peduncles 1-flowered, calyx-teeth long-lanceolate acute with stellate hairs. *Triana in Trans. Linn. Soc.* xxviii. 55.

CEYLON; Colombo and Saffragam District; somewhat rare, *Thwaites.*

Stems elongate, roundish, with scattered lax hairs. *Leaves* 1–3 in., broad-elliptic, acute, 5-nerved, hairy on both surfaces; petiole $\frac{1}{8}$ – $\frac{3}{4}$ in. Peduncles $\frac{1}{2}$ – $1\frac{1}{2}$ in., solitary or few and subumbelled, carrying small round or ovate bracts. *Calyx-tube* densely clothed with stalked stellate hairs standing at right angles to the surface. *Fruit* less than $\frac{1}{4}$ in. broad, campanulate or somewhat ovoid, truncate.

22. ***O. aspericaulis***, *Hook. f. ms.*; *Triana in Trans. Linn. Soc.* xxviii. 55; stem erect simple scabrous with short hairs ending in a robust much-branched corymb, leaves 6 in. petiole $1\frac{1}{4}$ in., fruit ovoid truncate distinctly 10-angled.

TENASSERIM or ANDAMANS, *Helper* No. 2244.

Leaves elliptic-lanceolate, rounded at the base, 5–9-nerved, hairy on both surfaces. *Bracts* lanceolate, caducous. *Calyx-tube* with scattered adpressed simple

hairs and a few compound hairs near the top, teeth long-lanceolate with simple hairs on the back. Ovary crowned with many long bristles. Petals $\frac{3}{4}$ in. Fruit $\frac{1}{2}$ in.

23. **O. octandra**, DC. Prodr. iii. 142 ex Triana; branches and branchlets woody, leaves oblong to lanceolate short-petioled 3-nerved sparingly scabrous or quite smooth on the upper surface, flowers scattered or 2-5 shortly pedicelled, calyx-teeth ovate-oblong, fruit scarcely $\frac{1}{5}$ in. broad obscurely ribbed or smooth sometimes with scattered stellate hairs. Triana in Trans. Linn. Soc. xxviii. 54 excl. nearly all syn. O. virgata, W. & A. Prodr. 323; Thwaites Enum. p. 105; Naud. in Ann. Sc. Nat. ser. 3. xiv. p. 61. O. polycephala, Naud. l. c. 67. O. Wightiana, Benth. in Wall. Cat. 4074. [Of the figures quoted by Triana, Bot. Mag. 2235 and Wight Ic. 998 do not refer to the present plant; Bot. Mag. 4026 has been referred above to O. chinensis; and Wight Ic. 376 may represent our var. major but does not give any idea of the typical O. octandra, DC.]

SOUTH DECCAN PENINSULA in and near the mountains; plentiful. CEYLON, up to 3000 ft. alt.; Thwaites.

Branches subquadrangular with adpressed hairs, or woody nearly round and glabrous. Leaves (in the typical O. octandra) not more than 1 in.; petiole $\frac{1}{2}$ in. Calyx-tube with scattered stellate hairs, teeth usually ciliate and with one stellate terminal bristle, sometimes perfectly glabrous.—This typical woody small-leaved shrub appears very distinct, but even the small-leaved branches carry sometimes large leaves also; and it thus graduates into—

VAR. major; leaves larger often 2 in. frequently hairy on the upper surface often whitened beneath, heads flowers and fruit larger than in the type. O. virgata, Wight Ic. t. 376.—This variety is confounded by many authors with O. cupularis; but it differs in the perianth being more constantly 5-merous, and in its anthers which are not truncate nor suddenly narrowed into a very short beak, but gradually narrowed upward. It has also been mixed with O. aspera, but differs by the ovary having much fewer bristles on the top.

24. **O. nutans**, Wall. Cat. 4068; leaves narrowly lanceolate 3-nerved glabrous striolate above scabrous on the nerves beneath, flowers in small clusters, calyx-tube nearly glabrous with pectinate scales between the bases of the calyx-teeth, calyx-teeth large broad lanceolate glabrous ciliate on margin hairy at the vertex, fruit often nodding. Triana in Trans. Linn. Soc. xxviii. 54.

SUBTROPICAL HIMALAYA from SIKKIM eastwards, alt. 500-2500 ft., frequent to the upper end of ASSAM; also on the northern base of the KHASIA Mts.

A woody branching small shrub. Leaves commonly $1\frac{1}{2}$ by $\frac{1}{4}$ in.; petiole $\frac{1}{2}$ in. Flowers mauve-purple, not very large. Fruit $\frac{1}{2}$ in. broad, campanulate, truncate.

25. **O. Wynaadensis**, C. B. Clarke; stems with adpressed short hairs, leaves 5 in. oblong-lanceolar petiole $\frac{3}{4}$ in., flowers in subterminal corymbs, calyx-tube with scattered flat setigerous scales otherwise glabrous teeth large broad-lanceolate glabrous shortly ciliate.

DECCAN PENINSULA, Wight No. 1099; Wynaad, alt. 4000 ft.; C. B. Clarke.

Leaves 5-nerved, scabrous-hairy on both surfaces. Fruit $\frac{1}{2}$ in. broad, ovoid, truncate, the free part of the ovary with a ring of short hairs (joined at their base into a narrow tube) near its top, otherwise glabrous.

26. **O. nepalensis**, Hook. Fl. Exot. t. 31; leaves 3-4 in. elongate oblong-lanceolate 5-nerved softly hairy on both surfaces petiole less than $\frac{1}{2}$ in., flowers in small rather close corymbs, calyx-tube with large flat scales fringed with bristles of which 5 prominently alternate with the calyx-teeth, calyx-teeth large broad-lanceolate glabrous ciliate. DC. Prodr. iii. 142; Wall. Cat. 4061;

Bot. Reg. 1475; *Naud. in Ann. Sc. Nat. ser. 3. xiv. 68 and xiii. t. 7, fig. 2*; *Triana in Trans. Linn. Soc. xxviii. 55*; *Kurz in Journ. As. Soc. 1877, pt. ii. 75*. *O. Chulesis, Don Prodr. 221*; *DC. Prodr. 143*. *O. speciosa, Don Prodr. 222*.

SUBTROPICAL HIMALAYA from NEPAL eastwards and in the KHASIA Mts.; alt. 0-4000 ft., abundant.—DISTRIB. Ava.

A shrub; branches with adpressed hairs. *Bracts* ovate, glabrous, villous, centre of the backs villose. *Flowers* purple-mauve or white. *Fruit* $\frac{3}{4}$ by $\frac{1}{2}$ in., campanulate, truncate, scales permanent.

2. *OTANTHERA*, Blume.

Shrubs. *Leaves* subcoriaceous, entire, 3-5-nerved. *Panicles* small, terminal and subterminal. *Calyx-tube* ovoid, carrying pectinate scales or simple hairs or subglabrous; teeth 5-6, deciduous. *Petals* 5-6, obovate. *Stamens* 10-12, alternate slightly longer; anthers opening by one pore at the summit, not beaked; connective not produced at the base, augmented by two auricles which are close to the anthers in the shorter stamens a little removed below them in the longer. *Ovary* half-inferior, apex carrying bristles, 5-6-celled; style filiform, simple; ovules very numerous, placentas axile, radiating. *Fruit* a berry. *Seeds* very many, curved through half a circle, minutely punctate.—DISTRIB. Species 2 or 3, extending from Burma to Singapore, Malaya, the Philippines and North Australia.

Otanthera comes between *Osbeckia* and *Melastoma*: the alternate stamens being auricled at the base exactly on the plan of those in *Melastoma*, but in a much less degree.

1. *O. moluccana*, *Blume in Flora*, 1831, p. 489; leaves sparingly shortly hairy beneath, small panicles of 3-5 flowers terminal and from one or two of the upper axils, fruit ovoid truncate with scattered shortly-stalked stellate hairs. *Blume Mus. Bot. p. 56, t. 20*; *Naud. in Ann. Sc. Nat. ser. 3. xiii. 353*; *Miq. Fl. Ind. Bat. i. pt. i. 515*. *O. cyanoides, Triana in Trans. Linn. Soc. xxv. 56*. *Melastoma cyanoides DC. Prodr. iii. 146*. *M. moluccanum, Blume Bijdr. 1078*; *DC. Prodr. iii. 146*.—(*Rheede Hort. Mal. iv. t. 43* quoted by *Triana* may be *O. rubro-limbata*).

MERGUI; *Griffith* (Kew Distrib. No. 2253).—DISTRIB. Moluccas; Sierra Leone (*Triana*).

Stems scabrous. *Leaves* 2-2 $\frac{1}{2}$ in., elliptic-lanceolate; petiole $\frac{1}{4}$ in. *Bracts* ovate, deciduous. *Petals* less than $\frac{1}{2}$ in., white. *Fruit* $\frac{1}{2}$ in. broad.

[*O. bracteata, Korth.* has the calyx-tube covered with long simple approximated ascending bristles, the broad bracts on the pedicels several close together subpersistent: otherwise it is much like *O. moluccana*. *Kurz in For. Fl. i. 502* and in *Journ. As. Soc. 1877, pt. ii. 75*, says *O. bracteata, Korth.* is not unfrequent in Tenasserim. But *Griffith's* Mergui plant is clearly *O. cyanoides* *Triana* as appears from examples named by *Triana's* hand, while *Kurz* quotes *Triana* for *O. bracteata*.]

2. *O. nicobarensis, Teysm. & Binn. Nov. Pl. Hort. Bogor. 29*; flowers terminal and axillary in small panicles, calyx-teeth glabrous acuminate ciliate, fruit oblong from a rounded base purple.

NICOBARS; collected by the Novara expedition and communicated by them to the Buitenzorg Botanic Garden; *Kurz (Journ. As. Soc. 1876, pt. ii. 131)*.

A low shrub; branches tetragonous, subglabrous, but hairy at the nodes. *Leaves* $\frac{3}{4}$ -3 in., ovate or oblong-ovate, acuminate, rounded at the base, 5-nerved, shortly strigose on both surfaces; petiole $\frac{1}{2}$ in. *Petals* 5, purple. *Stamens* subequal, anthers with two auricles added at the base.—*Not seen*.

EXCLUDED SPECIES.

O. RUBRO-LIMBATA (*Lachnopusium rubro-limbatum*, Blume) is figured by Link & Otto, *lc. Pl. Sel.* t. 41, as a plant raised in European gardens from the "East Indies." It is more likely from Malaya than India, and Mr. Benthams in *Fl. Austral.* iii. 292 thinks it probably identical with *Otanthera bracteata*.

O. KOTI-GUEDA, Naud. in *Ann. Sc. Nat. ser.* 3. xiv. 64, is reduced to *O. Wightiana* by Triana; but Naudin describes its calyx-teeth short.

3. **MELASTOMA**, Linn.

Strigose or villous shrubs. *Leaves* petioled, oblong or lanceolate, entire, 3-7-nerved. *Flowers* terminal, solitary clustered or paniced, showy, purple, 5- (rarely 6-7-) merous. *Calyx-tube* with simple (rarely with penicillate) hairs, lobes deciduous. *Petals* equal in number to the calyx-lobes. *Stamens* twice as many as the petals, very unequal, alternate longer ones with purple anthers having the connective long-produced at base and terminating in two lobes, the shorter ones having yellow anthers the connective not produced but with two tubercles in front. *Ovary* more or less united to the calyx-tube, 5- (rarely 6-7-) celled, apex bearing bristles; style filiform, simple; ovules very numerous, placentas axile, radiating. *Fruit* coriaceous or somewhat berried, bursting irregularly. *Seeds* minute, very many, curved through half a circle, minutely punctate.—**DISTRIB.** Species 40 or 8 in South-East Asia and its islands, extending to North Australia and Polynesia.

* *Hairs* closely adpressed at their base to the calyx-tube.

1. **M. malabathricum**, Linn.; *DC. Prodr.* iii. 145; stems with short dense hairs adpressed or spreading, leaves with adpressed scabrous hairs above, scabrous on the nerves beneath and shortly hairy or nearly glabrous between them, bracts large elliptic narrowed into a stalk generally enclosing the buds, scaly hairs on the calyx-tube flat lanceolate, calyx-teeth long (or very long) ovate-lanceolate to narrow-lanceolate, glabrous within or with a few short hairs near the tip only. *Roxb. Hort Beng.* 33; *Fl. Ind.* ii. 405; *Wall. Cat.* 4040; *Bot. Reg.* t. 672; *W. & A. Prodr.* 324; *Wight Ill.* t. 95; *Dalz. & Gibs. Bomb. Fl.* 92; *Naud. in Ann. Sc. Nat. ser.* 3. xiii. 285; *Thwaites Enum.* 106 (*a. and β.*); *Kurz For. Fl.* i. 503, not of *Miq. Fl. Ind. Bat.* i. pt. i. 507. ? *M. obvolutum*, *Jack in Trans. Linn. Soc.* xiv. 3. *Trembleya rhinanthra*, *Griff. Notul.* iv. 677, cf. *Kurz in Flora*, 1871, p. 289.

Throughout INDIA very abundant, from sea-level up to 6000 ft. alt. "Indian Rhododendron" of the English denizens. Not towards the Indian Desert.—**DISTRIB.** Not found out of India: i.e. the above description has been narrowed to the Indian typical plant which is not found in Malaya, etc.

A spreading shrub 6 ft. *Leaves* 3-4 in., broad-lanceolate; petiole $\frac{3}{8}$ in. *Flowers* 1-5, clustered, mauve-purple. *Fruit* $\frac{1}{4}$ in. wide, short-ovoid, truncate, becoming pulpy within. *Calyx-teeth* often $\frac{1}{2}$ - $\frac{5}{8}$ in., not shorter than the tube.—Mr. Benthams in *Fl. Austral.* iii. 293 proposes to include 24 species of Naudin under *M. malabathricum*, Linn.

VAR. adpressum, Wall. Cat. 4081; leaves narrow-lanceolate smaller than in *M. malabathricum* with a rigid more harshly scabrid pubescence. *M. anopanthum* Naud. in *Ann. Sc. Nat. ser.* vol. xiii. 277.—Mergui to Singapore, and in Penang. The Java plant under this name in the Kew Herbarium is as different from Wall. Cat. 4081 as is any *Melastoma* in this section.

2. **M. polyanthum**, Blume in *Mus. Bot.* i. 52, t. 6; stems with short dense hairs adpressed or spreading, leaves with short hairs above adpressed or

subpatent, with short often soft hairs between the nerves beneath, bracts lanceolate or lanceolate-obovate much smaller than the buds and early deciduous, scaly hairs on the calyx-tube flat lanceolate, calyx-teeth triangular acute glabrous within shorter than the tube and often (*O. brachyodon*, *Naud.*) very short. *Naud. in Ann. Sc. Nat. ser. 3. xiii. 287; Miq. Fl. Ind. Bat. i. pt. i. 502. M. malabathricum, Jack in Trans. Linn. Soc. xix. p. 4, with fig.; Benth. Fl. Austral. iii. 292, partly. M. brachyodon, Naud. l. c. 292.*

SINGAPORE; *Sir R. Schomburgk, T. Anderson.*—DISTRIB. Throughout Malaya abundant to North Australia.

Only differs from *M. malabathricum* in the smaller bracts and shorter calyx-teeth; and is united with it by Mr. Bentham.

3. ***M. normale***, *Don Prodr. 220*; branches densely shaggy, leaves with short patent hairs above and pubescent or villous beneath, calyx-teeth long lanceolate hairy within nearly to their base. *DC. Prodr. iii. 145; Naud. in Ann. Sc. Nat. ser. 3. xiii. 289; Kurz For. Fl. i. 504. M. Wallichii, DC. Prodr. iii. 146; Wall. Cat. 4039, partly. M. napalensis, Lodd. Bot. Cub. t. 707.*

NIPAL TO BHOTAN, alt. 2000–6000 ft. KHASIA Mts., alt. 4000 ft., frequent.—DISTRIB. Ava, *Kurz.*

A large shrub, reaching 20 ft. in the interior Himalaya. Leaves 3–5 in., lanceolate; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in. Flowers 3–10, clustered; bracts not large nor enclosing the buds; petals a brighter more rosy mauve than in *M. malabathricum*. Fruit as in *M. malabathricum* or rather larger.—*M. velutinum* Seem. of Polynesia does not belong here.

4. ***M. imbricatum***, *Wall. Cat. 4047*; stem densely clothed with adpressed ovate obtuse scales, leaves beneath with very small scabrous hairs, scales on the calyx-tube flat ovate acute, calyx-teeth ovate acuminate hairy within half-way down, fruit ovoid the margin at the top somewhat dilated. *Triana in Trans. Linn. Soc. xxviii. 60*, but the syn. *M. fasciculare* *Naud.* is doubtful.

EAST BENGAL; *Griffith* (Kew Distrib. No. 2242). PENANG, *Wallich*; TENASSE-RIM, *Helfer* (Kew Distrib. No. 2243).

Apparently very large. Leaves 8 in., broad-elliptic, acute; petiole 2 in. Flowers in terminal clusters of about 12; bracts not large. Fruit $\frac{1}{4}$ – $\frac{5}{8}$ in., ovoid.

** Hairs on the calyx-tube long, at their base spreading, then ascending or patent.

5. ***M. sanguineum***, *Sims in Bot. Mag. t. 2241*; stem with scattered long harsh patent hairs, leaves glabrous above scabrous beneath on the nerves and minutely hairy between them or nearly glabrous, calyx-teeth linear-lanceolate. *DC. Prodr. iii. 145; Don in Mem. Wern. Soc. iv. 289; Miq. Fl. Ind. Bat. i. pt. i. 504; Naud. in Ann. Sc. Nat. ser. 3. xiii. 281. M. decemfidum, Jack in Trans. Linn. Soc. xiv. 6; Roxb. Fl. Ind. ii. 406; Wall. Cat. 4042; DC. Prodr. iii. 146; Naud. l. c. 282; Kurz in Journ. As. Soc. 1877, pt. ii. 75.*

PENANG, SINGAPORE and MALACCA; *Wallich, Cuming, Griffith, Maingay.*—DISTRIB. Malaya and South China.

Leaves 4–5 in., narrowly lanceolate; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in. Flowers 1–4, clustered, often very large, rose-purple. Bristles on the calyx-tube often $\frac{1}{4}$ – $\frac{1}{2}$ in., hair-pointed. Fruit $\frac{1}{2}$ in. wide and upwards.

VAR. *molle*, *Wall. Cat. 4046*; leaves 6 by 2½ in. with scattered villous hairs on both surfaces. *M. crinitum, Naud. l. c. 280.*

6. ***M. Houtteanum***, *Naud. in Ann. Sc. Nat. ser. 3. xiii. 291*; branches with dense adpressed or ascending villous hairs, leaves with scattered hairs above shortly villous beneath, calyx-teeth linear-lanceolate. *Kurz For. Fl. i. 504.*

PEGU, Kurz. TENASSERIM or ANDAMANS; *Helper* (Kew Distrib. No. 2241).

Leaves 4-5 in., broad-lanceolate; petiole $\frac{1}{4}$ - $\frac{3}{4}$ in. *Flowers* clustered. Hairs on calyx-tube $\frac{1}{4}$ - $\frac{1}{2}$ in.—This species is essentially like *M. sanguineum*, but the indumentum of the stem and branches is of a widely different character: as to the leaves, the indumentum of *M. sanguineum* var. *molle* is exactly half-way between that of *M. sanguineum* and *M. Houtteanum*.

DOUBTFUL SPECIES.

As to the numerous species of *Melastoma* admitted by Triana in *Trans. Linn. Soc.* xxviii. 59, 60 as native in India, the names *M. triflorum*, Naud.; *ellipticum*, Naud.; *microphyllum*, Naud.; *lanuginosum*, Blume; *Royenii*, Blume; *longifolium*, Naud. are not found in the Kew collection. So far indeed from multiplying species out of the existing material, it would be better to reduce the whole of the Indian forms to three, viz., *M. malabathricum* (including *M. polyanthum* and *M. imbricatum*); *M. normale*; and *M. sanguineum* (including *M. Houtteanum*).

As to the 13 species of *Melastoma* described by Roxburgh, the first eight are octandrous; the next two have been admitted; the last two are outside the limits of the present Flora.

M. FINDLAYSONII, Wall. Cat. 4041, has not the place of collection given, and it is doubtful whether it was found within the limits of the Flora Indica. The Wallichian example shows the leaves and fruit, which might be those of *Osbeckia Leschenaultiana* above described; but Triana (assuming probably that had the stamens been all similar Wallich would have named it *Osbeckia* and not *Melastoma*) has called it *Dissotis Findlaysonii*.

M. CURVA, Roxb. Fl. Ind. ii. 406. "Shrubby, all the tender parts strigose, leaves petioled ovate-cordate 5-7-nerved finely serrulate, panicles terminal subcorymbiform supra-decompound, flowers 10-androus, petals cordate ciliate."—Chittagong. Neither figure nor specimen is known: the description is too short for safe identification.

4. OXYSPORA, DC.

Large spreading shrubs with drooping branches terminated by large, lax, almost naked panicles of rose-purple flowers. *Leaves* opposite, long-petioled, large, 5-7-nerved, ovate, acuminate, uppermost pair below the panicle often sessile much smaller and subcordate at base. *Panicle* long, sometimes narrow; branches decussate; bracts very small. *Calyx-tube* ovate-cylindric; teeth 4, short, triangular. *Petals* 4, subacute. *Stamens* 8, of which 4 are purple with longer filaments, 4 are yellow; anthers narrowed upwards, at top opening by one pore, produced at base, connective with or without appendage. *Ovary* inferior, 4-celled, apex glabrous; style simple, elongate; ovules very many, placentas axile, radiating. *Capsule* dry, elliptic, elongate, with 8 ribs. *Seeds* very many, falcate; raphe lateral, produced at top in front into a point.—DISTRIB. Species 4, whereof 3 are in East Bengal, 1 in Sumatra.

1. *O. paniculata*, DC. Prodr. iii. 123; branchlets panicles and nerves of the leaves beneath with some stellate pubescence, capsule long-elliptic very little narrowed below the calyx-mouth, seeds with a sharp right angle at the top of the back and a produced angular point at the top in front. Wall. Pl. As. Rar. t. 88; DC. Mem. Melast. t. 4 (not correct as to the base of the connective); Wall. Cat. 4076; Miq. Fl. Ind. Bat. i. pt. i. p. 556. *O. vagans*, Bot. Mag. t. 4553; Lemaire Jard. Pl. t. 79. *Arthrostemma paniculatum*, Don in Mem. Wern. Soc. iv. 299; Prodr. 222 (partly). *Melastoma rugosa*, Roxb. MS.

SUBTROPICAL and TEMPERATE HIMALYA, from NIPAL to BHOTAN; alt. 3000-7000 ft. KHASIA Mts.; alt. 3000-5000 ft., common. Abundant in the interior of Sikkim covering the hill sides.

Leaves 4–5 in. (in some examples attaining $14\frac{1}{2}$ in.), ovate, acute; petiole 1–2 in., at its apex are some rough bristles. Longer *stamens* with the anther-cells diverging below the truncate base of the connective where the filament is attached. *Fruit* $\frac{3}{8}$ by $\frac{1}{2}$ in.

2. *O. vagans*, Wall. Cat. 4075, partly; branchlets petioles and nerves of the leaves beneath with some scattered patent villous hairs, capsule elliptic prominently narrowed below the enlarged calyx-mouth, seeds blunt-headed with a sharp right angle at the top of the back and a very short point at the top in front. *O. vagans*, var. *a.* Wall. Pl. As. Rar. p. 78; Triana in Trans. Linn. Soc. xxviii. 73; Kurz For. Fl. i. 505. *Melastoma vagans*, Roxb. Hort. Beng. 33; Fl. Ind. ii. 404. *Homocentria vagans*, Naud. in Ann. Sc. Nat. ser. 3. xv. 308.

MISHMEE; Griffith. KHASIA Mts., alt. 1000–3000 ft., common. CHITTAGONG; Roxburgh.

A rather smaller shrub than the preceding with the panicle generally more slender. Longer *stamens* with the anther-cells slightly produced at the base, connective having added to its base a linear spur.—Wall. Cat. 4075 contains some *O. paniculata* not any *O. cernua*.

3. *O. cernua*, Triana in Trans. Linn. Soc. xxviii. 73; glabrous, capsule elliptic truncate hardly narrowed below the calyx-mouth, seeds simply falcate. Kurz For. Fl. i. 505. *O. vagans* var. *β.* Wall. Pl. As. Rar. p. 78. *Melastoma cernua*, Roxb. Hort. Beng. 33; Fl. Ind. ii. 404. *Allozygia cernua*, Naud. in Ann. Sc. Nat. ser. 3. xv. 309.

MISHMEE; Griffith (Kew Distrib. No. 2262); CHITTAGONG, alt. 0–1000 ft.; H. f. & T.

A shrub, generally resembling *O. paniculata*. *Leaves* commonly 6 in., attaining $12\frac{1}{2}$ in. in some examples; petiole 2 in. Rachis of the panicle somewhat sharply quadrangular at the base, but cannot be said to be 4-winged in any of the specimens at Kew (as Roxburgh states it to be). Longer *stamens* with the anther-cells shortly produced and diverging below the truncate base of the connective where the filament is attached.

5. **KENDRICKIA**, Hook. f.

A climber, ascending to the top of the highest trees, when in blossom tinged the forest red. *Leaves* opposite, petioled, oblong or obovate, obtuse, fleshy. *Flowers* terminal, in few-flowered umbels or solitary, large; peduncles stout, 2-bracteolate. *Calyx* urn-shaped, rose-purple; limb shortly 4-toothed, greenish. *Petals* 4, fleshy, a fine red. *Stamens* 8, equal; anthers at the attenuated summit opening by one pore, at the base shortly produced, connective having a horn about $\frac{1}{8}$ in. at the base. *Ovary* inferior, 4–6-celled; style simple, filiform; ovules very many, placentas axile, fleshy. *Capsule* globose, 1-celled by absorption of the septa, opening at the apex by 4–6 valves. *Seeds* very many, minute, prismatic.

1. *K. Walkeri*, Hook. f. in Gen. Pl. i. 752; Triana in Trans. Linn. Soc. xxviii. p. 75, t. vi. fig. 70. *Pachycentria Walkeri*, Thwaites Enum. 107. *Medinilla*? *Walkeri*, Wight Ill. i. p. 217; Gardn. in Calc. Journ. Nat. Hist. viii. p. 11.

ANAMALLAYS; Col. Beddome. CEYLON, alt. 3000–5000 ft.; Wight; Walker; Gardner, Thwaites.

Stems in their lower part creeping up trees like ivy, hence flatterred with the leaves

distichous; at the summits spreading pendent with leaves on all sides. *Leaves* 1-2 in., narrowed at the base, minutely furfuraceous or nearly glabrous, 3-nerved from the base with two additional nerves from the midrib much higher up; petiole $\frac{1}{4}$ in. *Petals* $\frac{3}{4}$ in.—“One of the most beautiful of Ceylon plants” (Thwaites).

6. ALLOMORPHIA, Blume.

Shrubs, tall or short. *Leaves* opposite, long-petioled, large, lanceolate ovate or orbicular, 15-nerved, glabrous or nearly so. *Panicles* terminal, compound, with small flowers in clustered whorls. *Calyx-tube* funnel-shaped or campanulate, limb of 4 very short lobes. *Petals* 4, rose or white, small. *Stamens* 8, nearly equal; anthers attenuated at the top with one pore, cells long-produced and diverging at their bases; connective without appendage. *Ovary* 3- (rarely 4-) celled enclosed by but nearly free from the calyx-tube; style filiform, simple; ovules very many, placentas axile, 2-fid. *Capsule* small, dry, urn-shaped or subcylindric, ribbed, opening at the top by 3-4 valves. *Seeds* very many, narrowly obtrapezoidal.—**DISTRIB.** Species 5: whereof 4 are from the Malay Peninsula and its attached islands; 1 from Canton.

1. **A. exigua**, Blume in *Flora*, 1831, p. 523; leaves lanceolate or ovate-lanceolate not cordate at the very base, pedicels in fruit not more than $\frac{1}{5}$ in., fruit ovoid 3-celled prominently 6-ribbed contracted at the top below the permanent calyx-rim. *Naud. in Ann. Sc. Nat. ser. 3. xv. 310*; *Triana in Trans. Linn. Soc. xxviii. 74*. *Melastoma exigua*, Jack in *Trans. Linn. Soc. xiv. 10*; *DC. Prodr. iii. 149*; *Wall. Cat. 4048*.

PENANG and MALACCA; Wallich, Griffith, &c.—**DISTRIB.** Philippines.

A tall shrub, nearly glabrous. *Leaves* often 9-10 in.; petiole 1-3 in. *Panicle* minutely rusty-pubescent; bracts $\frac{1}{4}$ - $\frac{1}{3}$ in., lanceolate or narrow-spathulate. *Calyx-tube* most minutely hairy. *Ripe fruit* $\frac{1}{12}$ in. broad.

2. **A. umbellulata**, Hook. f. ms.; *Triana in Trans. Linn. Soc. xxviii. 74*; leaves lanceolate or elliptic-lanceolate often cordate at the very base, pedicels umbellulate in bud $\frac{1}{4}$ in. and more. *Kurz For. Fl. i. 506*.

TENASSERIM or ANDAMANS; Helfer (Kew Distrib. No. 2260).

Shrub 10 ft. (Helfer); nearly glabrous except the panicle which is minutely pubescent and much more lax than that of *A. exigua*. *Flowers* larger than those of *A. exigua*. *Calyx-tube* in the young flowers funnel-shaped rather than campanulate; teeth more prominent. *Fruit* unknown.

3. **A. Griffithii**, Hook. f. MS.; *Triana in Trans. Linn. Soc. xxviii. 74*; leaves round obtuse cordate at the base, panicle elongate with small distant whorls which are shortly corymbose rather than umbelled or clustered.

MALACCA, Griffith, Walker, Maingay No. 775.

Almost stemless; rootstock woody. *Leaves* 5-6 in. long and more broad, glabrous or slightly puberulous beneath. *Panicle* about 12 in., rusty-pubescent. *Calyx-tube* campanulate, minutely hairy. *Fruit* unknown.

4. **A. hispida**, Kurz in *Flora*, 1871, 290; petioles thick 5 in. hispid bristly, leaves 8-9 in. ovate 9-ribbed sparsely bristly above more densely beneath especially on the nerves, panicles glabrous or with bristles at the divisions, pedicels slender about $\frac{1}{4}$ in. so that the flowers are in subsessile clusters, calyx-tube 4-ribbed carrying some long bristles short campanulate with minute teeth, ovary adnate to the calyx near the base only.

BURMA, Martaban; Dr. Brandis (Kurz).

Not seen: the above is copied from Kurz.

7. **BLASTUS**, *Lour.*

A shrub with round branches. *Leaves* opposite, petioled, oblong-lanceolate, 3-5-nerved. *Flowers* very small, in axillary clusters; peduncles short, without bracts. *Calyx-tube* oblong, puberulous, limb shortly 4-lobed. *Petals* 4. *Stamens* 4, equal; anthers attenuate at the top, opening by one pore, cells produced and diverging at their bases; connective without appendage. *Ovary* inferior, 4-celled, puberulous at the apex; style filiform, simple; ovules very many, placentas axile, paired. *Capsule* small, obscurely 4-furrowed, opening at the summit by four pores. *Seeds* very many, raphe long, testa long-linear, produced at each end much beyond the small oblong nucleus.

1. **B. cochinchinensis**, *Lour. Fl. Cochinch.* 527; *Seemann Journ. Bot.* i. 281. *Anplectrum parviflorum*, *Benth. Fl. Hongk.* p. 116.

ASSAM; *Masters*. EAST BENGAL (prob. North-East Assam); *Griffith*.—DISTRIB. Hongkong and Formosa.

A shrub 6 ft., glabrous, innovations minutely puberulous. *Leaves* 3-4 in., lanceolate or elliptic-lanceolate; petiole $\frac{1}{4}$ - $\frac{3}{4}$ in. *Peduncles* in fruit $\frac{1}{4}$ in. or less. *Fruit* less than $\frac{1}{2}$ in. broad.

8. **OCHTHOCHARIS**, *Blume.*

Small erect glabrous shrubs, branches round. *Leaves* opposite, petioled, oblong or lanceolate, 3-5-nerved, minutely denticulate-serrulate. *Flowers* minute in axillary clustered cymes, rarely in axillary and terminal lax cymes. *Calyx-tube* obovoid, smooth; teeth 5, small, persistent. *Petals* 5. *Stamens* 10, equal; anthers oblong, obtuse at the top opening with one pore, at the base shortly produced; connective without appendage. *Ovary* inferior, 5-celled, glabrous at the apex; style simple, filiform; ovules very many, placentas axile. *Capsule* globose, 5-valved, enclosed by the membranous calyx-tube. *Seeds* very many, irregularly club-shaped.—DISTRIB. Species 4 or 5, extending from Singapore to Borneo.

1. **O. paniculata**, *Korth. Verh. Nat. Gesch. Bot.* 247, t. 64; leaves opposite very unequal, panicle terminal. *Blume Mus. Bot.* i. 40; *Naud. in Ann. Sc. Nat. ser. 3. xv.* p. 307, with fig.; *Miq. Fl. Ind. Bat.* i. pt. i. 556; *Triana in Trans. Linn. Soc.* xxviii. 74. *Melastoma oxyphyllum*, *Benth. in Wall. Cat.* 4083.

SINGAPORE; *Wallich*.—DISTRIB. Malaya.

Branches quadrangular, nearly glabrous, becoming minutely rusty towards the panicle. *Leaves* attaining 5 in. by 2, lanceolate, 5-nerved, glabrous or minutely rusty on the nerves; petiole $\frac{3}{4}$ in. *Panicle* $1\frac{1}{2}$ by $1\frac{3}{4}$ in., rusty puberulous, short-peduncled; branches opposite, supported by small linear bracts $\frac{1}{16}$ - $\frac{1}{5}$ in., the ultimate pedicels $\frac{1}{16}$ - $\frac{1}{5}$ in. *Calyx-tube* campanulate, nearly glabrous; teeth 5, minute. *Petals* 5, $\frac{1}{5}$ in., ovate, subacute, rose-purple. *Fruit* (not ripe) $\frac{1}{2}$ in. diam. subglobose.

2. **O. javanica**, *Blume in Flora*, 1831, 523; leaves somewhat fleshy 3-nerved secondary nerves obscure, cymes 1 in. axillary, pedicels in fruit scarcely $\frac{1}{4}$ in. *Naud. in Ann. Sc. Nat. ser. 3. xv.* 307; *Miq. Fl. Ind. Bat.* i. pt. i. 556; *Kurz For. Fl.* i. 507. *Melastoma? littoreum*, *Wall. Cat.* 4087.

TENASSERIM, *Helfer* (Kew Distrib. No. 2277). SINGAPORE; *Wallich*, *Griffith* No. 2278, *T. Anderson*, *Maingay*.—DISTRIB. Java.

A small shrub, 2-3 ft. *Leaves* 2½ in., lanceolate or narrow lanceolate, narrowed at both ends, sparsely minutely bristle-serrate; petiole ¼ in. *Fruit* ½ in. diam., subglobose.—The closely allied Malayan species have the cross secondary nerves very conspicuous; by which they differ from the present fleshy seashore plant.

9. **ANERINCLEISTUS**, Korth.

Large villous shrubs; branches round. *Leaves* petioled, ovate or lanceolate, entire, 5-7-nerved, with scattered hairs above, villous beneath. *Flowers* minute (in very small axillary clusters in the Indian species). *Calyx-tube* campanulate, densely hairy; lobes 4, very small. *Petals* 4, minute, glabrous. *Stamens* 8, equal; anthers attenuate at the top, opening with one pore, scarcely produced at the base; connective with or without a short spur. *Ovary* nearly free, 4-celled; style filiform, simple; ovules many. *Capsule* opening by 4 large pores at the summit. *Seeds* exceedingly minute, cuneate-obovoid.—DISTRIB. Species 3; Tenasserim coast, Mergui and Sumatra.

1. **A. Helferi**, Hook. f.; *Triana in Trans. Linn. Soc.* xxviii. 75; branches clothed with adpressed soft hairs, midrib of the leaves beneath with ascending subadpressed soft hairs, calyx-tube with ascending hairs. *Kurz For. Fl.* i. 507.

MERGUI; Griffith, *Helper* (Kew Distrib. No. 2304).

Leaves 6 by 4 in.; petiole 2 in. Clusters of *flowers* ⅔ in. *Fruit* ½ in., ellipsoid.

2. **A. Griffithii**, Hook. f.; *Triana in Trans. Linn. Soc.* xxviii. 75; branches densely clothed with brown soft spreading and deflexed hairs, midrib of the leaves beneath densely clothed with similar patent hairs, calyx-tube with somewhat spreading hairs. *Kurz For. Fl.* i. 507.

MERGUI; Griffith (Kew Distrib. No. 2304).

Exactly as the preceding species except as to the small differences in the indumentum above stated. Probably will be found to be a variety only when more material is obtained.

10. **SONERILA**, Roxb.

Herbs, sometimes woody at the base, nearly always small, many stemless. *Leaves* opposite, equal or unequal, from round to linear, entire or serrulate, 3-5-nerved. *Flowers* in racemes or scorpioid spikes, mostly red. *Calyx-tube* campanulate or long-funnel-shaped; teeth 3, short. *Petals* 3, acute or obtuse. *Stamens* 3 (in *S. obliqua* 6), equal; anthers obtuse or attenuate at the top, cells at the base shortly divaricate; connective without appendage. *Ovary* inferior, 3-celled, glabrous at the apex; style simple, filiform; ovules many, placentas axile. *Capsule* obovoid, trigonous, elongate funnel-shaped, or campanulate, opening at the top by 3 valves. *Seeds* very many, smooth or covered by glandular points or small tubercles, ovoid or ellipsoid; raphe simple or running out into a lateral appendage, sometimes overtopping the seed.—DISTRIB. Species 58; 45 tropical Indian and Malayan, and 1 in South China.

SECTION A. Stamens 3. (To Species 42.)

* *Anthers* short, truncate or acute at the top.

† *Species* not of Ceylon or the South Deccan Peninsula

1. **S. tenera**, Royle *Ill.* 215, t. 45; stem 2-4 in. erect little-divided, pedicels $0-\frac{1}{8}$ in., anthers short oblong truncate hardly narrowed at the top. *Wall. Cat.* 4098 partly.

SUBTROPICAL WESTERN HIMALAYA, Royle, Edgeworth. CHOTA NAGPORE, alt. 1000-2000 ft., abundant; C. B. Clarke.

Stem weak, sometimes winged, puberulous or minutely pubescent. *Leaves* $\frac{1}{4}-\frac{1}{2}$ in., ovate, nearly entire, equal or unequal, with a few scattered lax hairs; petiole less than $\frac{1}{8}$ in. *Calyx-tube* puberulous and with a few scattered lax hairs; teeth (at time of flowering) ovate, acute, as long as broad. *Petals* $\frac{1}{8}$ in., ovate, acute, rose-purple. *Capsule* nearly $\frac{1}{4}$ in., trigonous, elongate funnel-shaped, ribs between the angles very obscure, often narrowed at the base so as to be subsessile. *Seeds* ovoid, smooth; raphe not excurrent.—Wallich has distributed with Royle's *S. tenera*, a Tavoy plant, *S. stricta*, and Royle has not detected the error. The pubescence of the stem as given in the figure of Royle is very unlike nature. Triana has named Royle's original specimen "*potius S. brachyandra*, Naud." a Manilla species, and has made Edgeworth's specimen and some Khasian ones of *S. stricta* the type of *S. tenera*.

2. **S. stricta**, Hook. in *Bot. Mag.* t. 4394; stem 3-7 in. erect often branched, pedicels in fruit often nearly $\frac{1}{4}$ in., anthers ovate much narrowed at the top.

KHASIA Mts., alt. 3000-4000 ft., plentiful. PEGU to TENASSERIM, frequent.

Stem more or less puberulo-pubescent, and also with long lax spreading hairs. *Leaves* $\frac{1}{4}-1$ in., lanceolate or elliptic, narrowed at each end, with scattered lax hairs. *Calyx-tube* puberulous and with a few scattered lax hairs, teeth broader than long. *Petals* $\frac{1}{8}-\frac{1}{4}$ in., obovate, rose-purple. *Capsule* $\frac{1}{4}$ in., trigonous, elongate funnel-shaped, ribs between the angles very obscure. *Seeds* ovoid, smooth; raphe not excurrent.—The type of this species is *S. burmannica* Wall. *Cat.* 4098, but the striking form *S. stricta* was first published and the name must therefore be maintained. The true *S. Rottleri* Wall. is a Courtallum species and widely different, but Wallich seems in hand-and-eye distribution to have mixed the present species with it.

VAR. typica; leaves with a few denticulations, uppermost sometimes in whorls of 4, often purplish beneath.—Moulmein; Lobb No. 347; Parish, No. 427.

VAR. burmannica, Wall. *Cat.* 4098; leaves usually entire or nearly so. *S. tenera*, Wall. *Cat.* 4098 partly; Kurz in *Journ. As. Soc.* 1877, pt. ii. 78. *S. Rottleri*, Wall. *Cat.* 4097 partly. *Sonerila* sp. 5 Griff. *Notul.* iv. 676.

3. **S. erecta**, Jack in *Mal. Misc. et in Hook. Bot. Misc.* ii. 63; stem 8-12 in. firm erect with opposite branches, racemes secund, flowers sessile, capsule long-cylindric subtrigonus, seeds hemi-ellipsoidal covered with glandular raised points, raphe shortly excurrent and overtopping the seed. *Wall. Cat.* 4092; Benn. *Pl. Jav. Rar.* p. 217; Miq. *Fl. Ind. Bat.* i. pt. i. 563; Naud. in *Ann. Sc. Nat. ser.* 3. xv. 324; Triana in *Trans. Linn. Soc.* xxviii. 75.

MOULMEIN, Lobb. PINANG, Wallich. MALAYA, Maingay.—DISTRIB. Malaya.

Stem bifariously hairy. *Leaves* $\frac{1}{2}$ in., equal or unequal, lanceolate, slightly ovate at the base, hairy on both surfaces, subentire or minutely denticulate, sessile and long-petioled on the same plant. *Racemes* 2-6-flowered. *Calyx-tube* minutely pubescent. *Petals* $\frac{1}{4}$ in., ovate, acute, rosy. *Anthers* ovate, much narrowed upwards. *Fruits* $\frac{3}{8}-\frac{1}{2}$ in., $\frac{1}{4}$ in. apart.

†† *Species of Ceylon and the South Deccan Peninsula.*

4. **S. zeylanica**, W. & A. *Prodr.* 322; branches quadrangular nearly glabrous, anthers $\frac{1}{10}-\frac{1}{8}$ in. ovate narrowed upwards, capsule $\frac{1}{4}$ in. funnel-shaped subtrigonus with 6 prominent ribs. Arn. in *Hook. Comp. Bot. Mag.* ii. 307 (Ceylanica); Naud. in *Ann. Sc. Nat. ser.* 3. xv. 321; Thwaites *Enum.* 109; Triana in *Trans. Linn. Soc.* xxviii. 75.

CEYLON, alt. 6000 ft.; *Thwaites, Walker.*

Stems 4–12 in. with many spreading branches. *Leaves* $\frac{3}{8}$ – $\frac{3}{4}$ in., ovate or narrow-oblong, acute, denticulate, with a few scattered hairs above otherwise glabrous; petiole 0– $\frac{1}{2}$ in. *Calyx-tube* glabrous or with a few lax hairs. *Petals* $\frac{1}{4}$ in., purple or white, ovate, acute. *Capsule* about as long as its pedicel. *Seeds* with minute glandular elevated points, raphe excurrent but hardly overtopping the seed.—*S. zeylanica* is only separated from *S. rostrata* and *S. affinis* by the anthers, which (as above stated) are usually $\frac{1}{10}$ – $\frac{1}{8}$ in. long in *S. zeylanica* while in *S. affinis* they are usually $\frac{1}{6}$ in. In those cases where the anthers of an authentic example of *S. zeylanica* are actually longer than those of some examples of *S. affinis*, we endeavour to fall back on the degree and nature of the attenuation of the anthers, which should be acute in *S. zeylanica*, acuminate in *S. affinis*. The var. *pumila* is more distinct from *S. zeylanica* than are *S. rostrata* and *S. affinis*. Triana has placed Thwaites' numbered specimens of these species under various others.

VAR. *pumila*. Thwaites Enum. 109 (sp.); anthers short-oblong very truncate.

VAR. *Walkera*; seed without elevated points, excurrent raphe very much overtopping the seed, being exactly over the top of the seed like a cap.—Perhaps a species. Ceylon; *Walker*.

5. ***S. tomentella***, *Thwaites Enum.* 109; branches petioles and calyx-tube rusty-pubescent, anthers ovate very short, capsule short funnel-shaped trigonous 6-ribbed bristly. *Triana in Trans. Linn. Soc.* xxviii. 75.

CEYLON; Saffragam, *Thwaites*.

Branched, 10 in. high. *Leaves* ovate and ovate-oblong, minutely denticulate, with a few scattered hairs above, slightly pubescent beneath. *Petals* $\frac{1}{3}$ in., ovate, acute, white or pale rose. *Pedicels* as long as or longer than the capsule.

6. ***S. Brunonis***, *W. & A. Prodr.* 321; stem a foot high somewhat stout branched nearly glabrous, leaves oblong-lanceolate longitudinally 5–7-nerved from near the base with very rarely one or two fainter nerves from the midrib higher up. *Wight Ill.* 94, *lc.* t. 1059.

SOUTH DECCAN PENINSULA; Courtallum; *Wight No.* 1142. CEYLON, Newera Ellia; *Thwaites*.

Stems 4-angled. *Leaves* $1\frac{1}{3}$ – $2\frac{1}{2}$ in., with a few scattered hairs above and microscopic puberulous dots beneath; petiole $\frac{1}{2}$ – $1\frac{1}{4}$ in. *Petals* $\frac{1}{2}$ in., mauve-purple, ovate acute. *Capsules* $\frac{3}{8}$ in., narrow-funnel-shaped, with six thick ribs, longer than the pedicels, clustered on the shortened racemes. *Seed* obovoid with glandular elevated points, raphe not excurrent.—The present species is exceedingly like *S. versicolor* or *S. axillaris*, but (as *Wight* observes) may always be recognised by the longitudinal nervation of the leaves.

7. ***S. pedunculosa***, *Thwaites Enum.* 109; stem 3–10 in. weak rooting at the nodes, peduncles quasi-terminal very long, capsule $\frac{3}{8}$ – $\frac{1}{4}$ in. funnel-shaped subtrigonous obscurely 6-ribbed usually shorter than the pedicel. *Triana in Trans. Linn. Soc.* xxviii. 75. *S. Rottleri*, *Wall. Cat.* 4097, partly.

TRAVANCORE, Quilon; *Wight No.* 1111. CEYLON; tropical; *Thwaites*.

Stems and peduncles glabrous or pubescent. *Leaves* $1\frac{1}{2}$ – $2\frac{1}{2}$ in., ovate or oblong, minutely serrulate, sparsely pilose above minutely dotted beneath; petiole $\frac{1}{2}$ – $1\frac{1}{4}$ in. *Peduncles* 2–6-flowered. *Calyx-tube* glabrous or with a few scattered hairs. *Petals* $\frac{1}{4}$ in., ovate, acute, reddish. *Seeds* with elevated points, raphe much excurrent on the side near the top.

8. ***S. Arnottiana***, *Thwaites Enum.* p. 108; stem 12 in. high round branched upwards at least rufous-villous, petioles nerves of the leaves beneath

and peduncles with brown-red hairs, capsule $\frac{1}{5}$ in. broadly funnel-shaped trigonous 6-ribbed somewhat scabrous usually longer than the pedicel. *Bedd. Ic. Pl. Ind. Or. t.* 300.

CEYLON, alt. 6000 ft.; *Thwaites*.

Leaves nearly 2 by $\frac{3}{4}$ in., oblong or ovate, with 3-5 longitudinal nerves, nearly glabrous or with few scattered hairs above, minutely serrulate; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. *Calyx-tube* with lax spreading hairs. *Petals* $\frac{1}{4}$ - $\frac{1}{3}$ in., ovate, acute, purple. *Seeds* covered with elevated points, raphe excurrent the whole length of the seed.

VAR. tenella, *Beddome* in *Trans. Linn. Soc. xxv.* 217; stem leaves petioles and calyx-tube nearly glabrous.—*Anamallays*; alt. 3000 ft., *Beddome*. Stated by Col. *Beddome* to be allied to *S. Arnottiana*, *Thwaites*, and reduced to it by *Triana* in *Trans. Linn. Soc. xxviii.* 75. The examples communicated by Col. *Beddome* to Kew do not show fruit but seem the same as *S. Brunonis*; they differ considerably in their glabrousness from *S. Arnottiana*.

9. **S. Wightiana**, *Arn. in Hook. Comp. Bot. Mag. ii.* 307; stem attaining 15 in. round branched very brown-villous, petioles nerves of the leaves beneath and peduncles with brown or yellow hair, capsule $\frac{1}{4}$ in. funnel-shaped trigonous 6-ribbed scabrous usually shorter than the pedicel. *Triana in Trans. Linn. Soc. xxviii.* 75.

CEYLON; Adam's Peak; *Thwaites*.

Leaves $\frac{3}{4}$ -1 $\frac{1}{2}$ in., elliptic or oblong, with 3-5 longitudinal nerves, serrulate, with scattered scabrous hairs often on both surfaces; petiole often 1 in. *Calyx-tube* with lax spreading hairs. *Petals* $\frac{3}{8}$ in., purple, ovate, acute. *Anthers* ovate-oblong, obtuse. *Seeds* covered with elevated points, raphe scarcely excurrent.—This species only slightly differs from *S. Arnottiana* by its greater hairiness, its rather larger flowers, and more elongate capsule.

10. **S. Hookeriana**, *Arn. in Hook. Comp. Bot. Mag. ii.* 308; stem attaining 10 in. round branched and petioles and peduncles with red villous tomentum, leaves with scattered hairs on both surfaces, nerves beneath with spreading dense red or yellow hairs, capsule $\frac{1}{5}$ in. funnel-shaped trigonous 6-ribbed scarcely scabrous usually longer than the pedicel. *Naud. in Ann. Sc. Nat. ser. 3. xv.* 321; *Triana in Trans. Linn. Soc. xxviii.* 75.

CEYLON, Adam's Peak; *Walker, Thwaites* No. 173 and 426 partly.

Leaves $\frac{3}{4}$ -1 $\frac{1}{4}$ in., ovate or oblong, with 3-5 longitudinal nerves, serrulate; petiole $\frac{1}{4}$ - $\frac{5}{8}$ in. *Calyx-tube* with many spreading rufous hairs. *Petals* $\frac{1}{2}$ in., ovate, acute (pale?). *Anthers* ovate-oblong, obtuse. *Seeds* with subtubercular raised points, raphe much excurrent near the top of the seed.

11. **S. Gardneri**, *Thwaites Enum. p.* 107; stem 12 in. round rufous-villous, leaves ovate from a broad base short-petioled, petals $\frac{1}{2}$ - $\frac{5}{8}$ in. broad-elliptic, capsule $\frac{1}{3}$ in. ovoid trigonous slightly scabrous and hispid usually longer than the pedicel. *Triana in Trans. Linn. Soc. xxviii.* 75; *Bedd. Ic. Pl. Ind. Or. t.* 298.

CEYLON, alt. 5000 ft.; Horton Plains, *Thwaites*.

Leaves $\frac{3}{4}$ -1 in., minutely serrate with scattered hairs on both surfaces, nerves beneath rufous-villous; petiole $\frac{1}{3}$ - $\frac{1}{4}$ in. *Peduncles* short and with the calyx-tube rufous-villous. *Petals* mauve-purple. *Anthers* ovate-oblong, obtuse. *Seeds* subtuberculate with raised points, raphe elongated both above and below the seed.—This species is well separated from the preceding species by its ovoid not funnel-shaped capsule.

VAR. firma, *Triana l. c.*; leaves sessile. *S. firma, Thwaites ms.*—Ceylon, alt. 5000 ft., Central Province at Wattchelle; *Thwaites* No. 3373.—The example of this communicated by Mr. *Thwaites* to Kew is in flower and does not show fruit. It seems exactly *S. Gardneri* except as to the sessile leaves, but the fruit may prove it to be something quite different.

** *Anthers long attenuated or acuminate upwards.*

† *Plants with distinct stems, the leaves of each pair not very unequal.*

§ *Species of Ceylon and the South Deccan Peninsula.*

12. **S. robusta**, Arn. in Hook. Comp. Bot. Mag. ii. 308; stem attaining 21 in. shaggy with rufous-brown hair, leaves cordate-ovate sessile with long rufous hairs above and on the nerves beneath, capsule nearly $\frac{1}{4}$ in. campanulate trigonous hispid-scabrous 6-nerved, pedicel about $\frac{1}{4}$ in. Naud. in Ann. Sc. Nat. ser. 3. xv. 327; Triana in Trans. Linn. Soc. xxviii. 76.

CEYLON; Walker; Adam's Peak, alt., 5000-7000 ft. Thwaites No. 426 partly.

Branches ascending, round, with harsh or soft hairs. Leaves $\frac{1}{2}$ in., nearly entire. Calyx-tube with many spreading hairs. Petals $\frac{1}{2}$ in., elliptic, acute, purple. Anthers attenuated, long. Capsules 3-6 to the raceme, nearly sessile. Seeds with raised points, raphe excurrent on one side near the top.

VAR. *glabricaulis*, Thwaites ms.; stem 4-angular nearly glabrous, leaves sessile nearly glabrous beneath.—Ceylon; at Boputalanda, Central Provinces, Thwaites No. 3955.

13. **S. Harveyi**, Thwaites Enum. 107; stem 18 in. erect with ascending quadrangular branches nearly glabrous, calyx-tube glabrous, anthers subacuminate but much shorter and less attenuate than in *S. robusta*.

CEYLON, Central Province, alt. 6000-7000 ft.; Thwaites No. 2974.

Leaves $\frac{5}{8}$ in., rhomboid-oblong, unequal-sided, obtuse or subcordate at the base, glabrous on both surfaces, denticulate; petiole about $\frac{1}{20}$ in. Racemes short. Petals $\frac{1}{2}$ in., elliptic, acute, purple.—Triana in Trans. Linn. Soc. xxviii. 76 has erroneously called this species *S. Hartwegi*, and altered the naming of Thwaites' examples so as to confuse it with No. 12 *S. robusta*.

14. **S. affinis**, Arn. in Hook. Comp. Bot. Mag. ii. 307; stem 4-12 in. branching nearly glabrous, leaves ovate and ovate-lanceolate serrate, capsule $\frac{1}{8}$ - $\frac{1}{3}$ in. funnel-shaped trigonous 6-ribbed smooth usually shorter than the pedicel. Naud. in Ann. Sc. Nat. ser. 3. xv. 325; Thwaites Enum. 109; Triana in Trans. Linn. Soc. xxviii. 76.

CEYLON, Central Province, alt. 4000 ft.; Thwaites; Gardner, Walker.

Leaves $\frac{7}{8}$ in. (sometimes much smaller), thin, sparsely pilose above, minutely glandular-dotted and sometimes thinly hairy beneath; petiole $\frac{3}{8}$ in. Calyx-tube nearly glabrous, or with a few lax hairs. Petals $\frac{1}{2}$ in., ovate, acute, mauve. Anthers oblong, attenuated upwards. Seed with raised points, raphe excurrent on one side near the top.—See the remarks under No. 4 *S. zeylanica*.

VAR. *rostrata*, Thwaites Enum. 108 (sp.); anthers more attenuated, leaves less serrated, flowers usually a deeper colour.—Ceylon, alt. 1000-2000 ft.; Thwaites No. 2644.

15. **S. rhombifolia**, Thwaites Enum. 108; glabrous, stem 1-2 ft., leaves rhomboid narrowed at both ends crenate-serrate, capsule $\frac{1}{2}$ in. funnel-shaped trigonous 6-ribbed about as long as the pedicel.

CEYLON; at no great elevation, Thwaites.

Leaves 1 in., 3-nerved the lateral nerves near the margin, minutely glandular-punctate; petiole $\frac{1}{2}$ in. Petals $\frac{1}{2}$ in., purple-mauve. Seeds with raised points, raphe excurrent on one side near the top.

16. **S. amabilis**, Triana in Trans. Linn. Soc. xxviii. 76; branches woody round with scattered ascending bristly hairs, leaves oblong petioled 3-nerved subentire with scattered bristly hairs on both surfaces, capsule $\frac{1}{2}$ in. funnel-shaped or somewhat campanulate trigonous 6-ribbed smooth.

SOUTHERN DECCAN PENINSULA. Tinnivelly, alt. 2000 ft.; *Col. Beddome*.

Leaves $1\frac{1}{2}$ in., narrowed to each end, obtuse; petiole $\frac{1}{2}$ in. *Racemes* 3–6-flowered, crowded. *Calyx-tube* with few lax hairs. *Petals* $\frac{3}{8}$ – $\frac{1}{2}$ in., mauve. *Anthers* long, much attenuate.—Mr. Kurz had published a very different species as *Sonerila amabilis*, namely, *S. Kurzii* (No. 38).

17. ***S. travancorica***, *Bedd. Ic. Pl. Ind. Or.* t. 156; branches stout round adpressedly villous, leaves elliptic acute subentire pinnate-nerved with many long brown hairs on both surfaces, capsule $\frac{1}{2}$ in. subcampanulate trigonous 6-ribbed smooth longer than the pedicel. *Triana in Trans. Linn. Soc.* xxviii. 76.

TRAVANCORE, alt. 4000 ft.; *Col. Beddome*.

Leaves $1\frac{1}{2}$ –3 in., acute but scarcely acuminate, glandular-dotted, shaggy on the nerves beneath; petiole $\frac{1}{4}$ – $1\frac{1}{2}$ in. *Racemes* 3–9-flowered, short, pedicels with few scattered hairs. *Calyx-tube* glabrous or sparsely pilose. *Petals* $\frac{3}{8}$ – $\frac{1}{2}$ in., mauve, elliptic, acute. *Anthers* oblong, much attenuated upwards. *Seed* with raised points, raphe excurrent on one side near the top.

18. ***S. hirsutula***, *Arn. in Hook. Comp. Bot. Mag.* ii. 307; branches with spreading rufous hairs, leaves ovate or oblong subentire with many long brown hairs on both surfaces glandular-dotted and shaggy on the nerves beneath, calyx-tube with many lax patent rufous brown hairs. *Thwaites Enum.* p. 108; *Triana in Trans. Linn. Soc.* xxviii. 76.

CEYLON, Central Province, alt. 6000–7000 ft.; *Walker, Thwaites* No. 276.

Stem 1–2 ft. high, erect; branches round with four lines. *Leaves* 1–3 in., 5-nerved from near the rounded or cordate base or imperfectly pinnate-nerved; petiole often 2 in. *Racemes* short-peduncled, about 4-flowered. *Petals* $\frac{5}{8}$ in., elliptic, acute, mauve. *Anthers* greatly elongate. *Capsule* $\frac{1}{4}$ – $\frac{1}{2}$ in., subcampanulate, strongly 6-ribbed, longer than the pedicel.—This species is very near *S. travancorica*; it differs by the patent (not adpressed) hairs on the stem, and the broad or cordate (not acute) base of the leaves.

19. ***S. pilosula***, *Thwaites Enum.* p. 108; leaves ovate-lanceolate pinnate-nerved with short hairs over both surfaces very unequal at the base, calyx-tube with many short patent hairs, petals $\frac{3}{8}$ in. purple-red. *Triana in Trans. Linn. Soc.* xxviii. 76.

CEYLON, *Walker*; Saffragam District, alt. 1000–2000 ft., *Thwaites*.

Stem 6–18 in., round, striated, with many short patent hairs. *Leaves* 2–3 $\frac{1}{2}$ in., entire, somewhat acuminate; petiole 1–2 $\frac{1}{4}$ in. *Racemes* short, 6–12-flowered. *Anthers* much elongate. *Capsule* funnel-shaped, 6-ribbed (*Thwaites*).—This species is marked by the very unequal base of the leaves; one side of the blade being often continued for $\frac{1}{4}$ in. along the petiole. Perhaps a form of No. 22 *S. elegans*.

20. ***S. speciosa***, *Zenk. Pl. Ind.* 18, t. 18; stem nearly or quite glabrous below ending in a long peduncle villous upwards, leaves 5–9-nerved from the base, petals $\frac{5}{8}$ in. mauve round-elliptic acute, capsule $\frac{3}{8}$ in. hispid oblong trigonous from a subcampanulate base. *Zenk. in Ann. Sc. Nat. ser. 1.* vi. 151; *Bot. Mag.* t. 5026; *Wight Ic.* t. 995–2; *Triana in Trans. Linn. Soc.* xxviii. 76. *S. solanoides*, *Naud. in Ann. Sc. Nat. ser. 3.* xv. 324; xvi. t. 18, f. 3. *S. orbiculata*, *Lindl. in Journ. Hort. Soc.* viii. 57, with fig. *S. elegans*, *Bot. Mag.* 4978, not of *Wight*.

Hills of the South DECCAN PENINSULA, frequent. NILGHIRIS, *Wight*; MYSORE, *T. Lobb*; COURTAILLAM, *Wight*; &c.

Stems attaining 9–12 in., upper half often naked. *Leaves* 2–3 in., ovate or elliptic,

acute, glabrous or nearly so, denticulate or subserrate; petiole 1-2 in. *Raceme* often subpaniculate with 8-14 flowers and very hirsute. *Calyx-tube* generally with much lax brown hair. *Anthers* shortly beaked. *Capsule* definitely but lightly 6-ribbed, erect, usually longer than its pedicel. *Seeds* with raised points; raphe large, excurrent, like a hood near the top of the seed on one side.

21. **S. grandiflora**, *Wall. Cat.* 4099; stems very woody below branching round, leaves glabrous bristle-serrate 5-7-nerved from the base, petals $\frac{2}{3}$ - $\frac{3}{4}$ in. elliptic acute mauve. *Wight. Ic. t.* 995; *W. & A. Prodr.* 322; *Bot. Mag. t.* 5354; *Benn. Pl. Jav. Rar.* 216; *Triana in Trans. Linn. Soc.* xxviii. 76.

NILGHIRIS; near Sisparah, *Wight, Gardner.*

Leaves 1-2 in., crowded on the branchlets, oblong or elliptic, narrowed at both ends, acute, not much acuminate; petiole $\frac{1}{4}$ - $\frac{3}{4}$ in. *Racemes* densely flowered; peduncles short, terminal. *Calyx-tube* glabrous. *Anthers* much attenuated. *Capsule* $\frac{1}{4}$ - $\frac{1}{2}$ in., funnel-shaped, smooth, obscurely ribbed.

22. **S. elegans**, *Wight Ic. t.* 995-3; leaves pinnate-nerved with a very few scattered hairs above nearly or quite glabrous beneath, raceme pubescent, pedicel and calyx-tube hairy, capsule finally with its pedicel stiffly scabrous.

NILGHIRIS, Sispara; *Wight No.* 1109 partly, *McIvor.*

Suffrutescent; branches glabrous or with few scattered hairs. *Leaves* 2-4 in., elliptic-lanceolate from a rounded base, minutely serrulate, sometimes purpurascens beneath; petiole $\frac{1}{2}$ -2 in. *Racemes* lateral and terminal, long-peduncled. *Petals* $\frac{1}{2}$ in., light mauve. *Capsule* $\frac{2}{3}$ in., erect, funnel-shaped, trigonous, rather obscurely 6-ribbed, longer than its pedicel. *Seeds* with prominent raised points, raphe much excurrent near the top on one side.—This has been confused with the next species by Triana (*Trans. Linn. Soc.* xxviii. 76) and in Herbaria. It decisively differs by the very scabrous ripe capsules: also the indumentum of the leaves is different, and the peduncle longer. *S. pilosula* Thwaites (No. 19) may be a form of this with more pubescent leaves.

23. **S. versicolor**, *Wight Ic. t.* 1057; leaves pinnate-nerved with scattered hairs on both surfaces, raceme nearly glabrous, pedicel and calyx-tube glabrous, capsule finally quite glabrous. *S. axillaris*, *Wight. Ic. t.* 1058.

NILGHIRIS; *Wight; Gardner, &c. Mysore, T. Lobb.*

Suffrutescent, branches pubescent. *Leaves* 2-4 in., elliptic-lanceolate from a rounded base, finely serrulate, sometimes purpurascens beneath, hairs above sometimes with vesicular bases (giving the leaves a spotted appearance); petiole 1-3 in. *Racemes* terminal and many lateral. *Petals* $\frac{1}{2}$ in., mauve. *Capsules* $\frac{3}{8}$ - $\frac{1}{2}$ in., erect, in crowded clusters, narrowly funnel-shaped or almost oblong, rather obscurely 6-ribbed, longer than the pedicel. *Seeds* with prominent raised points, raphe excurrent near the top on one side.—*S. axillaris* Wight is exactly the same plant the axillary racemes being placed alternately up the stem on short peduncles with some regularity. *S. pilosula* (No. 19) differs by its hairy racemes and calyx-tube. In both *S. versicolor* and *S. elegans* the leaves are more or less unequal at the base.

24. **S. lanceolata**, *Thwaites Enum. p.* 107; leaves sessile long-lanceolate from a rounded base glabrous, capsules $\frac{1}{4}$ - $\frac{1}{2}$ in. clustered glabrous oblong somewhat funnel-shaped distinctly 6-ribbed longer than the pedicel. *Triana in Trans. Linn. Soc.* xxviii. 76; *Bedd. Ic. Pl. Ind. Or. t.* 299.

CEYLON, alt. 1000 ft., *Walker, Thwaites.*

Suffrutescent; branches round, glabrous. *Leaves* 2-3 in., 3-nerved from the base distantly serrulate upwards; petiole less than $\frac{1}{8}$ in. *Petals* $\frac{1}{2}$ in., mauve, broad elliptic, acute. *Anthers* not much attenuated. *Seeds* smooth or nearly so; raphe large, hooded, excurrent the whole length of the seed.

25. **S. angustata**, *Triana in Trans. Linn. Soc.* xxviii. 76; glabrous, leaves narrowly lanceolate 1-nerved, capsule $\frac{1}{5}$ in. short funnel-shaped cernuous about equal in length to the pedicel. *S. rhombifolia* β . *angustata*, *Thwaites ms.*

CEYLON; District Galle, *Thwaites* No. 2799 partly.

Stem 6 in.; branches wiry, subquadangular. Leaves $1\frac{3}{4}$ by $\frac{1}{4}$ in., with remote shallow crenatures upwards; petiole $\frac{1}{5}$ in.—The species is distinguished from No. 15 *S. rhombifolia* *Thwaites* by *Triana*, and the leaves appear very different. The specimen of *Thwaites* has no flowers.

§§ *Species of the Transyangetic Peninsula.*

26. **S. tenuifolia**, *Blume in Flora*, 1831, 491; stem attaining a foot glabrous or with a few spreading hairs, leaves ovate-lanceolate acuminate strongly serrate, capsule glabrous with a very wide mouth. *Benn. Pl. Jav. Rar.* 211, t. 44; *Naud. in Ann. Sc. Nat. ser. 3. xv. 324*; *Miq. Fl. Ind. Bat. i. pt. i. 563*; *Triana in Trans. Linn. Soc.* xxviii. 76.

MALACCA, Mount Ophir; *T. Lobb, Maingay* No. 779.—DISTRIB. Java.

Leaves $\frac{3}{4}$ –2 in., unequal, often pilose above; petiole $\frac{1}{4}$ – $1\frac{1}{2}$ in. Anthers oblong, attenuated. Capsule $\frac{1}{5}$ – $\frac{1}{4}$ in., trigonous, shorter than its pedicel, mouth $\frac{1}{4}$ – $\frac{1}{3}$ in. broad. Seeds with raised points, raphe excurrent on one side near the top.

27. **S. linearis**, *Hook. f. ms.*; *Triana in Trans. Linn. Soc.* xxviii. 76; nearly glabrous, leaves linear-spathulate sessile minutely distantly toothed or subentire, capsule $\frac{1}{4}$ in. campanulate narrow-cylindric glabrous faintly 6-ribbed longer than the pedicel. *Kurz in Journ. As. Soc.* 1877, pt. ii. 78.

MOULMEIN, on Mount Gerai, alt. 3000 ft., *T. Lobb* No. 345, 425.

Very erect, 15 in., with small round branches. Leaves 1 by $\frac{1}{16}$ in. Racemes terminal, 2–4-flowered. Calyx-tube minutely puberulous. Petals $\frac{1}{4}$ in., mauve. Anthers slender, attenuated upwards.

28. **S. picta**, *Korth. Verh. Nat. Gesch. Bot.* 249, t. 52; leaves ovate or lanceolate pinnate-nerved serrulate, racemes about 6-flowered short-peduncled terminal, calyx-tube and pedicel puberulous subpubescent, petals $\frac{1}{2}$ in. elliptic acute mauve, anthers much elongate. *Blume Mus. Bot. i. 11*; *Miq. Fl. Ind. Bat. i. pt. i. 564*; *Naud. in Ann. Sc. Nat. ser. 3. xv. 326*; *Triana in Trans. Linn. Soc.* xxviii. 76; *Kurz in Journ. As. Soc.* 1877, pt. ii. 78.

MERGUI, *Griffith*; Moulmein, *T. Lobb, Parish*.—DISTRIB. Sumatra.

Stem 4–8 in., little divided, pubescent or subtomentose upwards. Leaves 1–4 in., nearly glabrous, pubescent on the nerves beneath, usually none of the nerve quite basal and 2–3 nerves high up the midrib, blotched white or not along the midrib above; petiole $\frac{1}{2}$ – $\frac{3}{8}$ in. Capsule (ex *Korthals*) funnel-shaped, trigonous, sparsely pilose. Seeds with raised points, raphe very excurrent, hooded.

VAR. *Lobbii*; stem very rusty tomentose, leaves small scarcely 1 in.—Top of Thoungyeen, Moulmein, alt. 4000 ft.; *T. Lobb*.

29. **S. secunda**, *R. Br. in Wall. Cat.* 4094; stem weak pubescent simple, leaves elliptic acute pinnate-nerved, peduncle capsules and pedicels glabrous, capsule $\frac{1}{5}$ in. funnel-shaped subtrigonus as long as the pedicel, ribs not prominent. *Benn. Pl. Jav. Rar.* 216; *Triana in Trans. Linn. Soc.* xxviii. 76; *Kurz in Journ. As. Soc.* 1877, pt. ii. 78.

TAVOY; *Wallich*.

Stem 2–4 in., with 4–5 large leaves approximated at its summit. Leaves 2–4 $\frac{1}{2}$ in., minutely denticulate, with scattered long lax hairs on both surfaces, hairs some-

times vesicular at the base, sometimes blotched along the midrib above; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. Peduncle terminal, 2–3 in. Flowers not seen.

§§§ *Species of Bengal.*

30. **S. squarrosa**, Wall. in Roxb. *Fl. Ind. ed. Carey & Wall.* i. 182; stem 2–4 in. little divided thick, leaves crowded towards the upper part of the stem spatulate-lanceolate serrulate, petiole jointed on a tubercle of the stem which is supported on each side by rufous bristles, flowers racemed. Wall. *Cat.* 4093, *Pl. As. Rar.* t. 102; Naud. in *Ann. Sc. Nat. ser.* 3. xv. 325; Triana in *Trans. Linn. Soc.* xxviii. 76.

KHASIA Mts., alt. 3000–4000 ft.; frequent.

Leaves $\frac{3}{4}$ – $1\frac{1}{2}$ in., glabrous, attenuated into the petiole; stipules $\frac{1}{2}$ – $\frac{3}{4}$ in. Racemes few-flowered; peduncles subterminal, short. Calyx-tube glabrous. Petals $\frac{1}{4}$ – $\frac{1}{2}$ in., ovate, acute, mauve. Capsule $\frac{1}{4}$ in., glabrous, funnel-shaped, subtrigonal, hardly ribbed, pedicel very short. Seed obovoid, without raised points, raphe not at all excurrent.

31. **S. arguta**, R. Br. in Wall. *Cat.* 4095; stems 0–2 in., leaves elongate spatulate, petiole jointed on a tubercle of the stem which is supported on each side by a rufous bristle, peduncle 1-flowered. Naud. in *Ann. Sc. Nat. ser.* 3. xv. 326; Triana in *Trans. Linn. Soc.* xxviii. 76.

KHASIA Mts., alt. 3000–4000 ft., Wallich, H. f. & T., C. B. Clarke.

Leaves (including the petiole) 1–4 by $\frac{1}{4}$ – $\frac{1}{2}$ in., attenuated into the petiole, with scattered large hairs above or glabrous, 1-nerved, very minutely denticulate. Peduncle $1\frac{1}{2}$ –2 in. Calyx-tube glabrous. Petals $\frac{3}{8}$ – $\frac{1}{2}$ in., mauve, elliptic, acute. Capsule $\frac{3}{8}$ in., oblong, glabrous, subtrigonal, ribs obscure. Seed obovoid, with minute raised points, raphe not excurrent.—One example collected by Sir J. D. Hooker has broadly lanceolate leaves, $\frac{3}{8}$ in. broad, but agrees otherwise with the type.

32. **S. maculata**, Roxb. *Fl. Ind.* i. 177; stem short decumbent round often divided and with several lateral racemes, leaves pinnate-nerved ovate or lanceolate from a rounded or narrowed base ciliate scarcely serrulate usually with many long hairs on both surfaces sometimes nearly glabrous, peduncles not very long, capsules glabrous cernuous in clusters of 5–15. Wall. *Cat.* 4091; Triana in *Trans. Linn. Soc.* xxviii. 76; Kurz in *Journ. As. Soc.* 1877, pt. ii. 78. *S. emaculata*, Roxb. *Fl. Ind.* i. 178. *S. angustifolia*, Roxb. l. c., not of Wall. *Cat.*; Wall. *Pl. As. Rar.* t. 102. *S. picta*, Griff. *Notul.* iv. 676 (ex Kurz in *Flora* 1871–90). *S. Brandisiana*, Kurz in *Flora*, 1871, 290. *Sonerila* sp. 3 and 4, Griff. *Notul.* iv. 676.

NIPAL; Wallich. ASSAM HILLS and KHASIA Mts., alt. 1000–5000 ft., plentiful. MARTABAN and TENASSERIM, Kurz.

Leaves often 4 by 2 in., frequently unequal at the base, sometimes appearing spotted above from vesicular-based hairs; petiole 1–2 in., usually ciliate and pubescent. Calyx-tube puberulous, and generally with a few scattered hairs. Petals mauve, elliptic, very acute. Capsule $\frac{1}{4}$ in., oblong or somewhat funnel-shaped, slightly trigonal, obscurely ribbed, much longer than the pedicel. Seeds with prominent raised points, raphe only slightly excurrent near the top of the seeds on one side.—Wall. *Cat.* 4090 marked *Sonerila angustifolia* Roxb. is an *Argostemma*.

†† *Plants with distinct stems, the leaves of each pair exceedingly dissimilar.*

33. **S. moluccana**, Roxb. *Fl. Ind.* i. 178; stem short hirsute, larger leaf of each pair 4–5 in. with a petiole of 1 in. the smaller one $\frac{1}{2}$ in., capsule

intensely hispid scabrous. *Wall. Cat.* 4089; *Blume Mus. Bot.* i. p. 10; *Benn. Pl. Jav. Rar.* 215; *Miq. Fl. Ind. Bat.* i. pt. i. 562; *Triana in Trans. Linn. Soc.* xxviii. 77. *S. paradoxa*, *Naud. in Ann. Sc. Nat. ser.* 3. xv. 321. *S. begoniæ-folia*, *Blume Mus. Bot.* i. p. 11; *Naud. l. c.* 322; *Triana l. c.*

PINANG; *Wallich, Griffith, Maingay.* MALACCA; *Maingay.* SINGAPORE; *Wallich, Lobb.*—DISTRIB. Malaya.

Leaves ovate-lanceolate, very unequal at the base, pinnate-nerved, with much rufous or brown hair on both surfaces, ciliate, hardly serrulate. *Calyx-tube* very shaggy. *Petals* $\frac{1}{2}$ in., elliptic, acute. *Capsule* less than $\frac{1}{2}$ in., broad-campanulate, longer than its pedicel. *Seeds* almost epunctate, raphe very strongly excurrent near the top on one side.

††† *Stemless or almost stemless species (the stem sometimes elongate in S. Griffithii).*

§ *Capsule subhemispheric, i.e. short with the three angles obscure.*

34. ***S. Wallichii***, *Benn. Pl. Jav. Rar.* 215; leaves pinnate-nerved ovate acute, capsule short subcampanulate glabrous crowned by a prominent white margin, seeds with raised points and the raphe moderately excurrent on one side towards its top. *Triana in Trans. Linn. Soc.* xxviii. 77. *S. Rheedii*, *Wall. Cat.* 4096; *W. & A. Prodr.* 321. *S. acaulis*, *Beddome in Trans. Linn. Soc.* xxv. 216.

SOUTH MALABAR GHATS. COCHIN, *Johnston*; ANAMALLAYS, *Beddome*; BABABOODUN HILLS, *Law*.

Leaves from $\frac{1}{2}$ to 5 in. often broad or cordate at the base sometimes acute, minutely denticulate or entire, usually puberulous and also with a few scattered hairs; petiole 0–2½ in. *Peduncle* 1–8 in.; flowers 3–17, crowded, subumbelled; pedicels glabrous. *Petals* $\frac{1}{4}$ in., elliptic, acute, mauve. *Anthers* not greatly elongate. *Capsule* $\frac{1}{16}$ – $\frac{1}{10}$ in. exclusive of the margin, shorter than the pedicel.

35. ***S. scapigera***, *Dalz. in Hook. Lond. Journ. Bot.* vii. 672, t. 23; leaves nerved from near the base ovate or ovate-oblong, capsule campanulate glabrous crowned by a very narrow margin, seeds without raised points or excurrent raphe. *Dalz. & Gibs. Bomb. Fl.* 93; *Triana in Trans. Linn. Soc.* xxviii. 77.

BOMBAY GHATS, *Dalzell*; CONCAN and Bababoodun Hills, *Law*; MYSORE, *Lobb*.

Leaves commonly $\frac{1}{2}$ –1½ in., broad or cordate at the base, minutely crenate-serrate, glabrous, sometimes glandular puberulous dotted above; petiole often 2 in. *Peduncle* 1–3 in.; flowers 4–10, crowded, subumbellate; pedicels glabrous or nearly so. *Petals* $\frac{1}{3}$ – $\frac{3}{8}$ in., elliptic, acute, mauve. *Anthers* much elongate. *Capsule* $\frac{1}{8}$ – $\frac{1}{2}$ in., shorter than the pedicel.—The peduncle pedicels and petioles frequently become succulent and much thickened. Generally resembling *S. Wallichii* and closely allied to it.

36. ***S. rotundifolia***, *Bedd. in Trans. Linn. Soc.* xxv. 216; leaves orbicular or ovate nerved from near the base, peduncles 1–4-flowered, raceme glabrous or nearly so, capsule short hemispheric glabrous crowned by a narrow margin, seeds with raised large subtubercular points raphe not excurrent. *Triana in Trans. Linn. Soc.* xxviii. 77; *Bedd. Ic. Pl. Ind. Or.* t. 169.

SOUTH DECCAN; Anamallays, alt. 5000 ft.; *Beddome*.

Leaves $\frac{1}{2}$ – $\frac{3}{4}$ in. diam., cordate at the base, minutely denticulate, glabrous and minutely puberulous, dotted on both surfaces; petiole $\frac{1}{2}$ –1½ in. *Peduncles* 1½–3 in. *Petals* $\frac{3}{8}$ in., orbicular-obovate, mauve. *Anthers* short for the genus, little attenuate, truncate. *Capsule* $\frac{1}{16}$ – $\frac{1}{10}$ in., shorter than the pedicel.

37. **S. Kurzii**, C. B. Clarke; leaves orbicular nerved from the base, pedicels 3-5 with many patent hairs, capsule short (Kurz). *S. amabilis*, Kurz in *Flora*, 1871, 290.

SIKKIM; Rungait Valley, alt. 4000-5000 ft., Kurz; Rungbee Valley, alt. 2000-3000 ft., Jaffrey.

Leaves $\frac{1}{2}$ - $\frac{3}{4}$ in. diam., with many long patent hairs, subentire, cordate at the base; petiole $\frac{1}{2}$ - $1\frac{1}{4}$ in., with long patent hairs. Peduncle 1-2 in., with many patent hairs; pedicels crowded, subumbelled. Petals $\frac{3}{8}$ in., broadly elliptic, obtuse, rose-mauve. Anthers narrower upwards, hardly acuminate.

§§ Capsule oblong funnel-shaped, distinctly trigonous.

38. **S. Griffithii**, C. B. Clarke; leaves glabrous minutely dotted puberulous beneath, capsule $\frac{1}{2}$ in. funnel-shaped, pedicel nearly $\frac{1}{2}$ in., seeds with very minute points raphe prominently excurrent on one side near the top.

MALACCA, Mount Ophir; Griffith (Kew Distrib. No. 2300), T. Lobb, Maingay No. 781.

Stemless, or the stem 1-2 $\frac{1}{2}$ in. Leaves $\frac{1}{2}$ -1 in., ovate, glabrous or with scattered bristly hairs above, minutely denticulate, subciliate, nerves from near the base; petiole $\frac{1}{4}$ -1 in. Peduncle 1-4 in., 2-6-flowered; raceme short, glabrous or nearly so. Petals $\frac{1}{2}$ in., broadly elliptic, acute. Anthers long, attenuate.

39. **S. nudiscapa**, Kurz in *Journ. As. Soc.* 1877, pt. ii. 78; leaves with flaccid scattered hairs beneath, capsule $\frac{1}{2}$ in. narrow funnel-shaped, pedicel much shorter, seeds with very small minute raised points raphe scarcely excurrent.

MERGUI; Griffith (Kew Distrib. No. 2303). TENASSERIM or ANDAMANS, Helfer (Kew Distrib. No. 2303).

Nearly stemless. Leaves 1-2 in., very thin, ovate or elliptic-oblong, obtuse, nearly entire, somewhat pinnate-nerved; petiole 0- $\frac{3}{4}$ in. Peduncle 1-1 $\frac{1}{2}$ in., 3-8-flowered; raceme short, glabrous or nearly so. Petals $\frac{1}{4}$ in., elliptic, acute. Seeds hardly half as large as in any other species.

40. **S. violæfolia**, Hook. f. ms.; Triana in *Trans. Linn. Soc.* xxviii. 77; glabrous, bundles of rufous bristles $\frac{1}{8}$ - $\frac{1}{5}$ in. about the base of the petioles, capsule $\frac{1}{5}$ in. funnel-shaped usually shorter than the pedicel, seeds with minute raised points raphe not excurrent. Kurz in *Journ. As. Soc.* 1877, pt. ii. 78.

MOULMEIN; Lobb No. 356.

Stemless. Leaves 1-2 in., ovate, entire or minutely denticulate, 5-nerved, the upper two nerves often branching from the midrib at a point some way above its base; petiole $\frac{1}{2}$ -2 $\frac{1}{4}$ in. Peduncle 1-3 $\frac{1}{4}$ in., 3-8-flowered. Petals $\frac{1}{2}$ in., mauve, elliptic, acute. —In this and the next species the rufous bristles at the base of the petiole are exceedingly like those in *S. arguta* and *S. squarrosa*, but they are in numerous tufts (not 2 only and quasi-stipular as in those species) and the petiole is not jointed on a tubercle of a woody stem as in those species.

41. **S. khasiana**, C. B. Clarke; bundles of rufous bristles $\frac{1}{2}$ - $\frac{1}{4}$ in. about the base of the petioles, leaves usually with scattered bristly hairs above, capsule $\frac{1}{8}$ - $\frac{1}{5}$ in. oblong shorter than the pedicel, seeds with minute dots raphe not excurrent.

KHASIA Mts., alt. 4000-5000 ft.; Mamloo, Kalapani, H. f. & T.; Jarnin in Jaintea, C. B. Clarke.

Stemless. *Leaves* less than 1 in., ovate, often acute, entire, ciliate but scarcely serrate, 5-nerved from the base or the two upper nerves from the midrib; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in. *Peduncle* 1– $2\frac{1}{2}$ in., 1–4-flowered. *Petals* $\frac{1}{4}$ in., mauve, elliptic, acute. *Anthers* long, narrowed upwards but scarcely acuminate.—Near *S. violæfolia*, and possibly a hairy dwarf mountain form of it.

SECTION B. Stamens 6.

42. **S. heterostemon**, *Naud. in Ann. Sc. Nat. ser. 3. xv. 326, xvi. t. 18, f. 4*; glabrous or nearly so, leaves unequal, stamens 3 with longer filaments and purple anthers somewhat produced at base 3 with yellow anthers not produced, capsule broadly funnel-shaped sessile.

MALACCA; *Griffith, Lobb, Cuming*. SINGAPORE; *Maingay*.—DISTRIB. Malaya.

Stems attaining 18 in., much branched, with many lateral racemes. *Leaves* 2– $4\frac{1}{2}$ in., elliptic, acuminate or acute, broad often unequal at the base, entire, with 5–7 main longitudinal nerves; petiole $\frac{1}{4}$ – $1\frac{1}{2}$ in. *Racemes* on short peduncles, elongate in fruit, 10–20-flowered. *Seeds* with raised points, raphe excurrent the whole length of the seed.—The sessile broad funnel-shaped capsules readily distinguish this species. The leaves are sometimes puberulous subpubescent on the nerves, and sometimes show spots on the upper surface. This species is reduced to *S. obliqua*, *Korth. Verh. Nat. Gesch. Bot. p. 250* by Triana and probably correctly: but *S. obliqua* *Korth.* is classed as triandrous by all who quote it: cf. *Miq. Fl. Ind. Bat. i. pt. i. 563*.

43. **S. Bensoni**, *Hook. f. in. Bot. Mag. t. 6049*; glabrous below, peduncle upwards and raceme hairy, stamens equal, anthers all yellow not produced at the base.

Raised in London from seed sent from the MALABAR GHATS by Col. Benson.

This plant seems exactly *S. speciosa* (No. 20). The change of habitat and forcing in rich soil in an English stove may have developed the three stamens usually suppressed in the genus (?).

DOUBTFUL SPECIES.

S. BULLATA, *Griff. Notul. iv. 675*, from Malacca, is not identifiable. Triana (*Trans. Linn. Soc. xxviii. 77*) thinks it may be a *Driessenia*, but the terminal panicle points rather to *Allomorphia*.

S. GLABERRIMA, *Arn. in Hook. Bot. Mag. ii. 307*. The specimen thus named in Wight's Herbarium is *S. rhombifolia*. We have seen no other.

S. HELFERI, *C. B. Clarke*; stem 8 in. branched woody round rusty-pubescent, leaves $\frac{5}{8}$ in. elliptic acute entire 3-nerved from the base rusty shortly pubescent on both surfaces as is the petiole ($\frac{1}{4}$ in.), racemes lateral 2–4-flowered on peduncles less than $\frac{1}{4}$ in., capsule $\frac{1}{4}$ – $\frac{1}{2}$ in. funnel-shaped subsessile nearly glabrous with triangular erect teeth.—TENASSERIM or ANDAMANS, *Helper* (*Kew Distrib. No. 2295*).

S. MACULATA; Rheede's plant (*Hort. Mal. ix. t. 65*) usually referred to *S. maculata* is certainly not that plant; it may be No. 20 *S. speciosa*, *Zenk.*

11. **SARCOPYRAMIS**, *Wall.*

An erect glabrous herb; stem quadrangular. *Leaves* petioled, ovate or lanceolate, serrulate, 3-nerved. *Flowers* in small clusters, pedicelled or nearly sessile, axillary and terminal, small, rose-purple. *Calyx-tube* glabrous, obpyramidal, 4-winged; limb very short, 4-toothed. *Petals* 4, ovate. *Stamens* 8, equal; anthers oblong, scarcely produced at the base, connective appendaged at the base with a spur. *Ovary* half-adnate to the calyx, 4-celled; style filiform; ovules very many, placentas axile. *Capsule* crowned with four large scales,

opening by 4 valves at the top. *Seeds* numerous, obovoid, covered with prominent raised points, raphe not excurrent.

1. **S. nepalensis**, *Wall. Tent. Fl. Nep.* t. 23; *Cat.* 4088; *Benn. Pl. Jav. Rar.* 214. *S. lanceolata*, *Wall. Cat.* 6290; *Benn. l. c.*; *Kurz in Journ. As. Soc.* 1877, pt. ii. 77. *S. grandiflora*, *Griff. Notul.* iv. 678; *l. c. Pl. Asiat.* t. 639.

NIPAL and SIKKIM, alt. 4000–9000 ft.; plentiful. KHASIA MTS., alt. 4000–6000 ft.; plentiful. BURMA and MALAY PENINSULA; *Griffith, Kurz.*

Stem often 2–6 in., succulent, weak, sometimes 18 in. with thick woody branches. *Leaves* 2–4 in., from ovate to lanceolate, long-acuminate; petiole $\frac{1}{2}$ –1 in. *Calyx-tube* glabrous, sometimes with minute bundles of hairs between the bases of the teeth. *Petals* scarcely $\frac{1}{4}$ in. *Fruit* about $\frac{1}{4}$ in., quadrangular, mouth of the calyx-tube very wide. —Triana reduces (*in Trans. Linn. Soc.* xxviii. 77, 78) to this species *Sonerila Naudiniana* *Miq. Fl. Ind. Bat.* i. pt. i. p. 565 with syn. But Miquel removed this plant from *Sarcopyramis* because it had 6 stamens: there is no authentic specimen of it at Kew.

12. **PHYLLAGATHIS**, *Blume.*

Herbaceous small shrubs with very short stems. *Leaves* opposite (or the terminal leaf solitary), large, petioled, orbicular, cordate, 7–9-nerved. *Flowers* in a peduncled dense head, purple. *Calyx-tube* campanulate, glabrous or with long bristles near the top, teeth 4 (rarely 3), acute, long-setose. *Petals* 4 (rarely 3), ovate, acute, glabrous. *Stamens* 8 (rarely 6), equal; anthers elongate, scarcely produced at the base, connective without appendage. *Ovary* adnate to the bottom of the calyx-tube, 4- (rarely 3-) celled, glabrous at the apex; style filiform; ovules very numerous, placentas large axile. *Capsule* broadly funnel-shaped, opening by 4 valves at the top. *Seeds* ellipsoid, somewhat obovoid, with glandular hardly raised dots, raphe slightly excurrent along one side of the seed its whole length.—DISTRIB. Species 2; one Malayan, one Bornean.

1. **P. rotundifolia**, *Blume in Flora*, 1831, 507; leaves glabrous or puberulo-glandular beneath, flower-heads with ovate bracts beneath. *Korth. in Verh. Nat. Gesch. Bot.* t. 57; *Naud. in Ann. Sc. Nat. ser. 3.* xv. p. 332; *Bot. Mag.* t. 5282; *Triana in Trans. Linn. Soc.* xxviii. 77. *Melastoma rotundifolium*, *Jack in Trans. Linn. Soc.* xiv. 12; *DC. Prodr.* iii. 149.

MALACCA; *Griffith, Maingay.* ? TENASSERIM or ANDAMANS, *Helfer* No. 2266.

Leaves usually 4–9 in. diam., obtuse or acute, entire, usually red beneath; petiole 2–5 in., with long pendent coarse bristles or nearly glabrous. *Bracts* to the flower head red, $\frac{1}{2}$ in. wide and upwards. *Calyx-teeth* from short-ovate with a mucro to ovate-lanceolate attenuate. *Capsule* about $\frac{1}{4}$ in., fruiting pedicel about $\frac{1}{2}$ in.—*Helfer's* No. 2266, in fruit, shows the capsule trigonous with smooth almost convex faces: the other typical examples show the fruit 6–8-ribbed, the ribs prominent: in all these the fruit is over-ripe and the wall partly broken down. *Helfer's* plant may be a new species or even a new genus; but the leaves are exceedingly like the well-marked leaves of *Phyllagathis*.

13. **MARUMIA**, *Blume.*

Twining shrubs; branches round, thickened at the nodes. *Leaves* opposite, short-petioled, coriaceous, elliptic-lanceolate, cordate at the base, 3-nerved from the base besides two submarginal nerves, entire, tomentose beneath. *Cymes* axillary; flowers 3–5, large, pedicelled, purple or white. *Calyx-tube* cylindric,

tomentose (and often bristly or stellate-hairy); lobes 4, persistent. *Petals* 4, obovate. *Stamens* 8, unequal; anthers elongate, opening by a single pore; connective of the longer anthers carrying in front two long bristles and behind often one or two spurs or several twisted bristles. *Ovary* at the base (or half its height) adnate to the calyx, 4-celled, densely hairy at the apex; style filiform; ovules numerous, placentas axile. *Berry* ellipsoid, crowned by the calyx-limb. *Seeds* numerous, oblong-ellipsoid, with glandular scarcely raised dots, raphe slightly excurrent along the whole length of one side.—**DISTRIB.** Species 10, extending from the southern half of the Transgangetic Peninsula to Borneo and the Philippines.

1. **M. nemorosa**, *Blume in Flora*, 1831, 505; branches rusty closely pubescent subtomentose, calyx-tube rusty closely pubescent stellate-tomentose sometimes scabrous subtuberculate, teeth ovate-lanceolate acuminate. *Naud. in Ann. Sc. Nat. ser. 3. xv.* 279; *Miq. Fl. Ind. Bat. i. pt. i.* 532; *Triana in Trans. Linn. Soc. xxviii.* 82. *M. affinis*, *Korth. in Verh. Nat. Gesch. Bot.* 241, t. 60; *Miq. l. c.* 533. *Melastoma nemorosum*, *Jack in Trans. Linn. Soc. xiv.* 8; *DC. Prodr. iii.* 149; *Wall. Cat.* 4043.

PINANG; *Wallich, Schomburgk, Phillips.* MALACCA; *Griffith, Maingay.*—**DISTRIB.** Borneo, Sumatra.

Leaves 3–4 in., shining, minutely puberulous above, rufous-stellate beneath; petiole $\frac{1}{4}$ in. *Peduncle* 1–2 in.; pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. Connective of the longer *anthers* at the base with two long bristles in front and several short twisted hairs behind.

2. **M. zeylanica**, *Blume in Flora*, 1831, 505; branches rusty closely pubescent or subtomentose and with scattered spreading long bristles, calyx-tube rufous-stellate tomentose and with spreading bristles $\frac{1}{2}$ in., teeth triangular-lanceolate. *Blume Rumph. t. 5*; *Triana in Trans. Linn. Soc. xxviii.* 82. *M. echinulata*, *Naud. in Ann. Sc. Nat. ser. 3. xv.* 280; *Miq. Fl. Ind. Bat. i. pt. i.* 534. *Melastoma rhodocarpum*, *Wall. Cat.* 4045.

MALACCA; *Maingay.* SINGAPORE; *Wallich, Walker, T. Anderson.*—**DISTRIB.** Malaya to the Philippines.

Leaves 3–4 in., shining above, rufous-stellate beneath; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in. *Peduncle* 1 in., pedicels $\frac{1}{4}$ – $\frac{1}{2}$ in. Connective of the longer *anthers* at the base with two long bristles in front and several short twisted hairs behind.

VAR. subglabrata; leaves beneath glabrous except the nerves. Singapore, *T. Anderson.*

3. **M. reticulata**, *Blume Mus. Bot. i.* 34; branches rusty tomentose and with spreading scattered long bristles, calyx-tube rufous-stellate tomentose and with spreading bristles $\frac{1}{4}$ in. from clustered tubercular bases, teeth short triangular in the bud ovate rounded reflexed after flowering tomentose within. *Triana in Trans. Linn. Soc. xxviii.* 82. *M. stellulata*, *Korth. in Verh. Nat. Gesch. Bot.* 243, not of *Blume*.

MALAY PENINSULA; *Griffith (Kew Distrib. No. 2269).* MALACCA; *Maingay No. 784.*—**DISTRIB.** Sumatra and Java.

Leaves 2–3 $\frac{1}{2}$ in., shining impressed-reticulate above, with scattered stellate pubescence beneath; petiole $\frac{1}{2}$ in. *Peduncles* $\frac{1}{2}$ –1 in., chiefly from the upper axils forming a quasi-terminal panicle; pedicels $\frac{1}{2}$ in. Connective of the longer *anthers* at the base with two long bristles in front; anthers very long, sigmoid.—*M. oligantha*, *Naud. in Ann. Sc. Nat. ser. 3. xv.* 300; *Miq. Fl. Ind. Bat. i. pt. i.* 534 is said by *Triana* to be also a syn. of *M. reticulata*, *Blume*.

14. **DISSOCHÆTA**, Blume.

Shrubs, usually twiners. *Leaves* opposite, petioled or nearly sessile, elliptic or oblong-lanceolate, rounded at the base, 3-nerved from the base besides two submarginal nerves, entire. *Flowers* large or small, in terminal sometimes leafy panicles, purple or white, bracts large or small. *Calyx-tube* campanulate-cylindric, densely stellate-tomentose pubescent or glabrous; limb obscurely 4-lobed, more rarely distinctly 4-toothed, persistent. *Petals* 4. *Stamens* 8, unequal, 4 shorter sometimes wanting, connective of the 4 longer with 2 long bristles in front at the base (in all the Indian species). *Ovary* adnate to the calyx, 4-celled, apex glabrous or densely hairy; style filiform; ovules very many, placentas axile. *Berry* ovoid or elliptic, crowned with the calyx-limb. *Seeds* ellipsoid, flattened on the side of the raphe.—**DISTRIB.** Species 16, extending from Pinang and Malacca throughout Malaya to the Philippines.

* *Anthers* very long, attenuate upwards.

1. **D. annulata**, Hook. f. ms.; Triana in Trans. Linn. Soc. xxviii. 83; branches panicle and leaves beneath with much rufous stellate tomentum, panicle narrow leafy with large bracts to the young flowers, calyx-tube of the buds more than $\frac{1}{2}$ in. densely woolly-rufous and stellate-hairy, teeth distinctly triangular. *Melastoma bracteatum*, Wall. Cat. 4044, partly.

PINANG; Wallich, Griffith (Kew Distrib. No. 2268). Mount Ophir, MALACCA, Maingay No. 788.—**DISTRIB.** Borneo.

Leaves 3–4 $\frac{1}{2}$ in., glabrous above or minutely pubescent on the nerves; petiole $\frac{1}{4}$ in. *Panicle* consisting of axillary cymes (exactly resembling that of *Marumia reticulata*); bracts $\frac{3}{4}$ in., oblong, caducous; pedicels less than $\frac{1}{4}$ in. *Fruit* (not ripe) ellipsoid, calyx-mouth enlarged, teeth somewhat rounded.—The stem of this plant has rings at the nodes as in *Marumia*: its natural affinity seems altogether with *Marumia reticulata* and *M. nemorosa*: it recedes from *M. reticulata* only by the absence of the long bristles on the calyx-tube so common in *Marumia*; from *M. nemorosa* it recedes by the quasi-paniculate inflorescence and the absence of any twisted hairs at the base of the connective other than the two long bristles in front.

2. **D. punctulata**, Hook. f. ms.; Triana in Trans. Linn. Soc. xxviii. 83; branches and panicle densely closely dark-red furfuraceous, panicle narrow not leafy, bracts small linear deciduous, calyx-tube $\frac{1}{5}$ – $\frac{1}{4}$ in. densely dark-red furfuraceous, teeth short triangular in the expanded flower.

MALACCA; Griffith (Kew Distrib. No. 2291); Maingay No. 789. SINGAPORE and PINANG; Walker.

Leaves 2 $\frac{1}{2}$ –3 $\frac{1}{2}$ in., glabrous above, with scattered dark-red stellate hairs beneath; petiole $\frac{1}{5}$ – $\frac{3}{8}$ in. *Panicle* terminal, pedicels hardly more than $\frac{1}{4}$ in. *Fruit* (not ripe) campanulate (seems about to become ovoid), calyx-teeth not then prominent, nor the mouth enlarged.

3. **D. bracteata**, Blume in Flora, 1831, 495; branches upwards and panicle with small stellate pubescence, panicle somewhat spreading not leafy, bracts large oblong longer than the expanding buds, calyx-tube of the buds $\frac{1}{4}$ – $\frac{1}{2}$ in. with more or less stellate pubescence limb (in the bud) nearly entire or very obscurely 4-toothed. *Miq. Fl. Ind. Bat. i. pt. i. 529*; Triana in Trans. Linn. Soc. xxviii. 84. *D. bracteosa*, Naud. in Ann. Sc. Nat. ser. 3. xv. 76; *Miq. Fl. Ind. Bat. i. pt. i. 527*. *Melastoma bracteatum*, Jack in Trans. Linn. Soc. xiv. 9; Wall. Cat. 4044, partly.

PINANG; *Wallich*, *Porter*. MALACCA; *Maingay* No. 791, 793.

Leaves $2\frac{1}{2}$ – $3\frac{1}{2}$ in., glabrous above, with scattered stellate hairs beneath; petiole $\frac{1}{4}$ in. *Pedicels* $0\frac{1}{4}$ in. *Petals* rose (Jack). *Fruit* ellipsoid, mouth of the calyx enlarged.—*Maingay's* example No. 791 has larger flowers than the *Wallichian* types but appears to agree otherwise: the fruits in *Maingay's* examples are more than $\frac{1}{2}$ in. long (though not ripe).

4. **D. pallida**, *Blume in Flora*, 1831, 500; branches and panicle minutely puberulous with microscopic stellate often evanescent hairs, panicle somewhat spreading not leafy with minute lanceolate caducous bracts, calyx-tube of the buds $\frac{1}{4}$ – $\frac{1}{2}$ in. minutely puberulous or glabrous, limb (in the bud) nearly entire or very obscurely 4-lobed. *Naud. in Ann. Sc. Nat. ser. 3. xv. 77, t. xv. f. 4*; *Miq. Fl. Ind. Bat. i. pt. i. 528*; *Triana in Trans. Linn. Soc. xxviii. 83*. *D. superba*, *Naud. l. c.*; *Miq. l. c.* *D. ovalifolia*, *Naud. l. c. 76*; *Miq. l. c. 527*. *D. astrostricta*, *Miq. Fl. Ind. Bat. Suppl. 318*. *Melastoma pallida*, *Jack in Trans. Linn. Soc. xiv. 12*; *DC. Prodr. iii. 150*; *Wall. Cat. 4049*.

PINANG; *Wallich*. MALAY PENINSULA; *Griffith* (Kew Distrib. No. 2292). SINGAPORE, PINANG &c.; *Walker*, *Maingay* No. 792.—DISTRIB. Malaya Archipelago.

Leaves attaining 6 by $3\frac{1}{4}$ in., glabrous above, dotted beneath with separate stellate minute hairs; petiole $\frac{3}{8}$ in. *Pedicels* less than $\frac{1}{4}$ in. *Fruit* ovoid, mouth of the calyx much enlarged.—The 4 shorter stamens are sometimes obsolete, which accounts for the multiplication of species here by authors.

** *Anthers short, oblong, truncate, not narrowed upwards.*

This section is much more distinct from section * than the latter is from *Marumia*; there is no case of intermediate anthers, they are either decidedly truncate or very elongate. The three species of this section ** are very closely allied; the panicle is large and lax, the ultimate pedicels short, the bracts caducous, the flowers small, the calyx-limb from the bud truncate or only very obscurely 4-lobed.

5. **D. intermedia**, *Blume in Flora*, 1831, 493; leaves beneath and panicle stellately tomentose sometimes ferruginous, fruit $\frac{1}{4}$ in. broad more or less pubescent crowned by the enlarged calyx-mouth not distinctly ribbed. *Naud. in Ann. Sc. Nat. ser. 3. xv. 72*; *Miq. Fl. Ind. Bat. i. pt. i. 524*; *Triana in Trans. Linn. Soc. xxviii. 83*. *Melastoma rubiginosum*, *Wall. Cat. 4052, partly*.

PINANG and SINGAPORE; *Wallich*. MALAY PENINSULA, *Griffith* (Kew Distrib. No. 2287), *Helper* (Kew Distrib. No. 2286).—DISTRIB. Malay Archipelago.

Leaves 3 in.; petiole $\frac{1}{2}$ in. Nodes of panicle often much thickened. *Flowers* rather larger than in the two following species.

6. **D. celebica**, *Blume Mus. Bot. i. 36*; leaves beneath and panicle rufous-stellate tomentose, fruit less than $\frac{1}{2}$ in. broad minutely pubescent ribbed, calyx-limb caducous leaving only a scar. *Miq. Fl. Ind. Bat. i. pt. i. 530*; *Triana in Trans. Linn. Soc. xxviii. 83*. *D. microcarpa*, *Naud. in Ann. Sc. Nat. ser. 3. xv. 72*; *Miq. l. c. 523*. *D. bancana*, *Miq. l. c. 529*. *Melastoma fallax*, *Wall. Cat. 4050*; ? *Jack in Trans. Linn. Soc. xiv. 13*. *M. rubiginosum*, *Wall. Cat. 4052, partly*.

PINANG; *Wallich*. MALAY PENINSULA; *Griffith* (Kew Distrib. No. 2288). MALACCA; *Maingay* No. 790. SINGAPORE; *T. Anderson*.—DISTRIB. Malay Archipelago.

Leaves 3 in.; petiole $\frac{1}{2}$ in. Nodes of panicle often much thickened.—Not well distinct from the preceding species.

7. **D. gracilis**, *Blume in Flora*, 1831, p. 498; leaves beneath and panicle glabrous or very nearly so, fruit less than $\frac{1}{2}$ in. broad glabrous ovoid much nar-

rowed upwards, calyx-mouth appearing only as a scar. *Korth. Verh. Nat. Gesch. Bot.* 267; *Naud. in Ann. Sc. Nat. ser. 3. xv. 75*; *Miq. Fl. Ind. Bat. i. pt. i. 526*; *Triana in Trans. Linn. Soc. xxviii. 83*. *Melastoma gracile*, *Jack in Trans. Linn. Soc. xiv. 14*; *DC. Prodr. iii. 149*. *M. fallax*, *Wall. Cat. 4080*. ? *M. glauca*, *Griff. Ic. Pl. Asiat. 637*.

PINANG and SINGAPORE; *Wallich*.—DISTRIB. Malay Archipelago.

Leaves 3 in.; petiole sometimes $\frac{3}{4}$ in. Nodes of *panicle* often thickened. *Stamens* 8 or 4, as in the two preceding species. *Petals* nearly white (Jack). *Bracts* $\frac{1}{2}$ in., oblong, much exceeding the expanding buds.

15. ANPLECTRUM, A. Gray.

Twining shrubs. *Leaves* opposite, short-petioled, entire, oblong, narrowed upwards, 3-5-nerved from the base. *Flowers* not large, white, in terminal panicles sometimes leafy at the base. *Calyx-tube* ovoid, limb obscurely 4-lobed or truncate. *Petals* 4. *Stamens* 4 perfect; anthers attenuated upwards, opening by one pore, connective at base shortly appendaged or subnude, never with two long bristles in front; imperfect stamens 4, 2, or 0, with a rudimentary anther often bicaudate. *Ovary* 4-celled, free at the apex, with 4 vertical ridges; style simple; ovules many, placentas axile. *Berry* ovoid or globose, crowned with the calyx-limb. *Seeds* very many, small, falcate, obovoid; raphe long, lateral.—DISTRIB. Species 12, extending from Mergui, Pinang and Singapore to Borneo, and the Philippines.

1. **A. glaucum**, *Triana in Trans. Linn. Soc. xxviii. 84 excl. many of the syn.*; leaves 4-6 in. from a broad or subcordate base glabrous beneath suddenly narrowed into a short obtuse subcaudate tip. *A. cyanocarpum*, *Kurz in Journ. As. Soc. 1877, pt. ii. 78, not of Triana*. *Dissochæta spoliata*, *Naud. in Ann. Sc. Nat. ser. 3. xv. 69, t. 4, fig. 1*; *Miq. Fl. Ind. Bat. i. pt. i. 521*. *Melastoma cernuum*, *Wall. Cat. 4054, not of Roxb.* *M. glaucum*, *Wall. Cat. 4055*. *Osbeckia tetrandra*, *Roxb. Fl. Ind. ii. 224*.

PINANG; *Wallich*. MERGUI and MALAY PENINSULA; *Griffith* (Kew Distrib. No. 2289); *Maingay* No. 793-2. TENASSERIM or ANDAMANS; *Helfer* (Kew Distrib. No. 2290).—DISTRIB. Malay Archipelago.

Flowers cernuous. Shorter *stamens* 4, 2 or 0. *Fruit* $\frac{1}{8}$ – $\frac{1}{10}$ in. broad. *Pedicels* and *calyx-tube* minutely puberulous, plant otherwise glabrous.—*A. cyanocarpum*, *Triana*, has the stem somewhat thickly covered with long spreading bristles. None of the plants collected within the area of the Indian Flora show such bristles: the two species may not be distinct, but Mr. Kurz, while not uniting them, says that Helfer's No. 2290 is *Triana's A. cyanocarpum*, which must be wrong, as *Triana* has written *A. glaucum* on Helfer's No. 2290.

2. **A. pallens**, *Blume Mus. Bot. i. 38*; leaves $1\frac{1}{2}$ –2 $\frac{1}{2}$ in. glabrous or minutely puberulous beneath 3-nerved (scarcely 5-nerved) suddenly narrowed into a long obtuse subcaudate tip. *Naud. in Ann. Sc. Nat. ser. 3. xv. 304*; *Miq. Fl. Ind. Bat. i. pt. i. 554*; *Triana in Trans. Linn. Soc. xxviii. 84*. *Melastoma petiolare*, *Wall. Cat. 4053*.

PINANG; *Wallich*, *Porter*. MALACCA; *Maingay* No. 795, 2663.—DISTRIB. Sumatra, Borneo.

Shorter *stamens* usually 0. *Fruit* $\frac{1}{2}$ in. broad, glabrous. Young *calyx-tube* often minutely but densely rufous tomentose.—Some of the Archipelago examples have leaves $4\frac{1}{2}$ in. and are then very like *A. glaucum*.

3. **A. divaricatum**, *Triana in Trans. Linn. Soc.* xxviii. 84, partly; branchlets panicles and leaves beneath with ferruginous stellate tomentum. *Dissochæta anceps*, *Naud. in Ann. Sc. Nat. ser. 3. xv. 70.* *D. palembanica*, *Miq. Fl. Ind. Bat. Suppl. 317.* *D. glauca*, *Blume in Flora*, 1831, p. 501. *Melastoma glauca*, *Jack in Trans. Linn. Soc. xv. 15.* *M. polyanthum*, *Benth. in Wall. Cat. 4051.*

PINANG; *Wallich, Walker.* MALACCA; *Griffith, Maingay* No. 794; *Cuming*, No. 2259.—DISTRIB. Java to Philippines.

Leaves usually 2–2½ in., oblong, acute, glabrous above or rufous stellate-tomentose on the nerves; *petiole* ⅛–¼ in. *Young calyx-tube* densely stellate-tomentose. *Shorter stamens* often 2, sometimes 4 or 0. *Fruit* less than ½ in. broad, finally glabrous.

4. **A. annulatum**, *Triana in Trans. Linn. Soc.* xxviii. 84; branches nearly glabrous but with scattered patent bristly hairs, more thickened at the nodes than the other species and with a ring of dense rufous tomentum below each node, leaves nearly glabrous beneath. *Melastoma annulatum*, *Wall. Cat. 4056.*

PINANG; *Porter.*

Leaves 4–5 in., glabrous, oblong, cordate at the base; *petiole* ⅛–½ in., with spreading bristles. *Panicle* with spreading bristles, and rufous-tomentose. *Young calyx* rufous-tomentose. *Fruit* ½ in. broad, ovoid, ultimately glabrous or nearly so.

DOUBTFUL SPECIES.

A. ASSAMICUM, *C. B. Clarke*; stem with coarse spreading bristles somewhat annulated at the nodes, leaves very large short-petioled elliptic-lanceolate with spreading bristly hairs on the nerves beneath otherwise glabrous.

ASSAM, foot of the Naga Hills, and BHOTAN, *Griffith* (Kew Distrib. No. 2285).

Branches stout. *Leaves* 5–7 in., very acute, cordate at the base; *petiole* ⅛–¼ in., densely coarsely bristly. *Panicle* (in fruit) terminal, large, repeatedly trichotomous; *fruits* very numerous (like those of *Anplectrum*), smooth, campanulate at the base (not ripe ½ in. broad).—*Flowers* not seen.

A. BARBATUM, *Triana in Trans. Linn. Soc.* xxviii. 84; *Melastoma?* *barbatum*, *Wall. Cat. 4082* from Chappedong in Martaban.

The Wallichian example exhibits neither inflorescence, flowers nor fruit, and is indeterminable. *Leaves* 4 in., ovate, shortly acuminate, glabrous; *petiole* ½ in., glabrous but with a dense erect fringe of rusty bristles on its upper face; stem nearly glabrous.

16. MEDINILLA, *Gaud.*

Branching shrubs, erect or scandent. *Leaves* opposite or whorled, entire, often fleshy, glabrous in all the Indian species, usually longitudinally 3–9-nerved. *Flowers* in terminal panicles or lateral cymes, white or rose, with or without bracts, 4- or 5- rarely 6-merous. *Calyx-tube* ovoid or cylindric, limb truncate or obscurely toothed. *Stamens* twice as many as the petals, equal or nearly equal (rarely unequal); anthers opening at the top by one pore; connective not (or very shortly) produced at the base but having two tubercles in front and a spur behind. *Ovary* inferior, 4–6-celled, usually glabrous at the apex; style filiform; ovules very many, placentas axile. *Berry* crowned by the limb of the calyx. *Seeds* very many, ovoid or subfalcate, raphe often thickened and excurrent.—DISTRIB. Species 50; mainly in Malaya, East Bengal and Ceylon; a few are found in the Fiji Archipelago and in the East African islands.

* Flowers in axillary cymes (*see also* 10. *M. himalayana*).

† *Leaves whorled.*

1. *M. rosea*, *Gaud. in Freyc. Voy. Bot.* 484, t. 106; branches round, leaves obovate-oblong 3-nerved the two lateral nerves near the margin, flowers 4-merous. *Naud. in Ann. Sc. Nat.* ser. 3. xv. 286; *Triana in Trans. Linn. Soc.* xxviii. 85.

MALACCA, Mount Ophir; *Griffith* (Kew Distrib. No. 2282), *Maingay* No. 796.—DISTRIB. Marianne Islands.

Leaves $1\frac{1}{2}$ in.; *petiole* $\frac{1}{4}$ in. *Cymes* 3-10-flowered. *Flowers* large. *Anthers* shortly produced at the base, connective having a short spur. *Berry* nearly $\frac{1}{4}$ in. broad, ovoid. *Seeds* falcate-ellipsoid, raphe not excurrent.

2. *M. macrocarpa*, *Blume Rumph.* i. 14, t. 2; branches round, leaves obovate-oblong acute 3-nerved, flowers 5-merous. *Naud. in Ann. Sc. Nat.* ser. 3. xv. 293; *Miq. Fl. Ind. Bat.* i. pt. i. 544; *Triana in Trans. Linn. Soc.* xxviii. 86.

MALACCA; *Maingay* No. 799.—DISTRIB. Malay Archipelago.

Leaves $2\frac{1}{2}$ -4 in.; *petiole* $\frac{1}{2}$ - $\frac{3}{4}$ in. *Cyme* 3-10-flowered. *Flowers* large. *Calyx-limb* even in the bud truncate entire in *Maingay's* examples. *Anthers* long, produced at the base, spur of the connective long. *Berry* $\frac{1}{2}$ in. wide, hardly narrowed upward. *Seeds* falcate-ellipsoid, smooth, raphe not excurrent.

†† *Leaves opposite.*

3. *M. Hasseltii*, *Blume in Flora* 1831, p. 513; branches round verrucose, leaves lanceolate, flowers 4-merous, fruit ovoid, calyx-rim not produced far above the fruit, seeds obovoid smooth slightly flattened on the side of the raphe which is not produced. *Miq. Fl. Ind. Bat.* i. pt. i. 542. *M. crassifolia*, *Triana in Trans. Linn. Soc.* xxviii. 86, partly. *Melastoma laurifolium*, *Wall. Cat.* 4084.

SINGAPORE; *Wallich*. MALACCA; *Maingay* No. 797.—DISTRIB. Java, Sumatra.

Leaves 4-7 in., 3-nerved, an obscure pair of nerves very near the margin sometimes added, very acuminate, narrowed at the base in the Indian examples (less so in *Blume's* authentic specimen); *petiole* $\frac{1}{8}$ - $\frac{1}{4}$ in. *Anthers* at the base distinctly but shortly produced, spur of the connective short. *Fruit* $\frac{1}{2}$ in. diam.—Reduced to *M. crassifolia* by *Triana*; but, as *Blume* observes, the leaves are much longer, with shorter petioles, and the flowers 4-merous. The true *M. crassifolia*, *Blume*, has not been found in British India.

VAR. *Griffithii*; cymes lateral on short peduncles but greatly developed repeatedly divided with opposite branches at right angles and sometimes 40 flowers on one cyme.—Mount Ophir, Malacca; *Griffith* (Kew Distrib. No. 2282).

4. *M. rubicunda*, *Blume in Flora*, 1831, 512; branches round somewhat striated, leaves elliptic or lanceolate, flowers 4-merous, fruit ovoid, calyx-rim very short, seed obovoid smooth slightly flattened on the side of the raphe which is not produced. *Naud. in Ann. Sc. Nat.* ser. 3. xv. 288, t. 13, fig. 1; *Miq. Fl. Ind. Bat.* i. pt. i. 539; *Triana in Trans. Linn. Soc.* xxviii. 86. *M. erythrophylla*, *Lindl. in Part. Mag. Bot.* x. 79; *Naud. l. c.* 289; *Miq. l. c.* 540. *Melastoma rubicunda*, *Jack in Trans. Linn. Soc.* xiv. 18; *DC. Prodr.* iii. 148; *Wall. Cat.* 4086. *M. erythrophyllum*, *Wall. Cat.* 4085.

SUBTROPICAL HIMALAYA from SIKKIM eastward. KHASIA Mts., alt. 2000-5000 ft., common. PINANG; *Wallich*.—DISTRIB. Sumatra.

Leaves 2-6 in., narrowed at both ends, 3-5-nerved, one pair of nerves often starting $\frac{1}{4}$ in. above the base of the leaf; *petiole* 0- $\frac{1}{2}$ in. *Peduncles* rarely 1 in.

Anthers at the base very shortly produced, spur of the connective very short. *Fruit* $\frac{1}{8}$ – $\frac{1}{5}$ in. diam., when ripe black, edible though insipid, rim of the calyx then evanescent.—This plant really differs little from *M. Hasseltii*; but in its typical form the leaves are elliptic nearly sessile: also the anthers at the base and the spur of the connective are even shorter.

5. ***M. fuchsioides***, *Gardn. in Calc. Journ. Nat. Hist.* viii. 12; branches round somewhat striated, leaves subsessile elliptic-oblong subcuneate at the base, peduncles 1–3-flowered, flowers 4-merous. *Thwaites Enum.* 106; *Triana in Trans. Linn. Soc.* xxviii. 86.

CEYLON; *Gardner*; Newera Ellia and Horton Plains, *Thwaites*,

Leaves 2–3½ in., 3–5-nerved, minutely glandular beneath (*Thwaites*). *Peduncles* solitary; pedicels and calyx rose-purple. *Petals* a fine lake below, white at top. *Anthers* shortly produced at the base, connective with a short spur. *Fruit* $\frac{1}{2}$ in. diam., subglobose.—The specimens of this very succulent plant are imperfect and the above description is mainly compiled from *Gardner* and *Thwaites*' description.

6. ***M. maculata***, *Gardn. in Calc. Journ. Nat. Hist.* viii. 13; branches quadrangular angles waved winged, leaves subsessile ovate obtuse or oblong obscurely crenate, peduncles 1–3-flowered, flowers 4-merous small. *Thwaites Enum.* 106; *Triana in Trans. Linn. Soc.* xxviii. 86, *excluding the syn. Don.*

CEYLON; Central Provinces, alt. 3000–5000 ft., *Thwaites*, *Macrae*, *Walker*.

Leaves $\frac{3}{4}$ –1½ in., 3-nerved, minutely glandular beneath (*Thwaites*). *Calyx-tube* green-red. *Petals* $\frac{1}{2}$ in., pale-rose. *Anthers* shortly produced at the base, connective with a short spur. *Fruit* $\frac{1}{2}$ in. broad, very small, subcampanulate.

VAR. *Thwaitesii*, leaves cuneate-obovate.—Ceylon; Hellesseen, Pasdoon Corle, *Thwaites* No. 3443.

7. ***M. Beddomei***, *C. B. Clarke*; branches round, leaves short-petioled orbicular or broad-elliptic, peduncles 1-flowered, flowers 4-merous large. *M. radicans*, *Bedd. Ic. Pl. Ind. Or.* t. 184, *not of Blume*. *Triplettrum radicans*, *W. & A. Prodr.* 324.

WESTERN PENINSULA; KURG, *Wight*. WYNAAD, alt. 2000–3500 ft., *Beddome*.

Leaves 1–1½ in., 3-nerved, much thicker than those of *M. maculata*. *Petals* (in *Wight's* own No. 1151) more than $\frac{1}{2}$ in. *Beddome* says the flowers are “14–15 lines long.” *Anthers* prominently produced at the base, spur of the connective also prominent; four additional imperfect stamens sometimes present (*ex Beddome*).—This plant wholly differs from *M. maculata* (with which *Triana* unites it doubtfully) by its much larger flowers as well as different leaves and anthers. It does not appear however that *Triana* ever saw *Wight's* No. 1151. Nor did *Beddome*, who doubts if it can be the same as his *M. radicans*: with which however it agrees perfectly.

8. ***M. malabarica***, *Bedd. Ic. Pl. Ind. Or.* 157; branches round striate somewhat verrucose, leaves 2–3 in. elliptic narrowed to both ends 3–5-nerved, petiole less than $\frac{1}{4}$ in., flowers 4-merous, anthers oblong short truncate subnude at base.

ANAMALLAYS and NILGHIRIS, alt. 3000–4000 ft.; *Beddome*.

Peduncles axillary, 1–3-flowered. *Flowers* large. *Filaments* long, anthers short with two glandular swellings at the apex of the filament inside, spur of the connective perceptible behind but very small.—This species in leaves and inflorescence is much like *M. rubicunda*; but in its anthers it is altogether remote, and approaches *Pachycentria*.

** Flowers in terminal panicles or quasi-lateral cymes.

9. **M. speciosa**, Blume in *Flora* 1831, 515; branches thick smooth with numerous erect bristles at the nodes, leaves 6-10 in. in whorls of 4 or 3 less often in pairs subsessile obovate-lanceolate 7-9-nerved one pair of nerves starting 1-4 in. above the base of the leaf. *Bot. Mag.* t. 4321; *Naud. in Ann. Sc. Nat.* ser. 3. xv. 291; *Miq. Fl. Ind. Bat.* i. pt. i. 540; *Triana in Trans. Linn. Soc.* xxviii. 87. *Melastoma eximium*, Blume *Bijd.* 1072, not of Jack.

MALAYA; Maingay No. 798.—DISTRIB. Java, Moluccas.

Panicle long, branches whorled; bracts $\frac{1}{2}$ in., narrow obovate-lanceolate; pedicels calyx and petals rose. Anthers shortly produced at the base, spur of the connective short. Fruit $\frac{1}{2}$ - $\frac{1}{4}$ in. broad, ovoid, rim of the calyx shortly produced above the fruit.

10. **M. himalayana**, Hook. f.; *Triana in Trans. Linn. Soc.* xxviii. 88; branches round smooth striate, leaves nearly sessile broadly elliptic, cymes terminal and quasi-lateral trichotomous, peduncles 1-1 $\frac{1}{2}$ in., pedicels divaricate in fruit.

SIKKIM; alt. 3000-6000 ft.; J. D. H. KHASIA Mts.; Surareem, alt. 5000 ft.; J. D. H., C. B. Clarke.

Leaves 2 $\frac{1}{2}$ in., 3-5-nerved almost from the base, obtusely acuminate; petiole not $\frac{1}{8}$ in. Flowers $\frac{3}{4}$ in. diam., rose. Anthers 2-tubercled at the base, connective without a spur. Berry $\frac{1}{8}$ in. diam., spherical.—This species has been confounded in herbaria with *M. rubicunda*, which is found over the same area. In *M. himalayana* the terminal panicle is small and often only quasi-axillary panicles are seen: but the peduncle is much longer than in *M. rubicunda* and the branches of the panicle in fruit are divaricate, not ascending as in *M. rubicunda*.

11. **M. pauciflora**, Hook. f.; *Triana in Trans. Linn. Soc.* xxviii. 88; ultimate branchlets subquadrangular, leaves sessile elliptic, cymes terminal very short few-flowered.

SIKKIM at Darjeeling; *Herb. Griffith* (Kew Distrib. No. 2283).

Leaves 1 $\frac{1}{2}$ in., 3-nerved from the base, abruptly acuminate. Flowers $\frac{3}{4}$ in. diam., very shortly pedicelled. Calyx-tube campanulate, limb obscurely 4-toothed. Anthers small, linear, with two tubercles at the base, connective without a spur.—Only one example of this has been seen: the inflorescence is strictly terminal; the locality is not quite certain and may be "East Himalaya."

IMPERFECTLY KNOWN AND DOUBTFUL SPECIES.

M. MAINGAYI, C. B. Clarke; glabrous, branches round smooth, leaves 1-1 $\frac{1}{2}$ in. opposite sessile cuneate-obovate obtuse 3-nerved, flowers 4-fid, petals $\frac{1}{2}$ in., anthers oblong narrowed upwards opening by a terminal pore with two tubercles at base and no distinct spur on the connective, seeds oblong elliptic smooth larger than in the other species of *Medinilla*.—MALACCA; Maingay No. 807, 806.

There is nothing to show the nature of the inflorescence or the shape of the berry.

M. GRIFFITHII, C. B. Clarke; glabrous, branches round remotely verrucose, leaves 5-7 in. elliptic acuminate at both ends 3-nerved, petiole $\frac{1}{2}$ - $\frac{3}{4}$ in., inflorescence in weak axillary cymes, fruit small, seeds of the genus.—MISHME; *Griffith* (Kew Distrib. No. 2281).

This differs by its large long-petioled leaves from all the other species.

M. MERGUIENSIS, C. B. Clarke; glabrous, branches round smooth, leaves 2-3 $\frac{1}{2}$ in. obovate-elliptic obtuse 3-nerved, petiole $\frac{1}{2}$ - $\frac{3}{4}$ in., cyme compound, anthers oblong narrowed upwards with a terminal pore, a long spur to the connective near the base but the tubercles at the apex of the filament very obscure.—MERGUI; *Griffith* (in *Herb. Wight*).

Only a detached fragment of the panicle is preserved. This may be a *Pachycentria*.

17. **POGONANTHERA**, Blume.

Shrubs, nearly glabrous; branches round, minutely scaly. *Leaves* opposite, petioled, oblong or ovate, entire, glabrous, 3-nerved. *Flowers* small, pulverulent, in small terminal panicles having opposite branches. *Calyx-tube* campanulate, subquadrangular; limb 4-toothed. *Petals* 4, lanceolate. *Stamens* 8, equal; anthers oblong, acute, opening by a terminal pore, not produced at the base; connective at the base bearded behind with a tuft of hairs, not spurred. *Ovary* half-inferior, 4-celled, with a tuft of hairs at the apex; style filiform; ovules very many, placentas axile. *Berry* small, globose, 4-celled, crowned with the calyx-limb. *Seeds* very many, obovoid-oblong, smooth.—DISTRIB. Species 2; in Malaya from Malacca to Borneo.

1. ***P. pulverulenta***, Blume in *Flora*, 1831, 521; Korth. *Verh. Nat. Gesch. Bot.* t. 65; Griff. *Notul.* iv. 678; Miq. *Fl. Ind. Bat.* i. pt. i. 553; Triana in *Trans. Linn. Soc.* xxviii. 89. *Melastoma reflexa*, Blume l. c.; Naud. in *Ann. Sc. Nat.* ser. 3. xv. 303; Triana l. c. *M. pulverulentum*, Jack in *Trans. Linn. Soc.* xiv. p. 19; DC. *Prodr.* iii. 149; Blume *Bijd.* 1072. *M. rubicundum*, Jack l. c. 18; DC. l. c. 148; Wall. *Cat.* 4086.

MALACCA and SINGAPORE; Wallich, Griffith, Maingay.—DISTRIB. Through Malaya to Borneo.

Leaves 3–4½ by 1–2½ in., narrowed to both ends, 3-nerved with sometimes other two faint nerves close to the margin; petiole ¼–½ in., with two tubercles or auricles at its apex. *Panicle* 2–3 in. and as much broad, short-peduncled, with minute bracts at the divisions. *Berry* about ½ in. broad, narrowed beneath the small calyx-limb.—Blume distinguishes as *P. reflexa*, a form with white transparent petals having a minute tooth on each margin, and which occurs creeping on rocks near the seashore as noted by Jack and Griffith, from the typical *P. pulverulenta* which occurs in the forests, and which has red petals powdered with yellow and a tooth on each side. The distinction between the limb of the petal being toothed or only tumid cannot be traced in the dried specimens: and Blume's subsidiary distinctions regarding the texture of the leaves and the presence or absence of the extra pair of submarginal veins do not hold. Jack named the white-flowered form *rubicundum* because the panicle and calyces are in it a fine rose-purple.

18. **ASTRONIA**, Blume.

Shrubs with round branches. *Leaves* opposite, petioled, ovate or oblong, entire, 3-nerved. *Flowers* in terminal panicles, small, white or purple. *Calyx-tube* campanulate, glabrous or puberulous; limb irregularly truncate or 3–8-lobed. *Petals* 4–5. *Stamens* 8–10–12, equal; filaments short, broad; anthers short, obtuse, opening by slits down the front, connective spurred at the base or unappendaged. *Ovary* inferior, 2–5-celled, glabrous at the apex; style short, stigma capitate; ovules numerous, placentas axile, nearly basal. *Capsule* finally breaking up irregularly. *Seeds* very many, linear, raphe excurrent.—DISTRIB. Species 12; in Malaya, the Fiji and Navigator groups and Tahiti.

1. ***A. smilacifolia***, Triana in *Trans. Linn. Soc.* xxviii. 152; glabrous, panicle and calyx-tube minutely brown-rufous tomentose, calyx-limb minutely 5-lobed. *Melastoma smilacifolia*, Wall. *Cat.* 4057.

PINANG; Wallich. MALAYA; Maingay No. 808.

Leaves 4–5 in., lanceolate and broad-lanceolate, narrowed to both ends; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in. *Panicle* 1–3 in., ultimate pedicels $0\frac{1}{2}$ in. *Petals* less than $\frac{1}{2}$ in., obovate. *Capsule* $\frac{1}{2}$ – $\frac{1}{2}$ in. broad, ovoid or hemispheric.

19. **PTERNANDRA**, Jack.

Glabrous shrubs with round branches. *Leaves* opposite, sessile or short-petioled, ovate or lanceolate, entire, coriaceous, 3-nerved. *Flowers* small, in axillary (and terminal) small cymes or panicles. *Calyx-tube* verrucose, campanulate; limb truncate, obscurely 4-toothed. *Petals* 4, blueish or white. *Stamens* 8, equal; filaments short, subulate; anthers broad-oblong, obtuse at both ends, opening by slits, connective simple at the base or very shortly spurred behind. *Ovary* inferior, 4-celled, apex flat glabrous; style long, stigma clavate; ovules very many, placentas sub-basal. *Berry* ovoid, truncate. *Seeds* very many, cuneate-obovoid, raphe excurrent on one side towards the end, somewhat angular.—**DISTRIB.** Species 6 (or perhaps 2 only), from Pinang and Malacca through Malaya to the Philippines.

1. **P. cœrulescens**, Jack in *Mal. Misc.* ii. 61; leaves $2\frac{1}{2}$ – $4\frac{1}{2}$ in. ovate or lanceolate, stamens blue. *Wall. Cat.* 4077; *Triana in Trans. Linn. Soc.* xxviii. 153; *Kurz For. Fl.* i. 509 and in *Journ. As. Soc.* 1877, pt. ii. 79. *Ewyckia cyanea*, Blume *Rumph.* i. 24, t. 8; *Miq. Fl. Ind. Bat.* i. pt. i. 568; *Triana l. c.* E. Jackiana, Walp. *Rep.* v. 724. E. paniculata, *Miq. Fl. Ind. Bat. Suppl.* 321 ex *Kurz*. *Apteuxis trinervis*, *Griff. Notul.* iv. 672.—Nov. Gen. *Roxb. Fl. Ind.* ii. 225.

PINANG and MALACCA; Wallich. MERGUI; Griffith. TENASSERIM; Helfer. NICOBARS; Kurz. Malacca; Cuming, Griffith.—**DISTRIB.** Through Malaya to the Philippines.

Leaves narrowed at the base; petiole $0\frac{1}{2}$ in. *Panicles* 1–3 in., terminal and in the upper axils, very short-peduncled, often crowded with many flowers, ultimate pedicels very short, bracts minute. *Berry* $\frac{1}{2}$ in. broad, narrower at the mouth.

VAR. *Jackiana*; petioles attaining $\frac{1}{4}$ in., cymes axillary few-flowered.—Malacca; Griffith; Maingay No. 801.

2. **P. capitellata**, Jack in *Mal. Misc.* ii. *Addenda prefixed to the paper* p. 3; leaves 6–8 in. ovate or broad-elliptic, cymes hardly 1 in. axillary few-flowered dense. *Wall. Cat.* 4079; *W. & A. Prodr.* 325; *Triana in Trans. Linn. Soc.* xxviii. 153; *Kurz For. Fl.* i. 509 and in *Journ. As. Soc.* 1877, pt. ii. 79. *Ewyckia capitellata*, Walp. *Rep.* v. 724; *Miq. Fl. Ind. Bat.* i. pt. i. 568. E. medinilliformis, *Naud. in Ann. Sc. Nat.* ser. 3. xviii. 261.

PINANG; Jack, Wallich. TENASSERIM; Helfer (Kew Distrib. No. 2279). MALACCA; Maingay No. 802. SINGAPORE; Wallich.

Leaves widest near the base; petiole less than $\frac{1}{4}$ in.—Doubtfully distinct from *P. cœrulescens*: the leaves are usually much larger while the cymes are smaller.

3. **P. paniculata**, Benth. in *Wall. Cat.* 4080; leaves short-petioled normally elliptic or lanceolate, ends of the branches dividing into bundles of small-leaved branchlets on which are the scattered flowers. *P. latifolia*, *Triana in Trans. Linn. Soc.* xxviii. 153. *Ewyckia latifolia*, Blume *Mus. Bot.* i. 6.

PINANG; Porter. MALACCA; Griffith (Kew Distrib. No. 2273).—**DISTRIB.** Sarawak.

The normal leaves are about 5 by 2 in., the abnormal leaves on the "panicles" are very narrow lanceolate, often 1 by $\frac{1}{8}$ – $\frac{1}{4}$ in.—This is probably only a proliferous state of *P. cœrulescens* as Korthals and Miquel treat it.

20. **KIBESSIA**, DC.

Large shrubs, glabrous or minutely pubescent. *Leaves* opposite, short-petioled, ovate or oblong, entire, coriaceous, 3-nerved. *Flowers* axillary, long-peduncled, solitary or clustered, large (except in *K. tuberculata*); peduncles 1-3-flowered, pedicels 2-bracteolate in the middle. *Calyx-tube* campanulate or hemispheric, covered with elongated scales or simple tubercles; limb 4-lobed and persistent or calyptriform and deciduous. *Petals* 4, ovate or oblong. *Stamens* 8, equal, filaments short, subulate; anthers short, very thick, opening by slits, connective at the base naked or shortly spurred. *Ovary* inferior, 4-celled, apex glabrous depressed; style filiform, stigma clavate; ovules very many, placentas sub-basal. *Berry* subglobose, covered with scales or tubercles, or in *K. tuberculata* ultimately nearly smooth. *Seeds* cuneate-obovoid, angular.—DISTRIB. Species 14; confined to Malaya, from Pinang to Borneo.

1. **K. simplex**, Korth. *Verh. Nat. Gesch. Bot.* 253; leaves narrowed at the base, calyx-tube with oblong-linear scales those towards the top of the tube about $\frac{1}{4}$ in. persistent in the fruit, calyx-limb calyptriform, fruit $\frac{1}{2}$ in. broad. *Blume Mus. Bot.* i. 9; *Triana in Trans. Linn. Soc.* xxviii. 152. *K. cupularis*, Dcne. in *Deless. Ic. Sel.* v. t. 5 and in *Ann. Sc. Nat.* ser. 3. v. 317. *Pternandra echinata*, Jack in *Mal. Misc.* ii. *Addenda prefixed to the paper* 3; *Wall. Cat.* 4078, for the most part.

PINANG and MALACCA; Wallich, Griffith, &c. SINGAPORE; T. Anderson.—DISTRIB. Borneo, Philippines.

Young branches obscurely quadrangular, rusty puberulous. *Leaves* 2-3 in., oblong or elliptic, acuminate, when young pubescent beneath, when mature glabrescent or with rusty pubescence on the nerves; petiole $\frac{1}{2}$ - $\frac{1}{4}$ in. *Peduncles* 1- (less often 3-) flowered; bracts nearly $\frac{1}{4}$ in., oblong, persistent. Scales of the calyx-tube minutely rusty pubescent.

2. **K. pubescens**, Dcne. in *Ann. Sc. Nat.* ser. 3. v. 318; leaves oblong base somewhat rounded or subcordate, calyx-tube with triangular short subulate scales, those towards the top of the tube scarcely $\frac{1}{2}$ in., limb 4-lobed persistent, fruit $\frac{1}{2}$ in. broad. *Triana in Trans. Linn. Soc.* xxviii. 152. *Pternandra echinata*, Wall. *Cat.* 4078, letter a only.

PINANG, Wallich.

Young branches obscurely quadrangular, rusty puberulous. *Leaves* 2-3 in., oblong or elliptic, acuminate, when mature with minute rusty pubescence beneath, nerves with longer pubescence; petiole hardly $\frac{1}{2}$ in. Scales of the calyx-tube minutely rusty-pubescent. Apex of the ovary in fruit concave, with 16 radiating lines.—Very near the preceding species.

3. **K. acuminata**, Dcne. in *Ann. Sc. Nat.* ser. 3. v. 316; leaves narrowed or rounded at the base nearly glabrous, calyx-tube with triangular scales those towards the top of the tube linear elongate, limb calyptriform acuminate into a linear point. *Triana in Trans. Linn. Soc.* xxviii. 153.

SINGAPORE; Walker, *Maingay* No. 804.

Young branchlets and peduncles minutely rusty pubescent. *Leaves* 2-3 in., oblong or elliptic, acuminate, when mature glabrous or scarcely rusty pubescent on the nerves beneath; petiole scarcely $\frac{1}{2}$ in. *Bracts* of the buds $\frac{1}{2}$ in., ovate.

4. **K. tuberculata**, Hook. f. in *Gen. Pl.* i. 772; young calyx-tube covered with sessile flat tubercles, limb 4-toothed, fruit ovoid nearly glabrous finally. *Rectomitra tuberculata*, Blume *Mus. Bot.* i. 7; *Triana in Trans. Linn. Soc.* xxviii. 153. *Ewyekia tuberculata*, Korth. *Verh. Nat. Gesch. Bot.* 255; *Miq. Fl. Ind. Bat.* i. pt. i. 569.

MALACCA; *Maingay* No. 805.—DISTRIB. Sumatra.

Branchlets round, glabrous. *Leaves* 2–3 in., ovate or elliptic, shortly acuminate, glabrous; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in. *Peduncles* glabrous, clustered, 3–5-flowered; bracts less than $\frac{1}{2}$ in. *Fruit* $\frac{1}{8}$ – $\frac{1}{5}$ in. diam.

21. MEMECYLON, Linn.

Shrubs or *trees*, glabrous. *Leaves* opposite, short-petioled or sessile, coriaceous, orbicular ovate or lanceolate, entire, pinnate-nerved rarely 3-nerved. *Flowers* usually in small axillary rarely terminal simple or paniced cymes or umbels. *Calyx-tube* campanulate, glabrous; limb dilated, truncate or shortly 4-lobed. *Petals* 4, blue or white, rarely reddish. *Stamens* 8, equal, filaments long; anthers short, opening by slits in front, connective ending in a horn behind. *Ovary* inferior, 1-celled; apex glabrous surmounted by a convex or depressed disc with 8 radiating grooves; style filiform, simple; ovules 6–12 (in *M. Maingayi* 20 at least), whorled on a free central placenta. *Berry* globose or ellipsoid, crowned with the calyx-margin, 1-seeded. *Seed* large, cotyledons convolute.—DISTRIB. Species about 100 (but very difficult and many doubtful of determination) numerous in South-East Asia and its islands; a few extending into Polynesia and Australia, several in tropical Africa.

The following is merely an artificial key to the material at Kew: the species which appear tolerably distinct from *M. edule* are taken first; and the last group contains the enormous mass of specimens that appear difficult to separate from *M. edule*.

I. Leaves 3-nerved from the base.

1. **M. Arnottianum**, *Thwaites Enum.* 113; leaves long caudate-acuminate, apex obtuse, peduncle 1 in. very slender. *Triana in Trans. Linn. Soc.* xxviii. 159. *Eugenia*? *capitellata*, *Arn. Pugill.* 17.

CEYLON; “at no great elevation,” *Thwaites, Walker*.

Shrub 10–12 ft.; branchlets slender, round. *Leaves* 2–2½ in., somewhat distichous, elliptic, suddenly acuminate, base roundish, punctate on both surfaces; petiole scarcely $\frac{1}{16}$ in. *Peduncles* solitary; flowers few, very small, sessile at their apex; petals white (*Thwaites*). *Berry* scarcely $\frac{1}{4}$ in. diam., globose, areola $\frac{1}{16}$ in. wide.—A variety communicated by Mr. Thwaites has the leaves much larger, 4½ in., the acuminate apex much shorter.

2. **M. Gardneri**, *Thwaites Enum.* 113; leaves acute scarcely acuminate, inflorescence clustered, peduncle 0–¼ in. *Triana in Trans. Linn. Soc.* xxviii. 159.

CEYLON; alt. 2000–5000 ft.; *Thwaites*.

A small tree; ultimate branchlets quadrangular. *Leaves* broad-elliptic, narrowed at the base, opaque, pellucid-punctate; petiole $\frac{1}{8}$ in. *Flowers* white (*Thwaites*), very small; buds very acute. *Calyx-tube* at the time of flowering funnel-shaped, distinctly 4-toothed. *Berry* size of a pea, spherical, purple-black.

II. Leaves pinnate-nerved, often very opaque, midrib always conspicuous, nerves conspicuous or obscure.

* *Ultimate branchlets quadrangular* (see also No. 21, 22, 24, 37, 40).

† *Leaves usually more than 4 in. (nerves often distinct).*

3. **M. Wightii**, *Thwaites Enum.* 113; leaves 3–4½ in. subsessile elliptic-lanceolate base cordate, peduncle 0, pedicels clustered $\frac{1}{8}$ – $\frac{1}{6}$ in., calyx-tube at the time of flowering subcampanulate.

WESTERN PENINSULA; Canara; *Ritchie*. CEYLON, alt. 3000–4000 ft., *Thwaites*.

A tree 25 ft.; ultimate branchlets stout, acutely quadrangular. Secondary nerves conspicuous, marginal looped nerve obscure. *Buds* obtuse, calyx-limb 4-dentate. *Petals* blue. *Berry* $\frac{1}{4}$ – $\frac{1}{3}$ in. diam., globose.—United by Triana with *M. amplexicaule* No. 24, which has round stems, much larger flowers, and the calyx-tube at the time of flowering saucer-shaped.

4. **M. Hookeri**, *Thwaites Enum.* 113; leaves 6–9 in. sessile oblong-lanceolate base cordate, peduncle 0, pedicels $\frac{1}{4}$ in. clustered, calyx-tube at the time of flowering saucer-shaped. *Triana in Trans. Linn. Soc.* xxviii. 158.

CEYLON; alt. 1000 ft.; *Thwaites*.

An erect shrub 8–12 ft., sparingly branched; ultimate branchlets stout, acutely quadrangular. *Leaves* very conspicuously nerved, secondary nerves running into a conspicuous marginal nerve. *Buds* obtuse, but apiculate; calyx-limb obscurely 4-lobed. *Petals* blue. *Berry* $\frac{1}{3}$ in. diam., spherical, finally black-purple.—*Thwaites* has sent (under No. 2686*) examples marked "*M. Hookeri*, variety with exalate branchlets, sessile flowers." These examples have perfectly round branchlets and seem in all respects identical with No. 25 *M. macrophyllum*, *Thwaites*.

5. **M. Griffithianum**, *Naud. in Ann. Sc. Nat.* ser. 3. xviii. 274; leaves 5–7 by 1–1½ in. nearly sessile linear-lanceolate rounded or somewhat acute at the base, peduncle 0, pedicels $\frac{1}{8}$ – $\frac{1}{5}$ in. clustered. *Triana in Trans. Linn. Soc.* xxviii. 158, *not of Kurz, in For. Fl.* i. 515. *M. cæruleum*, var. 3 *Griffithianum*, *Kurz, For. Fl.* i. 511.

MERGUI; *Griffith* (No. 2323 Kew Distrib.).

Ultimate branchlets 4-winged. *Leaves* somewhat opaque, secondary nerves visible, marginal quite obscure; petiole 0– $\frac{1}{8}$ in. *Flowers* rather large, pale blue (*Griffith*); buds obtuse. *Calyx-tube* at the time of flowering funnel-shaped, limb nearly truncate. *Disc* depressed, conspicuously rayed.—*M. Horsfieldii*, *Miquel*, said by *Kurz* (*Journ. As. Soc.* 1876, pt. ii. 54) to be a synonym of *M. Griffithianum*, widely differs; of *M. Campongum*, *Miquel*, also given as a synonym by *Kurz*, no authentic specimen exists at Kew. In *Journ. As. Soc.* 1877, pt. ii. 82, and *For. Fl.* i. 515, *Kurz* quotes for *M. Griffithianum* *Helfer's* No. 2331, from which it is clear that he refers to No. 20 *M. grande*, *Retz*, var. *merguica*.

6. **M. elegans**, *Kurz in Journ. As. Soc.* 1872, pt. ii. 307, *For. Fl.* i. 514; leaves 3–4 in. elliptic obtuse narrowed at the base, petiole $\frac{1}{8}$ – $\frac{1}{5}$ in., peduncles $\frac{1}{2}$ in. 3 or 4 together carrying mostly simple umbels, pedicels $\frac{1}{8}$ in.

SOUTH ANDAMAN ISLAND; *Kurz*.

A shrub; ultimate branchlets distinctly quadrangular. *Leaves* with the secondary nerves visible, marginal quite obscure. *Peduncles* quadrangular. *Flowers* blue (*Kurz*). *Calyx-tube* somewhat large, at the time of flowering saucer-shaped; disc on the apex of the ovary depressed, prominently rayed.

VAR. *dichotoma*; leaves 3–4 in. subsessile ovate-elliptic acute or shortly acuminate, cymes very short, peduncle 0– $\frac{1}{8}$ in., pedicels $\frac{1}{8}$ – $\frac{1}{5}$ in. Malacca, *Griffith* (No. 2324 Kew Distrib.); Mount Ophir, *Maingay* No. 818, 820. *Branchlets* somewhat flattened, repeatedly forked, ultimate quadrangular, at least under the nodes. *Leaves* at the base rounded or acute but not at all acuminate, secondary nerves conspicuous,

marginal obscure; petiole sometimes manifest, attaining $\frac{1}{16}$ in. Flowers blue, somewhat large, buds obtuse. *Calyx-tube* truncate even in the bud. *Disc* depressed, distinctly rayed. *Berry* $\frac{1}{4}$ in. diam., spherical, areola very small, about $\frac{1}{16}$ in. wide.

†† *Leaves rarely attaining 4 in., usually opaque, nerves obscure.*

7. **M. amabile**, *Bedd. Ic. Pl. Ind. Or.* t. 163; leaves $1\frac{1}{2}$ – $2\frac{1}{4}$ in. nearly sessile oblong-lanceolate opaque, base cordate, peduncles $\frac{1}{2}$ – $\frac{3}{4}$ in. 1–3 together axillary and terminal, pedicels $\frac{1}{5}$ in.

SOUTH CANARA GHATS, up to 2000 ft.; *Beddome*.

Cymes small, simple on each peduncle or compound but close. *Calyx-tube* funnel-shaped at the time of flowering, limb truncate; buds obtuse. *Petals* blue. *Disc* plane (*Beddome*).—Very probably a form of *M. terminale* No. 22 with quadrangular branchlets; but the peduncles are rather shorter, and the flowers smaller.

VAR. *malaccensis*; leaves $1\frac{1}{2}$ – $2\frac{1}{4}$ in. oblong acuminate base rounded very opaque coriaceous, peduncles $\frac{1}{2}$ in. clustered axillary and terminal, cymes simple, pedicels less than $\frac{1}{2}$ in.—Malacca, *Maingay* No. 819.—Branchlets quadrangular, 4-winged below the nodes. *Petiole* $\frac{1}{16}$ in. *Buds* acute, not large. *Calyx-tube* saucer-shaped at the time of flowering; limb in the bud nearly truncate. *Disc* depressed, obscurely rayed.—This is perhaps really allied to *M. pauciflorum* No. 10, but the leaves differ materially in their rounded base and acuminate apex.

8. **M. elegantulum**, *Thwaites Enum.* 112; leaves 3 in. narrow-lanceolate long acuminate apex obtuse, panicles filiform somewhat elongate few-flowered, pedicels subsolitary one half longer than the calyx. *Triana in Trans. Linn. Soc.* xxviii. 159.

CEYLON; Saffragam district at no great elevation; *Thwaites*.

Leaves acute at the base, nerves obscure; petiole $\frac{1}{8}$ in. *Flowers* white. *Berry* spherical, the size of a pea.

9. **M. gracile**, *Bedd. Ic. Pl. Ind. Or.* t. 164; leaves 1– $1\frac{1}{2}$ in. elliptic-lanceolate acuminate apex obtuse, peduncles solitary $\frac{1}{4}$ in. 8-flowered, pedicels $\frac{1}{8}$ in.

TRAVANCORE and TINNEVELLY GHATS; *Col. Beddome*.

A small tree or large shrub; branchlets slender, distinctly quadrangular. *Leaves* opaque, nerves very obscure; petiole $\frac{1}{16}$ – $\frac{1}{8}$ in. *Petals* pale blue. *Disc* distinctly rayed.—*Beddome* describes the pedicels as 2–3 in. long, probably a misprint for 2–3 lines.

10. **M. pauciflorum**, *Blume Mus. Bot.* i. 356; leaves $\frac{1}{2}$ – $1\frac{1}{2}$ in. subsessile rhomboid oblong or elliptic obtuse or acute but not acuminate opaque acute at the base, peduncles scarcely any, pedicels less than $\frac{1}{4}$ in. *Miq. Fl. Ind. Bat.* i. pt. i. 578; *Triana in Trans. Linn. Soc.* xxviii. 158; *Kurz For. Fl.* i. 514. *M. australe*, *F. Muell. ex Triana in Trans. Linn. Soc.* xxviii. 159. *M. umbellatum*, *Benth. Fl. Austral.* iii. 293, not of others.

CHITTAGONG; *H. f. & T. Mergui*; *Griffith*; TENASSERIM, *Helper* (Kew Distrib. No. 2332). ANDAMANS; *Kurz*. SINGAPORE; *Lobb*.—DISTRIB. Through Malaya to North Australia.

A tree 20–25 ft. high. *Flowers* minute, whitish (*Kurz*). *Calyx* at the time of flowering saucer-shaped. *Disc* distinctly rayed. *Buds* very acute or rostrate. *Berry* $\frac{1}{2}$ in. diam., spherical, areola scarcely $\frac{1}{16}$ in. wide; pedicel $\frac{1}{4}$ – $\frac{3}{8}$ in.—*Miquel (Fl. Ind. Bat.* i. pt. i. p. 578) says that *M. pauciflorum* is hardly more than a form of *M. myrsinoides* Blume; and Blume's authentic specimens hardly differ except

by the leaves being considerably larger. Triana in Kew Herb. has referred a totally different plant to *M. myrsinoides*, viz. *Wall. Cat. 4019 (M. umbellatum, Wall.)*, which has round stems, petioled leaves, buds not rostrate, and is *M. edule* or very near thereto.

11. ***M. ellipticum***, *Thwaites Enum.* 112; petiole $0-\frac{1}{16}$ in. but often distinct, leaves $2\frac{1}{4}$ in. broad-elliptic obtuse or shortly acuminate apex obtuse, base round or acute not acuminate, peduncles clustered $0-\frac{1}{2}$ in., pedicels attaining $\frac{1}{5}$ in. *Triana in Trans. Linn. Soc.* xxviii. 159.

CEYLON; between Galle and Ratnapoora at no great elevation; *Thwaites, Walker, Gardner.*

A small tree. *Calyx* at time of flowering saucer-shaped, small. *Flowers* white. Nerves of the *leaves* obscure, but the marginal ones visible.—Mr. Thwaites appears to have issued his No. 1557 without name: it seems the same as 3479, and has small globose berries about $\frac{1}{8}$ in. diam., the areola scarcely $\frac{1}{16}$ in. wide.

12. ***M. varians***, *Thwaites Enum.* 112; leaves $\frac{1}{2}-1\frac{1}{2}$ in. oblong acute or obovate rhomboid or elliptic obtuse always narrowed at the base, nerves very obscure, petiole $0-\frac{1}{8}$ in., inflorescence densely clustered hardly extending $\frac{1}{2}$ in. from the stem, buds obtuse, calyx-tube at the time of flowering saucer-shaped, disc very obscurely rayed. *Triana in Trans. Linn. Soc.* xxviii. 159. *M. parvifolium*, *Thwaites Enum.* 113; *Triana l. c.*

CEYLON; alt. 2000–7000 ft., *Thwaites.*

A small tree. *Petals* white or blue. *Berry* $\frac{1}{4}-\frac{1}{3}$ in. diam., spherical, shortly pedicelled, areola $\frac{1}{12}$ in. diam., prominent.—Thwaites says that his *M. parvifolium* is possibly a variety of his *M. varians* but that the leaves are cuneate at the base and a good deal smaller; but in 2927 (marked *M. varians*) the leaves are smaller than in most of his *M. parvifolium* and very cuneate at base. This species is very near *M. ellipticum* Thwaites, but differs by its leaves not acuminate. It is also very near *M. pauciflorum* (No. 10) which differs in its rostrate buds and strongly radiate disc. Lastly the branchlets are sometimes nearly round and then it has been named *M. capitellatum* or *M. edule*.

** *Ultimate branchlets round.*

† *Berry large, $\frac{1}{2}$ in. diam. or more.*

13. ***M. procerum***, *Thwaites Enum.* 415; leaves 6–10 in. elliptic acuminate subacute at the base, petiole $\frac{1}{5}-\frac{1}{2}$ in., berry $\frac{3}{8}-\frac{1}{2}$ in. diam. subsessile areola prominent $\frac{1}{5}$ in. wide. *Triana in Trans. Linn. Soc.* xxviii. 158.

CEYLON; Pasdoon and Hinidoon Corle, *Thwaites.*

A tree 30–40 ft. high. *Leaves* thick, but both the secondary and looped marginal nerves can be seen, much paler beneath; petiole grooved on the upper surface. *Calyx* $\frac{1}{8}$ in. broad (in flower?).

14. ***M. ovoideum***, *Thwaites Enum.* 112; leaves 3 in. round-elliptic base cordate sessile or exceedingly shortly suddenly narrowed into a minute petiole, peduncle 0, pedicels very short clustered. *Triana in Trans. Linn. Soc.* xxviii. 159. *M. macrocarpum*, *Thwaites Enum.* 110.

CEYLON; alt. 4000–5000 ft., near Adam's Peak; *Thwaites.*

A small tree; branchlets thick. *Leaves* very thick, coriaceous, nerves obscure. *Berry* $\frac{1}{2}$ in. diam., areola raised on a cylindric neck, disc within the mouth elevated and strongly rayed in the ripe fruit.—Thwaites *ovoideum* No. 2622, among other things differs in the mouth of the fruit which is depressed not radiate and is to be referred to *M. revolutum* No. 27.

15. **M. heteropleurum**, *Blume Mus. Bot.* i. 362; leaves 4-6 in. nearly sessile narrowly elliptic acuminate nerves distinct, inflorescence close axillary, buds obtuse, flowers large. *Miq. Fl. Ind. Bat.* i. pt. i. 579; *Triana in Trans. Linn. Soc.* xxviii. 157.

BURMA and MALAY PENINSULA; *Griffith* (No. 2337 Kew Distrib.). MALACCA; *Maingay* No. 816. SINGAPORE; *Maingay* No. 815.—DISTRIB. Sumatra and Java.

Leaves acute, but not at all acuminate at the base; both the secondary and marginal nerves prominent. *Calyx-tube* saucer-shaped at the time of flowering, limb truncate even in the bud. *Disc* flat, prominently rayed, *Berry* $\frac{1}{2}$ in. diam. or more, areola $\frac{1}{8}$ in. wide, somewhat prominent, disc much depressed.

16. **M. cerasiforme**, *Kurz, For. Fl.* i. 516; leaves 3-4 in. elliptic acuminate at both ends coriaceous, berries in short cymes $\frac{1}{2}$ in. diam. very succulent.

CHITTAGONG; *Kurz*.

Leaves dried olive-yellow, lateral nerves obscure; petiole $\frac{1}{8}$ in. *Flowers* not seen. *Peduncles* (of the fruits) $\frac{1}{2}$ in., pedicels $\frac{1}{8}$ in. *Berries* blue-black unusually succulent.

17. **M. Maingayi**, *C. B. Clarke*; leaves 8 in. subsessile oblong-lanceolate rounded or subcordate at the base secondary and marginal nerves prominent, cymes clustered axillary, peduncles and pedicels about $\frac{1}{2}$ in. stout, flowers very large, buds obtuse, calyx-tube at the time of flowering campanulate limb truncate disc somewhat convex very prominently rayed.

MALACCA; *Maingay* No. 814.

The finest species of the genus, the flowers being far larger than in any other species, the calyx-tube in bud nearly $\frac{1}{4}$ in. wide. *Maingay's* example does not show fruit, but from the size of the flower it may be presumed that it would be large.

18. **M. microstomum**, *C. B. Clarke*; leaves 5 in. sessile ovate or oblong subobtuse cordate at the base opaque, flowers small densely clustered axillary, berry nearly $\frac{1}{2}$ in. diam., calyx-limb 0, areola scarcely $\frac{1}{20}$ in. diam.

MALACCA; Keddah Peak, *Maingay* No. 821. ?MALAY PENINSULA, *Col. Low*.

A small tree (*Maingay*). *Leaves* thick, subamplexicaul, marginal nerves obscure, secondary visible. *Pedicels* less than $\frac{1}{2}$ in., slender. *Buds* obtuse; *calyx-tube* funnel-shaped at the time of flowering, rays of the disc very obscure.

†† *Berry* less than $\frac{1}{2}$ in. diam. *Inflorescence* 2 in. or more, except in *M. merguicum* and *M. grande*.

19. **M. Amherstianum**, *C. B. Clarke*; leaves 2-3 in. oblong acute very thick nerveless, petiole $\frac{1}{2}$ in., panicle large terminal. *Wall. Cat.* 9127.

AMHERST; *Wallich*.

Flowers in close umbels at the summits of the ultimate branches of the panicle.—Differs from *M. paniculatum*, *Jack*, in the much smaller and thicker leaves.

20. **M. grande**, *Retz Obs.* iv. 26; leaves 3-5 in. elliptic or somewhat ovate acuminate narrowed but not at all acuminate at the base, petiole $\frac{1}{2}$ in., peduncles $\frac{1}{2}$ -1 in. solitary or 2-3 together thick, berry nearly $\frac{1}{4}$ in. wide areola $\frac{1}{12}$ in. wide. *Wall. Cat.* 4103; *Triana in Trans. Linn. Soc.* xxviii. 158. *M. laxiflorum*, *Wall. Cat.* 4472. *M. edule* var. β , *Thwaites Enum.* 110. *M. ambiguum*, *Blume Mus. Bot.* i. 359; *Triana l.c.*

CEYLON; Thwaites, No. 3442. SINGAPORE; *Wallich*.—DISTRIB. Java.

Nerves of the *leaves* subprominent, marginal more obscure, apex obtuse often out of one plane so that in drying it is either broken off or crumpled and turned on one side. Branches of the *cyme* glabrous. *Buds* obtuse, not large. *Calyx-tube* at the time of flowering saucer-shaped, limb truncate. *Disc* scarcely depressed, rays prominent.—As regards the *name* of this species, that of Retz is cited by Triana, and his description suits the species, but will also suit several others. As regards the plant itself, the flowers and fruit are identical with *M. edule* var. *ovatum*; but the leaves are rather larger and the inflorescence rather more effuse. Thwaites is very likely right in regarding it as a variety of *M. edule*.

VAR. 1. *Horsfieldii*, Miq. Fl. Ind. Bat. i. 572 (sp.); nerves less prominent, inflorescence shorter, buds acute. *M. celastrinum*, Kurz For. Fl. i. 515.—Pegu, Kurz. Malacca; Maingay No. 811.

VAR. 2. *pubescens*; leaves 3–4½ in. glabrous elliptic suddenly acuminate, cymes proliferously umbellate, branches distinctly rusty-pubescent.—Malacca; Griffith (Kew Distrib. No. 2336). Branchlets round. *Leaves* acute, hardly acuminate at the base, secondary and marginal nerves somewhat prominent; petiole ½ in. *Inflorescence* in young flower 2 in. *Calyx* (in flower time) very small, shallow, saucer-shaped. *Disc* rayed. *Fruit* not seen.—This variety is marked by Triana, *M. ambiguum* Bl.?

VAR. 3. *khasiana*; leaves 3–4 in. elliptic acuminate at both ends, apex acute, petiole ½ in., fruit in a lax panicle extending 2–3 in., berry ¼ in. wide areola somewhat prominent ⅓ in. wide.—Khasia Mts.; Griffith (No. 2333 Kew Distrib.). *Leaves* dried yellow, not very thick but rather opaque, nerves evident, marginal obscure. *Peduncle* in fruit 1–1½ in., pedicels often ½ in. The remains of the *disc* in the mouth of the fruit show that it was in flower prominently rayed.—Very near var. *Horsfieldii* but has the leaves more acuminate at both ends.

VAR. 4. *merguica*; leaves 4–6 in. elliptic and broad-elliptic obtuse narrowed gradually to the base subpetiolate, nerves somewhat distinct, peduncles solitary or clustered ½–¾ in., cymes compound. *M. Griffithianum*, Kurz in Journ. As. Soc. 1877, pt. ii. 82, not of Naud.—Mergui; Griffith. Tenasserim or Andamans; Helfer (No. 2331 Kew Distrib.). *Leaves* (in all the examples) with scattered glands on the lower surface. *Calyx-tube* at the time of flowering saucer-shaped or almost funnel-shaped, limb subtruncate. *Buds* medium-sized, obtuse; disc on the apex of the ovary rayed prominently. *Fruit* ¼ in. diam., areola ⅓ in. wide.

21. *M. costatum*, Miq. in Blume Mus. Bot. i. 360; leaves 5–8 in. subsessile oblong-lanceolate cordate at the base secondary nerves strongly impressed, thyriform, Miquel, peduncles and pedicels exceedingly thick. *Miq. Fl. Ind. Bat. i. pt. i. 573; Triana in Trans. Linn. Soc. xxviii. 157. M. grande, Blume Bijl. 1095; Wall. Cat. 4101.*

MALACCA; Maingay No. 813.—DISTRIB. Java, Sumatra, Borneo.

A small tree; branchlets round but with four short acute wings at the base of the leaves. *Calyx-tube* at the time of flowering campanulate, limb truncate. *Disc* depressed, rays prominent. *Berry* ¼ in., ellipsoid, longer than broad; areola prominent, more than ⅓ in. wide.—A species well marked by the prominent short wings on the branchlets at the base of the very short petiole.

††† *Berry* less than ½ in. diam. *Inflorescence* less than 2 in. *Leaves* cordate at the base, sessile or very shortly petioled.

22. *M. terminale*, Dalz. in Hook. Kew Journ. iii. 121; leaves 1½–2½ in. lanceolate acute opaque, peduncles ½–1½ in. slender 1–3 from the same axil axillary and terminal, pedicels umbelled. *Triana in Trans. Linn. Soc. xxviii. 158; Dalz. & Gibs. Bomb. Fl. 93.*

Southern Ghats of the DECCAN PENINSULA; CANARA; Gibson, Dalzell.

A shrub 2-3 ft. (Dalzell). *Calyx-tube* at the time of flowering saucer-shaped, limb truncate. *Buds* not large nor acute. *Disc* depressed, rays obscure. *Berry* $\frac{1}{3}$ in. wide, ovoid, subglobose (broader than long), areola $\frac{1}{3}$ in. wide.—This species has the branchlets with 4 lines and sometimes almost quadrangular: it is probably not distinct from *M. amabile* No. 7.

23. **M. cæruleum**, *Jack in Mal. Misc.* i. 26 (not of *Guill. & Perr.*); leaves 4-6 in. ovate or oblong acute not acuminate, berry $\frac{1}{3}$ in. ellipsoid much longer than broad areola prominent $\frac{1}{3}$ in. broad. *Miq. Fl. Ind. Bat.* i. pt. i. 580; *Triana in Trans. Linn. Soc.* xxviii. 158; *Kurz For. Fl.* i. 511. *M. cordatum*, *Wall. Cat.* 4100, partly; *Griff. Notul.* iv. 673. *M. manillanum*, *Naud. in Ann. Sc. Nat.* ser. 3. xviii. 276; *Miq. l. c.* 576. *M. lutescens*, *Presl Epim. Bot.* 208, not of *Naud.*

Southern MALAY PENINSULA with its islands, plentiful.—DISTRIB. Philippines.

Shrub 10 or 12 ft. *Leaves* opaque, sessile, rounded at the base, secondary and marginal nerves inconspicuous. *Peduncles* clustered, thick; inflorescence 1-1 $\frac{1}{4}$ in. *Calyx-tube* at the time of flowering funnel-shaped; buds obtuse. *Flowers* somewhat large, intense blue. *Disc* much depressed, rays obscure.—Widely cultivated in Bengal, &c., for the sake of its bright blue flowers. The branchlets are round as *Jack* states and not quadrangular as *Presl* states: but there is no doubt as to *Presl's* plant as he describes from *Cumming's* No. 2322 which is *M. cæruleum*. Of *Kurz's M. cæruleum*, var. 2. *floribundum*, I know nothing.

VAR. *pulehrum*, *Kurz For. Fl.* i. 510 (sp.); peduncles and pedicels more slender.—Andamans, *Kurz*. *Kurz's* specimens have the inflorescence hardly more slender than in *M. cæruleum*. *Kurz* appears to have abandoned the distinction he founded on the less ellipsoid berry.

24. **M. amplexicaule**, *Roxb. Fl. Ind.* ii. 260; leaves 2-6 in. elliptic or oblong amplexicaul, peduncle 0, pedicels less than $\frac{1}{4}$ in. slender clustered, berry $\frac{1}{3}$ in. globose or subovoid, areola $\frac{1}{3}$ in. broad somewhat prominent. *Wight Ic. t.* 279; *W. & A. Prodr.* 320; *Naud. in Ann. Sc. Nat.* ser. 3. xviii. 277; *Miq. Fl. Ind. Bat.* i. pt. i. 580. *M. depressum*, *Benth. in Wall. Cat.* 4101; *Triana in Trans. Linn. Soc.* xxviii. 158. *M. sessile*, *Wall. Cat.* 4112. *M. cordatum*, *Wall. Cat.* 4100 partly.

PINANG *Roxburgh, Wallich.*

Leaves sometimes acuminate, secondary nerves prominent. *Buds* small, obtuse. *Flowers* pale yellowish-blue. *Disc* depressed, rays obscure. *Berry* not longer than broad.—This (and not *M. cæruleum*, as *Triana* says) is certainly *Roxburgh's M. amplexicaule*, for, besides other reasons, *Roxburgh's* figure, preserved at Kew, has yellow flowers.

VAR. 1. *malabarica*; leaves often not exceeding 2-3 in., sometimes distinctly petioled, never acuminate, secondary nerves obscure.—Nilghiris, Mts. of Kurg, &c., plentiful. Not from Ceylon, for *Thwaites*, No. 2570 cited by *Triana* is *M. Wightii*, No. 3.

VAR. 2. *cordata*, *Wight mss.*; branchlets distinctly quadrangular.—This seems not remote from No. 7 *amabile*.

25. **M. macrophyllum**, *Thwaites Enum.* 111; leaves 6-12 in. oblong-lanceolate, peduncles 0, pedicels short, berry $\frac{1}{3}$ in. diam. spherical. *Triana in Trans. Linn. Soc.* xxviii. 158.

CEYLON; alt. 1000-3000 ft., *Thwaites*.

Leaves with the nerves little impressed but both the secondary and marginal

are visible. *Petals* pale blue (Thwaites).—Neither Mr. Thwaites' examples nor his description show this species to differ from *M. amplexicaule* except by the leaves being larger (see No. 4. *M. Hookeri*).

26. ***M. orbiculare***, *Thwaites Enum.* 112; leaves $1\frac{1}{2}$ in. diam. orbicular very thick and opaque, pedicels less than $\frac{1}{4}$ in. clustered. *Triana in Trans. Linn. Soc.* xxviii. 158.

CEYLON; alt. 1000 ft., Hinidoon Corle; *Thwaites*.

A small tree. *Buds* small, obtuse. *Calyx-tube* at the time of flowering saucer-shaped. *Petals* blue. *Disc* obscurely rayed.

27. ***M. revolutum***, *Thwaites Enum.* 111; leaves 3 in. round-elliptic coriaceous nerves impressed, peduncles clustered rather stout in fruit $\frac{3}{4}$ in., berry $\frac{1}{4}$ in. diam. spherical mouth less than $\frac{1}{8}$ in. wide. *Triana in Trans. Linn. Soc.* xxviii. 159.

CEYLON; alt. 5000 ft., Rambodde; *Thwaites*.

A small tree. *Flowers* small, white. *Berry* black-purple. Whole inflorescence not exceeding 1 in. in the fruiting example communicated by Mr. Thwaites, but Mr. Thwaites' picture shows it 2 in. very dense and compound in flower.

28. ***M. deccanense***, *C. B. Clarke*; leaves 4–5 in. narrowly oblong-lanceolate, peduncle 0, pedicels clustered less than $\frac{1}{4}$ in., flowers small. *M. Heyneanum*, *Wight Ic. t.* 278?. *M. Wightianum*, *Triana in Trans. Linn. Soc.* xxviii. 158 (not *M. Wightii*, *Thwaites*).

DECCAN PENINSULA; *Wight*.

Branches with 4 lines, ultimate branches terete. *Leaves* rounded and almost cordate at the base, opaque, thin, secondary nerves not prominent; petiole $\frac{1}{8}$ in.—Separated by Triana from *M. Heyneanum* from which it considerably differs. As to *Wight Ic. t.* 278 it exhibits exactly the leaves of the present species, but the inflorescence appears rather to belong to the next.

†††† *Berry* less than $\frac{1}{2}$ in. diam. *Inflorescence* less than 2 in. *Leaves* 4–6 in., long-petioled, narrow-lanceolate, acuminate at the base.

29. ***M. Heyneanum***, *Benth. in Wall. Cat.* 4102; leaves 4–7 in. lanceolate elongate nerves impressed narrowed into the petiole $\frac{1}{4}$ in., inflorescence less than 1 in., peduncles usually short, buds large acute. *W. & A. Prodr.* 319; *Triana in Trans. Linn. Soc.* xxviii. 158. *M. jambosoides*, *Wight Ic. t.* 277; *Thwaites Enum.* 112; *Miq. Fl. Ind. Bat. i.* pt. i. 580.

DECCAN PENINSULA; Courtallum &c. *Wight*. CEYLON; up to 3000 ft., *Thwaites*.

Calyx-tube at the time of flowering broadly funnel-shaped, limb truncate. *Disc* obscurely rayed. *Berries* less than $\frac{1}{4}$ in. diam., spherical, nearly sessile.—The typical *M. Heyneanum* Benth. is a well marked and easily recognised plant; but the two varieties of Mr. Thwaites could never have been referred to it in the herbarium. Mr. Thwaites says the berry is as much as $\frac{1}{2}$ in. diam. in the Ceylon plants, but his specimens at Kew do not show fruit.

VAR. 1. *latifolia*; leaves broader a fresh green colour narrowed almost to the base so that there is scarcely any true petiole, nerves visible but slender and hardly at all impressed.—*Thwaites No.* 2468.

VAR. 2. *angustifolia*; leaves linear-lanceolate when dry orange yellow thick and opaque.—*Thwaites No.* 1555.

††††† Berry less than $\frac{1}{2}$ in. diam. Inflorescence less than 2 in. Leaves usually less than 4 in., distinctly acuminate, often rostrate, base not cordate, petiole short. (See also *M. grande* above). N.B. This series only differs from the *M. edule* series by the more distinct acumination of the leaves.

30. *M. lævigatum*, Blume Mus. Bot. i. 358; leaves 2-3 in. broad-elliptic suddenly shortly acuminate at both ends, petiole $\frac{1}{8}$ - $\frac{1}{4}$ in., peduncles clustered 0- $\frac{1}{4}$ in., inflorescence not $\frac{3}{4}$ in., buds large very acute. *Miq. Fl. Ind. Bat.* i. 576; *Triana in Trans. Linn. Soc.* xxviii. 157; *Kurz For. Fl.* i. 513. *M. Myrtilli*, Blume l. c. 357; *Miq. Fl. Ind. Bat.* i. 578. *M. pachyderma*, Wall. Cat. 4104. *M. Vosmaerianum*, Scheffer in *Flora* 1870, 249.

TAVOY; Wallich. TENASSERIM and ANDAMANS; Helfer (Kew Distrib. No. 2328). MALACCA; Maingay No. 817.—DISTRIB. Java, Sumatra, Borneo.

Branchlets round (Blume says subquadrangular in *M. lævigatum*, terete in *M. Myrtilli*; but they seem all the same and never distinctly quadrangular). Leaves somewhat thin but opaque, nerves obscure but can be seen. Peduncles occasionally terminal as well as axillary. Calyx-tube at the time of flowering more than $\frac{1}{8}$ in., wide, saucer-shaped. Disc on the apex of the ovary obscurely rayed. Berry $\frac{1}{4}$ in. diam., globose, subsessile, mouth small.

VAR. *sylvaticum*, Thwaites Enum. 110 (sp.); petiole somewhat shorter, leaf long decurrent (but in Thwaites' example No. 1567 the leaves are petioled exactly as in *M. sylvaticum*).—Ceylon; alt. 2000-4000 ft.; common, Thwaites. As Mr. Thwaites remarks, some of his examples of *M. sylvaticum* are very near *M. edule*; they differ by the more acuminate leaves and the larger, sharply acute buds. Triana in Herb. inquires how the two differ.

31. *M. intermedium*, Blume Mus. Bot. i. 358; leaves 2-4 in. oblong-lanceolate acuminate at each end somewhat rostrate with the apex obtuse, petiole $\frac{1}{8}$ - $\frac{1}{4}$ in., peduncles solitary axillary $\frac{1}{4}$ - $\frac{3}{4}$ in., pedicels few $\frac{1}{8}$ - $\frac{1}{4}$ in., buds somewhat large acute. *M. umbellatum*, Blume Bijdr. 1094; *Naud. in Ann. Sc. Nat.* ser. 3. xviii. 273; *Triana in Trans. Linn. Soc.* xxviii. 157. *M. garcinoides* β . *elongatum*, Blume Mus. Bot. i. 358.

TENASSERIM or ANDAMANS; Helfer (Kew Distrib. No. 2335).—DISTRIB. Sumatra, Java.

Leaves somewhat thin, nerves all slender but visible. Calyx-tube at the time of flowering saucer-shaped. Disc on the apex of the ovary obscurely rayed.—This species is exceedingly near *M. lævigatum*; the leaves are narrower with a longer acumination; the simple umbels at the summit of manifest peduncles give a slightly different look to the inflorescence.

32. *M. plebejum*, Kurz For. Fl. i. 513; leaves 2 $\frac{1}{2}$ -3 $\frac{1}{2}$ in. elliptic-lanceolate acuminate acute at the base, petiole $\frac{1}{8}$ - $\frac{1}{2}$ in., cymes lateral short, otherwise like *M. edule*.

PEGU; Kurz.

Leaves opaque, nerves scarcely visible, marginal quite obscure.—Kurz' example communicated exhibits neither flower nor fruit, so there must be doubt whether the subjoined var. belongs.

VAR. *silhetense*: peduncles 0- $\frac{1}{8}$ in. clustered, inflorescence extending hardly $\frac{1}{2}$ in., calyx-tube at the time of flowering saucer-shaped or somewhat funnel-shaped small, disc on the apex of the ovary prominently rayed. Chattuck, in the plain of Sylhet. H. f. & T.—Leaves exactly those of *M. plebejum* Kurz. Marked *M. lævigatum* Blume? by Triana, but the inflorescence as well as the leaves must be nearer *M. plebejum*, unless all are referable to one species.

33. **M. acuminatum**, *Smith ex Triana in Trans. Linn. Soc.* xxviii. 158; leaves 2–2½ in. broad-elliptic acuminate at both ends apex long rostrate obtuse, petiole $\frac{1}{8}$ – $\frac{1}{5}$ in., peduncles solitary (or 2 together) $\frac{1}{4}$ – $\frac{3}{4}$ in., cyme somewhat lax compound, buds very acute not large.

MALACCA; *Griffith* (Kew Distrib. No. 2325–1).

Leaves nearly concolorous, opaque. *Peduncles* sometimes terminal as well as axillary. *Disc* on the apex of the ovary distinctly rayed.—This can hardly be more than a variety of *M. levigatum*; it differs by its decisively rostrate leaves and smaller flowers. *Memecylon Maingay* No. 810 (from Malacca) slightly differs by having the leaves much lighter coloured on the lower surface and shortly rostrate, the peduncles shorter, and is still nearer *M. levigatum*.

VAR. *flavescens*; leaves 2½–3 in. elliptic acuminate at both ends apex rostrate obtuse secondary and marginal nerves distinct, petiole $\frac{1}{8}$ – $\frac{1}{5}$ in., inflorescence extending $\frac{1}{2}$ – $\frac{3}{4}$ in., peduncles clustered about $\frac{1}{8}$ in., cyme-branches repeatedly shortly divided, flowers very small. Malacca; *Griffith* No. 2325–2.—*Leaves* concolorous, greenish yellow in the dried examples. Branches of the cyme minutely scabrous almost puberulous. *Calyx-tube* at the time of flowering saucer-shaped, limb truncate. *Disc* on the apex of the ovary distinctly rayed.—Marked as “nov. sp.” by Triana.

34. **M. fuscescens**, *Thwaites Enum.* 111; leaves 2–2½ in. nearly sessile elliptic acuminate rostrate base acute, nerves slender but visible, inflorescence extending less than $\frac{1}{2}$ in. *Triana in Trans. Linn. Soc.* xxviii. 159.

CEYLON; Kokool Corle, at no great elevation; *Thwaites* No. 2926, 287.

Berry $\frac{1}{3}$ in. diam., spherical, ex *Thwaites*.—Mr. *Thwaites* in a note on No. 2926 doubts if it is really distinct from *M. levigatum* var. *sylvaticum* (No. 36 above).

35. **M. rostratum**, *Thwaites Enum.* 111; leaves 1½–2 in. elliptic acuminate rostrate apex obtuse base attenuate opaque coriaceous, inflorescence extending less than $\frac{1}{2}$ in. *Triana in Trans. Linn. Soc.* xxviii. 159.

CEYLON; Central Province, alt. 3000–4000 ft., *Gardner, Thwaites*.

A small tree. *Petals* white. *Berry* $\frac{1}{8}$ in. diam., spherical, mouth scarcely $\frac{1}{16}$ in. wide.

36. **M. rhinophyllum**, *Thwaites Enum.* 110; leaves 2–3 in. subsessile elliptic acuminate apex obtuse base acute opaque nerves very obscure, inflorescence extending less than $\frac{3}{4}$ in. *Triana in Trans. Linn. Soc.* xxviii. 159.

CEYLON; Central Province up to 3000 ft.; *Walker, Thwaites*, No. 2928, 2572.

A small tree. *Peduncles* about $\frac{1}{8}$ in., clustered; cymes small, somewhat dense; buds small, not acute. *Flowers* pale blue. *Berry* $\frac{1}{4}$ in. diam., black-purple, spherical.—Differs from the last species by its leaves sessile not acuminate at the base. These three Ceylon species (41, 42, 43) seem very close together, but Mr. *Thwaites*, who knows them alive, keeps them separate. But they are not so near together as the Malayan species of *Blume* in this same series. In this (as in so many other cases) there are only two courses open in order to represent all the material, viz., either a large grouping of existing species or the founding of a number of new ones on very slender grounds.

+++++ *Berry* less than $\frac{1}{3}$ in. diam. *Inflorescence* less than 2 in. *Leaves* usually less than 4 in., not acuminate though often acute, base not cordate.

37. **M. angustifolium**, *Wight Ic.* t. 276; leaves 2 in. opaque very narrow-oblong obtuse base attenuate, petiole $\frac{1}{5}$ in. *Thwaites Enum.* 111; *Triana in Trans. Linn. Soc.* xxviii. 158.

DECCAN PENINSULA; *Wight*, No. 1069. CEYLON; up to 2000 ft. alt.; *Thwaites*.

Shrub 6-8 ft. high. *Inflorescence* dense, extending hardly $\frac{3}{4}$ in.; peduncles usually $\frac{1}{8}$ - $\frac{1}{5}$ in., clustered. *Flowers* blue, as of *M. edule*. *Calyx-tube* at the time of flowering saucer-shaped, limb truncate. *Disc* on the apex of the ovary depressed, very obscurely rayed. *Berry* size of a pea, black-purple. (*Thwaites*.)

VAR. 1. *attenuata*; leaves still narrower elongate attenuate apex obtuse.—Ceylon, *Thwaites*.

VAR. 2. *Helperi*; branchlets quadrangular, berries $\frac{1}{4}$ in. diam.—Tenasserim or Andamans; *Helper* (Kew Distrib. No. 2334).—This has been placed with *M. angustifolium* because of its narrow leaves, which are, however, more obtuse and less petioled than those of *M. angustifolium*. If not placed here, it must form an additional species near *M. varians* No. 12.

38. **M. phyllanthifolium**, *Thwaites ex Triana in Trans. Linn. Soc.* xxviii. 159; leaves $\frac{1}{2}$ in. nearly sessile narrow-oblong obtuse narrowed at the base coriaceous opaque.

CEYLON, alt. 5000 ft.; *Thwaites*.

Branches wiry, leaves approximate, resembling a small woody *Phyllanthus*. *Flowers* very small, usually 3 on an axillary peduncle about $\frac{1}{2}$ in. *Berry* small, spherical, crowned prominently by the calyx-limb, but not ripe.—Entirely unlike every other species in the genus.

39. **M. campanulatum**, *C. B. Clarke*; leaves $2\frac{1}{2}$ -4 in. subpetiolate elliptic acute base attenuated opaque, calyx-tube at the time of flowering distinctly campanulate.

MALACCA; *Griffith*, Memecylon No. 5 (No. 2325 (not 2325-1 nor 2325-2) of Kew Distrib.).

Leaves suddenly narrowed, sometimes very shortly acuminate. *Peduncle* 0; pedicels $\frac{1}{8}$ - $\frac{1}{5}$ in., clustered. *Calyx-tube* even in the bud campanulate, limb truncate. *Buds* somewhat acute. *Disc* on the apex of the ovary depressed, very obscurely rayed.—This has been treated as a var. of No. 23 *M. cæruleum*, Jack; it seems very much nearer *M. lævigatum*, from which it differs chiefly in the round (not acute) base of the calyx-tube at the time of flowering.

40. **M. edule**, *Roxb. Cor. Pl.* t. 82; leaves $1\frac{1}{2}$ -3 $\frac{1}{2}$ in. elliptic or ovate acute at both ends hardly acuminate, petiole $\frac{1}{2}$ - $\frac{1}{5}$ in., nerves obscure, calyx-tube at the time of flowering saucer-shaped limb truncate.

EASTERN PENINSULA and CEYLON.

Flowers medium-sized, blue rarely white; buds obtuse or at least not very acute. *Calyx-tube* at the time of flowering saucer-shaped, limb truncate. *Disc* at the apex of the ovary depressed, obscurely rayed. *Berry* $\frac{1}{4}$ in. diam., black-purple, globose or slightly ovoid, mouth about $\frac{1}{2}$ in. wide.—The first three varieties run completely together which will account for the variety of quotation of the synonyms by authors: var. 4 recedes further from the type. The remaining varieties are called species by most authors. *M. myrsinoides*, Blume, differs from *M. edule* by its quadrangular branchlets. Triana reduces *M. umbellatum*, Wall. Cat. 4109, to *M. myrsinoides*, Blume: but the examples of Wallich 4109 have the branchlets exactly round.

VAR. 1. *typica*; peduncles clustered $\frac{1}{8}$ - $\frac{1}{4}$ in., leaves acute or obtuse. *M. edule*, *Roxb. Fl. Ind.* ii. 260; *DC. Prodr.* iii. 6; *Wall. Cat.* 4107; *Dalz. & Gibs. Bomb. Fl.* p. 93; *Kurz For. Fl.* i. 512. *M. edule* var. *a.*, *Thwaites Enum.* 111. *M. umbellatum*, *Burm. Fl. Zeyl.* t. 31. *M. tinctorium*, *Kæn. ex W. & A. Prodr.* 319; *Wight Ill.* t. 93. *M. globiferum*, *Wall. Cat.* 4108. *M. pyriform*, *Naud. in Ann. Sc. Nat.* ser. 3. xviii. p. 277.

VAR. 2. *ramiflora*; inflorescence densely clothing the branches, peduncle often (but not always) wanting. *M. edule*, *Lamk. Dict.* iv. 88; *DC. Prodr.* iii. 6; *W. & A.*

Prodr. 319. *M. sessile*, Wall. *Cat.* 4112 *ex W. & A. Prodr.* 320. Not *M. ramiflorum*, Griff. *Notul.* iv. 673.

VAR. 3. *capitellata*; peduncle more elongated sometimes 1 inch. *M. capitellatum*, Linn.; *DC. Prodr.* iii. 6; *Roxb. Hort. Beng.* 28. ? *Lamk. Ill.* t. 284.

VAR. 4. *ovata*; leaves often 4 in. more rounded at the base more acute sometimes subacuminate at the apex. *M. ovatum*, Sm. *ex Kurz For. Fl.* i. 512. *M. edule*, var. γ , *Thwaites Enum.* 110. *M. umbellatum*, Hb. *Heyne in Wall. Cat.* 4109. *M. tinctorium*, var. β , W. & A. *Prodr.* 319. *M. prasinum*, Naud. *in. Ann. Sc. Nat.* ser. 3. xviii. p. 275. *M. grande*, Wall. *Cat.* 4103, partly. *M. lucidum* and *pyrifolium*, Presl *Epim. Bot.* 209, 210.

VAR. 5. *lata*; nerves distinct, peduncles elongate often 1-1½ in., pedicels 0, calyx prominently 4-toothed. *M. capitellatum*, *Thwaites Enum.* 110 (not of Linnaeus).—Ceylon; *Thwaites* No. 1564, 1565; *Walker*; *Moon*; *Major Champion*.—Called *Samara leia* by Moon in Herb. by which he understood Burmann's *Fl. Zeyl.* t. 30; also *M. Walkeri*, Hook. in Herb.: also marked *nov. sp.* by Triana in Herb. Hook.

VAR. 6. *rubro-carulea*, *Thwaites Enum.* 415 (sp.); Triana in Trans. Linn. Soc. xxviii. 159.—Ceylon; East Matelle; *Thwaites*.—Mr. Thwaites says this differs from *M. edule* by the leaves more acuminate with the base more rounded. But the specimen (No. 3809) sent to Kew has the leaves very obtuse not at all acuminate, and narrowed into the petiole at the base: in short it is a typical example of *M. edule* var. 1 *typica*.

VAR. 7. *cuneata*, *Thwaites Enum.* 112 (sp.); Triana in Trans. Linn. Soc. xxviii. 159.—Ceylon; alt. 3000 ft.; *Thwaites* No. 2538.—The leaves are cuneate attenuate at the base, so that in some there is hardly any petiole; otherwise the same as *M. edule*.

VAR. 8. *leucantha*, *Thwaites Enum.* 110 (sp.); Triana in Trans. Linn. Soc. xxviii. 159.—Ceylon; alt. 3000-5000 ft.; *Thwaites*; *Gardner*.—This differs from *M. edule* by its white flowers and its leaves more distinctly nerved.

VAR. 9. *scutellata*, Triana in Trans. Linn. Soc. xxviii. 157. *M. myrtifolium*, Wall. *Cat.* 4111. *M. obtusum*, Wall. *Cat.* 4110. *M. punctatum*, Presl, and *scutellatum*, Naud. *ex Kurz For. Fl.* i. 513.—Transgangetic Peninsula from Chittagong to Singapore.—DISTRIB. Malay Archipelago. Leaves very thick, opaque, obscurely punctulate on both surfaces, narrowed much at the base, subepetiolate; otherwise much like *M. edule* type.—Kurz separates specifically *M. punctatum*, Presl, having the calyx with a tubercled base, from *M. scutellatum*, Naud. having the calyx with a smooth base. But both these descriptions of calyx may be seen on one branchlet, as in Helfer No. 2330 Herb. Distrib.: the tuberculation is caused by an insect.

VAR. 10. *Thwaitesii*; calyx-tube in the bud distinctly campanulate, teeth after flowering triangular. *M. umbellatum*, *Thwaites* No. 387, not of Burmann.—Ceylon, alt. 3000 ft.—Burmann states that his *umbellatum*, *Fl. Zeyl.* t. 31 is called Waryakha by the Cinghalese, a name attributed by Thwaites to *M. capitellatum*, Linn. It appears closely allied to *M. capitellatum*, Linn. but the very broad base of the calyx in bud is unlike *M. edule*.

VAR. 11. *Rottleriana*; inflorescence lax extending 2-2½ in.—Deccan Peninsula?—Called *M. capitellatum* by Heyne in Herb. Rottler and probably the extreme form of that variety.

VAR. 12. *molesta*; branchlets distinctly quadrangular.—Anamallay Mts.; *Wight* No. 1072.—Wight's specimens are ample and beautifully preserved: they are exactly *M. edule* var. 2. *ramiflorum*, except that the branchlets (and even the branches) are quadrangular. They are sufficient to shake the faith of any botanist in the whole existing arrangement of the species of *Memecylon*.

DOUBTFUL AND EXCLUDED SPECIES.

M. SUBQUADRANGULARE, *DC. Prodr.* iii. 6; no example known, and not recognisable from description.

M. ROYENII, *Blume Mus. Bot.* i. 360, is probably some form of *M. edule*, *Roxb.*, for Blume states that it is the Wellie Kala of Burmann's herbarium.

M. FLORIBUNDUM, Wall. *Cat.* 4113 is a *Eugenia*.

M. PYRIFORME, Wall. Cat. 4106 is not Melastomaceous.

M. PAUCIFLORUM, Wall. Cat. 4114 is *Canthium glomeratum*, Miq.

M. ACUMINATUM, Wall. Cat. 4105 is not a *Memecylon*.

M. SURTRINERVIUM, Miq. var. *grandifolia*, Kurz in Journ. As. Soc. 1876, pt. ii. 131, from the Nicobars, with leaves 8-10 in., and obovoid-oblong berries $\frac{2}{3}$ in. diam., is perhaps next to *M. heteropleurum* No. 19, but we have seen no specimen.

Two branchlets with detached leaves and fruits collected by Dr. T. Anderson at Singapore are referred by Triana to *Pachycentria tuberculosa*, Korths, a Borneo species. The identification appears correct; but this very imperfect material is the only ground for supposing that the species has been collected within the limits of the present Flora.

ORDER LXI. **LYTHRACEÆ.** (By C. B. Clarke, F.L.S.)

Trees shrubs or herbs; branches often quadrangular. Leaves entire, opposite, sometimes alternate or whorled; stipules 0. Inflorescence various, often in cymes or panicles. Flowers hermaphrodite, regular, rarely oblique, unisexual in *Crypteronia*. Calyx-tube free, persistent; lobes 3-6, valvate, accessory often added. Petals as many as the calyx-teeth, rarely 0, inserted near the top of the calyx-tube. Stamens definite or very many, inserted on the calyx-tube. Ovary free, in the bottom of the calyx-tube (rarely inferior), 2-6-celled; style long, stigma capitate rarely 2-lobed; ovules very many, placentas axile (rarely parietal). Fruit coriaceous or membranous, free or more or less adnate to the base of the calyx, 2-6-celled or by imperfection of the partitions 1-celled, dehiscent or not. Seeds many, various in shape, angular round or winged, albumen 0; embryo straight, cotyledons convolute in *Sonneratia* and *Punica*.—DISTRIB. Species 250; in the tropics of the whole world especially of America; a few species scattered over the temperate zones.

Nesæa triflora, Kunth, introduced into Wight and Arnott's *Prodromus* (p. 307), is a Mauritian plant collected occasionally in India.

TRIBE I. **Ammannieæ.** Low or aquatic herbs with small or minute flowers. Calyx membranous.

Herbs growing in moist places 1. AMMANNIA.

Herb growing in water the flower-spike exsert 2. HYDROLYTHRUM.

TRIBE II. **Lythreæ.** Trees or shrubs. Calyx herbaceous or coriaceous. Petals often large wrinkled.

* *Calyx curved, flowers secund.*

Stamens declinate 3. WOODFORDIA.

** *Calyx straight, flowers symmetric.*

Flowers 6-fid. Capsule circumsciss 4. PEMPHIS.

Flowers 4-fid. Capsule irregularly breaking up 5. LAWSONIA.

Flowers minute subunisexual. Capsule 2-valved 6. CRYPTERONIA.

Flowers 6-fid. Capsule 3-6-valved. Seeds winged 7. LAGERSTRÆMIA.

Flowers 4-8-fid. Capsule 4-8-valved. Seeds minute 8. DUABANGA.

Berry subglobose, 10-15-celled, ∞-seeded 9. SONNERATIA.

Anomalous genera with inferior ovary.

Calyx-lobes 5-7, thick. Stamens ∞ 10. PUNICA.

Calyx-lobes 5, small. Stamens 10 11. AXINANDRA.

1. **AMMANNIA**, Linn.

Annual glabrous herbs growing in damp places; branches often quadrangular. *Leaves* opposite and alternate, sometimes whorled, entire; stipules 0. *Flowers* small, axillary, solitary and subsessile, or in small trichotomous cymes; bracteoles usually 2. *Calyx* campanulate or tubular-campanulate, 3-5-toothed, often with minute interposed teeth or folds. *Petals* 3-5 or 0, small, inserted between the calyx-teeth. *Stamens* 2-8, inserted on the calyx-tube. *Ovary* enclosed in the calyx-tube, 1-5-celled, the septa very thin often absorbed; style filiform or short, stigma capitate; ovules very many, placentas axile. *Capsule* membranous, globose or long-ellipsoid, enclosed in the calyx, 2-3-valved, or irregularly breaking up or circumsciss. *Seeds* many, often nearly covering the placenta which is often ultimately free central, small, smooth, round on the back, raphe on the inner face, ellipsoid or nearly hemispheric.—DISTRIB. Species 30, in the tropics and warm temperate zones of the whole world.

SUBGENUS I. **Rotala**. *Flowers* axillary, solitary or in sessile spikes. *Capsule* 2-4-valved.

* *Calyx* in fruit campanulate, longer than broad.

1. **A. peploides**, Spreng. *Syst.* i. 444; cauline leaves elliptic nerves prominent beneath, capsule 2-valved, seeds narrow-oblong subfalcate. *Boiss. Fl. Orient.* ii. 742; *Kurz in Journ. As. Soc.* 1877, pt. ii. 84. *A. nana*, Roxb. *Fl. Ind.* i. 427, not of Wallich. *A. repens*, Rottl.; *DC. Prodr.* iii. 80. *Ameletia indica*, *DC. Prodr.* iii. 76; *Wall. Cat.* 2093; *W. & A. Prodr.* 303; *Blume Mus. Bot.* ii. 135, t. 47; *Dalz. & Gibs. Bomb. Fl.* 96; *Wight Ic.* t. 257. *A. elongata*, *Blume Mus. Bot.* ii. 135. *A. acutidens*, *Miq. Fl. Ind. Bat.* i. pt. i. 617. *A. polystachya*, *Wall. Cat.* 2094. *A. latifolia*, *Wall. Cat.* 2096, partly. *Peplis indica*, *Willd. Sp. Pl.* ii. 244.

INDIA; common, in rice fields &c. throughout the plains and in warm places in the lower mountains.—DISTRIB. Malaya to the Philippines and Canton; Cabul and Persia.

Stems decumbent often rooting or erect, 3-12 in. high. *Leaves* opposite, larger on the main stem, $\frac{1}{2}$ - $\frac{3}{4}$ in., elliptic, narrowed at the base, sometimes almost petioled. *Flowers* often approximate in numerous sessile axillary spikes, solitary, sessile in the axils of reduced floral leaves; bracteoles 2, minute, lanceolate: or flowers sometimes strictly axillary, distant. *Calyx-tube* long-campanulate, scarcely striate; teeth 4, often pink, acute, triangular in fruit, accessory teeth obscure or 0. *Petals* 0, or 4 small. *Capsule* ellipsoid, longer than broad. *Seeds* pink, somewhat angular, hilum quite obscure.

2. **A. Ritchiei**, C. B. Clarke; cauline leaves elliptic nerves not prominent beneath, capsule 4-valved, seeds nearly hemispheric.

BELGAUM, in rice fields, *Ritchie*.

Stems 6-12 in. rooting amongst floating weeds (*Ritchie*). *Leaves* opposite, cauline $\frac{1}{2}$ - $\frac{3}{4}$ in., elliptic, sessile. *Flowers* solitary, distant, lower distinctly pedicelled. *Calyx* long-campanulate, truncate; teeth 4, minute, hardly so large as the minute interjected ones. *Petals* 4, minute, rose. *Capsule* ellipsoid, longer than broad, as long as the calyx-tube. *Seeds* brown-yellow, elliptic, peltate.

3. **A. rotundifolia**, Ham. in *Don Prodr.* 220; leaves orbicular, flowers sessile close-packed in terminal spikes, capsule 4-valved. *Roxb. Fl. Ind.* i. 425;

DC. Prodr. iii. 79; *W. & A. Prodr.* 306; *Wall. Cat.* 2095; *Wight Ic.* t. 258; *Kurz in Journ. As. Soc.* 1877, pt. ii. 85. *A. latifolia*, *Wall. Cat.* 2096, partly. *A. subspicata*, *Benth. in Hook. Lond. Journ. Bot.* i. 484. *Ameletia rotundifolia*, *Dalz. & Gibs. Bomb. Fl.* 96. *A. subspicata*, *Benth. in Hook. Kew Journ. Bot.* iv. 81.

INDIA; common, in rice fields &c. throughout the plains and in warm places in the lower mountains; not received from Ceylon.—DISTRIB. China, Formosa.

Rooting and creeping extensively so as often to form large patches in moist turf: stems usually 4–6 in., roundish and leafy. *Leaves* $\frac{1}{2}$ in. diam., opposite, sessile or shortly petioled, nerved, approximate below becoming distant towards the spikes. *Flower-spikes* dense, pedunculate, often 3 sometimes one only, sometimes panicked; floral leaf one to each flower, ovate or oblong, bracteiform, bracteoles 0 or most minute. *Calyx-tube* campanulate, not elongate; teeth 4, acute, triangular, without interjected folds. *Petals* 4, obovate, twice the length of the calyx-teeth, bright rose. *Capsule* ellipsoid, a little longer than broad. *Seeds* brown-yellow, ellipsoid, peltate.—In this species, in *A. floribunda* below, and probably in others, the flowers are dimorphic; one kind has the stamens included and the style very long-exserted, the other kind has the stamens long-exserted and the style short: these are doubtless reciprocally fertile in the manner discovered by Mr. Darwin for *Lythrum Salicaria*. No stress must be laid on the descriptions of the length of the style in this genus.

4. ***A. tenuis***, *C. B. Clarke*; leaves opposite ovate or elliptic, flowers sessile close-packed in terminal spikes, capsule 2-valved. *Ameletia tenuis*, *Wight Ic.* t. 257; *Dalz. & Gibs. Bomb. Fl.* 96.

CENTRAL INDIA from BANDA to the CONCAN and BEHAR. EAST BENGAL; *Griffith* No. 2310.

Erect, or but shortly creeping at the base; varying from simple stems 3–4 in. to very compound stems 8–10 in. *Leaves* $\frac{1}{4}$ – $\frac{1}{2}$ in., sessile or nearly so, often acute. *Flower-spikes* dense, on filiform peduncles; floral leaf one to each flower, oblong or lanceolate, bracteoles lanceolate, exceeding half the length of the calyx. *Calyx-tube* campanulate, much more elongate than that of *A. rotundifolia*; teeth 4, acute, without interjected folds. *Petals* 4, obovate, not much longer than the calyx-teeth. *Capsule* ellipsoid, much longer than broad. *Seeds* brown-yellow, elliptic, peltate.

5. ***A. floribunda***, *C. B. Clarke*; leaves alternate, upper narrow-oblong or linear, flowers sessile close packed in terminal spikes, capsule 2-valved. *Ameletia floribunda*, *Wight Ill.* 206, not good and the reference to the figure wrong; *Hook. Ic. Pl.* t. 826; *Dalz. & Gibs. Bomb. Fl.* 96. *Nimmonia floribunda*, *Wight in Madras Journ. of Science* vi. 34, t. 20.

Mahableshwur Hills, BOMBAY; *Law, Stocks*.

Erect or but shortly creeping at the base; stems often much branched, 8–10 in. Lower leaves 1–2 in., broad-oblong, obtuse, sessile, base broad, upper leaves $\frac{1}{4}$ – $\frac{1}{2}$ in., linear or narrow-oblong. *Flower-spikes* dense on filiform peduncles; floral leaf one to each flower, oblong or lanceolate; bracteoles lanceolate, exceeding half the length of the calyx. *Calyx-tube* campanulate, elongate, like that of *A. tenuis*; teeth 4, acute, without interjected folds. *Petals* 4, obovate, nearly twice the calyx-teeth, bright rose. *Capsule* ellipsoid, much longer than broad. *Seeds* brown-yellow, elliptic, peltate.—Very closely allied to the preceding species.

6. ***A. Rotala***, *F. Muell. Fragm.* iii. 108; leaves in whorls of 3–6 linear, flowers sessile axillary, capsule 3-valved. *Benth. Fl. Austral.* iii. 295. *Rotala verticillaris*, *Linn.*; *DC. Prodr.* iii. 76; *Wall. Cat.* 6321; *W. & A. Prodr.* 303;

Wight Ic. t. 260; *Dalz. & Gibs. Bomb. Fl.* 96; *Miq. Fl. Ind. Bat.* i. pt. i. 614. *R. apetal.*, *F. Muell. Fragm.* iii. 108.—*Rheede Hort. Mal.* ix. t. 81.

DECCAN PENINSULA; *Wight, Rottler. CONCAN, Law.* CEYLON, abundant, *Thwaites*.—DISTRIB. Australia. Tropical Africa.

Erect or shortly creeping; stems 3-6 in. *Leaves* $\frac{1}{4}$ - $\frac{1}{2}$ in., sometimes somewhat ovate at the base. Lower whorls of *flowers* often distant, upper sometimes almost spicate. *Calyx* tubular; teeth 3-5, small. *Petals* small, fugacious, or 0. *Stamens* 3-5. *Capsule* ellipsoid, longer than broad. *Seed* half-obovoid, the plane face somewhat excavated.—*Hypobrichia Spruceana, Benth. in Herb. Spruce* which has been reduced to a synonym of *Rotala verticillaris*, differs in its inflorescence and short calyx.

7. **A. dentelloides**, *Kurz in Journ. As. Soc.* 1870, pt. ii. 76; leaves opposite linear, flowers sessile axillary, capsule 2-valved.

SIKKIM TERAI near Siligori; *Kurz, C. B. Clarke.*

Stems 2-4 in., procumbent. *Leaves* $\frac{1}{4}$ - $\frac{1}{2}$ in., linear or narrow oblong, obtuse. *Flowers* scattered, not at all spicate. *Calyx-tube* elongate-campanulate, 5-ribbed; teeth 5, triangular, acute; teeth and sometimes the whole tube with minute scattered hairs, accessory teeth 0. *Petals* minute. *Capsule* ellipsoid, much longer than broad. *Seed* half-ellipsoid, excavated on the plane face.

** *Calyx in fruit hemispheric, tube as broad as or broader than long.*

8. **A. pygmæa**, *Kurz in Seemann Journ. Bot.* v. 376; very minute, leaves opposite linear, flowers sessile axillary, capsule 2-valved.

KHASIA MTS., alt. 2000 ft., *H. f. & T.*; RAJMAHAL HILLS (Bengal), *Kurz*; throughout CHOTA NAGPORE, alt. 1000-2000 ft., *C. B. Clarke.* CALCUTTA; Botanic Garden, *Kurz.*

Stems tufted, 1-3 in. *Leaves* $\frac{1}{4}$ - $\frac{1}{3}$ in., linear or narrow-oblong, at the base narrower almost petioled, obtuse often with two points (as described by Harvey in *Suffrenia capensis*). *Flowers* not spicate, most minute. *Calyx-tube* short; teeth 4, triangular, accessory teeth 0. *Petals* if any minute, not yet seen. *Stamens* 2 (occasionally 3-4 *Kurz*). *Capsule* spherical, slightly acute. *Seeds* black, half-ellipsoid or nearly half-spherical, excavated on the plane face.—*Kurz* says the capsule is 3-valved: the very perfect examples from Chota Nagpore have the capsule 2 valved. *Suffrenia capensis, Harvey Thes. Capens.* ii. t. 189, differs from the Indian plant only in the larger and longer capsule. Compare *Rotala filiformis, Hiern in Oliv. Fl. Trop. Afr.* ii. 468, where Harvey's linear-leaved plant is united with the European *Suffrenia* which has oblong, broad-based leaves.

9. **A. simpliciuscula**, *Kurz in Journ. As. Soc.* 1871, pt. ii. 54; leaves opposite narrow-oblong, flowers solitary axillary shortly pedicelled, capsule 3-valved.

CHITTAGONG; tropical rice fields; *H. f. & T., Kurz.*

Stems decumbent, 1-2½ in. Lower *leaves* $\frac{1}{2}$ in., almost petioled, upper shorter, somewhat obovate. *Flowers* small, lower distant, upper approximate. *Calyx-tube* short; teeth 4, triangular, accessory teeth 0. *Capsule* globose, much longer than the calyx. *Seeds* black, subhemispheric, excavated on the plane face.

10. **A. pentandra**, *Roxb. Fl. Ind.* i. 425; cauline leaves opposite elliptic-oblong sessile faintly nerved, flowers solitary axillary sessile, capsule 3-celled. *DC. Prodr.* iii. 79; *W. & A. Prodr.* 305; *Wall. Cat.* 2102; *Blume Mus. Bot.* ii. t. 46; *Kurz in Journ. As. Soc.* 1877, pt. ii. 85. *A. nana, Roxb. in Wall. Cat.* 2105. *A. rubra, Ham. in Don Prodr.* 220; *Wall. Cat.* 2107. *A. subspicata, Herb. Hohenack.* No. 1611. *A. densiflora, Roth Nov. Sp.* 99; *DC. l. c.* 79;

W. & A. Prodr. 305. *A. debilis*, *Ait. in Herb. Zool. & Mor.* *Rotala* Roxburghiana, *Wight Ic.* t. 260; *Wall. Cat.* 2105. *Tritheca pentandra*, *Miq. Fl. Ind. Bat.* i. pt. i. 614. *Winterlia uliginosa*, *Spreng. Syst.* i. 788. *Sellowia uliginosa*, *Roth l. c.* 163; *DC. l. c.* 380.

Throughout Tropical INDIA, in moist places, very common.—DISTRIB. China, Malaya; and (including the varieties below enumerated) Australia and Tropical Africa.

Stems 6–12 in., often with many opposite branches divergent at right angles and covered with flowers. *Cauline leaves* usually 1 in., upper floral leaves becoming bractiform, oblong, base broader. *Flowers* often approximate, never in distinct spikes; bracteoles subulate as long as the calyx. *Calyx-teeth* 5, lanceolate, very acuminate; accessory teeth 5, subulate, often as long as the primary teeth. *Petals* 5, narrow-obovate, small or 0. *Capsule* spherical or globose-depressed. *Seeds* black, hemispheric, excavated on the plane face.

VAR. *illecebroides*, Arn. in *Herb. Wight*; smaller, cauline leaves $\frac{1}{2}$ in. *A. nana*, *Wall. Cat.* partly not Roxb. nor *Rottl.* *Rotala*? decussata, *DC. Prodr.* iii. 76; *Hiern in Oliv. Fl. Trop. Afr.* ii. 467.

VAR. *fimbriata*, *Wight Ic.* t. 217 (sp.); cauline leaves longer narrower often cordate at the base, petals larger sometimes fimbriate. *A. Heyneana*, *Wall. Cat.* 2104. *A. hexandra*, *Wall. Cat.* 2103.—Wallich's example has six stamens, otherwise is exactly *A. fimbriata*, *Wight*.

SUBGENUS II. **Eu-Ammannia.** *Flowers* in whorls, cymes or clusters. *Capsule* circumsciss or bursting irregularly.

11. ***A. baccifera***, *Linn.*; *Blume Mus. Bot.* ii. 133; cauline leaves opposite or alternate oblong or narrow-elliptic narrowed at the base, flowers in dense clusters forming knots on the stem or in looser but very short axillary cymes, capsule globose. *Dalz. & Gibs. Bomb. Fl.* 97; *Kurz in Journ. As. Soc.* 1877, pt. ii. 85. *A. vesicatoria*, *Roxb. Fl. Ind.* i. 426; *DC. Prodr.* iii. 78; *W. & A. Prodr.* 305; *Wall. Cat.* 2098, partly. *A. indica*, *Lamk.*; *DC. l. c.* 77; *W. & A. Prodr.* 305; *Wall. Cat.* 2099; *Blume l. c.* t. 46. *A. debilis*, *Ait. Hort. Kew*, ed. 1, i. 163. *A. verticillata*, *Boiss. Fl. Orient.* ii. 743, not of *Link.* *Hapalocarpum vesicatorium* and *H. indicum*, *Miq. Fl. Ind. Bat.* i. pt. i. 618. *Cryptotheca apetalata*, *Blume Bijdr.* 1128; *DC. l. c.* 76.

Throughout Tropical INDIA, in moist places, very common.—DISTRIB. Afghanistan. Malaya. China. Australia. Tropical Africa.

Glabrous, erect, 6–8 in. sometimes 2 ft. Lower leaves and branches usually opposite; cauline leaves 1–2½ in., usually narrow but obtuse. *Calyx-tube* hemispherical; teeth 4, broad, triangular, accessory folds or teeth small. *Petals* usually 0, or small. *Capsule* depressed, imperfectly circumsciss above the middle. *Seeds* black, subhemispheric, excavated on the plane face.

12. ***A. salicifolia***, *Monti ex Blume Mus. Bot.* ii. 132; glabrous, leaves sessile lanceolate rounded at the base, flowers densely clustered in the axils, capsule globose depressed not covered by the calyx-teeth. *Dalz. & Gibs. Bomb. Fl.* 97. *A. egyptiaca*, *Willd. Hort. Berol.* t. 6. *A. verticillata*, *Lamk.* III. t. 77. f. 3, not of *Wight*; *DC. Prodr.* iii. 79. *A. glauca*, *Wall. Cat.* 2100; *W. & A. Prodr.* 305. *A. densiflora*, *Miq. in Herb. Hohenack.* No. 770.

PUNJAB; *Edgeworth, T. Thomson.* KUMAON, alt. 4000 ft.; *Strachey & Winterbottom.* BEHAR; *J. D. H.* EAST BENGAL; *Griffith.* CONCAN; *Stocks, Ritchie.* DECCAN PENINSULA; *Wight* 981; *Perottet.*—DISTRIB. Tropical Africa.

Glabrous, erect, sometimes 2 ft. high, leaves and branches opposite. Cauline leaves often 2 in. by less than $\frac{1}{2}$ in., frequently cordate at the base. *Calyx* in fruit hemispheric; teeth 4, erect, triangular, too short to close over the capsule; accessory

folds usually present but small. *Capsule* reddish, exactly like that of *A. baccifera*. *Seed* half-obovoid, excavated on the plane face, one end much smaller than the other.—*A. verticillata*, Boiss. *Fl. Orient.* ii. 743, has the leaves attenuated to the base; and is therefore *A. baccifera*, *Linn.*, for the only character by which *A. baccifera* can be distinguished from *A. salicifolia*.

13. ***A. cordata***, *W. & A. Prodr.* 304; glabrous, leaves sessile oblong cordate subamplexicaul, flowers 2–5 shortly pedicelled in each axil, capsule globose covered by the calyx-teeth. *Wall. Cat.* 6322. *A. salicifolia*, *Monti var. β.* *Thwaites Enum.* 121.

EAST BENGAL, Noakhali, *C. B. Clarke*. DECCAN PENINSULA; *Wight*. CEYLON; *Thwaites*.

Glabrous, erect, 12–18 in., leaves and branches opposite. *Cauline leaves* 1–1½ in., margins often white cartilaginous. *Flowers* very shortly pedicelled, but not congested. *Calyx-tube* campanulate with 4 green striations; teeth 4, triangular, connivent over the capsule; accessory teeth as 4 small prominent horns. *Capsule* globose, much larger than that of *A. salicifolia*, not becoming red pseudo-baccate as does that of *A. baccifera* and *A. salicifolia*. *Seeds* subhemispheric, excavated on the plane face.

14. ***A. lanceolata***, *Heyne in Wall. Cat.* 2106 *B., C.*; leaves opposite oblong-elliptic attenuate to the base scarcely petioled, flowers 2–5 shortly pedicelled in each axil, calyx campanulate minutely pubescent, petals large. *A. verticillata*, *W. & A. Prodr.* 304, *exclud. all syn.* *A. salicifolia*, *Thwaites Enum.* 121, *as to var. α. only.*—*Rheede Hort. Mal.* ix. t. 84?

DECCAN PENINSULA, *Wight*. Red hills of the Carnatic; *G. Thomson*. CEYLON; *Thwaites*.

Erect, 4–16 in., branches numerous, opposite. *Cauline leaves* 1–1½ in., margins often white cartilaginous, younger leaves usually puberulous punctate or subpubescent. *Flowers* not congested, often whorled; bracteoles linear, obtuse, green, as long as the calyx. *Calyx-tube* campanulate, ovoid; teeth 4, triangular, short, with 4 shorter triangular exterior teeth. *Petals* exceeding much the calyx, larger than in any other species of *Eu-Ammannia*. *Capsule* globose. *Seed* subhemispheric, excavated on the plane face.

15. ***A. senegalensis***, *Lamk. Ill.* t. 77, f. 2.; leaves opposite elongate-oblong sessile subauriculate at the base, cymes peduncled compound, capsule $\frac{1}{12}$ in. diam. globose. *DC. Prodr.* iii. 77. *A. auriculata*, *Willd. Hort. Berol.* t. 7; *DC. l. c.* 80; *Boiss. Fl. Orient.* ii. 743.

Plains of the PUNJAB and of NORTH-WEST HINDOSTAN, ascending to 5000 ft. *Royle, T. Thomson, Edgeworth.*—DISTRIB. Afghanistan. Persia. Egypt. Tropical Africa. Australia.

Glabrous, erect, 6–24 in., branches sharply quadrangular. *Cauline leaves* 1–2 in. *Bracteoles* on the cyme-branches minute, linear. *Calyx* campanulate, with 4 or 8 green lines becoming indistinct in fruit; teeth 4, broad-triangular, teeth obscure. *Petals* 0 or caducous. *Stamens* 6 or 8. *Capsule* becoming ultimately red, much exceeding the calyx-tube. *Seeds* half-ellipsoid, excavated on the plane face.—This species is distinct so far as the Indian material is concerned. Some African examples have the cyme much closer and are doubtfully separable from *A. salicifolia* above. *Kurz (in Journ. As. Soc.* 1877, pt. ii. 85. 86) gives Chittagong as a locality for this plant: which may be so, or his plant may have been *A. cordata* No. 13.

16. ***A. multiflora***, *Roxb. Fl. Ind.* i. 426; leaves opposite elongate-oblong sessile subauriculate at the base, cymes peduncled compound, capsule $\frac{1}{20}$ in. diam. globose. *DC. Prodr.* iii. 79; *W. & A. Prodr.* 305; *Wall. Cat.* 2101;

Boiss. Fl. Orient. ii. 743; *Dalz. & Gibs. Bomb. Fl.* 97; *Kurz in Journ. As. Soc.* 1877, pt. ii. 85.

Throughout INDIA on the plains.—DISTRIB. Afghanistan. Persia. Australia.

Glabrous, very erect, 6–24 in.; branches numerous, sharply quadrangular. Cauline leaves 1–1½ in. *Bracteoles* on the cyme-branches most minute, linear. *Calyx* campanulate, hemispheric or scarcely elongate; teeth 4, short-triangular. *Petals* 0, or small and caducous. *Stamens* 4, 6 or 8. *Capsule* often ultimately red, globose, not enclosed by the calyx. *Seeds* half-ellipsoid, excavated on the plane face.—Very closely allied to *A. senegalensis* and united with it by Mr. Hiern, perhaps correctly, but the two forms do not meet or pass into each other in India. *Cryptotheca dichotoma*, *Blume Bijdr.* 1128; *DC. Prodr.* iii. 76 (*Ammannia microcarpa*, *DC. Prodr.* iii. 77), from Java and Timor, has been united with *A. multiflora* Roxb. by *Kurz in Journ. As. Soc.* 1871, pt. ii. 56, but differs in the much more elongate calyx-tube and larger cauline leaves: it is certainly very near *A. multiflora*.

17. **A. octandra**, *Linn. f. Suppl.* 127; leaves opposite linear-oblong subauriculate at the base, cymes very shortly peduncled 3–5-flowered, calyx in fruit large campanulate 4-angled with 8 distinct ribs. *Roxb. Cor. Pl.* t. 133; *Fl. Ind.* i. 425; *DC. Prodr.* iii. 80; *Wall. Cat.* 2097; *W. & A. Prodr.* 304; *Blume Mus. Bot.* ii. 132; *Dalz. & Gibs. Bomb. Fl.* 97; *Kurz in Journ. As. Soc.* 1877, pt. ii. 86. *Ammanella linearis*, *Miq. Fl. Ind. Bat.* i. pt. i. 619. *Diplostemon octandrum*, *Miq. l.c.* 615.

DECCAN PENINSULA; *Rottler*; *Heyne*; *Wight*; *G. Thomson*. CEYLON; *Thwaites*. CHITTAGONG; *Kurz*.—DISTRIB. Malaya.

Erect, 6–18 in., branches quadrangular, often scabrous. Cauline leaves 1–2 in., sometimes very narrow. *Calyx* in fruit $\frac{1}{5}$ in., often minutely pubescent or scabrid, nearly truncate; teeth 4, small. *Petals* $\frac{1}{12}$ in., obovate, rose-coloured. *Stamens* 8, filaments long, dark-red. *Capsule* somewhat ellipsoid, as long as the calyx. *Seeds* subhemispheric.—This species is reduced to *A. latifolia* Linn. by *Griseb. Fl. Brit. West Indies* 270; but the West Indian specimens, though like the Indian in leaves and habit, are entirely without the subulate angles of the ripe fruit which form the essential character of *A. octandra*.

18. **A. subrotunda**, *Wall. ex Kurz in Journ. As. Soc.* 1871, pt. ii. 55; “leaves sessile almost orbicular pinnate-nerved, flowers on slender short pedicels forming shorter or longer slender racemes.”

BURMA or EAST BENGAL; *Kurz*.—DISTRIB. Ava.

Not seen: diagnosis copied from Mr. Kurz.

2. **HYDROLYTHRUM**, *Hook. f.*

A glabrous aquatic herb. Lower leaves whorled, linear. *Spikes* exsert out of the water with oblong bractiform leaves. *Flowers* whorled, subsessile in the axils of bracts, lower whorls distant, upper approximate, often with opposite bracts; bracteoles 2, subulate. *Calyx* campanulate; teeth 4, triangular; accessory teeth 0. *Petals* 4, inserted between the calyx-lobes. *Stamens* 4, on the middle of the calyx-tube. Hypogynous scales 4, bifid. *Ovary* in the bottom of the calyx, free, 2-celled; style simple, stigma capitate; ovules not many, placentas axile. *Capsule* small, globose, 2-celled. *Seeds* 3 or 4 in each cell, ovoid, concave.—A genus only separable from *Ammannia* by habit: for hypogynous glands exist in *Amm. rotundifolia*.

1. **H. Wallichii**, *Hook. f. in Gen. Pl.* i. 777; *Hook. Ic. Pl.* t. 1007. *Rotala*, sp. *Wall. Cat.* 9059. R. (*Mirkocœ*) *myriophylloides*, *Welw.*; *Oliv. Fl. Trop. Afr.* ii. 469. *Ammannia Wallichii*, *Kurz in Journ. As. Soc.* 1877, pt. ii. 84.

TAVOY; *Wallich*. MOULMEIN; *Lobb*.—DISTRIB. Java, Angola.

Stems 8 in., weak, little divided, probably erect in the water. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., about 8–12 in each whorl; emerged leaves $\frac{1}{4}$ in., acute or obtuse. *Calyx* without accessory teeth. *Petals* elliptic, rose-coloured, far exceeding the calyx-teeth. *Capsule* not ripe in the Indian examples, dehiscing septicidally from the apex in the African. —Mr. Hiern says (in *Oliv. Fl. Trop. Afr.* ii. 469) that the Angola plant is congeneric with the Tavoy plant; but it appears conspecific.

3. **WOODFORDIA**, *Salisb.*

A shrub. *Leaves* opposite, subsessile, entire, lanceolate, beneath whiter and with black glandular dots. *Flowers* in short panicle cymes on axillary peduncles, rarely solitary, scarlet; pedicels 2-bracteate at their base. *Calyx* long-tubular, slightly curved, mouth oblique; teeth 6, short, with 6 minute accessory teeth. *Petals* 6, small or 0, inserted at the top of the calyx-tube. *Stamens* 12, declinate, inserted on the calyx-tube below its middle. *Ovary* at the bottom of the calyx-tube, free, sessile, oblong, 2-celled: style filiform, stigma small; ovules very many, placentas axile. *Capsule* ellipsoid, membranous, included in the calyx. *Seeds* very many, narrowly cuneate-obovate, quite smooth, without hairs or papillæ.

1. **W. floribunda**, *Salisb. Parad. Lond.* t. 42; *Boiss. Fl. Orient.* ii. 737; *Brand. For. Fl.* 238. *W. tomentosa*, *Bedd. Fl. Sylv. Anal. Gen.* t. xiv. fig. 4. *W. fruticosa*, *Kurz in Journ. As. Soc.* 1871, pt. ii. 56; *For. Fl.* i. 518. *Grislea tomentosa*, *Roxb. Cor. Pl.* t. 31; *Fl. Ind.* ii. 233; *DC. Prodr.* iii. 92; *Bot. Mag.* t. 1906; *Wall. Cat.* 2110; *W. & A. Prodr.* 308; *Blume Mus. Bot.* ii. t. 45; *Miq. Fl. Ind. Bat.* i. pt. i. 621; *Dalz. & Gibs. Bomb. Fl.* 97. *G. uniflora*, *Rich. Fl. Abyss.* t. 52. *G. punctata*, *Ham.*; *DC. l.c.* 92; *W. & A. Prodr.* 308. *G. micropetala*, *Hochst. et Steud. in Herb. Schimp.* 1906. *Lythrum fruticosum*, *Linn. Sp. Pl.* 641.

Throughout INDIA, common; ascending to 5000 ft.; but not seen in the alluvial mud of Bengal.—DISTRIB. Beloochistan, Tropical Africa, Madagascar, China.

A shrub with long spreading branches, brilliantly red with flowers in the hot season. *Leaves* 2–4 in., opposite or subopposite, usually rounded or cordate at the base (but one African form has leaves attenuate at the base); usually grey pubescent beneath, sometimes quite glabrous. *Calyx* $\frac{1}{4}$ – $\frac{1}{2}$ in., bright red. *Petals* scarcely longer than the calyx-teeth. *Seed* (figured by Blume and by Beddome as densely covered by long papillæ and stated by Kurz to be papillose-pilose) in every example at Kew entirely glabrous not exhibiting at any period of its development the smallest trace of a papilla.—This shrub is very uniform in character throughout India: the African examples vary much more. It is trimorphic after the manner described by Mr. Darwin in *Lythrum Salicaria*. See *Hiern in Oliv. Fl. Trop. Afr.* ii. 481.

4. **PEMPHIS**, *Forst.*

A maritime shrub or tree, attaining 35 ft. *Leaves* opposite, oblong, entire, very thick, fleshy. *Flowers* axillary, solitary, peduncles 2-bracteate at their base. *Calyx-tube* campanulate, 12– ∞ -ribbed; teeth 6, short, with 6 shorter accessory teeth. *Petals* 6, inserted at the top of the calyx-tube, nearly as long as

it, obovate, wrinkled, white or rose. *Stamens* 12, inserted in two series towards the middle of the calyx-tube. *Ovary* free, at the bottom of the calyx-tube, 3-celled at the base; style long, stigma capitate; ovules many, ascending, placentas 3 sub-basal. *Capsule* coriaceous, obovoid or nearly globose, included in the calyx-tube or exsert nearly half its length, circumsciss somewhat irregularly, ultimately 1-celled. *Seeds* very many, long cuneate-obovoid, angular, smooth, standing out in all directions from what appears to be a free central placenta.

1. **P. acidula**, *Forst. Gen. t. 34*; *DC. Prodr. iii. 89*; *Wall. Cat. 2108*; *W. & A. Prodr. 307*; *Griff. Notul. iv. 510*; *Blume Mus. Bot. ii. t. 43*; *Miq. Fl. Ind. Bat. i. pt. i. 619*; *Bedd. Fl. Sylv. Anal. Gen. t. xiv. fig. 5*; *Kurz For. Fl. i. 518*. *P. angustifolia*, *Roxb. Fl. Ind. ii. 465*. *Maclellandia Griffithiana*, *Wight Ic. t. 1996*. *Lythrum Pemphis*, *Linn. f. Suppl. 249*; *Lamk. Ill. ii. 408*, fig. 2. *Melanium fruticosum*, *Spreng. Syst. ii. 455*.

Southern coasts of both PENINSULAS and of CEYLON.—DISTRIB. Tropical coasts of the Old World

Branchlets young leaves and inflorescence with short grey hairs. *Leaves* 1 by $\frac{1}{2}$ in. *Peduncles* $\frac{1}{4}$ – $\frac{3}{8}$ in. *Capsule* $\frac{1}{2}$ in. diam.

5. LAWSONIA, Linn.

A glabrous erect shrub with round branches, sometimes spinous. *Leaves* opposite, entire, lanceolate. *Flowers* rather small, in large terminal paniced cymes; bracts small, deciduous. *Calyx-tube* exceedingly short; lobes 4, ovate. *Petals* 4, obovate, wrinkled, inserted at the top of the calyx-tube. *Stamens* usually 8, inserted in pairs between the petals, sometimes 4 only or 8 not paired. *Ovary* free, 4-celled (or 4-celled at the base); style very long, stigma capitate; ovules many, placentas axile. *Capsule* coriaceous, globose, exsert, irregularly breaking up, ultimately 1-celled. *Seeds* many, angular, pyramidal, smooth, packed on a central placenta.

1. **L. alba**, *Lamk. Ill. t. 296*, fig. 2; *DC. Prodr. iii. 91*; *Wall. Cat. 2109*; *W. & A. Prodr. 307*; *Wight Ill. t. 87*; *Miq. Fl. Ind. Bat. i. pt. i. 620*; *Boiss. Fl. Orient. ii. 744*; *Dalz. & Gibs. Bomb. Fl. 97*; *Bedd. Fl. Sylv. Anal. Gen. xiv. fig. 6*; *Brand. For. Fl. 238*. *L. inermis*, *Roxb. Fl. Ind. ii. 258*; *Griff. Ic. Pl. Asiat. t. 580*. *L. spinosa*, *Linn.*; *Lour. Fl. Cochinc. 281*. *L. purpurea*, *Lamk.*; *Spreng. Syst. ii. 217*.

Throughout INDIA, very common, cultivated; perhaps wild in Western India.—DISTRIB. Cabul, Persia. Cultivated in many tropical and warm temperate regions.

About 6 ft. high, often trimmed so as to make a close fence. *Leaves* $\frac{3}{4}$ –1 $\frac{1}{2}$ in., narrowed at the base, sometimes very shortly petioled, acute or obtuse. *Flowers* $\frac{1}{2}$ in. diam., sweet-scented, rose or white. *Sepals* $\frac{1}{12}$ in., permanent. *Capsule* size of a pea.

6. CRYPTERONIA, Blume.

Trees. *Leaves* opposite, petioled, entire, ovate or lanceolate. *Racemes* elongate, in branched panicles. *Flowers* minute, white or green, with short linear bracts at the base of the pedicels, polygamo-dioecious. *Calyx-tube* short, saucer-shaped, or longer subhemispheric; teeth 5 (rarely 4), valvate, persistent. *Petals* 0. *Stamens* as many as the calyx-teeth, inserted between them near the

top of the calyx-tube. *Ovary* free, globose, 2-celled; style long, stigma capitate sub-2-fid; ovules many, placentas axile. *Capsule* 2-celled, globose, pubescent, crowned by the persistent style, dehiscent at the vertex across the dissepiment so as to divide the style; fruit-pedicle deflexed. *Seeds* many, long-ellipsoid, testa produced at each end.—**DISTRIB.** Species 5 extending from Eastern Bengal to the Philippines.—The branches appear all functionally dioecious: those that perfect seed have all the stamens with short filaments: those that have stamens with long filaments have an ovary and style but set no seed.

1. **C. pubescens**, *Blume Mus. Bot.* ii. 123; leaves pubescent beneath, calyx-teeth short triangular, ripe capsule $\frac{1}{16}$ in. broad. *Henslowia pubescens*, *Wall. Cat.* 4904, and *Pl. As. Rar.* iii. 14, t. 221; *Miq. Fl. Ind. Bat.* i. pt. i. 716. *H. pubescens* together with the pubescent portion of *H. affinis*, *Planch. in Hook. Lond. Journ. Bot.* iv. 477, t. xvi. B.

RANGOON; McClelland. MERGUI; Griffith, No. 2512-2 (marked *H. affinis* by Planchon). PINANG.

Tree 30 ft. (attaining 80 ft. fide Kurz); branchlets nearly glabrous. *Leaves* 3-4½ in., from broad-elliptic to lanceolate, narrowed at both ends; pubescence beneath yellowish or brownish. *Panicles* pubescent; pedicels scarcely $\frac{1}{20}$ in. *Calyx* very small, in fruit being quite flat, not at all cup-shaped. *Capsule* in *H. pubescens* Wall. exactly the same size as in *H. affinis* Planch.: in both the fruits are sometimes barren and twice the normal size, probably from the attack of an insect.

VAR. Hookeri; leaves glabrous beneath, panicle pubescent or rarely glabrous. *C. paniculata*, Kurz in *Journ. As. Soc.* 1877, pt. ii. 86; *For. Fl.* i. 519, not of Blume. *Henslowia Hookeri*, *Wall. Cat.* 8566. *H. affinis*, as to the glabrous portion, *Planch. in Hook. Lond. Journ. Bot.* iv. 477. *H. pubescens*, *Griff. Notul.* iv. 404 and *Ic. Pl. Asiat.* t. 564, fig. ii.—Amherst and Tavoy; Wallich. Mergui; Griffith and Helfer (No. 2512 Kew Distrib.). Malaya; Maingay No. 650-2.—*Henslowia leptostachys*, Planch. (with which *H. paniculata*, Miq. coincides) differs by the smaller flowers much more remotely placed on more slender racemes. From Kurz's description (glabrous leaves) it seems that his *C. paniculata* exactly coincides with Wallich's *H. Hookeri*, and does not include (as Mr. Kurz supposes it does) the plant of Griffith. *C. pubescens* and *C. glabra* may possibly be united under *C. paniculata*, Blume, but *C. Griffithii* is distinct.

2. **C. glabra**, *Blume Mus. Bot.* ii. 123; leaves glabrous beneath, calyx in fruit somewhat cup-shaped with triangular-lanceolate suberect teeth, capsule $\frac{1}{18}$ in. broad. *Henslowia glabra*, *Wall. Cat.* 4093; *Planch. in Hook. Lond. Journ. Bot.* iv. 478; *Miq. Fl. Ind. Bat.* i. pt. i. 716.

KHASIA MTS., alt. 1000-3000 ft.; Wallich; *H. f. & T.* CHITTAGONG, alt. 1000 ft.; *H. f. & T.*—**DISTRIB.** Philippines.

An erect tree, 50-60 ft. *Leaves* lanceolate or elliptic-lanceolate, narrowed at both ends, membranous, nerves prominently raised beneath but slender. *Panicle*-branches glabrous or minutely pubescent; pedicels $\frac{1}{18}$ in.

3. **C. Griffithii**, *C. B. Clarke*; leaves glabrous very coriaceous, panicles and calyx covered with rusty red pubescence, pedicels $\frac{1}{20}$ in., calyx of male flower $\frac{1}{8}$ in. broad with lanceolate erect teeth. *Henslowia* sp. *Griff. Notul.* iv. 406, and *Ic. Pl. Asiat.* t. 564, fig. i.

MALACCA; Griffith No. 2513. MALAYA; Maingay.

Leaves 5-7 in., elliptic-lanceolate, the nerves raised beneath and thick.—This is very near *C. Cumingii*, Planch. of the Philippines, and may be a variety of it. *C. Cumingii* has a grey pubescence on the panicle, the pedicels are $\frac{1}{8}$ in. or more, the calyx is smaller.

7. **LAGERSTRÆMIA**, Linn.

Trees or shrubs. *Leaves* opposite, distichous (or the uppermost alternate), entire, oblong or ovate. *Panicles* axillary and terminal, usually trichotomous, sometimes dense; peduncles 2-bracteate at their apex; pedicels 2-bracteolate. *Flowers* often large. *Calyx-tube* funnel-shaped, smooth grooved angular or subulate; lobes 6 sometimes 7-9, ovate, subacute, valvate. *Petals* 6 sometimes 7-9 (or 0), inserted at the summit of the calyx-tube, clawed, wrinkled, margin crisped erose or fimbriate. *Stamens* very many, inserted near the bottom of the calyx-tube; filaments long, exsert. *Ovary* sessile, in the bottom of the calyx, 3-6-celled; style long, bent, stigma capitate; ovules very many, ascending, placentas axile. *Capsule* more or less adnate to the calyx, ellipsoid, coriaceous, smooth, 3-6-celled, 3-6-valved. *Seeds* many (rarely few), elongate, flat, erect, winged from their summit.—**DISTRIB.** Species 18, in South-east Asia extending to Australia; Burma being the centre of the genus.

SECT. I. Velaga. *Calyx-tube* smooth, neither ribbed nor subulate.

* *Calyx* glabrous or puberulous, not fulvous-tomentose.

1. **L. indica**, Linn.; DC. Prodr. iii. 93; petals $\frac{1}{2}$ – $\frac{3}{4}$ in. long-clawed, capsule $\frac{1}{2}$ in. diam. nearly globose, calyx-teeth erect on the fruit. *Roxb. Hort. Beng.* 38; *Fl. Ind.* ii. 505; *Bot. Mag.* t. 405; *W. & A. Prodr.* 308; *Wight Ill.* t. 86; *Kurz For. Fl.* i. 521. *L. elegans*, Wall. in *Part. Mag. Bot.* xiv. 269, with fig. *Velaga globosa*, Gaertn. *Fruct.* t. 133.

Throughout INDIA; common in gardens; possibly wild in the eastern boundary.—**DISTRIB.** Cultivated throughout the warm parts of Asia originally from China.

A shrub, showy in flower. *Leaves* 2 in., glabrous, elliptic or oblong, sessile, acute or somewhat obtuse at each end, never acuminate. *Panicle* not condensed, minutely pubescent or glabrous. *Petals* bright pink. *Calyx-teeth* on the fruit long-triangular, erect but distant, thin not woody. *Seed* $\frac{1}{4}$ in. including its wing.

2. **L. parviflora**, Roxb. *Hort. Beng.* 38; *Cor. Pl.* t. 66; *Fl. Ind.* ii. 505; leaves glabrous or shortly pubescent beneath, petiole less than $\frac{1}{2}$ in., petals less than $\frac{1}{4}$ in., calyx-teeth ultimately woody erect closely adpressed to the fruit. DC. Prodr. iii. 93; Wall. Cat. 2119 altogether not partly as say W. & A. Prodr. 308; *Wight Ic.* t. 69; *Griff. Ic. Pl. Asiat.* t. 592; *Bedd. Fl. Sylv.* t. 31; *Dalz. & Gibs. Bomb. Fl.* 98; *Brand. For. Fl.* 239; *Kurz For. Fl.* i. 521. *L. Fatioa*, Blume Mus. Bot. ii. 125. *Fatioa nepaulensis*, Wall.; DC. Prodr. iii. 89.

At the base of the WESTERN HIMALAYA, alt. 1000 ft. Throughout the DECCAN PLATEAU (i.e. everywhere south from the Gangetic Plain), alt. 1000-3000 ft.; abundant. Not in Central Bengal, nor Ceylon.—**DISTRIB.** Ava.

A tree, attaining 60 ft. *Leaves* 2-3 $\frac{1}{2}$ in., glabrous in the typical plant, oblong, acute or acuminate with the apex obtuse, beneath a lighter colour, often prominently reticulate. *Panicles* many- or few-flowered, not condensed. *Calyx* glabrous puberulous or minutely pubescent, in fruit somewhat funnel-shaped at the base, teeth small. *Petals* narrow, white. *Capsule* variable in size, in the typical plant $\frac{3}{4}$ –1 by $\frac{1}{2}$ – $\frac{3}{8}$ in. *Seeds* (with the wing) $\frac{1}{2}$ in. and upwards.

VAR. 1. majuscula; leaves glabrous larger sometimes 4-5 by 2 in., fruit very large, sometimes exceeding 1 $\frac{1}{2}$ by 1 in. *L. lanceolata*, Bedd. *Fl. Sylv.* t. 32, not of Wall.—Common on the north-eastern edge of the Deccan Plateau in Chota Nagpore and Behar.—Dr. Brandis (*For. Fl.* 240) supposes that Col. Beddome has made the grave

error of adding the fruit of one species to the leaves and flowers of another. Col. Beddome's figure is correct, but it is not *L. lanceolata* Wall. *L. corymbosa*, Griff. in *Herb.* is this, but the ticket of locality "East Bengal" is doubtful. This variety is not known from East Bengal.

VAR. 2. *benghalensis*; leaves pubescent beneath at least on the midrib, fruit smaller than in the type, often less than $\frac{1}{2}$ in., fruit-calyx campanulate instead of funnel-shaped at base. — Nipal; Wall. *Cat.* 2119 partly. Sikkim; alt. 1000–5000 ft.; J. D. H., Gamble, C. B. Clarke. Assam; Mrs. Mack. Birma; Griffith, whence his *Ic. Pl. Asiat.* t. 592.

3. *L. lanceolata*, Wall. *Cat.* 2120; leaves glabrous often very white beneath, petiole usually $\frac{1}{4}$ in., petals $\frac{1}{4}$ – $\frac{1}{2}$ in., calyx-teeth ultimately thick patent or reflexed. *W. & A. Prodr.* 309; *Dalz. & Gibs. Bomb. Fl.* 98?; *Brand. For. Fl.* 240. *L. microcarpa*, Wight *Ic.* t. 109; *Bedd. Fl. Sylv.* t. 30.

MALABAR COAST; from Bombay to Travancore, plentiful; no specimen from Coromandel.

Tree 30–50 ft. *Leaves* 3 in., elliptic-lanceolate, narrowed to both ends. *Panicle* generally compound, never condensed. *Calyx* rarely glabrous usually pubescent, sometimes white and shortly tomentose. *Capsule* usually smaller than that of *L. parviflora*, $\frac{1}{2}$ – $\frac{3}{4}$ by $\frac{1}{2}$ in.—A species distinguishable from all the forms of *L. parviflora* by its calyx-teeth patent in fruit and its longer petioles. Wallich's name is adopted in preference to that of Wight who confounded the plant with *L. parviflora*.

4. *L. venusta*, Wall. *Cat.* 2117; calyx-tube in bud smooth ovoid white puberulous with 6 linear accessory teeth outside the primary teeth, appearing as prominent horns on the buds.

BIRMA; Melloon on the Irrawaddy near Thayet Myoo; Wallich.

Leaves 3–4 $\frac{1}{2}$ in., elliptic-oblong, acute, glabrous. *Panicle* large, not condensed, white, puberulous. *Bud* as large as a pea, much larger than that of *L. parviflora*.

**** *Calyx with abundant fulvous or brown-red tomentum.***

5. *L. Rottleri*, C. B. Clarke; leaves stellately fulvous-tomentose beneath, capsule $\frac{3}{4}$ in. resembling that of *L. parviflora*.

DECCAN; Rottler.

Leaves 3 in., lanceolate, glabrous above, midrib tomentose; petiole $\frac{1}{2}$ in. *Panicle* lax, tomentose. *Calyx* in the bud fully $\frac{1}{2}$ in., with dense brown-red stellate wool without any trace of grooves or ribs. *Seed* $\frac{1}{2}$ in. including the wing.—Named by Rottler *L. hirsuta*? *Rheede Hort. Mal.* iv. t. 22; but this species, which is only known from Rheede's figure, is represented as having a deeply-grooved calyx.

6. *L. calyculata*, Kurz in Journ. As. Soc. 1872, pt. ii. 307; *For. Fl.* i. 522; leaves puberulous beneath, capsule $\frac{1}{4}$ – $\frac{1}{2}$ in.

MARTABAN; Kurz.

A tree, 60–70 ft. *Leaves* 5–7 in., oblong, acuminate, short-petioled. *Panicles* compound, with ferruginous or fulvous tomentum. *Calyx* in fruit cup-shaped campanulate, closely adpressed to the capsule, without grooves or ribs, densely ferruginous-tomentose; lobes short-triangular, reflexed. *Capsule* oblong, shining.

SECT. II. *Adambea*. *Calyx-tube* grooved, ribbed or subulate.

† *Adult leaves glabrous or nearly so.*

7. **L. Flos-Reginæ**, Retz Obs. v. p. 25; petiole distinct usually $\frac{1}{4}$ in., calyx covered with hard white (sometimes ferruginous) tomentum, ribs 12-14 flat or round not acute on the back, apex of the ovary glabrous. *Kurz For. Fl.* i. 524. *L. Reginæ*, Roxb. Cor. Pl. t. 65; *Hort. Beng.* 38; *Fl. Ind.* ii. 505; *DC. Prodr.* iii. 93; *Wall. Cat.* 2114; *W. & A. Prodr.* 308; *Wight Ic.* t. 413; *Blume Mus. Bot.* ii. t. 41; *Miq. Fl. Ind. Bat.* i. pt. i. 623; *Bedd. Fl. Sylv.* t. 29; *Dalz. & Gibs. Bomb. Fl.* 98; *Brand. For. Fl.* 240. *L. macrocarpa*, Wall. Cat. 2114. *Adambea glabra*, Lamk. Dict. 39.—*Rheede Hort. Mal.* iv. t. 20, 21.

From ASSAM to MALACCA, abundant. Hills of the DECCAN PENINSULA, common; and in CEYLON. In North-West India only cultivated?—DISTRIB. Malaya and China, in many cases perhaps cultivated.

A tree, reaching 50-60 ft., sometimes when old having on its trunk and larger branches a few strong straight spines 1-3 in. (See *Ham. in Trans. Linn. Soc.* xvii. 177.) *Leaves* 4-8 in., from broad-elliptic obtuse to long-lanceolate. *Panicle* large, lower branches often 6 in., curved, ascending, flowers scattered. *Petals* commonly 1 in. (sometimes more), mauve, margins erose-undulate, hardly fimbriate. *Calyx* in fruit thickened, woody; lobes triangular spreading. *Fruit* large, sometimes reaching $1\frac{1}{4}$ in. by 1 in. (Wallich reduced his *L. macrocarpa* number 913 to *L. Flos-Reginæ*, and also sank his herbarium names *L. oblonga* and *L. glaucescens*.)

VAR. angusta, Wall. Cat. 2113; leaves 15 (excl. petiole) by 6 in.; fruit $1\frac{3}{4}$ in., more acute at the apex. Irrawaddy, Wallich. Rangoon; McClelland.—This may possibly be the plant which Mr. Kurz (*For. Fl.* i. 524) means to preserve as the species *L. macrocarpa*. Not merely the leaves on young plants but the leaves on Wallich's specimens near the panicle are very large.

8. **L. hypoleuca**, Kurz in Journ. As. Soc. 1872, pt. ii. 307; *For. Fl.* i. 523; leaves shortly petioled sometimes glaucous white beneath, calyx covered with hard white tomentum, ribs 12 acute.

ANDAMANS, Kurz.

Tree 60-70 ft. *Leaves* 6-8 in., from ovate to ovate-lanceolate, acuminate or scarcely acute, attenuate or obtuse at the base. *Panicle* large, 1 ft. long, narrow-clongate, white, puberulous. *Petal's* $\frac{1}{2}$ in., oblong, lilac, undulate on the margin (Kurz). *Capsule* $\frac{2}{3}$ in. (Kurz), oblong, mucronate, woody. *Calyx* much more acutely ribbed than that of *L. Flos-Reginæ*, but the teeth of the alternate ribs are very obscurely excurrent in Mr. Kurz's specimens.

9. **L. floribunda**, Jack in Mal. Misc. i. 38; petiole very short, calyx covered with ferruginous stellate woolly tomentum with 12 acute ribs, apex of hairy ovary. *DC. Prodr.* iii. 93; *Wall. Cat.* 2115; *Miq. Fl. Ind. Bat.* i. pt. i. 623 (not *Blume Mus. Bot.* ii. t. 41); *Griff. Notul.* iv. 509; *Kurz For. Fl.* i. 522.

BURMA to SINGAPORE; frequent.—DISTRIB. Siam, Malaya, China.

Tree 30 ft. *Leaves* 5-7 in., oblong, acute, sessile, rounded at the base. *Panicle* large, lower branches often 6 in., ascending, curved, with rich brown stellate woolly tomentum. *Calyx* nearly equally 12-ribbed accessory teeth obsolete or obscure. *Petals* smaller than in *L. Flos-Reginæ*, at first of a more rosy colour but withering to mauve-purple. *Fruit* $\frac{1}{2}$ by $\frac{1}{4}$ in.; calyx-teeth spreading, small, not woody.

VAR. cuspidata, Wall. Cat. 2116 (sp.); accessory teeth of the calyx in the bud prominent appearing as 6 cusps at the summits of the alternate ribs.—Tavoy, Amherst, Wallich, who marks the species as *L. floribundæ prox.* It differs from the type in no point except the cusps mentioned.

10. **L. hexaptera**, *Miq. Fl. Ind. Bat.* i. pt. i. 623; calyx grey puberulous, teeth 6-9, ribs 6-9 almost winged alternate with the teeth, calyx-teeth in fruit spreading woody.

MALACCA; *Maingay* No. 653, 654.—DISTRIB. Celebes.

A moderate-sized tree (*Maingay*). *Leaves* 2–3 in., narrow elliptic-oblong, not acuminate, oblique, twisted at the apex, minutely ashy-puberulous beneath; petiole $\frac{1}{8}$ in. *Panicle* 4–6 in.; branches stout, ashy- or grey-puberulous. *Calyx* in the bud funnel-shaped not campanulate, smaller than that of *L. Flos-Reginæ*. *Petals* $\frac{1}{2}$ – $\frac{3}{4}$ in., flat, shortly clawed, sparingly erose-undulate on the margin. *Fruit* $\frac{1}{4}$ by $\frac{5}{8}$ in., calyx-wings slightly enlarged on the fruit.—The specimens of *Maingay* are very perfect but are identified with Miquel's plant from his description only.

†† *Adult leaves pubescent beneath.*

11. ***L. villosa***, *Wall. ex Kurz Pegu For. Report Append. B. 54*; leaves lanceolate acuminate pubescent on both surfaces, flowers small apetalous congested at the summits of the panicle-branches, calyx-ribs 6 obscure in the bud. *Kurz For. Fl. i. 524.*

BURMA; *Griffith* (Kew Distrib. No. 2240); *McClelland* (*Lagerstrœmia* sp. 9); *John Scott*; *Kurz*.

Tree 40–50 ft. (*Kurz*); branchlets panicles and leaves ashy-grey, pubescent. *Leaves* 2–3 in., finely acuminate, narrowed to the very short petiole. *Buds* very small, calyx-tube smooth, ribs only to be seen near the summit of the tube as six horns alternating with the primary calyx-teeth. *Capsule* $\frac{5}{8}$ – $\frac{3}{4}$ by $\frac{1}{4}$ in., the calyx-tube finally distinctly ribbed.—The name *villosa* is not in Wallich's Catalogue nor does it exist on any specimen at Kew, so that it cannot be guessed where Mr. Kurz found it: but the species is very good and unmistakable.

12. ***L. tomentosa***, *Presl Bot. Bermerk. 142*; leaves lanceolate acuminate stellately pubescent beneath, flowers with petals scattered on the panicle, calyx-ribs 12 prominent in the bud. *Kurz For. Fl. i. 522.* *L. pubescens* *Wall. Cat. 2112.*

BURMA; *Griffith & Helfer* (Kew Distrib. No. 2238, 2239); *John Scott*; *Kurz* No. 1976; *Brandis*.

Tree 70–100 ft. (*Kurz*); branchlets petioles and panicle fulvous stellate-woolly tomentose. *Leaves* 3–6 in., elliptic-lanceolate to narrow-lanceolate, adult glabrous reticulate above except the midrib which is fulvous stellate-tomentose; petiole $\frac{1}{8}$ – $\frac{1}{4}$ in. *Calyx* in the bud fulvous, tomentose, with 12 blunt ribs to the base. *Petals* $\frac{3}{8}$ in., finely clawed, erose, subfimbriate on the margin. *Capsule* $\frac{5}{8}$ by $\frac{1}{4}$ in., calyx-tube ultimately 6-ribbed (ribs corresponding to the primary teeth becoming obsolete); teeth triangular, reflexed.—In fruit the capsule and calyx become exactly like those of *L. villosa* and when the condensed panicle of *L. villosa* opens out in fruit, the two species are easily confounded. One sheet of *Wall. Cat. 2112* marked *L. pubescens* is really *L. villosa*, but all the other sheets of *Wall. Cat. 2112* are true. Among other tests, the leaves of *L. pubescens* are stellately hairy beneath, those of *L. villosa* are simply pubescent.

VAR. *Loudoni*, Teym. & Binn. Pl. Nov. in Hort. Bogor. cult. 1863, p. 27; leaves acute not acuminate, flowers not larger than in the type. *Kurz For. Fl. i. 523.*

8. **DUABANGA**, *Ham.*

Large glabrous trees with pendent quadrangular branches. *Leaves* opposite, distichous, large, short-petioled, long-oblong, acute, entire, cordate or rounded at the base. *Panicles* large, terminal, with opposite branches; flowers large. *Calyx-tube* wide, adnate to the base of the ovary; lobes 4–7, thick, valvate in the bud. *Petals* 4–7, clawed, obovate, crisped and undulate, white. *Stamens* very many, inserted on a perigynous ring. *Ovary* conical, 4–8-celled; style

bent, long, stigma capitate 4-8-lobed; ovules very many, ascending, placentas covering nearly the whole interior surface of the ovary-cells. *Capsule* globose on the thick spreading calyx, coriaceous, perfectly or imperfectly 4-8-celled, 4-8-valved. *Seeds* innumerable, minute, ellipsoid, testa produced at both ends in two tails much exceeding the length of the nucleus.—**DISTRIB.** Species 2, extending from Nipal south-eastwards to the Philippines and Borneo.

1. **D. sonneratioides**, *Ham. in Trans. Linn. Soc. xvii.* 178; flowering calyx nearly 1 in. wide at the base, petals 4-7 nearly 1 in., capsule 4-8-valved. *Hook. f. Ill. Him. Pl. t. 11*; *Kurz For. Fl. i.* 525. *Lagerstroemia grandiflora*, *Roxb. Hort. Beng. 38*; *Fl. Ind. ii.* 503; *DC. Prodr. iii.* 93; *Wall. Cat. 2111*; *Blume Mus. Bot. i.* 109. *Leptospartion grandiflorum*, *Griff. Ic. Pl. Asiat. t.* 591.

NIPAL to MARTABAN; alt. 500-3000 ft.; common in the SIKKIM and BHOTAN TERAI.

Tree attaining 100 ft. *Leaves* commonly 10 by $3\frac{1}{2}$ in; petiole usually $\frac{1}{2}$ - $\frac{1}{4}$ in.—*D. moluccana* differs by the calyx in flower much narrower at base, the petals 4 smaller, the capsule 4-valved: but agrees closely in habit.

9. SONNERATIA, Linn. f.

Trees, growing near the sea, glabrous. *Leaves* opposite, petioled, coriaceous, entire. *Flowers* without bracts, large, three together at the summits of the branches, or axillary solitary. *Calyx* thick, coriaceous; lobes 4-8, lanceolate, valvate. *Petals* 0 or as many as the calyx-lobes and linear-oblong. *Stamens* very many, inserted in a circular band on the calyx-tube. *Ovary* nearly free, or adnate at the base to the calyx-tube, many-celled; style long, stigma capitate; ovules very many, ascending, placentas axile. *Berry* subglobose, supported by the persistent calyx, 10-15-celled. *Seeds* very many, small, curved, angular; cotyledons convolute.—**DISTRIB.** Species 4-5 on the tropical sea-shores of the Eastern hemisphere.

† *Stigma* very large, umbrella-shaped.

1. **S. apetala**, *Ham. in Syne Emb. Ava iii.* 313, t. 25; leaves narrow-oblong, calyx-lobes 4, petals 0, stigma more than $\frac{1}{2}$ in. broad, capsule $\frac{1}{2}$ - $\frac{3}{4}$ in. broad globose. *DC. Prodr. iii.* 231; *Roxb. Hort. Beng. 38*; *Fl. Ind. ii.* 506; *Roth Nov. Sp. 233*; *Wall. Cat. 3642*; *W. & A. Prodr. 327*; *Griff. Notul. iv.* 650; *Kurz For. Fl. i.* 527.

Common in the SOONDERBUN. DECCAN PENINSULA as far as the Concan, *Law. TRANSGANGETIC PENINSULA* to Moulmein, *Falconer*.

Tree attaining 40 ft., growing in mangrove swamps flooded by the tide. *Leaves* 3-4 by $1-1\frac{1}{2}$ in., always narrow, attenuated at the base; petiole $\frac{1}{4}$ in. *Calyx* in flower $\frac{3}{4}$ in., style included or scarcely exsert. *Capsule* broader than high, convex at the top, walls not thickened.

†† *Stigma* capitate, not very large.

2. **S. acida**, *Linn. f. Suppl. 252*; leaves oblong or narrowly obovate-elliptic, calyx-lobes 6, petals 6 linear-oblong dark-red, capsule globose much depressed often 2 in. broad. *Roxb. Hort. Beng. 38*; *Fl. Ind. ii.* 506; *Roth Nov. Sp. 233*; *DC. Prodr. iii.* 231; *Wall. Cat. 3641*; *W. & A. Prodr. 327*; *Wight Ic. t.* 340; *Griff. Notul. iv.* 652; *Blume Mus. Bot. i.* 336; *Miq. Fl. Ind. Bat. i.* pt. i. 496; *Dalz. & Gibs. Bomb. Fl. 98*; *Brand. For. Fl. 242*; *Kurz For. Fl.*

i. 526. *Rhizophora caseolaris*, Linn. *Sp. Pl.* 635. *Aubletia caseolaris*, Gaertn. *Fruct.* i. t. 78.—*Rheede Hort. Mal.* iii. t. 40; *Rumph. Amb.* iii. t. 74.

BENGAL; *Griffith*. Soonderbun; C. B. Clarke. RANGOON, *McClelland*. PEGU; *Kurz*. DECCAN PENINSULA; *Rottler*. CEYLON; *Thwaites*.—DISTRIB. Java, Siam.

A small tree, not exceeding 15 ft. (*Kurz*), growing in mangrove swamps flooded by the tide. *Leaves* 3-4 by 1-1 $\frac{3}{4}$ in., attenuate almost to the base so that the petiole is subobsolete. *Buds* ellipsoid, calyx-tube not in the least angular. *Calyx* in flower 1 in. or more; style long-exserted sometimes 3 in. *Capsule* thick-walled, sometimes more than 2 in. broad, concave at the summit.—The Kew specimens are all narrow-leaved, the flowers 6-fid not 7-8-fid; but the examples are few and it is probable that to the synonyms above cited should be added *S. Pagatpat*, *obovata*, *evenia*, *lanceolata* for which see *Miq. Fl. Ind. Bat.* i. pt. i. 496, 497.

3. ***S. Griffithii***, *Kurz Pegu For. Report Append.* B. 54; *For. Fl.* i. 527; leaves broad obovate obtuse, calyx-tube not at all angular, lobes 6-8, petals 0. *S. alba*, *Griff. Notul.* iv. 652 not *Smith*. ? *S. neglecta*, *Blume Mus. Bot.* i. 338.

BURMA; *Griffith* (Kew Distrib. No. 2433). PEGU and TENASSERIM; *Kurz*.

Leaves 3 by 2 $\frac{1}{4}$ in., narrowed at the base; petiole more than $\frac{1}{8}$ in. *Buds* flowers and calyx exactly of *S. acida*; calyx-tube ovoid, perfectly free from ribs, petals wanting. *Fruit* unknown.—This seems an apetalous form of *S. acida*, but the leaves slightly differ from all the examples of that plant.

4. ***S. alba***, *Smith in Rees Cyclop.* xxxiii. No. 2; leaves elliptic obtuse or obovate narrowed to a short petiole, calyx-tube 6-8-angular (obscurely so in the bud distinctly in fruit), lobes 6-8, petals 0, fruit broadly obconic. *DC. Prodr.* iii. 231; *Blume Mus. Bot.* i. 338; *Miq. Fl. Ind. Bat.* i. pt. i. 497; *Kurz For. Fl.* i. 526. *S. mossambicensis*, *Klotzsch in Peters Reis. Mossamb. Bot.* t. 12. *S. acida*, *Benth. in Fl. Austral.* iii. 301; *Hiern in Oliv. Fl. Trop. Afr.* ii. 483.—*Rumph. Amb.* iii. t. 73.

MERGUI; *Griffith* (Kew Distrib. No. 2432). PEGU; *Kurz*. MALAYA; *Maingay* No. 654-2.—DISTRIB. Tropical shores of Africa with its islands, Malaya and Australia.

A small tree not exceeding 15 ft. (*Kurz*), growing in the saline littoral forests. *Leaves* 3 in., oblong or nearly round, narrowed at the base; petiole $\frac{1}{8}$ - $\frac{1}{4}$ in. *Flowers* the size of *S. acida*, with a very long style. *Fruit* 1 in. broad, calyx obconical at the base (not flat as in *S. acida*) ribbed as shown in *Klotzsch*' picture above cited.—This species was united with *S. acida* by Mr. Bentham, and the other writers at Kew have followed. Mr. Kurz has pointed out the distinction in the calyx; and there is a wide difference between the fruits so far as at present known; but the material is not ample.

10. **PUNICA**, Linn.

A large shrub; branchlets round, often armed. *Leaves* opposite subopposite or clustered, oblong or obovate, obtuse, entire. *Flowers* shortly pedicelled, axillary, solitary or somewhat clustered, large, orange-red. *Calyx-tube* funnel-shaped, coriaceous, adnate to the ovary below, enlarged above the ovary; lobes 5-7, persistent on the fruit. *Petals* 5-7, lanceolate, wrinkled, inserted between the calyx-lobes. *Stamens* very many, inserted round the mouth of the calyx. *Ovary* inferior with many cells in two whorls; style long, bent, stigma capitate; ovules very many, placentas in some cells axile in others parietal. *Berry* inferior, globose, many-celled. *Seeds* very many, angular, testa coriaceous with a watery outer coat; cotyledons convolute.

1. **P. Granatum**, *Linn. Sp. Pl.* 676; *DC. Prodr.* iii. 3; *Roxb. Hort. Beng.* 38; *Fl. Ind.* ii. 409; *Wall. Cat.* 3659; *W. & A. Prodr.* 327; *Wight Ill.* t. 97; *Griff. Ic. Pl. Asiat.* t. 634; *Boiss. Fl. Orient.* ii. 737; *Brand. For. Fl.* 241; *Kurz For. Fl.* i. 528. *P. nana*, *Linn.*; *Bot. Mag.* 634.

Cultivated throughout INDIA; probably wild in the north-west.—DISTRIB. Wild in Cabul and Persia; cultivated throughout the warmer regions of the globe.

Leaves commonly 2 by $\frac{1}{2}$ – $\frac{3}{4}$ in., narrower at both ends especially at the base, intra-marginal nerve distinct or obscure. *Flowering calyx* about 1 in., mouth $\frac{1}{2}$ in. broad. *Petals* $\frac{1}{2}$ in. or more. *Fruit* often 2 in. diam., containing much red juice round the seeds. (*The Pomegranate*.)

11. AXINANDRA, Thwaites.

Trees, glabrous or nearly so, branches quadrangular or terete. *Leaves* opposite, petioled, coriaceous, entire, acuminate, finely nerved beneath with an intramarginal nerve. *Racemes* simple, axillary, erect, the 3–5 terminal paniced; flowers small, pedicels short; bracteoles 3 at the base of each pedicel, minute, linear. *Calyx* superior, 5-lobed. *Petals* 5, small, triangular, caducous, inserted at the top of the calyx-tube. *Stamens* 10, in two whorls, 5 alternating with the petals and 5 others inserted just below; connective large; anthers small, subterminal. *Ovary* inferior, 5–6-celled; style straight, stigma simple; ovules in each cell 1–2, erect. *Capsule* half-superior, woody, ellipsoid, below adnate to the calyx-tube, above loculicidally 3–4 (rarely 5–6-) valved. *Seeds* erect, oblong, compressed, produced upwards into a wing; cotyledons flat.—DISTRIB. Species 4–5 from Ceylon, Malacca and Borneo.

A. EU-AXINANDRA. *Petals* convolute. *Ovule* 1 in each cell.

1. **A. zeylanica**, *Thwaites in Hook. Kew Journ.* vi. 66; branchlets acutely quadrangular, leaves rounded at the base, petiole about $\frac{1}{2}$ in., calyx-tube without ribs, style very short. *Bedd. Fl. Sylv.* t. 207.

CEYLON; Ambagamowa district, alt. 1500 ft.; *Thwaites*.

A large tree, 50–60 ft. (*Thwaites*). *Leaves* 4 by 2 in., gradually or suddenly acuminate. *Racemes* 2 in.; pedicels less than $\frac{1}{2}$ in., hardly lengthened in fruit. *Calyx* glabrous or microscopically puberulous. *Petals* falling off in a cap before expansion (*Thwaites*). *Capsule* 1 by $\frac{1}{2}$ in.; valves usually 3, very thick, woody.

B. NAXIANDRA, *Baillon*. *Petals* induplicate-valvate. *Ovules* 2 in each cell.

2. **A. Maingayi**, *C. B. Clarke*; branchlets terete, leaves narrowed at the base, petiole often $\frac{1}{4}$ in., calyx-tube at the time of flowering 10-ribbed, style long (exserted portion longer than the whole flower).

MALACCA; *Maingay* No. 654–2.

Leaves 4 by 2 in., gradually or suddenly acuminate. *Racemes* 2 in., more paniced than in *A. zeylanica*, panicle-branches quadrangular. *Calyx* and pedicel minutely puberulous, larger than in *A. zeylanica*. *Petals* expanding but caducous. *Fruit* not seen.—Closely allied to *A. Beccariana*, *Baill. in Bull. Soc. Linn. Paris* 1877, No. 16, 127, which has rather slenderer racemes and smaller flowers, the calyx hardly ribbed at the time of flower.

GENUS IMPERFECTLY KNOWN.

DICHOTOMANTHES, *Kurz in Seemann Journ. Bot.* ix. 194, is a tree imperfectly known possibly Lythraceous, collected by Dr. John Anderson in Yunnan, as yet not found within the limits prescribed for the Flora of British India.

ORDER LXII. **ONAGRACEÆ.** (By C. B. Clarke, F.L.S.)

Herbs, rarely undershrubs, sometimes aquatic. *Leaves* opposite or alternate, entire or toothed, undivided (in *Trapa* the submersed leaves pinnatifid), exstipulate. *Flowers* hermaphrodite, mostly axillary and solitary, or spiked or racemed towards the ends of the branches; subirregular. *Calyx-tube* wholly adnate to the ovary (half-adnate in *Trapa*), limb of 2-5 valvate lobes. *Petals* epigynous, alternate with the calyx-lobes, rarely 0. *Stamens* as many or twice as many as the petals, inserted with them. *Ovary* inferior (half-inferior in *Trapa*), 1-6-celled, most often 4-celled; style 1, cylindric or subulate, stigma capitate or nearly 2-lobed or 4-fid; ovules one or many in each cell, pendulous or half-ascending, placentas axile. *Fruit* various, dehiscent or indehiscent, membranous capsular or bony, 1- or several-celled, 1 or ∞ -seeded. *Seeds* without albumen, or nearly so.—DISTRIB. Species 300, spread throughout the world, most abundant in the North Temperate Zone.

Enothera is an American genus of which several species are cultivated in India: and among these *E. rosea* has run wild in the North-west Himalaya and in the Nilghiris; *E. tetraptera* and *E. odorata* have also run wild on the Nilghiris.

* *Seeds very many.*

† *Seeds comose.* 1. **EPILOBIUM.**

†† *Seeds not comose.*

Stamens twice as many as calyx-lobes 2. **JUSSLEA.**

Stamens as many as calyx-lobes 3. **LUDWIGIA.**

** *Seeds one or two.*

Terrestrial. Stamens 2 4. **CIRCEÆA.**

Aquatic. Stamens 4 5. **TRAPA.**

1. **EPILOBIUM, Linn.**

Herbs. *Leaves* alternate or opposite, undivided, entire or toothed. *Flowers* axillary and solitary, or racemed or spiked towards the ends of the branches, purple or white, regular or irregular. *Calyx-tube* scarcely produced above the ovary, linear; teeth 4, lanceolate, deciduous. *Petals* 4, obovate, retuse or notched. *Stamens* 8, epigynous, 4 shorter. *Ovary* inferior, 4-celled; style cylindric, stigmas 4 spreading or more or less combined; ovules many, axile, ascending, attached along a double placental vertical line in the inner angle of each cell. *Capsule* linear, 4-celled, dehiscing from the apex loculicidally, valves 4 recurved from the seed-bearing quadrangular column. *Seeds* very many, obovoid or ellipsoid, crowned by long silky hairs.—DISTRIB. Species 50; spread throughout the temperate and cold regions of the world, plentiful in New Zealand: appearing in the mountains only of the warmer regions.

SECT. I. **Chamænerium.** *Flowers* irregular. *Stamens* deflexed on one side. *Style* bent on one side in æstivation.

1. **E. angustifolium, Linn.; Boiss. Fl. Orient. ii. 745;** leaves narrow lanceolate glabrous beneath or nearly so reticulating nerves prominent primary nerves diverging nearly at right angles from the midrib, peduncles approximate

in long terminal spikes. *E. spicatum*, *Lamk. Dict.* ii. 373; *DC. Prodr.* iii. 40; *Wall. Cat.* 6324.

Temperate WESTERN HIMALAYA, alt. 8000–12,000 ft.; from KASHMIR and Baltistan to GURWHAL.—DISTRIB. Western Asia, Europe, North America.

Glabrous or nearly so, except the calyx-tube which is covered with close white tomentum. *Stem* 2–4 ft. *Leaves* often 4–6 by $\frac{3}{4}$ in., all scattered, nearly sessile, acute, entire or obscurely denticulate. *Spike* of flowers soon naked, bracts narrow, caducous. *Calyx-segments* lanceolate, acuminate, purplish, subpetaloid, free to the base. *Petals* $\frac{1}{2}$ – $\frac{5}{8}$ in., rose-purple, obovate, clawed. *Style* somewhat hairy above the base; stigmas 4, distinct, spreading. *Capsule* $2\frac{1}{2}$ – $3\frac{1}{2}$ in., closely pubescent. *Seed* narrowly obovoid, smooth, coma fulvous.

2. *E. reticulatum*, *C. B. Clarke*; leaves narrow-lanceolate pubescent beneath reticulating nerves prominent primary nerves diverging at acute angles from the midrib, peduncles distant in the axils of leaves that are not bractiform nor caducous.

SIKKIM; alt. 10,000–14,000 ft.; Lachoong and Kongra Lama; *J. D. H.*

Stem round, uniformly pubescent, apparently of the height of that of *E. angustifolium*. *Leaves* 4 by $\frac{5}{8}$ in., all scattered, nearly sessile, minutely denticulate, acute. *Calyx-segments* broad-lanceolate, acuminate, purplish, subpetaloid, free to the base. *Petals* $\frac{1}{2}$ – $\frac{5}{8}$ in., rose-purple, obovate. *Style* densely hairy above the base; stigmas 4, distinct, spreading. *Capsule* (not ripe) 3 in. on a peduncle $1\frac{1}{2}$ in.—This species has leaves somewhat like those of *E. angustifolium* but the inflorescence of *E. latifolium*.

3. *E. latifolium*, *Linn.*; *DC. Prodr.* iii. 40; leaves oblong narrowed at both ends glabrous or minutely pubescent without reticulating veins, peduncles distant in the axils of leaves that are not bractiform nor caducous. *E. speciosum*, *Dene. in Jacq. Voy. Bot.* t. 69. *E. Gerardianum*, *Wall. Cat.* 6326.

ALPINE WESTERN HIMALAYA; alt. 11,000–14,000 ft. KASHMIR; *Jacquemont*, *C. B. Clarke*. SIRMORE; *Gerard*, *Edgeworth*. KUMAON; *Strachey & Winterbottom*.—DISTRIB. Dauria, Altai, Arctic Asia, Europe and America.

The typical plant is 1 ft. high and glabrous except the calyx-tube; some of the Himalayan examples have the stem pubescent apparently much taller and the leaves minutely pubescent. *Leaves* $1\frac{1}{2}$ –3 by $\frac{1}{4}$ – $\frac{3}{4}$ in., scattered and opposite, entire or very obscurely denticulate, obtuse rarely somewhat acute. *Calyx-segments* broad-lanceolate, acuminate, purplish, subpetaloid, free to the base. *Petals* $\frac{1}{2}$ – $\frac{5}{8}$ in., rose-purple, obovate. *Style* with a few scattered hairs above the base; stigmas 4, distinct, spreading. *Capsule* 3 in., closely pubescent. *Seeds* narrowly obovoid, smooth, coma fulvous.

SECT. II. *Lysimachion*. *Flowers* regular. *Stamens* and style erect.

* *Stigma* distinctly 4-cleft with spreading lobes.

4. *E. hirsutum*, *Linn.*; *DC. Prodr.* iii. 42; hairy, middle cauline leaves opposite or alternate sessile obovate-lanceolate narrowed nearly to the base denticulate-serrulate. *Boiss. Fl. Orient.* ii. 746. *E. serratum*, *Jacq. Journ.*

TEMPERATE WESTERN HIMALAYA; alt. 5000–7000 ft.; from KASHMIR to KUMAON; *Royle*, *Madden*, *Jacquemont*. *T. Thomson*, &c.—DISTRIB. Europe, Africa, Asia from the Himalaya northwards and westwards.

Stem 2–5 ft., round, uniformly hairy with glandular pubescence, and with scattered long white hairs numerous towards the ends of the branches. Middle cauline leaves usually opposite, often 3 in. or more by $\frac{3}{8}$ in., sessile, semi-amplexicaul but not decurrent as lines down the stem, green and softly pubescent on both surfaces. *Sepals* green, oblong, acute in the expanded flower, in æstivation mucronate. *Petals* $\frac{3}{4}$ in. *Stigmas* 4, distinct, spreading. *Capsule* 2– $3\frac{1}{2}$ in., hairy, lower peduncles $\frac{1}{2}$ –1 in.

Seeds ellipsoid or obovoid, $2\frac{1}{2}$ times as long as broad, little narrowed at the base, punctulate, not papillose, coma fulvous.

VAR. *sericeum*, Benth. in Wall. Cat. 6325 (sp.); pubescence of the stem and leaves densely white silky (not tomentose). *E. tomentosum*, Vent. Hort. Cels. t. 90.—Distrib. the same as that of the typical *E. hirsutum*; into which this variety graduates.

VAR. *latum*, Wall. Cat. 6329 (sp.) in part; middle cauline leaves much smaller often about 1 in. not semi-amplexicaul at the base little pubescent, no white silky hairs on the plant.—Kashmir; *Jacquemont*. Chumba, alt. 3000 ft.; *C. B. Clarke*. Kumaon; *Wallich*; near Almora, alt. 5000 ft.; *Strachey & Winterbottom*. Julundur, alt. 1000 ft.; *C. B. Clarke*.—This plant has been from the leaves supposed near *E. tetragonum*; but the examples show the stigmas decisively spreading, so that it is either a var. of *E. hirsutum* or a new species.

5. *E. parviflorum*, Schreb.; DC. Prodr. iii. 43; middle cauline leaves mostly opposite sessile oblong-lanceolate hairy, broadest part of the leaf in its basal third portion. *Boiss. Fl. Orient. ii. 747*.

WESTERN HIMALAYA; *Edgeworth*; Simla, *T. Thomson*.—**DISTRIB.** West Asia, Europe, North Africa.

Stem 2-3 ft., round, without lines, pubescent and with much crisped white hair. Middle cauline leaves $1\frac{1}{2}$ -2 by $\frac{1}{2}$ - $\frac{3}{4}$ in., dentate, pubescent over both surfaces. *Sepals* green, oblong, acute, in the bud mucronate. *Petals* usually smaller than those of *E. hirsutum* but are $\frac{3}{8}$ in. in the Himalayan plant. *Stigmas* 4, distinct, spreading but hardly revolute. *Capsule* 2-3½ in., sparingly hairy, lower peduncles $\frac{1}{2}$ -1 in. *Seeds* ellipsoid or obovoid, $2\frac{1}{2}$ times as long as broad, little narrowed at the base, punctulate, not papillose, coma fulvous.—*Seed* exactly as that of *E. hirsutum*; punctulate by raised points, but these papillæ excessively minute.

VAR. *vestitum*, Benth. in Wall. Cat. 6327 (sp.); stem and leaves with fulvous shaggy hair, the stem itself somewhat glaucous.—Nipal; *Wallich*.

**** *Stigmas* combined or stigma clavate.**

† *Stem* round, the hairs sometimes in lines and the bases of the leaves somewhat decurrent in lines, but the stem not clearly quadrangular.

6. *E. roseum*, Schreb.; Boiss. Fl. Orient. ii. 749; stem uniformly hairy or with hairy lines, leaves petioled (shortly in nearly all the Indian forms) from ovate to narrow-lanceolate, seeds obovoid not fusiform nor gradually narrowed at the top.

TEMPERATE HIMALAYA, alt. 5000-11,000 ft.; common.—**DISTRIB.** West Asia and Europe.

VAR. *indicum*; middle cauline leaves lanceolate or ovate with crisped pubescence on the midrib beneath, lateral nerves slightly raised glabrous or hairy, capsules scattered long-pedicelled, seed punctulate points raised most minutely.—Baltistan and Kashmir to Kumaon, alt. 5000-11,000 ft., common.—*Stem* 2 ft., usually hairy all round, sometimes with four well-marked lines. Middle cauline leaves 1-2 in. opposite sometimes ternate, sometimes glabrous beneath except the midrib, more often with crisped hairs on the primary nerves also; petiole often less than $\frac{1}{2}$ in. but sometimes nearly $\frac{1}{4}$ in. *Peduncle* of the lower capsules often 1 in. or more. Coma of the seed very white in well-preserved examples, but often discoloured in others.—*E. latum*, Wall. Cat. 6329, belongs mainly to *E. hirsutum*; but some of it belongs here and some to *E. tetragonum*. Large quantities of the form of this plant with broad ovate leaves and a petiole of $\frac{1}{4}$ in. or thereabout constitute *E. montanum* var. *himalayense* of Indian herbaria: but in all these the style is unmistakably clavate, not at all (or most obscurely) lobed at the summit.

VAR. *Dalhousieanum*; capsules often approximate, the lowest with a very short peduncle, seed rather narrowly ellipsoid prominently papillose.—From Kashmir to Sikkim, alt. 6000-9000 ft.; abundant about Dalhousie.—*Stem* round, uniformly pu-

bescent. *Capsules* typically in erect clusters, lowest peduncle usually less than $\frac{1}{4}$ in.—This is one of the best marked forms of Indian *Epilobiums* and may be a good species; it is common in herbaria marked *E. montanum* var., or *E. organifolium* var. (by H. f. & T., *roseum* var.).

VAR. *anagallidifolium*, Lamk. (sp.) in Syme Engl. Bot. t. 506; stem 4-12 in. glabrous near the base with hairy lines in the middle uniformly minutely pubescent near the top, leaves small oblong obtuse nearly glabrous beneath, seeds most minutely papillose.—West Tibet; *Thomson*.—Agrees exactly with the figure of Syme: reduced to *E. alpinum* Linn. in *Boiss. Fl. Orient.* ii. 750 and in *Hk. f. Student's Brit. Fl.* 145. It differs slightly from *E. alpinum* by the less elongate seed very obtuse at the summit and the more petioled leaves; but runs into var. *indicum*.

VAR. *cylindricum*, Don Prodr. (sp.) 222; stem glabrescent often with distinct hairy lines, leaves linear-lanceolate on longer petioles very little pubescent, capsules long-peduncled, seeds obovoid most minutely papillose. *DC. Prodr.* iii. 43; *Wall. Cat.* 6328.—From Kashmir to Sikkim, alt. 6000-10,000 ft.—This plant has numerous axillary short branchlets covered with linear-lanceolate leaves and has thus a general resemblance to *E. palustre*, but the petioles are long and the seeds not elongate.

7. *E. Hookeri*, C. B. Clarke; stem without lines uniformly pubescent, middle cauline leaves opposite nearly sessile elliptic-oblong broad or rounded at the base, glabrous beneath except the greatly raised nerves, seeds ellipsoid. *Epilobium* No. 11, *Herb. Ind. Or., H. f. & T.*

KHASIA MTS., alt. 3000-6000 ft., common.—**DISTRIB.** Japan.

Stem 2-3 ft., quite round, usually thick set with leaves. *Leaves* $1\frac{1}{2}$ by $\frac{5}{8}$ in., denticulate; nerves much impressed above, elevated and covered with crisped pubescence beneath. *Petals* $\frac{1}{4}$ in., purple. *Stigma* clavate, elongate. *Capsules* 2-3 in., scattered, lower peduncles often $\frac{1}{2}$ in. *Seeds* obtuse, not narrowed at the apex, only slightly narrowed at the base, most minutely papillose, coma fulvous.

8. *E. khasianum*, C. B. Clarke; stem without lines uniformly villose, middle cauline leaves opposite subsessile elliptic-oblong villous over both surfaces, seeds ellipsoid. *Epilobium* No. 6, *Herb. Ind. Or., H. f. & T.*

KHASIA MTS., alt. 4500-5500 ft.; *T. Lobb, Griffith, H. f. & T., C. B. Clarke.*

Stem 2-3 ft., quite round. *Leaves* $1\frac{1}{2}$ by $\frac{5}{8}$ in., approximate, clothed with tawny hair, nerves impressed. *Petals* $\frac{1}{2}$ in. and upwards. *Stigma* clavate, very obscurely lobed. *Capsules* 2-3 in., scattered, little pubescent, lower peduncles $\frac{1}{2}$ -1 in. *Seeds* obtuse, not narrowed at the summit, only slightly narrowed at the base, most minutely papillose, coma fulvous.—This differs from *E. Hookeri* in its villous indumentum and very large flowers, but may be a form of it. It also in its hairiness and shape of the leaves resembles *E. parviflorum* var. *vestitum*; but the stigma in *E. khasianum* is hardly lobed.

9. *E. palustre*, Linn.; DC. Prodr. iii. 43; stem without lines glabrous or with scanty sparse pubescence, leaves narrow-oblong rarely elliptic sessile or nearly so glabrous or nearly so, seeds (in the Indian forms) obovoid not narrowed upwards. *Boiss. Fl. Orient.* ii. 748.

NORTHERN KASHMIR and Baltistan, alt. 8000-14,000 ft.; *T. Thomson, C. B. Clarke.*—**DISTRIB.** Northern Asia, Europe and America; but the Indian three forms all recede from the European type in their abbreviated seeds.

VAR. *typicum*; stem 8-10 in., middle cauline leaves $1-1\frac{1}{4}$ by $\frac{1}{2}$ in., entire or scarcely dentate, capsules 2 in., scattered, lower peduncle often $\frac{3}{4}$ in., seeds ellipsoid, not at all narrowed at top not greatly narrowed at the base most minutely papillose, coma fulvous.—This form agrees closely with the European type, but the seed is entirely without the beak or production of the testa at the apex.

VAR. *majus*; stem 1-2 ft., middle cauline leaves 2-3 in. often much denticulate, sometimes petioled and sometimes broader elliptic when the plant can only be dis-

tinguished from *E. roseum* var. *indicum* by its greater glabrousness and obtuser leaves.

VAR. *minimum*; stem 3–4 in. with 1–2 capsules, flowers and leaves very small. —This in general appearance coincides with *E. alpinum*, Linn. but the seeds are broadly obovoid not at all elongate upwards.

10. ***E. organifolium***, Lamk. *Dict.* ii. 376; middle cauline leaves opposite sessile or very shortly petioled ovate or ovate-oblong, seeds elongate narrow obovoid somewhat narrowed at the top. DC. *Prodr.* iii. 41; Boiss. *Fl. Orient.* ii. 750.

ALPINE HIMALAYA, alt. 9000–14,000 ft.; from KASHMIR to SIKKIM.—DISTRIB. Northern cool temperate and Arctic zone.

Greatly varying in the size of stem, leaves and flowers. Stem usually 8 in., sometimes 2 ft., usually with 2 hairy lines, sometimes exactly terete and uniformly pubescent. Middle cauline leaves usually 1 in., sessile, ovate, pubescent only on the somewhat raised nerves beneath; but the leaves are sometimes petioled, nearly 3 in., pubescent, sometimes $\frac{1}{2}$ in. sessile glabrous. Flowers usually few, approximated towards the ends of the branches. Petals usually less than $\frac{1}{4}$ in.; in the var. *E. Balanœ* Boiss. (collected by J. D. H. also in Sikkim) the petals exceed $\frac{3}{8}$ in. Capsule $1\frac{1}{2}$ –3 in., peduncle also variable in length. Seed minutely punctulate, coma fulvous.

VAR. *villosum*; stem villous, leaves $\frac{3}{4}$ –1 in. villous over both surfaces sessile ovate. —Sikkim, alt. 10,000–12,000 ft.; Latong, J. D. H. *Epilobium* No. 7, *Herb. Ind. Or. H. f. & T.*—Stems 4–8 in., little divided. Leaves acute, nearly all opposite. Flowers few, approximated, not large. Stigma clavate. Capsule half-ripe, seeds not seen.—A remarkable plant. The lowest leaves are small thick obovate rounded glabrous, greatly resembling the similar leaves in *E. organifolium*.

11. ***E. alpinum***, Linn.; DC. *Prodr.* iii. 41; stems weak somewhat pubescent, middle cauline leaves opposite small subsessile narrow-elliptic glabrous or pubescent on the nerves beneath, flowers few towards the end of the branches. Boiss. *Fl. Orient.* ii. 750.

SIKKIM; alt. 12,000 ft.; Lachen, J. D. H.; Jongri, C. B. Clarke.

Stems 2–10 in., slender, scarcely divided. Middle cauline leaves $\frac{1}{4}$ –1 in., denticulate obscurely or prominently, scarcely acute. Capsule $1\frac{1}{2}$ in., peduncle $\frac{1}{4}$ – $\frac{1}{2}$ in. Seeds minutely papillose, narrowly ellipsoid, little narrowed at the summit; coma silky, white.—This is perhaps *E. alpinum* of Boissier but is not the ordinary European plant which has a beaked seed as described in Hk. f. *Student's British Flora*, p. 145; the European examples also have a fulvous coma.

†† Stem clearly quadrangular.

12. ***E. tetragonum***, Linn.; DC. *Prodr.* iii. 43; middle cauline leaves mostly opposite oblong or narrow-elliptic glabrous but with crisped hair on the raised nerves beneath usually denticulate-serrulate rarely acute. Boiss. *Fl. Orient.* ii. 748. *E. brevifolium*, Don *Prodr.* 222.

SIKKIM, alt. 5000–12,000 ft., very common. KHASIA Mts., alt. 4000–6500 ft., common.—DISTRIB. Cold and cool temperate zones of both hemispheres, and at temperate elevations on mountains in the warmer zones.

Stems 1–3 ft., with crisped pubescence on the four angles. Middle cauline leaves opposite, $\frac{1}{2}$ –2 in., usually sessile, but in some Indian examples distinctly petioled, nerves beneath raised often very prominently, above much impressed. Flowers rose or purple, rather small. Capsule $1\frac{1}{2}$ –2 in.; peduncle $\frac{1}{4}$ – $\frac{1}{2}$ in. Seeds narrowly elliptic, not narrowed at the summit, very little narrowed at the base, minutely papillose, coma fulvous.

VAR. ? amplexans, Wall. Cat. 6330; stem obscurely quadrangular or the bases of the leaves confluent and decurrent in two hairy lines, leaves nearly sessile often somewhat rounded at the base.—Kumaon; Wallich. Sikkim, alt. 10,000–13,000 ft. (Tungu and Lachen); J. D. H.

Except that the hairy lines down the stem are strongly marked this plant might be *E. organifolium* above.

DOUBTFUL SPECIES.

E. laxum, Royle Ill. p. 211, t. 43. The figure shows the stem uniformly hairy, while the letterpress states that there are four lines on the stem.

2. JUSSIÆA, Linn.

Herbs or undershrubs, growing usually in swamps. Leaves alternate, undivided, mostly entire. Flowers yellow or white, axillary, solitary; pedicel usually 2-bracteate at the apex. Calyx-tube scarcely produced above the ovary, linear; teeth 4–6, acute, persistent. Petals 4–6, epigynous. Stamens double the number of petals, epigynous. Ovary inferior, 4–5-celled; style simple, usually very short, stigma 4–5-lobed; ovules ∞ , axile, in several vertical rows at the inner angle of each cell. Capsule linear, round or angular, 4–5-celled, 8–10-ribbed, opening septicidally in valves separating from the persistent ribs or irregularly between the ribs. Seeds very many, without coma.—DISTRIB. Species 30, in the tropics of the whole world, most numerous in America.

1. **J. repens**, Linn.; DC. Prodr. iii. 54; creeping or floating, leaves obovate or oblanceolate obtuse narrowed into the petiole, petals 5 (rarely 6) white the veins at base slightly yellow, capsule woody, seeds quadrate with a white corky testa. Ham. in Trans. Linn. Soc. xiv. 305; Roxb. Hort. Beng. 33; Fl. Ind. ii. 401; Wall. Cat. 6331; Hook. Bot. Misc. iii. 800, t. 40; W. & A. Prodr. 336; Miq. Fl. Ind. Bat. i. pt. i. 628; Gibs. & Dalz. Bomb. Fl. 98; Boiss. Fl. Orient. ii. 751; Kurz in Journ. As. Soc. 1877, pt. ii. 90. *J. fluviatilis*, Blume Bijl. 1132; DC. l. c. *J. Swartziana*, DC. l. c. *J. floribunda*, Griff. Notul. iv. 688. *Cubospermum palustre*, Lour. Fl. Cochinc. 337.—Rheede Hort. Mal. ii. t. 51.—Probably *Jussiea diffusa*, Forsk. in Oliv. Fl. Trop. Afr. ii. 488 with many others.

Throughout INDIA with CEYLON; very common.—DISTRIB. The warmer parts of the whole world.

Herbaceous, often creeping on the margins of tanks, the stems also spreading on the water and sustaining themselves on the surface by white vesicles $\frac{1}{2}$ – $1\frac{1}{2}$ in. Leaves very variable in size, $\frac{1}{2}$ –3 in., usually glabrous sometimes hairy, upper usually 1–2 in., nearly always obtuse in the Indian examples. Pedicel usually as long as the capsule, sometimes quite short. Petals about $\frac{1}{2}$ in., obovate. Capsule $\frac{1}{2}$ – $1\frac{1}{2}$ in., linear-cylindric, glabrous or with scattered hairs. Seeds smooth, reticulated.

2. **J. suffruticosa**, Linn.; DC. Prodr. iii. 58; erect, leaves lanceolate, petals 4 all yellow, capsule not woody, seeds subhemispheric, testa with a prominent raphe shining brown not corky. Wall. Cat. 6334; Miq. Fl. Ind. Bat. i. pt. i. 628; Kurz in Journ. As. Soc. 1877, pt. ii. 90. *J. exaltata*, Roxb. Hort. Beng. 33; Fl. Ind. ii. 401. *J. villosa*, Lamk. Dict. iii. 331; DC. Prodr. iii. 57; Wall. Cat. 6333; W. & A. Prodr. 336; Gibs. & Dalz. Bomb. Fl. 98. *J. fruticosa*, DC. l. c. *J. scabra*, Willd.; DC. l. c. *J. Burmanni*, and *octophila*, DC. l. c. *J. longipes*, Griff. Notul. iv. 689. *J. decumbens*, Wall. Cat. 6322. *J. angustifolia*, Lamk. Dict. iii. 331 and Ill. t. 280, fig. 3; DC. Prodr. iii. 55; Miq. Fl. Ind. Bat. i. pt. i. 627. *Epilobium fruticosum*, Lour. Fl. Cochinc. 226.—Rheede Hort. Mal. ii. t. 50.

In all INDIA except the western desert region; and in CEYLON.—DISTRIB. The warmer moist parts of the whole world.

Erect, branching, sometimes 4-6 ft. *Leaves* 3 by $\frac{3}{4}$ in., more or less villous (rarely in Indian examples subglabrous), sometimes short, ovate-lanceolate, sometimes nearly linear, shortly petioled or sessile. *Pedice*l very short, bracts inconspicuous, or (in var. *bracteata* of Rottler) foliaceous, 1 in. *Petals* $\frac{1}{4}$ – $\frac{3}{8}$ in. *Capsule* 1-2 in., linear-cylindric, more or less villous or finally glabrous, 8-ribbed, membranous, breaking up between the ribs.—The form called *J. angustifolia* which has very narrow nearly glabrous leaves is found in Burma and thence to Australia, but there are no examples from Cis-Gangetic India.

3. **LUDWIGIA**, Linn.

Herbs. *Leaves* alternate, undivided, subentire. *Flowers* usually axillary, solitary, sessile or nearly so, peduncle 2-bracteate at its apex. *Calyx-tube* scarcely produced above the ovary, linear in the Indian species; teeth 3-5, acute, persistent. *Petals* 3-5 (or 0), epigynous. *Stamens* equal in number to the calyx-segments, epigynous. *Ovary* inferior, 4-5-celled; style simple, stigma capitate; ovules very many, attached in 2 or more vertical rows to the inner angle of each cell. *Capsule* linear or oblong (in the Indian species), 4-5-celled, opening by terminal pores or breaking up irregularly along the sides. *Seeds* numerous, obovoid, smooth, raphe obscure or prominent but not large, without coma.—DISTRIB. Species 20, mostly in North America; extending from the cool temperate zone to the equator; chiefly inhabiting marshes.

1. **L. parviflora**, Roxb. *Hort. Beng.* 11; *Fl. Ind.* i. 419; capsule $\frac{1}{2}$ by $\frac{1}{8}$ – $\frac{1}{12}$ in. linear-oblong, seeds in many rows in each cell, raphe obscure. DC. *Prodr.* iii. 59; *Wight Ill.* t. 101; *W. & A. Prodr.* 336; *Dalz. & Gibs. Bomb. Fl.* 99; *Benth. Fl. Austral.* iii. 307; *Boiss. Fl. Orient.* ii. 752; *Kurz in Journ. As. Soc.* 1877, pt. ii. 91. *L. lythroides*, Blume *Bijd.* 1134; DC. l.c. *D. jussiaeoides*, Wall. *Cat.* 6335 not of Linn. and others.

Throughout INDIA and CEYLON; common in rice fields and other moist places.—DISTRIB. Malaya. North Australia. Persia. Abyssinia.

Erect, 8-24 in., glabrous. *Leaves* 2-3 by $\frac{1}{2}$ – $\frac{3}{4}$ in., lanceolate or linear-lanceolate, narrowed to the base. *Flowers* very shortly pedicelled, commonly 4-fid. *Petals* small, yellow. *Capsule* inflated, smooth, the seeds not separately distinguishable through its walls.

2. **L. prostrata**, Roxb. *Hort. Reng.* 11; *Fl. Ind.* i. 420; capsule $\frac{1}{2}$ – $\frac{3}{4}$ by $\frac{1}{20}$ in. linear, seeds in one row in each cell, raphe narrow but prominent. DC. *Prodr.* iii. 59; *Wight Ic.* t. 762; *Kurz in Journ. As. Soc.* 1877, pt. ii. 91. *L. diffusa*, Ham. in *Trans. Linn. Soc.* xiv. 301 *Wall. Cat.* 6336. DC. l.c. *L. fruticulosa*, Blume *Bijd.* 1133; DC. l.c. *Nematopyxis prostrata*, pusilla, and *fruticulosa*, Miq. *Fl. Ind. Bat.* i. pt. i. 630.

NORTH-WEST INDIA; Royle. ASSAM. SILHET. RANGOON. CEYLON. Madras? Heyne in *Herb. Rottler*.—DISTRIB. Malaya, Japan.

Prostrate, or decumbent and then erect, 8-24 in., glabrous. *Leaves* 2-3 by $\frac{1}{2}$ – $\frac{3}{4}$ in., lanceolate, narrowed to the base. *Flowers* sessile, 4-fid. *Capsule* not inflated, the walls drawn tightly over the seeds so that each seed can be counted from without.—This species of Roxburgh's was extricated by Mr. Bentham in *Fl. Austral.* iii. 308, where the synonymy is cleared up. Some of the Sillet examples however have some of the capsules very like those of *L. parviflora*, and others inflated for half their length like *L. parviflora*, and for the other half linear constricted like *L. prostrata*. The two species are identical except as to their capsules and seeds.

4. **CIRCÆA**, Linn.

Herbs. *Leaves* opposite, petioled, ovate, sinuate-dentate, membranous. *Flowers* small, white, pedicelled, in terminal and lateral peduncled racemes, finally lax; pedicels spreading, with minute subulate (or 0) bracts at their base. *Calyx-tube* ovoid, scarcely produced above the ovary, limb bipartite. *Petals* 2, obcordate, 2-lobed, epigynous. *Stamens* 2, epigynous. *Ovary* inferior, 1-2-celled; style filiform, stigma capitate almost 2-lobed; ovules attached to the inner angle of the cells, solitary or rarely 2 superimposed. *Fruit* small, pyriiform, subcoriaceous, indehiscent, 1-2-celled. *Seeds* 1 in each cell, ellipsoid.—**DISTRIB.** Species 2 or 3, in subarctic and cool temperate regions of the northern hemisphere, extending southwards to the tropics on mountains.

1. **C. lutetiana**, Linn.; *DC. Prodr.* iii. 63; leaves ovate-lanceolate more or less pubescent not pellucid, fruit 2-seeded narrowed at the base patent-deflexed shorter than its pedicel covered with long hooked hairs. *Lamk. Ill.* t. 16, fig. 1; *Boiss. Fl. Orient.* ii. 753. *C. repens*, *Wall. Cat.* 6341.

TEMPERATE HIMALAYA from KUMAON to SIKKIM, alt. 7000–10,000 ft.; *Wallich, Major Madden, J. D. H., T. Thomson*; examples few.—**DISTRIB.** The northern hemisphere, extending south to near the tropic of Cancer.

Stems 1–2 ft., erect or decumbent at the base only, puberulous or pubescent. *Leaves* 2 by 1–1½ in., long-petioled, rounded or narrowed at the base. *Bracts* 0. *Petals* white or pinkish. *Fruit* ½ in., obovoid, the hooked hairs usually longer than half the width of the fruit.—The *C. repens* of Wallich agrees closely with the European common type; the stem is decumbent for a short space at the base only.

2. **C. cordata**, Royle *Ill.* t. 43; leaves ovate-lanceolate cordate at the base more or less pubescent not pellucid, fruit 2-seeded broad-elliptic patent-deflexed little longer than broad from a broad rounded unequal base covered with long hooked hairs, not shorter than its pedicel.

WESTERN HIMALAYA; *Royle*; alt. 7000–8000 ft.; *T. Thomson*. KASHMIR, *C. B. Clarke*. SIMLA, *Jacquemont*; DALHOUSIE, Chumba, alt. 7000–9000 ft. plentiful, *C. B. Clarke*.—**DISTRIB.** Mandshuria, Japan.

Stems 1–2 ft., stouter and more hairy than of *E. lutetiana*, erect. *Leaves* 3½ by 2 in., sometimes larger; petiole often 1½ in. *Bracts* 0. *Petals* yellow (ex Royle) and appear so in the dried examples. *Fruit* scarcely ½ in., nearly or quite as much broad, the two carpels at the base generally descending unequally on the pedicel.

3. **C. alpina**, Linn.; *DC. Prodr.* iii. 63; leaves ovate glabrous or slightly pubescent often pellucid, fruit 1-seeded narrowed at the base shorter than its pedicel, glabrous or not densely hairy. *Lamk. Ill.* t. 16, fig. 2; *Wight Ill.* t. 101*; *Boiss. Fl. Orient.* ii. 753. *C. intermedia*, *Wall. Cat.* 6342.

TEMPERATE HIMALAYA, from KASHMIR to SIKKIM, alt. 7000–11,000 ft., not rare. KHASIA Mts., alt. 4500–6000 ft. NILGHIRIS and PUNEY Mts., alt. 7000 ft.—**DISTRIB.** The Temperate Northern hemisphere.

Erect, 6–8 in., typically nearly glabrous. *Leaves* ¾ in., and about equally broad, long-petioled, rounded or cordate at the base, often deeply sinuate-toothed subangulose, glabrous or pubescent on the nerves. *Bracts* minute, subulate, sometimes obscure. *Petals* white. *Fruit* less than ½ in., obovoid, sometimes nearly glabrous, sometimes with many hooked hairs, but the hairs neither so many yellow nor long as commonly are those of *C. lutetiana*.

VAR. *himalaica*; stem taller 10–18 in., leaves much larger 1½ in. more pubescent not pellucid.—In the Himalaya only; the type of Wallich's *C. intermedia*. This plant has only one seed to the fruit and differs only in trivial characters from *C. alpina*.

5. **TRAPA**, Linn.

Floating herbs. *Leaves* dimorphic; submersed opposite, root-like, pinnatifid, with filiform segments; emersed rosulate, rhomboidal, the petiole with a spongy dilatation near its apex. *Flowers* axillary, solitary, peduncled. *Calyx-tube* short, adnate to the lower part of the ovary; limb 4-partite, 2 or all the segments persistent and becoming spinescent on the fruit. *Petals* 4, white, small, inserted at the margin of an epigynous disc. *Stamens* 4. *Ovary* half-inferior, with a conical vertex, 2-celled; style subulate, stigma capitate; ovule solitary in each cell, pendulous from the upper inner angle. *Fruit* bony, 1-celled, large, obovoid, with 4 angles, 2 or all of which carry spines, indehiscent, with a short cylindric beak at the top through which the radicle is protruded. *Seed* 1, inverse, cotyledons very unequal.—**DISTRIB.** Species 2, extending through the warmer parts of the Old World, from Central Europe to China and to Tropical Africa.

1. **T. bispinosa**, Roxb. *Cor. Pl.* 234; *Hort. Beng.* 11; *Fl. Ind.* i. 428; leaves usually very villous beneath, fruit with 2 angles spinescent. *DC. Prodr.* iii. 64; *Wall. Cat.* 6339; *W. & A. Prodr.* 337; *Miq. Fl. Ind. Bat.* i. pt. i. 636; *Dalz. & Gibs. Bomb. Fl.* 99; *Kurz in Journ. As. Soc.* 1877, pt. ii. 91. *T. quadrispinosa*, *Wall. Cat.* 6340 not *Roxb.*—*Rheede Hort. Mal.* xi. t. 33.

Throughout INDIA and CEYLON.—**DISTRIB.** South-eastern Asia and Malaya; Tropical Africa.

In the Roxburghian type, floating leaves 2 by $2\frac{1}{2}$ –3 in., very villous beneath, posterior margin entire, anterior lightly crenate; petiole 4–6 in., woolly. *Fruit* $\frac{3}{4}$ in. long and broad, glabrous or hairy; two opposite angles each with an often retrorsely scabrous spine, the other two angles sometimes obsolete.—Very doubtfully distinct from the next species as Wallich has noted on his specimens.

VAR. incisa, *Wall.*; leaves much smaller about $\frac{3}{4}$ in. much less villous beneath incise serrate on the anterior margin.—Marked also *T. quadrispinosa* by Wallich; but though the leaves are the leaves of *T. natans*, the fruit is that of *T. bispinosa*.

2. **T. natans**, Linn.; *DC. Prodr.* iii. 63; leaves sparingly villous on the nerves beneath, fruit with all 4 angles carrying spines. *Lamk. Ill.* t. 75; *Boiss. Fl. Orient.* ii. 753. *T. quadrispinosa*, *Roxb. Hort. Beng.* 11; *Fl. Ind.* i. 451; *DC. l. c.*

KASHMIR; *Falconer, Jacquemont.* SILHET; *Roxburgh* (but no example thence at Kew).—**DISTRIB.** Persia to Central Europe and the Upper Nile.

Floating leaves 1 in., dentate or incise-dentate on the anterior margin; petiole 2–4 in., glabrescent. *Fruit* $\frac{3}{4}$ in. broad, the 4 angles all spinescent but the two lateral spines shorter.

ORDER LXIII. **SAMYDACEÆ.** (By C. B. Clarke, F.L.S.)

Trees or shrubs. *Leaves* alternate, often distichous, petioled occasionally subsessile, simple, entirely or lightly crenate or serrate, often closely punctulate beneath; stipules small, deciduous. *Flowers* regular, small, axillary, shortly pedicelled, densely fascicled or in long simple or paniced racemes. *Calyx* coriaceous, persistent; tube short, free, or longer and adnate to the ovary; limb 3–7-fid. *Petals* as many as the calyx-lobes (or 0), perigynous, imbricated. *Stamens* definite or indefinite, often with staminodes between or united in a tube with them. *Ovary* superior or half-superior, 1-celled; style 1, capitate or

3-fid at the apex, or styles 2-5; ovules many or several, placentas 2-5 (usually 3), parietal. *Fruit* loculicidally 2-5- (usually 3-) valved, valves carrying the seeds on their medial line. *Seeds* several (usually few sometimes many), oblong or angular, albuminous, usually drilled.—**DISTRIB.** Species 150, scattered through the tropical regions of the globe, rarely also in the subtropical.

Petals 0, flowers in axillary fascicles 1. CASEARIA.
 Petals 0, racemes slender in a terminal panicle 2. OSMELIA.
 Petals present, racemes axillary and terminal 3. HOMALICUM.

1. CASEARIA, Jacq.

Shrubs or small trees. *Leaves* alternate, distichous, petioled, undivided, entire or slightly serrate, often minutely punctate beneath; stipules small, lateral, caducous. *Flowers* small, greenish-yellow, clustered in the axils (in the Indian species); pedicels short, jointed above their base, surrounded by small scales. *Calyx* inferior, deeply 4-5-lobed; lobes imbricate, obtuse, persistent. *Petals* 0. *Stamens* double the number of calyx-lobes or thereabout, united in a tube with staminalodes alternating with the free portion of the filaments; staminal tube hypogynous, sometimes very short so that the filaments are nearly or quite free. *Ovary* free, ovoid, 1-celled; style simple; stigma capitate or 3-fid; ovules many, parietal. *Capsule* succulent, globose or ovoid, ellipsoid (when dry somewhat 3-angular or 6-ribbed), 3- rarely 2-valved. *Seeds* many, angular or obovoid, with a fleshy usually coloured aril; embryo straight.—**DISTRIB.** Species 80, in the warmer parts of the whole globe, most plentiful in America.

* *Adult leaves and petioles glabrous.*

1. **C. glomerata**, Roxb. *Hort. Beng.* 33; *Fl. Ind.* ii. 419; leaves lanceolate or elliptic-lanceolate acuminate denticulate or crenate often obscurely and minutely so but never quite entire, acute or obtuse but not rounded cordate at the base, pedicels with minute yellow hair, fruit $\frac{1}{2}$ in., ellipsoid. *DC. Prodr.* ii. 49; *Benth. Fl. Hongk.* 122; not of Kurz *Flor. Fl.* i. 530. *C. ovata*, Wall. *Cat.* 7192 E, not of Roxb.

SIKKIM, BHOTAN and KHASIA, alt. 3000-5000 ft., common.—**DISTRIB.** Hong Kong (and probably Malaya, for the examples of *C. glabrata* Miq. collected in Sumatra appear *C. glomerata*).

A shrub, or in interior Sikkim a tree 20-30 ft.; branchlets somewhat angular, glabrous, not or but little lenticellate. *Leaves* commonly 4 by $1\frac{3}{4}$ in. (in Sikkim frequently 9 in.); petiole $\frac{1}{2}$ in. *Pedicels* usually very many, $\frac{1}{2}$ in. *Calyx* small, more or less pubescent in the bud. *Stamens* 7-10, staminalodes yellow.—A plant collected in Sikkim by Mr. Kurz, marked "*C. glabra*," has bark densely uniformly lenticellate, petioles $\frac{1}{2}$ - $\frac{1}{2}$ in. and the young buds and pedicels without the smaller yellow hairs; it can scarcely be Roxburgh's *C. glabra* from the Moluccas and which is not represented in the Kew Herbarium.

2. **C. leucocolepis**, Turcz. in *Bull. Soc. Nat. Mosc.* 1858, pt. i. 463; leaves oblong acute crenulate base rounded unequal, pedicels with minute grey hairs. ? *C. viridiflora* Lamk. *Dict.* vi. 493.

SINGAPORE; *T. Lobb*.—**DISTRIB.** Java, Philippines.

Branchlets nearly glabrous. *Leaves* 5-6 by 2 in.; petiole $\frac{1}{2}$ in. *Pedicels* $\frac{1}{2}$ in.; buds minutely hairy, larger than those of *C. glomerata*.—There is a doubt whether Thos. Lobb's No. 468 on which Turczaninow founded the species was not collected at Luzon instead of Singapore. If so the species has not yet been found in British India.

Also, Turczaninow's description is not correct as to the absolute glabrousness of the species. The sepals and tips of the branchlets of Lobb No. 468 are minutely pubescent; and the examples of *C. angustata*, *Teys. & Binn.* (see *Miq. Fl. Ind. Bat.* i. pt. i. 710) only differ by being slightly more pubescent. Lastly, the whole does not differ from *C. glomerata* so much as *C. glomerata* if cultivated at Singapore might be expected to vary from the Sikkim type.

3. *C. graveolens*, *Dalz. in Hook. Journ. Bot.* iv. 107; leaves elliptic obtuse or shortly acute more or less crenate, base of the calyx pubescent, pedicel above the articulation glabrous, fruit $\frac{3}{4}$ in. ellipsoid. *Dalz. & Gibs. Bomb. Fl.* 11; *Brand. For. Fl.* 243. *C. Hamiltoni*, *Wall. Cat.* 7195 chiefly. *C. macrogyna*, *Turcz. in Bull. Soc. Nat. Mosc.* 1858, pt. i. 463; *Kurz in Journ. As. Soc.* 1877, pt. ii. 92; *For. Fl.* i. 529.

GURWHAL and KUMAON; *Royle, Wallich, &c. SIKKIM*; alt. 1500 ft., *C. B. Clarke*. DECCAN PENINSULA, especially the western side, common; *Wight, &c. BURMA*; *McClelland, Kurz*.

A shrub, or tree 20 ft.; branchlets glabrous to the final stipules. *Leaves* (in the type) 4 by $2\frac{3}{4}$ in., broadly elliptic, little acuminate, rounded at the base; petiole $\frac{1}{4}$ in.; but the leaves are often narrower, almost lanceolate, and acute at the base. *Pedicels* usually short, sometimes $\frac{1}{4}$ in., jointed at or above the base, aureo-pubescent below the articulation glabrous above to near the base of the calyx. *Calyx* always pubescent at the base, above sometimes densely aureo-pubescent sometimes glabrous.—This species is to be separated from *C. glomerata* by the pedicel glabrous above its articulation and by its geographic locality; from *C. esculenta* by its less entire less thick leaves and the calyx pubescent at its base. As to the Wallichian Number quoted: in the large paper type, *Wall. Cat.* 7195, A and one sheet of B is *C. graveolens*; the other part of B does not belong to the genus. The Burmese plant is distributed by Mr. Kurz under the name *C. Hamiltoni*, *Wall.* correctly: but in *Journ. As. Soc.* and *For. Fl.* he has changed the name to *C. Canziana*, *Wall.* (see 10. *C. tomentosa*.) Now Roxburgh says his *C. ovata* has the leaves downy beneath, whereas Mr. Kurz says (truly) that his plant has all parts glabrous: Wallich's own *Canziana* is hairy.

4. *C. esculenta*, *Roxb. Fl. Ind.* ii. 422; leaves elliptic-lanceolate entire acute at the base or at least not rounded, pedicel above its articulation and calyx glabrous, fruit $\frac{1}{2}$ – $\frac{3}{4}$ in. ellipsoid. *C. lævigata*, *Dalz. in Hook. Journ. Bot.* iv. 107; *Dalz. & Gibs. Bomb. Fl.* 11. *C. Championii* and *zeylanica*, *Thwaites Enum.* p. 19. *C. varians*, *Thwaites Enum.* 19 at least as regards var. a; *Bedd. Fl. Sylv.* t. 208.

MALABAR, from BOMBAY to KURG, frequent. CEYLON, plentiful; *Thwaites*. MOULMEIN and SINGAPORE, *Lobb. Griffith, Maingay*.

A shrub or small tree, branches glabrous. *Leaves* 3–6 by 1–2 in., broad-lanceolate, narrowed to both ends, entire or most obscurely crenate, thick, subcoriaceous; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Pedicels* short, usually less than $\frac{1}{4}$ in. in fruit, jointed at the base. *Carpels* 2, with 2-fid stigma (*Thwaites* No. 2604, 2657); but carpels often 3 (see *Beddome Fl. Sylv.* 208).—*C. Championii* *Thwaites* with very entire coriaceous acuminate leaves is exactly the form sent from Moulmein and Singapore.

VAR. *angusta*; leaves narrow-lanceolar 4 by 1 in.—Ceylon; *Thwaites* No. 2603 reduced with hesitation to *C. esculenta* by Mr. Benthham in *Fl. Austral.* iii. 309.

5. *C. coriacea*, *Thwaites Enum.* 20; leaves obovate obtuse or rounded at the vertex entire, pedicel above its articulation and calyx glabrous, fruit $\frac{1}{2}$ – $\frac{3}{4}$ in. ellipsoid. *C. varians* var. γ obovata *Thwaites l. c.*

CEYLON, alt. 6000–8000 ft.; *Thwaites, Gardner, Walker*.

A small tree, branches glabrous. *Leaves* 2 in., much narrowed at the base; petiole $\frac{1}{2}$ in. *Carpels* always 2 (*Thwaites*).

6. **C. rubescens**, *Dalz. in Hook. Journ. Bot.* iv. 108; leaves elliptic-lanceolate entire acute or obtuse base not rounded, pedicels minutely pubescent, fruit $\frac{3}{4}$ in. and upwards ellipsoid. *Dalz. & Gibs. Bomb. Fl.* 11.

BOMBAY GHATS, CONCAN AND KURG; *Dalzell, Stocks, Ritchie.*

A shrub 4-6 ft. (*Dalzell*); branches glabrous to the final stipules. *Leaves* $4\frac{1}{2}$ by $2\frac{1}{2}$ in., acuminate, coriaceous often ruddy (but not more so than some examples of *C. esculenta*); petiole $\frac{1}{4}$ in. *Pedicels* short, usually less than $\frac{1}{2}$ in., jointed at the base. *Calyx-lobes* broad, minutely pubescent.—This species is here distinguished from *C. esculenta* solely by the minute pubescence of the pedicels.

7. **C. macrocarpa**, *C. B. Clarke*; leaves narrowly lanceolate, pedicels glabrous, fruit $1\frac{1}{4}$ by $\frac{5}{8}$ in.

PINANG; *Maingay* 660-2.

Branchlets reddish, glabrous. *Leaves* 5 by $1\frac{1}{4}$ in., entire, acute at both ends, reddish, reticulate, shining; petiole $\frac{1}{4}$ in. *Pedicels* few, not exceeding $\frac{1}{2}$ in., glabrous, reddish, buds glabrous. *Seeds* $\frac{1}{4}$ in., obovoid, compressed.

8. **C. albicans**, *Wall. Cat.* 7197; leaves oblong acute at both ends, pedicels glabrous, fruit 2 by $1\frac{1}{8}$ in. ovoid bright yellow when ripe (*Maingay*).

PINANG; *Wallich.* MALACCA; *Maingay*, No. 660.

Branchlets thick, glabrous, striate. *Leaves* 9 by $2\frac{3}{4}$ in., entire, coriaceous, nerves much raised beneath; petiole $\frac{3}{8}$ in. *Pedicels* clustered, $\frac{1}{4}$ in., buds glabrous.—It is possible that this species may prove a variety of the preceding, but the leaves are much broader, the fruit ovoid (instead of narrowly ellipsoid) as noted by Dr. Maingay.

** *Adult leaves on the midrib beneath together with the petiole more or less pubescent.*

9. **C. Vareca**, *Roxb. Hort. Beng.* 33; *Fl. Ind.* ii. 418; leaves oblong closely serrate softly hairy beneath, pedicels above the articulation glabrous, fruit $\frac{1}{2}$ in. broadly ellipsoid yellow or pinkish yellow. *Wall. Cat.* 7194; *Kurz For. Fl.* i. 530.

TERAI of the Himalaya from SIKKIM eastward and of KHASIA, at 500-3000 ft. elevation, plentiful.—DISTRIB. Ava.

A shrub, branchlets pubescent. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., often somewhat cbovate, obtuse suddenly narrowed but sometimes acuminate; petiole $\frac{1}{4}$ in. *Pedicels* less than $\frac{1}{4}$ in., usually jointed far above the base, very hairy below the articulation. *Staminal* tube elongate, stamens often 10. *Seeds* in bright red pulp.—The leaves have regularly and closely placed serrations which prominently mark this species from all others and appear to have completely protected it against synonyms.

10. **C. tomentosa**, *Roxb. Fl. Ind.* ii. 421; leaves elliptic-oblong or lanceolate entire or crenate not acuminate base acute or rounded, pedicels and calyx hairy, fruit $\frac{1}{2}$ - $\frac{3}{4}$ in. broad-ellipsoid. *Wall. Cat.* 7191; *Brand. For. Fl.* 243, t. 31. *C. Anavinga*, *Dalz. & Gibs. Bomb. Fl.* 11. *C. ovata*, *Roxb. Fl. Ind.* ii. 420 (not of Willd.); *Wall. Cat.* 7192 excl. E. *C. Canziana*, *Ham. in Wall. Cat.* 7192; *Voigt Hort. Sub. Calc.* 78; *Kurz in Flora* 1871, 294. *C. elliptica*, *Willd. Sp. Pl.* ii. 628; *DC. Prod.* ii. 51; *Wight Ic.* t. 1849; *Wall. Cat.* 7193; *Blume Mus. Bot.* i. 253; *Miq. Fl. Ind. Bat.* i. pt. i. 709. *C. glabra*, *Hort. Calc. in Herb. Wall. and Herb. Heyne.* *C. Dallichii*, *F. Muell.*; *Benth. Fl. Austral.* iii. 309. *Samyda piscidia*, *Ham. in Wall. Cat.* 7193 D?—*Rheede Hort. Mal.* v. 50.

Throughout INDIA and CEYLON, common.—DISTRIB. Malaya and North Australia.

A shrub, or tree attaining 25 ft.; branchlets tomentose pubescent or nearly glabrous. *Leaves* 4 by $1\frac{1}{2}$ in., tomentose beneath or pubescent or only slightly hairy about the base of the midrib, rarely so closely serrate as in *Wight Ic.* t. 1849, often nearly entire; petiole variable from $\frac{1}{3}$ – $\frac{3}{8}$ to 6 in. in Central India examples. *Pedicels* usually numerous, less than $\frac{1}{4}$ in.; buds usually hairy, sometimes nearly glabrous. *Staminal* tube short, stamens 7–10 (sometimes 12 Benth.). *Seeds* in red pulp.—The typical *C. tomentosa* of North-West India has softly villous oblong nearly entire leaves; the South Indian examples (var. *elliptica*) have the leaves more glabrous, more crenate-serrate and more narrowed at base. With these the Malayan examples agree. As to *C. Canziana*, Wall. Cat. 7192 stated by Wall. to be equivalent to *C. ovata* Roxb. the numerous examples of Wight and Wallich have the pedicels buds and leaves beneath villous and if it is separable as a species it is certainly not *C. graveolens*. Willdenow says his *C. elliptica* has glabrous leaves and Roxburgh says his *C. glabra* has glabrous leaves; so that these synonyms as known only from description must be excluded. But it is very probable that they relate to the nearly glabrous form *C. Dallachii* (see Benth. *Fl. Austral.* iii. 309).

11. **C. Lobbiana**, Turcz. in *Bull. Soc. Nat. Mosc.* 1858, pt. i. p. 463; leaves oblong-lanceolate acuminate entire softly hairy beneath, flowers almost sessile, fruit less than $\frac{1}{4}$ in. diam. nearly globose.

MOULMEIN and SINGAPORE, *T. Lobb*; MALACCA, *Griffith*.

Branchlets round, softly hairy. *Leaves* $2\frac{1}{2}$ – $3\frac{1}{2}$ by $\frac{3}{4}$ – $1\frac{1}{4}$ in.; petiole $\frac{1}{8}$ – $\frac{1}{2}$ in. *Buds* most minutely pubescent. *Fruit* subsessile.—Scarcely differs from *C. tomentosa* but by the more acuminate leaves.

12. **C. grewiae-folia**, Vent. *Choix.* 48; leaves large oblong hairy beneath entire or crenulate base rounded or cordate, pedicels pubescent, fruit $\frac{3}{4}$ –1 in. *DC. Prodr.* ii. 51; *Miq. Fl. Ind. Bat.* i. pt. i. 706. *C. variabilis* Blume *Mus. Bot.* i. 252. *C. subcuneata*, *Miq. l. c.* *C. cinerea*, Turcz. in *Bull. Soc. Nat. Mosc.* 1858, pt. i. 462.

MALACCA, *Maingay* No. 659, 661.—DISTRIB. Malaya to the Philippines.

A small tree (*Maingay*), branchlets more or less pubescent. *Leaves* 7 by $2\frac{1}{2}$ in.; petiole $\frac{1}{2}$ in. *Pedicels* often $\frac{1}{4}$ in., jointed at the base, buds generally pubescent.—Differs little from *C. tomentosa* but by the cordate base of the leaves as Ventenat mentions. Miquel says his *C. subcuneata* differs from the typical *C. grewiae-folia*; being less hairy; but in Miquel's own communicated examples there is hardly any difference even in this respect.

13. **C. wynadensis**, Bedd. *Ic. Pl. Ind. Or.* t. 160; leaves elliptic-lanceolate acuminate denticulate-serrate pubescent beneath narrowed into the petiole, pedicels pubescent.

WYNAAD; alt. 2000–3000 ft.; *Beddome*.

A small tree (*Beddome*), branchlets aureo-villous. *Leaves* 4–6 by $1\frac{1}{4}$ –2 in.; petiole $\frac{1}{4}$ – $\frac{3}{8}$ in. *Pedicels* not very many together, $\frac{1}{2}$ in. or less; buds minutely pubescent. *Stigma* 4-lobed (*Beddome*).—Differs considerably from *C. tomentosa* among other things by the leaves being acuminate to a very sharp point.

14. **C. Kurzii**, C. B. Clarke; leaves lanceolate or oblong-lanceolate narrowed at the base with spreading yellow hairs beneath crenate or nearly entire, pedicels pubescent very long, fruit ellipsoid ($\frac{3}{4}$ in. ?). *C. glomerata* var. *puberula*, Kurz in *Journ. As. Soc.* 1877, pt. ii. 92; *For. Fl.* i. 530.

CHITTAGONG; *H. f. & T.*—DISTRIB. Northern Burma.

Branchlets minutely pubescent. *Leaves* 5 by 2 in.: petiole nearly $\frac{1}{2}$ in. *Pedicels* not very many together, $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx* minutely pubescent. *Fruit* not ripe but

cannot become very large.—The pedicels are much longer in this species than in any of the others; and the pubescence of the leaves beneath differs from all except that of *C. grewiaefolia*. A *Casearia* collected by Griffith in fruit in Assam may be this, but the pedicels are shorter, and some of the leaves rounded at the base, approaching thus *C. grewiaefolia*.

IMPERFECTLY KNOWN AND EXCLUDED SPECIES.

C. ASTYLA, Turcz. in Bull. Soc. Imp. Mosc. 1863, 608; branchlets pubescent, leaves glabrous, sterile stamens densely white-hirsute, style 0.

EAST INDIES; Roxburgh (fide Turcz.).

Leaves lanceolate, somewhat long but obtusely acuminate, margin revolute entire, shining, not punctate; petiole short. Pedicels 3 or few. Calyx-tube top-shaped, contracted in the middle, segments reflexed.—A very distinct species in the structure of its flowers, forming the type of a separate subgenus.—Not seen; the foregoing is taken from Turczaninow.

CASEARIA ? CORIACEA, Wall. Cat. 7196, is *Chætocarpus castanocarpus*, Thwaites Enum. 275.

CASEARIA ? ACUMINATA, Wall. Cat. 7198, has opposite leaves and is remote from the genus and order.

CASEARIA ? LUCIDA, Wall. Cat. 7199, is a Euphorbiaceous plant, possibly the male of Wall. Cat. 7196.

2. OSMELIA, Thwaites.

Trees. Leaves alternate, petioled, ovate or oblong-lanceolate, entire or obscurely serrate, epunctate; stipules minute, deciduous. Flowers small, very nearly sessile, in long racemes which are simple or panicked. Calyx inferior, divided nearly to the base; lobes 5, rounded, imbricate. Petals 0. Stamens 10 (or 8), 5 alternating with as many 2-lobed hairy scales and 5 inserted in the notches of those scales. Ovary superior, 1-celled; styles 3, short, with capitate stigmas; ovules few, placentas 3, parietal. Capsule subglobose, 3-valved. Seeds few, subglobose, with red fleshy aril.—DISTRIB. Species 3; one in Ceylon, two in the Philippines.

1. *O. zeylanica*, Thwaites Enum. 20; leaves glabrous narrow elliptic-lanceolate acuminate nearly entire, panicle terminal. Benth. in Journ. Linn. Soc. v. Suppl. 89; Bedd. Fl. Sylv. t. 209. *Casearia paniculata*, Gardn.

CEYLON; Gardner; Central Province, alt. 3000 ft., not common; Thwaites.

Younger branches and panicle pubescent. Leaves 2–4 by 1–1½ in., narrowed at the base; petiole ½ in. Panicle lax, racemes 4–6 in. Flowers white tinged with red, each supported by a single cup-shaped bract. Stamens 10. Ovary very hairy. Capsule ¾ in., coriaceous. Seeds 1–4, subglobose.

3. HOMALIUM, Jacq.

Shrubs or trees. Leaves alternate, crenate or subentire, petioled or sessile, rarely punctulate. Flowers hairy, small, in slender axillary and sub-terminal simple or panicked racemes; bract at the base of the pedicel often prominent but caducous. Calyx-tube funnel-shaped, adnate to the base of the ovary; lobes 5–7, narrow, persistent. Petals 5–7, inserted in the throat of the calyx, linear-oblong, persistent. Disk tomentose. Stamens solitary or in fascicles of 1–7, opposite the petals with alternating glands. Ovary half-superior, 1-celled:

styles 2-5, filiform, stigmas capitellate; ovules many or several, placentas parietal, extending only down the upper free portion of the ovary. *Capsule* half-superior, coriaceous, 2-5-valved at the apex. *Seeds* few, angular or oblong. —**DISTRIB.** Species 30, scattered over the hot regions of nearly the whole globe.

As no one of the Indian specimens exhibits fruit, the description of the capsule and seeds in the above diagnosis has been assumed to apply to the Indian species.

SECT. I. **Blackwellia**. *Stamens* 1 opposite each petal.

* *Racemes* paniced.

1. **H. nepalense**, *Benth. in Journ. Linn. Soc.* iv. 34; leaves ovate or elliptic subacute petioled crenate glabrous, panicles with divaricate branches minutely tomentose or nearly glabrous. *Blackwellia nepalensis*, *Wall. Pl. As. Rar.* t. 179; *Wall. Cat.* 4900; *DC. Prodr.* ii. 54. B. (*Astranthus*) *acuminata*, *Wall. in Herb.*

NIPAL; *Wallich*.

Leaves $4\frac{1}{2}$ by $2\frac{1}{2}$ in., subacute obtuse or scarcely rounded at the base; petiole $\frac{1}{2}$ in. *Panicles* 3-4 in. long and broad, axillary. *Flowers* small, short-pedicelled, 6-7-fid.

** *Racemes* elongate simple.

2. **H. tomentosum**, *Benth. in Journ. Linn. Soc.* iv. 34; leaves nearly sessile obovate repand-crenate pubescent or tomentose beneath, flowers clustered subsessile. *Kurz For. Fl.* i. 531. *Blackwellia tomentosa*, *Vent. Choix* t. 57; *DC. Prodr.* ii. 55; *Miq. Fl. Ind. Bat.* i. pt. i. 714. B. *spiralis*, *Wall. Cat.* 4897, partly; *DC. l. c.*

PEGU; *Wallich, Kurz*.—**DISTRIB.** Java.

Leaves 5 by 3 in., narrowed or scarcely rounded at the base; petiole $\frac{1}{2}$ in. or less. *Racemes* 6 in., axillary, scattered, tomentose. *Flowers* small, 5-6-fid. *Calyx-tube* not elongated, segments about equalling the petals.

3. **H. longifolium**, *Benth. in Journ. Linn. Soc.* 35 (*excl. syn.*) leaves petioled oblong or oblong-lanceolate not rounded at the base entire or nearly so glabrous, flowers clustered pedicelled, calyx-tube short segments nearly as long as the petals. *Blackwellia macrostachya*, *Turcz. in Bull. Soc. Imp. Mosc.* 1863, 610 *ex descr.*

PINANG; *Phillips*. MATAYA; *Maingay* No. 665.

Tree not very large but high (*Maingay*). *Leaves* 4-7 by $1\frac{1}{4}$ - $2\frac{1}{4}$ in.; petiole $\frac{1}{4}$ in. *Racemes* 6 in., axillary, scattered, but mostly towards the ends of the branchlets, tomentose or scarcely more than puberulous; pedicels short, usually less than $\frac{1}{2}$ in. *Flowers* small, 6-8-fid.—For the synonym *Wall. Cat.* 4897 in part adduced by Mr. Bentham see *H. propinquum* below.

4. **H. minutiflorum**, *Kurz For. Fl.* i. 532; glabrous, leaves petioled oblong coarsely crenate, pedicels glabrous, flowers minute about $\frac{1}{24}$ in. long.

BURMA, probably Martaban or Tenasserim; *Brandis*.

An evergreen tree. *Leaves* 3-5 in., obtusely apiculate, thin, coriaceous; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in., stout. *Racemes* glabrous, simple or slightly branched, in pairs or solitary, axillary. *Calyx* glabrous; segments oblong-linear, villous-ciliate. *Filaments* slender, one before each petal. Not seen: description copied from Mr. Kurz.

5. **H. zeylanicum**, *Benth. in Journ. Linn. Soc.* iv. 35; leaves petioled elliptic narrowed at both ends crenate glabrous, flowers clustered pedicelled,

calyx-tube oblong top-shaped segments shorter than the petals. *Bedd. Fl. Sylv.* t. 210. *Blackwellia zeylanica*, *Gardn. in Calc. Journ. Nat. Hist.* vii. 452. *B. tetrandra*, *Wight Ic.* t. 1851.

MALABAR, up to 4000 ft., not uncommon; *Law, Stocks, &c.* CEYLON, moister parts up to 3000 ft.; *Walker, &c.*

A tree 40–50 ft. *Leaves* 4 by 2 in., obtusely acuminate; petiole $\frac{3}{8}$ in. *Racemes* axillary, scattered, also approximated at the ends of the branches, often dense with flowers; pedicels short, usually about $\frac{1}{2}$ in. *Flowers* small (but varying considerably in size), 4–6-fid. *Styles* 3–4.

SECT. II. **Racoubea.** *Stamens* 2–7 opposite or subopposite each petal: some of the filaments sometimes having no anthers.

* *Racemes* paniced or more or less divided.

6. **H. Schlichii**, *Kurz For. Fl.* i. 532; leaves petioled elliptic narrowed at both ends coarsely crenate glabrous, racemes terminal or subterminal, paniced grey-pubescent, stamens 3 before each petal.

CHITTAGONG, in tropical forests; *Kurz.*

7. **H. propinquum**, *C. B. Clarke*; leaves petioled oblong undulate-crenate pubescent on the midrib beneath, racemes often simple, flowers clustered pedicelled, calyx-tube oblong top-shaped segments nearly as long as the petals. *H. longifolium*, in part *Benth. in Journ. Linn. Soc.* iv. 35. *Blackwellia propinqua*, *Wall. Cat.* 4898. *B. spiralis*, *Wall. Cat.* 4897 A.

PEGU; *Wallich.*

Leaves 4–8 by $1\frac{1}{2}$ –3 in., obtuse, base usually narrowed sometimes unequally rounded; petiole scarcely $\frac{1}{4}$ in., villous. *Racemes* 6 in., towards the ends of the branches, villous-tomentose, simple or branched once; pedicels about $\frac{1}{2}$ in. *Flowers* small, 6-fid. *Stamens* 2 before each petal, both bearing anthers.

** *Racemes* elongate, simple.

8. **H. Griffithianum**, *Kurz in Journ. As. Soc.* 1877, pt. ii. 93; *For. Fl.* i. 531, character emended and all syn. excl.; leaves short-petioled elliptic-rounded subcordate at the base pubescent on the nerves above aureo-villous beneath crenate, flowers clustered very short-pedicelled 8–10-fid, calyx-tube very short. *H. foetidum*, *Benth. in Journ. Linn. Soc.* iv. 37 partly, not of others. *Blackwellia dasyantha*, *Turez. in Bull. Soc. Imp. Mosc.* 1863, 610. *Blackwellia* sp. *Griff. Notul.* iv. 584.

MERGUI, *Griffith* No. 991. TENASSERIM, *Helper.*

Branchlets with spreading yellow hairs. *Leaves* 3 by 2 in., not much acuminate, above densely yellow villous-pubescent on the nerves with scattered hairs on the surface especially near the margin; long golden spreading hairs on the midrib beneath, and bundles of similar hairs in the axils of the nerves; petiole scarcely $\frac{1}{2}$ in., densely villous. *Racemes* 6 in., tomentose; pedicels very short, less than $\frac{1}{2}$ in. *Flowers* small, but larger and more hairy than those of *H. foetidum*. *Calyx-segments* shorter than the petals. *Styles* 5.—*Griffith* states in *Notul.* that his plant has two stamens before each petal, as his specimens clearly show: it is by oversight that Mr. Kurz has described one only.

9. **H. foetidum**, *Benth. in Journ. Linn. Soc.* iv. 37; leaves petioled elliptic narrowed at both ends glabrous crenate, flowers clustered pedicelled 6–8-fid, calyx-tube short segments a little shorter than the petals. *Blackwellia foetida*,

Wall. Cat. 4899; *Deless. Ic. Sel.* iii. 53; *Miq. Fl. Ind. Bat.* i. pt. i. 714. *As-tranthus foetida*, *Wall. in Herb. Ludia foetida*, *Roxb. Fl. Ind.* ii. 508 *ex Wallich.*

MALACCA; *Griffith, Maingay* No. 664.—DISTRIB. Malaya.

A tree, branchlets leaves and petioles glabrous. *Leaves* 4–7 by $1\frac{1}{2}$ – $3\frac{1}{2}$ in., base narrowed; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. *Racemes* 6 in., minutely tomentose or glabrous; pedicels short, often $\frac{1}{2}$ in. *Stamens* 2 or 3 before each petal. *Ovary* densely villous. *Styles* 3–4 (5 *ex Maingay*). *Fruit* 1-seeded according to a note of *Maingay*.

10. **H. grandiflorum**, *Benth. in Journ. Linn. Soc.* iv. 37; leaves short-petioled elliptic-oblong entire coriaceous glabrous, flowers pedicelled solitary 6–7-fid, calyx-tube short, segments enlarged after flowering and longer than the petals, stamens about 7 to each petal.

MALACCA; *Griffith*.—DISTRIB. Sumatra.

Leaves 6 by $2\frac{1}{2}$ in.; petiole hardly $\frac{1}{4}$ in. *Racemes* 6 in., puberulo-pubescent or tomentose, pedicels about $\frac{1}{4}$ in. *Flowers* large, calyx-segments after flowering $\frac{3}{8}$ in. *Ovary* even in flower with the apex much elevated. *Styles* 5.

11. **H. travancoricum**, *Bedd. Fl. Sylv.* t. 211; leaves petioled elliptic crenate glabrous, flowers subsessile clustered usually 5-fid, calyx-tube short turbinate segments hardly half the length of the petals, stamens 3–4 opposite each petal.

SOUTH MALABAR MTS.; Travancore and Tinnivelly Ghauts; *Beddome*.

A handsome middle-sized tree (*Beddome*). *Leaves* 3–4 by $1\frac{1}{2}$ – $1\frac{3}{4}$ in., obtuse acute or acuminate, base subacute or obtuse hardly rounded; petiole less than $\frac{1}{4}$ in. *Racemes* 2–4 in., axillary, puberulo-pubescent, not so dense-flowered as in *H. zeylanicum* (*ex Beddome*); but the flowers appear as dense as in other species.

DOUBTFUL SPECIES.

H. foetidum, *Kurz For. Fl.* i. 532 *not of others*; all parts quite glabrous, leaves broadly-oblong coarsely crenate, stamens in pairs opposite the petals, ovary glabrous.

TENASSERIM, *Kurz*.

The ovary is densely villous in all the *Kew H. foetidum*.

ORDER LXIV. PASSIFLOREÆ. (By M. T. Masters.)

Twining herbs or shrubs, rarely erect. *Leaves* alternate, stipulate, simple or lobed, penni- or palmi-nerved, frequently glandular beneath. *Petiole* usually provided with glands. *Stipules* foliaceous or minute. *Tendrils* axillary or 0. *Inflorescence* axillary, cymose, sometimes with one or more branches cirrose, rarely flowers solitary. *Bracteoles* 3, minute and scattered, or foliaceous and forming an epicalyx, rarely 0. *Flowers* regular, unisexual or bisexual. *Calyx* tubular at the base, fleshy, subcoriaceous or membranous; segments imbricate, 5. *Petals* 0 or as many as the calyx-lobes, springing from the tube of the calyx, membranous or fleshy, imbricate, marcescent. *Corona* of one or more rows, filamentous or membranous or both, arising from various portions of the calyx-tube, rarely 0; basilar corona urceolate or cup-shaped, surrounding the base of the andrœcium, sometimes represented by five separate glands of the disc; rarely 0. *Stamens* 5, on a gynophore or free at the base, perigynous; anthers oblong, 2-celled, basi- or dorsi-fixed, dehiscing laterally or introrsely. *Ovary* superior, on a gynophore or subsessile, 1-celled with 3 parietal placentas, rudimentary or absent in the male flowers. *Styles* 1 or 3; stigmas reniform,

capitate or flattened. *Ovules* numerous, pendulous, anatropous; funicle expanded into a cup-shaped arillus. *Fruit* baccate or capsular. *Seeds* numerous, ovoid or flattened, often pitted, covered with a fleshy arillus, albumen fleshy, rarely scanty; embryo straight, cotyledons flat leafy, radicle short terete.—**DISTRIB.** Chiefly tropical; most numerous in South America. Genera about 20; species about 300.

Carica Papaya, L. The Papaw is commonly cultivated, and is more or less naturalized in various parts of India.

TRIBE I. Passifloreæ. *Flowers* hermaphrodite. *Stamens* hypogynous.

Twining herbs or shrubs 1. PASSIFLORA.
Erect shrubs 2. PAROPSIA.

TRIBE II. Modeceæ. *Flowers* unisexual. *Stamens* perigynous.

3. MODECCA.

1. PASSIFLORA, Linn.

Twining shrubs. *Leaves* simple or palmilobed, usually with glands on the under surface and on the petiole; stipules thread-like or leafy. *Flowers* pedunculate; peduncles simple or cymose. *Bracteoles* 3, small, scattered. *Calyx-tube* fleshy, limb 5-lobed. *Petals* 5, springing from the throat of the calyx. *Corona* of one or more rows of fine threads springing from the throat of the calyx-tube and of one or more membranous folds arising lower down. *Gynophore* surrounded at the base by a shallow membranous cup or basilar corona; filaments 5, flat; anthers oblong, 2-celled, dorsifixed; pollen grains reticulate on the surface. *Ovary* 1-celled; styles 3, stigmas reniformi-capitate. *Fruit* baccate. *Seeds* arillate.—**DISTRIB.** A large genus most abundant in tropical and subtropical America. A few are Malayan and two Chinese.

In addition to the following species, several others are cultivated in Indian gardens, and some have become more or less naturalized, as indeed in all hotter countries. Among these may be mentioned varieties of *P. fetida* and *suberosa*. A form of the latter species was described by Wight as indigenous to Ceylon under the name of *P. Walkeriæ*, 39 Ill. ii. (t. 108), but there is no reason to suppose it indigenous.

1. *P. Leschenaultii*, DC. *Prodr.* iii. 326; leaves semiorbicular truncate palminnerved shortly 3-lobed glandless pubescent especially beneath. *Wall. Cat.* 1231; *W. & A. Prodr.* 352; *Hook. Ic. Pl.* t. 353; *Wight Ic.* t. 39.

KHASIA, PULNEY and NILGHIRI Mts.

A climbing shrub. *Branches* slender, angular. *Leaves* broader than long, more or less pubescent, especially on the under surface and along the 3 nerves, rarely entirely glabrous, base rounded or cordate, apex truncately 3-lobed, lateral lobes spreading lanceolate, central lobe very small; petiole 1 in., with 2 sessile glands below the middle. *Peduncles* in pairs in the axils of the leaves, simple, longer than the petiole; bracteoles 3, remote, linear. *Flowers* 2 in. diam.; tube short, saucer-shaped. *Sepals* oblong, obtuse. *Petals* white, equalling the sepals in length but narrower. *Outer corona* near the base of the tube, of two rows of linear filaments, the outer rather shorter than the petals, the inner much shorter; *inner corona* short, tubular, membranous, plicated, margin incurved and crisped; *basilar corona* small, cup-shaped, surrounding the base of the gynophore. *Anthers* linear. *Ovary* elongate-oblong. *Fruit* 1½ by 1 in., ovoid, glabrous, yellowish; rind leathery.

2. **P. nepalensis**, Wall. *Tent. Fl. Nep.* 20, t. 11; *Cat.* 1230; leaves ovate or ovate-lanceolate entire glaucous beneath. *Griffith Itin. notes*, 24; *Ic. Pl. Asiat.* t. 605, fig. 4. *P. geminiflora*, Don *Prodr.* 63.

NIPAL, Wallich. SIKKIM, alt. 4-6000 ft. KHASIA MTS., alt. 3-6000 ft., *H. f. & T.*

A glabrous climber with slender angular branches and distant leaves. *Stipules* $\frac{1}{2}$ in., linear-subulate. *Leaves* $2\frac{1}{2}$ -4 by 2-3 in., thin, membranous, deep green above, glaucescent beneath, marked near the base with 2-3 flat circular glands, rounded or cordate at the base, apiculate, 1- or sub-3-nerved, nerves prominent, smaller nerves arched, remote, inconspicuous; petiole $\frac{1}{2}$ in., usually with two glands above the middle. *Peduncles* simple, in pairs in the axils of the leaves, about half the length of the petiole, slender, 1-flowered, jointed above the middle, rarely cymose; cymes lax, few-flowered. *Flowers* less than $\frac{1}{2}$ in. diam., cup-shaped; tube short, cylindrical. *Calyx-lobes* longer than the tube. *Petals* equal to the calyx-lobes. *Corona* of many rows of short threads. *Gynophore* shorter than the flower. *Ovary* ovoid or subglobose, glabrous. *Fruit* subglobose, the size of a large pea, purplish.

EXCLUDED SPECIES.

P. CALONEURA, Kurz in *Journ. As. Soc.* 1877, ii. 95, described as from "Burma probably Upper Tenasserim or Martaban, Brandis," is, according to an authentic specimen sent by Dr. Kurz from the Calcutta Herbarium, the *Aristolochia trilobata*, L., of the West Indies and South America, no doubt introduced into India; it is not in flower or fruit, but the nervation of the leaf, no less than its form and indumentum, leaves no doubt as to this identification.

P. HEYNEANA, Wall. *Cat.* 1233 bis (alias 2248) is an *Olacinea*, probably referable to *Erythropalum populifolium*, Mast.

2. PAROPSIA, Noronh.

Shrubs. *Leaves* simple. *Flowers* in dense axillary cymes. *Calyx-tube* short; limb 5-parted. *Petals* 5, springing from the base of the calyx-tube. *Corona* of fine threads springing from the tube of the calyx and more or less divided into five antipetalous phalanges. *Gynophore* short; filaments flat; anthers oblong. *Ovary* subglobose. *Style* short dividing into three branches; stigmas reniformi-capitate. *Fruit* capsular.—DISTRIB. 4 or 5 species, natives of tropical Africa and Malaya.

1. **P. malayana**, Planch.; Mast. in *Trans. Linn. Soc.* xxvii. 639; leaves oblong finely serrated with a long abrupt acumen, calyx-tube campanulate, ovary globose.

MALACCA, Maingay, Griffith.

A shrub. *Leaves* $3\frac{1}{2}$ by 1 in.; petiole $\frac{1}{2}$ in. *Flowers* $\frac{1}{2}$ in. in diam. *Calyx* campanulate, tube short covered with tawny down; lobes oblong, obtuse, 4 or 5 times longer than the tube. *Petals* oblong, 1-nerved, half the length of the sepals. *Corona* of a single row of flat, villose threads, half the length of the petals and arising with them from the margin of the tube. *Gynophore* shorter than the petals. *Stamens* 5, filaments filiform; anthers oblong. *Ovary* globose, villose. *Stigmas* large, capitate-reniform.

2. **P. vareciformis**, Mast. in *Trans. Linn. Soc.* xxvii. 639; leaves oblong-obovate acuminate entire, calyx-tube very short, ovary turbinate. *Trichodia vareciformis*, Griff. *Notul.* iv. 571.

MALACCA, Griffith.

Shrub, more or less rusty pubescent. *Leaves* 6 by $2\frac{1}{4}$ in., coriaceous, glabrous

above; petiole under $\frac{1}{2}$ in. *Peduncles* $\frac{1}{8}$ in. *Flowers* nearly $\frac{1}{2}$ in. *Calyx*-segments leathery. *Petals* narrow at the base, ciliated. *Ovary* turbinate, villous. *Fruit* the size of a hazel nut, subglobose; rind dry, leathery. *Seeds* ovoid, flattened, pitted.—Larger in all its parts than *P. malayana*.

3. **MODECCA**, Lam.

Twining herbs or undershrubs. *Leaves* entire or palmilobed, usually with two or more flat, circular glands on the under surface and with similar glands at the apex of the petiole. *Cymes* axillary, few- or many-flowered, on long peduncles one or more of which is sterile and tendril-like. *Male flower*: *Calyx* tubular or bell-shaped; limb 5-lobed, lobes leathery, imbricate. *Petals* 5, free, membranous, 1-nerved, springing from the calyx-tube. *Corona* a ring of threads arising from near the base of the calyx-tube, or wanting. *Glands of the disc* 5, opposite the sepals, strap-shaped or capitate. *Andræcium* cup-shaped, membranous beneath; filaments 5, linear-subulate; anthers linear-oblong, 2-celled. *Ovary* rudimentary or 0. *Female flower*: *Calyx* and *corolla* as in the male. *Corona* a membranous fold, springing from near the base of the calyx-tube or none. *Glands of the disc* 5, strap-shaped, capitate, opposite the sepals. *Staminal nodes* 5, forming a membranous cup surrounding the base of the ovary, above dividing into barren filaments. *Ovary* globose or elliptic, sessile or stalked; style cylindrical or none; stigmas 3, capitate or flat and dilated. *Fruit* capsular, 3-valved. *Seeds* numerous, attached by long funicles to parietal placentas.—**DISTRIB.** A small genus, native of the tropics of the Old World.

SECT I. Microblepharis, W. & A. *Petals* springing from the throat of the calyx-tube, stigmas sessile.

1. **M. Wightiana**, Wall. Cat. 6764; leaves membranous uniform or diverse all cordate ovate acute or some more or less palmately 3-lobed. *Wight Ic.* 179; *W. & A. Prodr.* i. 353; *Thwaites Enum.* 128. *M. diversifolia*, Wall. Cat. 6763.

Hills of the WESTERN PENINSULA, and CEYLON.

Root tuberous. *Branches* striated, roughish. *Leaves* 2–3 by 2 in., glabrous, from ovate entire rounded or slightly cordate at the base to hastate or palmately lobed; the central lobe longest, obtuse; nerves remote; petiole about 1 in., with a sessile gland on each side at the top. *Peduncles* axillary, filiform. *Flowers* not seen. *Calyx*, according to Wight's figure, small; tube short, lobes ovate. *Petals* broad, shorter than the sepals, attached to the throat of the calyx. *Ovary* subglobose, surmounted by three cuneate, fringed, reflexed stigmas. *Fruit* glabrous, the size of a small plum, subglobose or ovoid, 3-valved. *Seeds* flattened, heart-shaped, rugulose, with parallel ridges around the margins.—Wight and Arnott refer Wallich's *M. diversifolia* to *Vitis lanceolaria*, but the type specimen in Wallich's herbarium clearly belongs to the present species.

2. **M. singaporeana**, Mast.; leaves leathery shortly petioled oblong acuminate, flowers elongate, anthers apiculate. *Passiflora singaporeana*, Wall. Cat. 1232.

MALACCA. Singapore, Wallich.—**DISTRIB.** Borneo.

Glabrous. *Leaves* 3–4 by 2 in., coriaceous, oblong-obovate, obtuse, tapering to the base, midrib prominent, secondary nerves remote; petiole $\frac{1}{2}$ in., with a large sessile gland on either side at the top. *Tendrils* as long as the petiole. *Male flowers* $\frac{1}{2}$ in., elongate-fusiform. *Calyx* leathery, shortly 5-lobed, lobes ovate, connivent (? always). *Petals* thick, leathery, oblong acute, springing from the calyx-tube just

beneath the throat. *Corona* none (?). *Glands of the disc* 5, small, oblong, at the base of the calyx-tube, opposite to its lobes. *Stamens* 5; anthers subsessile, erect, linear; connective long, thread-like. *Rudimentary ovary* fusiform. *Fruit* 2 in., long, glabrous, fusiform.—Maingay's specimens, like Wallich's, are very imperfect, but the two are sufficiently alike to leave no doubt of their specific identity.

3. **M. cardiophylla**, *Mast.*; leaves membranous long petioled cordate-ovate acute shortly acuminate, anthers muticous.

SIKKIM, KHASIA MTS., and ASSAM.

Glabrous. *Branches* terete. *Leaves* remote, 6-8 by 4-5 in., entire, rarely palmately lobed, basal lobes rounded divaricate; petiole 2-3 in., with a sessile gland on either side at the apex. *Cymes* many-flowered, on a cylindrical peduncle as long as the petiole, one branch cirrose. *Male flowers* $\frac{1}{2}$ in., bell-shaped. *Calyx* leathery, spotted, 5-lobed to the middle; lobes oblong, obtuse. *Petals* membranous, white, ovate, obtuse, springing from about the middle of the tube. *Andræcium* membranous and tubular below, above divided into five filaments; anthers linear-ovate, acute. *Glands of the disc* 5, small, opposite to the sepals. *Female flower*: *Calyx* $\frac{1}{2}$ in., funnel-shaped, slightly dilated above the base, leathery, spotted; lobes oblong, 3-nerved. *Petals* membranous, springing from the middle of the calyx-tube, oblong, 1-nerved, entire or minutely serrulate. *Glands of the disc* opposite the sepals, small, oblong, curved. *Barren stamens* forming a shallow membranous tube, divided above into filiform segments. *Ovary* raised on a short gynophore, ovoid, surmounted by a large peltate stigma with 3 reflexed wedge-shaped laciniate lobes.—In foliage very like the entire-leaved form of *M. palmata*, but the anthers and stigmas are quite different.

4. **M. cordifolia**, *Blume Bijdr.* 939; *Rumphia*, i. t. 49; leaves membranous cordate roundish acute not acuminate bullate, fruit elongate tapering to both ends. *Miq. Fl. Ind. Bat.* i. 702; *Kurz in Journ. As. Soc.* 1876, ii. 132 and 1877 ii. 95. ? *M. heterophylla*, *Kurz Andam. Rep. Append. A.* 39.

ANDAMAN ISLANDS, *Kurz*.—DISTRIB. JAVA.

Leaves 2-3 by 2 in., shortly petiolate, slightly glaucous beneath. *Calyx* elongate, constricted at the neck. *Petals* small. *Anthe*rs oblong muticous. *Fruit* 3 by 1 in.—I have seen no authentic specimen of this either from the Andamans or from Java. The specimen labelled by *Kurz heterophylla* in the herbarium has much larger and markedly acuminate leaves. It is probably an entire-leaved form of *M. palmata* or *M. trilobata*.

SECT. II. **Blepharantes**, *W. & A.* *Petals* springing from the base of the calyx-tube. *Style* trifid or styles 3; stigmas capitate.

5. **M. trilobata**, *Roxb. Cor. Pl.* t. 297; *Fl. Ind.* iii. 133; leaves membranous cordate 3-lobed with a gland under each sinus, anthers muticous, fruit oblong. *Wall. Cat.* 1234; *Kurz in Journ. As. Soc.* 1877, ii. 95.

SIKKIM, ASSAM, KHASIA MTS., CACHAR, CHITTAGONG.

Glabrous. *Branches* terete, glabrous, sulcate. *Leaves* remote, broader than long, 6-8 by 8-9 in., 3-5-lobed, cordate or hastate at the base; lobes oblong-obovate, acuminate, central one narrowed to the base. *Glands* 2, orbicular, flat, on the under surface of the leaf near the base; petiole 4 in., cylindrical, with a pair of glands at the extreme apex. *Peduncles* axillary, 5-6 in., divided near the apex into a leafless, many-flowered cyme, one branch of which is cirrose. *Male flower*: *Calyx* less than $\frac{1}{2}$ in., campanulate, 5-lobed, lobes oblong, obtuse. *Petals* oblong-obovate, springing from the base of the calyx-tube. *Stamens* 5, united at the base, filaments slender; anthers linear, obtuse. *Glands of the disc* 5, ligulate, incurved, opposite the sepals. *Rudimentary ovary* minute. *Female flower*: *Calyx* and *petals* as in the male, but larger. *Glands of disc* 5, ribbon-like, recurved. *Staminodes* 5, united at the base

into a membranous cup. *Gynophore* short. *Ovary* elongate, ovoid; style short, stigma large capitate 3-lobed. *Fruit* scarlet, oblong, $2\frac{1}{2}$ by $1\frac{1}{2}$ in.

6. **M. palmata**, Lam. *Encycl.* iv. 209; leaves membranous glabrous glandular palmately lobed or entire, anthers obtuse muticous, fruit globose. Wall. Cat. 6762 A and B; Wight Ic. t. 201; W. & A. Prodr. 353; Thwaites Enum. 128; Dalz. & Gibs. Bomb. Fl. 104; Mig. Fl. Ind. Bat. i. 703. M. tuberosa, Roxb. Fl. Ind. iii. 134. M. integrifolia, Lam. l. c. (not of Wall. Cat. 6765).—Rheede Hort. Mal. viii. t. 20-23.

WESTERN PENINSULA AND CEYLON.

Glabrous. *Branches* sulcate. *Leaves* remote, broader than long, 4-5 by 6-7 in., roundish, cordate, usually 3-5-lobed nearly to the base with a single circular flat gland beneath the sinus, sometimes entire, cordate, ovate, acuminate; lobes oblong-lanceolate, acuminate, tapering to the base; petiole 2 in., with a gland on either side at the apex. *Male flower*: *Calyx* about $\frac{1}{2}$ in., campanulate, 5-lobed, dilated at the base, lobes ovate-acute. *Petals* linear-oblong, 3-nerved, ciliate, springing from the base of the calyx-tube. *Corona* a ring of threads from the tube of the calyx, just above the dilated portion. *Filaments* subulate, united at the base; anthers linear-oblong. *Female flower*: *Calyx* $\frac{1}{2}$ in., campanulate; lobes ovate-acute. *Petals* linear, acute, ciliated, springing from the base of the tube. *Corona* a membranous fold fringed with white hairs, arising from near the base of the flower tube. *Glands* of disc oblong, opposite the sepals. *Staminodes* 5, forming a membranous cup surrounding the base of the ovary and above divided into flat strap-shaped filaments nearly as long as the glabrous subglobose ovary. *Style* nearly as long as the ovary, dividing into 3 branches; stigmas large capitate. *Fruit* the size of a small apple, subglobose. *Seeds* large, pitted, ribbed at the edges.—Root said to be poisonous, used as medicine by the Cingalese (Thwaites l. c.). M. integrifolia, Wall. Cat. 6765, is a garden specimen of uncertain identity not referable to the present species.

IMPERFECTLY KNOWN SPECIES.

M. ALIENA, Wall. Cat. 6766, from Silhet, is an Asclepiad, the flowers of which are too imperfect for determination.—There is no specimen in Wallich's herbarium.

M. APICULATA, Mast.; leaves membranous cordate roundish deeply 5-sect, segments lanceolate narrow at the base with a gland beneath the sinus on the under surface, anthers apiculate, fruit ovoid.—Burma, Pegu, McClelland.

Glabrous. *Branches* sulcate. *Petiole* 2 in. *Tendrils* very long. *Anthers* linear with a long slender apiculus. *Fruit* $1\frac{1}{4}$ in., ovoid, acute. *Seeds* subglobose slightly flattened.—Imperfect specimens only exist in the Kew herbaria, Sir Joseph Hooker who analysed the flower states in a note that it differs from M. trilobata by the apiculate anther. Possibly it may be the M. furfuracea of Wallich (see below).

M. FURFURACEA, Wall. Cat. 1235. Prome, Wallich.—There is no specimen of this in Wallich's herbarium.

M. NICOBARICA, Kurz in Trimen Journ. Bot. 1875, 327; Journ. As. Soc. 1876, ii. 132; leaves subcoriaceous oblong-acuminate rounded at the base and subpetate. Passiflora penangiana, Wall. Cat. 1233.—Penang, Wallich. Malacca, Griffith.

Glabrous. *Stems* very slender, sulcate. *Leaves* 4 by 1-2 in., oblong or oblong-lanceolate, 1-nerved, secondary nerves remote, arched; petiole eglandular, $\frac{3}{4}$ in. attached to the blade just within the base. *Tendrils* about 2 in. branched, thickened at the ends. *Fruit* $1\frac{1}{2}$ -2 in. long, glabrous, oblong, acute, 3-valved. *Seeds* discoid.—The specimens of Wallich and of Maingay are imperfect, but evidently belong to the same species.

M. POPULIFOLIA, Blume Rumphia, i. t. 50.—To this I refer with doubt Maingay n. 668 with cordate ovate-acute leaves, petioles with two large apical glands, fruits about 3 in. long tapering to both ends.

ORDER LXV. **CUCURBITACEÆ.** (By C. B. Clarke, F.L.S.)

Climbing herbs or shrubs; tendrils solitary, lateral, spiral, simple or divided. *Leaves* alternate, petioled, frequently cordate, simple lobed or pedately divided. *Flowers* monœcious or diœcious, yellow or white, racemed and solitary, less commonly paniced. *Calyx-tube* wholly adnate to the ovary (except in *Actinostemma*); limb rotate campanulate or tubular; lobes 5 (rarely 3), imbricate. *Petals* 5, inserted on the calyx-limb, united in a tube or nearly or quite free, sometimes fimbriated at the margin, valvate or involute in the bud. *Stamens* inserted at the mouth or about the middle or at the base of the calyx-tube, usually 3 (sometimes 5 or 2); anthers free or united into a tube, one usually 1-celled and the other two 2-celled, cells straight or flexuose or conduplicate, the connective sometimes crested or produced. *Ovary* inferior (in *Actinostemma* half-superior), usually 3-carpellary; style 1 with 3 stigmas, more rarely styles 2-3-4; placentas usually 3, vertical, in double lines, the edges of the carpellary leaves being often turned in so far that the ovary (in flower time even) is spuriously 3-celled; ovules usually many, horizontal, rarely pendulous, sometimes few and pendulous from near the top of the ovary (in *Dicalospermum* 3 erect from the base of the ovary?). *Fruit* generally berried or fleshy, indehiscent or dehiscing by valves or by a stopple, often 1-celled, the seeds being often packed in pulp or fibre. *Seeds* usually many, often compressed, horizontal, pendulous (or in *Dicalospermum* erect), frequently corrugated or subspinose on the margins, albumen 0.—**DISTRIB.** Species 400, in the warmer parts of the whole globe especially in the tropics.

TRIBE I. Cucumerinæ. *Ovules* horizontal (or pendulous). *Female flowers* usually solitary, never paniced. *Leaves* not divided into distinct leaflets (except rarely in *Thladiantha*).

A. *Anther-cells conduplicate or sigmoid.*

* *Corolla divided nearly or quite to the base into 5 petals.*

† *Petals fimbriate at their margin.*

Seeds 6. Calyx-tube 3-4 in. 1. HODGSONIA.

Seeds many. Calyx-tube less than 3 in. 2. TRICHOSANTHES.

†† *Petals entire.*

a. *calyx-tube of the male flower elongate; anthers usually included in the tube or nearly so.*

Seeds many, horizontal. Tendrils rarely divided 3. GYMNOPTALUM.

Seeds many, horizontal. Tendrils 2-3-fid. Petiole without glands. 4. WAREA.

Seeds 12-18, pendulous 5. HERPETOSPERMUM.

Tendrils divided. Fruit very large. Petiole with 2 glands at apex 6. LAGENARIA.

b. *Calyx-tube of the male flower short; anthers usually exerted from the tube or nearly so.*

a. *Stamens inserted near the mouth of the calyx-tube; anthers hardly or not at all cohering.*

- Male flowers (partly) in racemes. Fruit opening by
 a stopple 7. LUFFA.
 Flowers all solitary. Fruit very fleshy, indehiscent . 8. BENINCASA.

*β. Stamens inserted below the mouth of the calyx-tube; anthers
 more or less cohering.*

- Male flowers (partly) racemed. Tendrils simple . . 9. MOMORDICA.
 Male flowers clustered or solitary. Tendrils simple . 10. CUCUMIS.
 Flowers all solitary. Tendrils 2-3-fid 11. CITRULLUS.

*** Corolla campanulate, divided half way down or thereabout.*

- Tendrils simple. Flowers white 12. CEPHALANDRA.
 Tendrils divided. Flowers yellow 13. CUCURBITA.

B. Anther-cells straight (or in Bryonia somewhat curved).

** Flowers not large, yellow, male racemes or pedicels not stout.*

† Male and female pedicels 1-flowered, clustered.

- Tendrils 2-fid 14. BRYONIA.
 Tendrils simple 15. MUKIA.

†† Male flowers corymbose or subumbellate or racemed.

- Fruit shortly peduncled. Connective not produced . 16. ZEHNERIA.
 Fruit on a capillary peduncle. Connective produced . 17. MELOTHRIA.
 Fruit sessile, beaked 18. RHYNCHOCARPA.
 Fruit circumsciss near the base 19. CORALLOCARPUS.
 Fruit subsessile, indehiscent, without a beak . . . 20. CERASIOCARPUM.
 Ciliate bracts resembling stipules at base of the
 petioles 21. CTENOLEPIS.

*** Flowers large deep yellow, male raceme stout.*

- Calyx-tube short. Seeds very many 23. THLADIANTHA.
 Calyx-tube elongate. Seeds 3-9 24. EDGARIA.

TRIBE II. Orthospermeæ. *Ovules and seeds erect.*

- Seeds 3, each with two empty cells 22. DICÆLOSPERMUM.

TRIBE III. Zanoniææ. *Ovules pendulous. Flowers small, the females
 in panicles or many-flowered racemes. Stamens 5, free, each with a single
 small straight anther.*

A. Leaves not divided into separate leaflets.

- Fruit small circumsciss. Leaves serrate 26. ACTINOSTEMMA.
 Fruit long clavate. Leaves subentire 28. ZANONIA.

B. Leaves pedately divided into 3-5 leaflets.

- Fruit trigonous obovoid. Leaflets serrate. Tendrils
 bifid 25. GOMPHOGYNE.
 Fruit pea-like. Leaflets serrate. Tendrils simple . 27. GYNOSTEMMA.
 Fruit elongate clavate. Leaflets entire 29. ALSOMITRA.

1. **HODGSONIA**, *H. f. & T.*

A large climber. *Leaves* coriaceous, 3-5-lobed, long-petioled; tendrils 2-3-fid. *Flowers* large, dioecious; males in long racemes; bracts oblong, entire, deciduous; females solitary. **MALE:** calyx long-tubular, mouth shortly campanulate, teeth 5, short; petals 5, connate at the base, very long-fimbriate; stamens 3, filaments very short; anthers exserted, connate, linear, one 1-celled, two 2-celled, cells conduplicate. **FEMALE:** calyx and corolla as in the male; ovary globose, 1-celled; style long, stigmas 3 oblong bifid exserted; placentas 3, parietal, near the base of the ovary, 2-ovulate on each side. *Fruit* large, depressed globular, 12-grooved, flesh hard; perfect seeds usually six, each having a smaller commonly barren one attached to its side, flat-ellipsoid, with sunk veins.

1. **H. heteroclita**, *H. f. & T. in Proc. Linn. Soc.* ii. 257; *Hk. f. Ill. Himal. Pl.* t. 1, 2, 3; *Fl. d. Serres*, t. 1262; *Kurz in Journ. As. Soc.* 1877, pt. ii. 97. *Trichosanthes heteroclita*, *Roxb. Fl. Ind.* iii. 705; *Wall. Cat.* 6684, A, B, C. *T. grandiflora*, *Wall. Cat.* 6685 not of Blume.

SIKKIM; alt. 0-4000 ft. ASSAM. KHASIA MTS. alt. 0-3000 ft. EAST BENGAL and CHITTAGONG; PEGU and MARTABAN; *Kurz*. PINANG and MALACCA.

Stem extending sometimes 100 ft. *Leaves* 6-8 in. long and broad, glabrous, deeply lobed; lobes entire or very sparingly denticulate, acute. Male racemes 8 in.; bracts $\frac{1}{2}$ in. *Calyx* often rusty-pubescent without, tube 3-4 by $\frac{3}{8}$ in. *Corolla-lobes* 2 in., brown-villous, 3-nerved without, white, tinged yellow within, ending in a fringe 4 in. *Fruit* 4-10 in. wide, red-brown, closely tomentose. *Seeds* 2-3 by 1-1 $\frac{1}{2}$ in.

2. **TRICHOSANTHES**, *Linn.*

Scandent herbs. *Leaves* entire or 3-9-lobed, denticulate; tendrils usually 2-5-fid. *Flowers* dioecious less often monœcious, white; male peduncles usually in axillary pairs, one 1-flowered caducous, the other racemose; bracts large or small or 0; female flower solitary. **MALE:** calyx long-tubular; teeth 5, lanceolate, entire serrate or laciniate. *Corolla* 5-fid nearly to the base, lobes long-fimbriate; stamens 3; anthers almost included, connate (free in *T. dioica*), long-linear, one 1-celled, two 2-celled, cells conduplicate. **FEMALE:** calyx and corolla as in the male. *Ovary* inferior, at the base of the calyx-tube, 1-celled; style filiform, 3 or 6-fid at apex; placentas 3, parietal; ovules very many, horizontal, half-pendulous. *Fruit* lanceolate or globose, smooth, acute or obtuse at the apex. *Seeds* many, horizontal, packed in pulp, compressed, ellipsoid, sometimes angular on the margin.—**DISTRIB.** Species 20, in South-East Asia, extending through Malaya to North Australia in one direction, through China to Japan in another.

* *Bracts of the male raceme large, sheathing the flowers from a broad base.*

1. **T. palmata**, *Roxb. Fl. Ind.* iii. 704; leaves palmate half-way down in 5 or 3-7 broad lobes (but vary from angular nearly entire to deeply palmate with linear-oblong lobes), bracts ovate or obovate lacerate or strongly serrate, fruit globose the size of a small orange, seeds $\frac{3}{8}$ in. scarcely angular on the margins. *Wall. Cat.* 6688 excl. C, F; *W. & A. Prodr.* 350 as to α and β ; *Wight Ill.* t. 104, 105; *Dalz. & Gibs. Bomb. Fl.* 103. *T. laciniosa*, *Wall. Cat.* 6689 A, B. *T. aspera*, *Heyne in Herb. Rottler.* *T. tricuspis*, *Miq. Fl. Ind.*

Bat. i. pt. i. 679. *T. cordata*, Wall. Cat. 6686 excl. A and B. *T. anguina*, Wall. Cat. 6687 F partly. *T. bracteata*, Kurz in Journ. As. Soc. 1877, pt. ii. 99. *Cucurbita Melopepo*, Wall. Cat. 6725. *Involucraria Wallichii*, Seringe in DC. Prodr. iii. 318. *Bryonia palmata*, Wall. Cat. 6711 F.

From the HIMALAYAS to CEYLON and SINGAPORE; very common in all moist thickets, ascending to 5000 ft.—DISTRIB. Malaya, China, Japan, North Australia.

Climbing often 30 ft. *Diœious* so far as all the examples go, but Roxburgh has placed it in Monœcia without remark. *Leaves* 2–6 in. diam., not at all hairy beneath, usually glabrous or less commonly scabrous on the nerves, often with several large glands near the apex of the petiole, cordate at the base; segments dentate, serrate, divaricate, sometimes subpinnatifid (var. *incisa* Heyne), usually acute (but obtuse in var. *sinuata*, Heyne); petiole 1–3 in. *Tendrils* commonly 3-fid. Male *peduncles* usually paired, the racemed one 6 in., naked below; bracts ovate or obovate, glabrous or viscid with scattered glands or pubescent. *Calyx-tube* 1½ in., closely tomentose or glabrous; sometimes much larger in the Sikkim examples; teeth long-lanceolate, sometimes dentate serrate or subpinnatifid. *Fruit* 1½–2 in. diam., not acute, bright red with 10 orange streaks. *Seeds* very many, immersed in green pulp.—The extreme forms of the leaves are var. *laciniosa*, Wight, which has the leaves palmate nearly to the base the segments scarcely ¼ in. wide and sometimes subpinnatifid; and var. *Thomsoni* from Moradabad with the leaves entire and slightly 5-angular; in both the leaves are coriaceous and with their petioles more or less covered with scattered round white minute flat scales. The Himalayan specimens recede further by their large subsucculent flaccid leaves and very large flowers.

VAR. *Scotanthus*, C. B. Clarke; calyx-teeth broad-lanceolate entire, petals nearly destitute of fimbriations especially in the female.

VAR. *tomentosa*, Heyne in Herb. Rottler; leaves tomentose beneath divided not more than half-way down.—Deccan Peninsula Mts.; Wight No. 1134, 1136 partly; G. Thomson. Ceylon, alt. 2600 ft.; Gardner.—This looks like a good species but the fruit and seeds are as in var. 1. This closely resembles the Australian *T. subvelutina* Muell. in Herb. referred to *T. palmata* by Benthams. The distribution of *T. palmata* is extended to Japan on the faith of two examples collected by Maximowicz. They belong to the commonest Bengal type of *T. palmata*, but bear the name *T. japonica*, Regel, which in Regel Ind. Sem. 1868, p. 90, is said to have solitary male flowers, and has been referred by authors to the neighbourhood of *T. cucumerina*. A *Trichosanthes* collected in Mergui by Griffith No. 759 (No. 2532 Kew Distrib.) has the leaves with short hairs beneath; otherwise resembles the var. *tomentosa*.

2. ***T. multiloba***, Miq. Ann. Mus. Lugd. Bat. ii. 82; leaves deeply (only half-way down) palmate in 5 or 3–9 lobes narrowed near their base, bracts ovate or obovate deeply serrate, fruit 2–4 in. ovoid or oblong acute, seeds ¾–1 in. more or less angular on the margins. *T. grandibracteata*, Kurz in Journ. As. Soc. 1877, pt. ii. 99 ex descr.

SIKKIM, East Himalaya and KHASIA Mts.; alt. 2000–6000 ft.; plentiful. MALACCA? Maingay 671.—DISTRIB. China?. Bhamo. Japan.

Rambling extensively. *Diœious*. *Leaves* 3–6 in. diam., usually glabrous beneath or less commonly scabrous with scattered bristles, subcordate at the base; segments serrate (sometimes lobed), ascending, less divaricate than in *T. palmata*, acute; petiole 1–3 in., often with several large glands near the apex; tendrils commonly 3-fid. Male *peduncles* usually paired, the racemed one 6 in., naked below. *Calyx-tube* 1–2½ in.; teeth lanceolate-subulate, entire. *Fruit* bright red with orange streaks. *Seeds* very many in green pulp.—This is perhaps a variety of *T. palmata*, the Himalayan large form of which it so closely resembles, that in the absence of the fruit it cannot always be distinguished from it.—The locality “China” is added on the faith of Hance’s No. 13,745 marked *T. palmata* Roxb. which it may be, as it does not exhibit fruit nor does Maingay’s Malacca example.

VAR. ? *majuscula* (*Trichosanthes* sp. 7 *Herb. Ind. Or. Hk. f. & T.*); male raceme stout more than 1 ft., bracts long little serrate, leaves very large. Khasia Mts.; alt. 4000 ft.; *Hk. f. & T.*—Perhaps a new species, but the examples consist of male racemes and leaves only. No. 12,298 C. B. Clarke (Darjeeling alt. 3000 ft.) seems the same.

3. ***T. cordata***, *Roxb. Fl. Ind.* iii. 703; leaves cordate-ovate acute entire or obscurely angular-lobed hairy beneath, bracts elongate obovate entire or scarcely serrate, fruit globose size of a small orange, seeds $\frac{1}{2}$ in. scarcely angular on the margins. *Wall. Cat.* 6686 A.; *Kurz in Journ. As. Soc.* 1877, pt. ii. 99. *T. tuberosa*, *Roxb. Ic. ined.* *T. palmata*, *Wall. Cat.* 6688 F partly, & C.

From the base of the EASTERN HIMALAYA in SIKKIM and ASSAM to PEGU. Frequent in the KHASIA Terai and CACHAR.

An extensive climber. *Diœcious*. Leaves often 6–8 in., dentate-serrate; tendrils usually 3-fid. Male *peduncles* usually paired, the racemed one often 8 in., stout; bracts pubescent. *Calyx-tube* $1\frac{1}{2}$ in., densely hairy without, segments finely acuminate. *Fruit* almost exactly as in *T. palmata*, bright red, orange-streaked, apex not acute.

VAR. *subpedata*; leaves pedately lobed almost to the base.—Cachar; C. B. Clarke.—The bracts and indumentum are exactly as in the type. Judging by the description, *T. macrosiphon*, *Kurz in Journ. As. Soc.* 1872, pt. ii. 308, differs less from *T. cordata*, *Roxb.* than does this var. *subpedata*.

** *Bracts of the male raceme large, subpersistent, narrowed to the base, not sheathing.*

4. ***T. truncata***, C. B. Clarke; leaves ovate from a truncate hastate or obtuse (not cordate) base sometimes subpeltate entire or irregularly tricuspid glabrous denticulate or not, bracts ovate slightly serrate nearly glabrous, female plant unknown.

SIKKIM, alt. 1000 ft.; J. D. H. KHASIA Mts., alt. 4000 ft. (Cherra Coal-pit) *H. f. & T.*; C. B. Clarke.

Stem twining; tendrils 2–3-fid. Leaves glabrous coriaceous or membranous, polymorphous, sometimes exactly ovate with a rounded subentire margin sometimes deeply 3-cuspidate. Male *peduncle* 6 in. *Calyx-tube* $\frac{3}{4}$ – $1\frac{1}{2}$ in., somewhat tomentose without: corolla (ex *Hook. f.*) greenish-white.

5. ***T. himalensis***, C. B. Clarke; leaves palmately 3-lobed deeply cordate villous or pubescent beneath, bracts lanceolate incise-serrate, fruit 3–4 in. long-cylindric tapering at both ends. *T. cordata*, *Wall. Cat.* 6686 B. *Cucurbita ficifolia*, *Wall. Cat.* 6721.

SIKKIM, alt. 2000–5000 ft. from Yoksun to the plains; J. D. H., C. B. Clarke.

Stems extensively climbing, with the petioles and leaves pubescent and hairy. *Diœcious*. Leaves 5 in., usually deeply palmate, irregularly serrate; tendrils 3-fid. Male *peduncles* 3–4 in., bracts $\frac{1}{2}$ – $\frac{3}{4}$ in. *Calyx-tube* $1\frac{1}{2}$ –2 in., very narrow, little hairy without. *Fruit* 3–4 by $1\frac{1}{4}$ in., nearly circular in section. *Seeds* $\frac{1}{4}$ – $\frac{1}{2}$ in. diam., polymorphous, sometimes obovoid the broader part subtrimerous, sometimes drum-shaped.—Certain seeds were sent by Dr. Anderson to Naudin, who grew them and has placed the resulting leaves in the Kew Herbarium accompanied by a drawing of the seed, and has attached the name *Platygonia himalensis* thereto. These leaves may belong to the present species.

VAR. *glabrior*; leaves glabrous above pubescent or scabrous on the nerves beneath.—Khasia; alt. 4000 ft. *Trichosanthes* sp. 9 *Herb. Ind. Or., H. f. & T.*—The examples are of leaves and male racemes only.

*** *Bracts of the male raceme 0 or minute.*

6. **T. dicælosperma**, C. B. Clarke; leaves cordate-ovate acute denticulate softly shortly pubescent on both surfaces, fruit $1\frac{1}{2}$ in. diam. globose, seeds $\frac{1}{2}$ in. compressed subquadrate equally 3-celled the lateral cells empty. ?*T. reniformis*, Kurz in *Flora* 1871, 294.

SIKKIM, alt. 2000–5000 ft.; J. D. H. KHASIA Mts., alt. 4000 ft.; H. f. & T.

Stems long, twining, innovations at least pubescent. *Diœcious*. Leaves 4 by $3\frac{1}{2}$ in., not at all lobed; petiole $1\frac{1}{2}$ in.; tendrils 2-fid. Male *peduncles* paired, one early 1-flowered, the other 2–3 in., racemed, ebracteate. *Calyx-tube* $1\frac{1}{4}$ in., narrow, pubescent. *Fruit* pubescent, with 10 paler vertical bands. *Seeds* in orange pulp.—This is perhaps Kurz's *reniformis* obtained in Sikkim, but it can hardly be *T. reniformis*, Mig. *Fl. Ind. Bat.* i. pt. i. 675, which has obtuse lobes to the leaves and the male spikes leafy-bracteate.

7. **T. dioica**, Roxb. *Fl. Ind.* iii. 701; leaves cordate oblong acute, petiole scabrous woolly, male flowers not racemed woolly without, anthers free. *Wall. Cat.* 6692 A, B, D.

Throughout the plain of NORTH INDIA from the PUNJAB to ASSAM and EAST BENGAL; common.

Stems twining extensively, more or less woolly and scabrous. *Diœcious*. Leaves 3 by 2 in., harsh, sinuate-dentate, not lobed; petiole $\frac{3}{4}$ in.; tendrils 2-fid. Male *peduncles* paired, the second-flowering often 2 in. but not racemed in any example at Kew. *Calyx-tube* $1\frac{3}{4}$ in., narrow. *Fruit* 2– $3\frac{1}{2}$ in., oblong or nearly spherical, acute, orange-red. *Seeds* $\frac{3}{8}$ – $\frac{1}{2}$ in., half-ellipsoid, compressed, corrugate on the margin.—United with the next species by Benth. in *Fl. Austral.* iii. 315. Roxburgh says "Stamens three distinct" which has been repeatedly verified in the living plant.

8. **T. nervifolia**, Linn.; DC. *Prodr.* iii. 314; leaves cordate oblong acute, petiole glabrous, male flowers partly racemed glabrous. W. & A. *Prodr.* 349. *T. cuspidata*, Lamk.; DC. *Prodr.* iii. 314.—Rheede *Hort. Mal.* t. 16, 17.

DECCAN PENINSULA; Quilon, Wight. Kurg (tropical region); G. Thomson. CEYLON; not uncommon up to 5000 ft.; Thwaites.

Stems twining, glabrous. *Diœcious*. Leaves 3 by $1\frac{1}{2}$ –2 in., membranous, sinuate-dentate, not lobed; petiole $\frac{3}{4}$ in.; tendrils 2-fid. Male *peduncles* usually paired, the second-flowering carrying a raceme (finally elongate and zigzag) of about 12 flowers. *Calyx-tube* $1\frac{1}{2}$ in. *Fruit* (and seeds from Rheede's drawing) 2–3 in., circular in section, about twice as long as broad, acute. *Seeds* $\frac{3}{8}$ – $\frac{1}{2}$ in., half-ellipsoid, compressed, corrugated on the margin.

9. **T. cucumerina**, Linn.; DC. *Prodr.* iii. 315; leaves cordate subreniform 5- (3–7-) lobed or 5-angular lobes not acuminate pubescent or puberulous on both surfaces, fruit 1–3 in. ovoid-conical, seeds corrugate. Roxb. *Fl. Ind.* iii. 702; *Wall. Cat.* 6690 A, B, C, D, F; *Blume Bijl.* 933; *Dalz. & Gibs. Bomb. Fl.* 102; *Mig. Fl. Ind. Bat.* i. pt. i. 676; *Naud. in Ann. Sc. Nat. ser. 4*, xviii. 191; *Kurz in Journ. As. Soc.* 1877, pt. ii. 98. *T. laciniosa*, Klein in *Herb. Rottler*. *T. pilosa*, Wall. *Cat.* 6691. *Bryonia umbellata*, Wall. *Cat.* 6700 D. *Cucumis Missionis*, Wall. *Cat.* 6728.

Throughout INDIA and CEYLON.—DISTRIB. Malaya, North Australia.

Stems twining, more or less pubescent. *Diœcious* or less often (? when cultivated) *monœcious*. Leaves 2–4 in. diam., usually 5-lobed about half-way down, lobes obtuse or if acute not acuminate; petiole $\frac{3}{4}$ in.; tendrils 2-fid. Male *peduncles* in pairs, the earlier 1-flowered, the later racemed; occasionally in place of the earlier is found a female. *Calyx-tube* 1 in. *Seeds* $\frac{3}{8}$ – $\frac{1}{2}$ in., half-ellipsoid, compressed, in red pulp.—In Bth. & Hk. f. *Gen. Pl.* i. 833, under *Ceratosanthes*, *T. cucumerina* is a misprint for *T. corniculata*.

10. **T. anguina**, Linn.; *DC. Prodr.* iii. 314; leaves cordate subreniform 5- (3-7-) lobed or 5-angular lobes not acuminate pubescent or puberulous on both surfaces, fruit elongate cylindric sometimes contorted, seeds corrugate. *Roxb. Fl. Ind.* iii. 701; *Bot. Mag.* t. 722; *Blume Bijl.* 933; *W. & A. Prodr.* 350; *Wall. Cat.* 6687; *Lamk. Ill.* t. 794; *Miq. Fl. Ind. Bat.* i. pt. i. 677?; *Naud. in Ann. Sc. Nat.* ser. 4, xviii. 91; *Kurz in Journ. As. Soc.* 1877, pt. ii. 98.

INDIA, cultivated.—DISTRIB. China, Malaya.

Except in the fruit this agrees altogether with *T. cucumerina*, of which it is probably a cultivated form. The fruit, used as a vegetable, is eminently polymorphous. Miquel places this species at the head of his *Involucrarie* which he states to have great leafy sheathing bracts to the male flowers, but in the Indian *T. anguina* these bracts are minute.

11. **T. lobata**, *Roxb. Fl. Ind.* iii. 701; leaves cordate orbicular 5-lobed half-way down or more lobes acuminate pubescent, fruit oblong acute, seeds smooth. *Wall. Cat.* 6693.

DECCAN PENINSULA; *Wight*; *Rottler, G. Thomson, &c.*

Stem and petioles with flaccid hairs. *Leaves* pubescent beneath, and with flaccid hairs; tendrils 3-5-fid. *Fruit* 2-4 by 1-2 in., acute at both ends. *Seeds* half-ellipsoid, compressed, margins entire.—Probably a variety of *T. cucumerina* as suggested by *W. & A. Prodr.* 350. *T. lobata*, *Kurz in Journ. As. Soc.* 1877, pt. ii. 98, having the seeds tubercled (from Chittagong) is perhaps nearer *T. cucumerina* or *T. anguina* as here understood: but the three species are difficult to separate.

12. **T. integrifolia**, *Thwaites Enum.* 127, *not of Kurz*; dioecious, leaves glabrous nerved elliptic or ovate acuminate less often lanceolate 3-nerved entire coriaceous base rounded or cordate, tendrils simple, flowers somewhat large solitary, fruit spherical shortly apiculate, seeds numerous crowded.

CEYLON, alt. 2000-4000 ft.; *Thwaites*.

Leaves $2\frac{1}{2}$ -6 by $1\frac{1}{2}$ -2 in.; petiole $\frac{3}{8}$ in. *Fruit* 2 in. diam., red. *Seeds* $\frac{1}{2}$ in., smooth, oblong, oblique, compressed, truncate at the hilum, with two indentations at the vertex, testa blackish green.—Not seen. The above description is translated from Mr. Thwaites, who has been careful in communicating examples to Kew of all his types; but his No. 1629 is not to be found in its place. Mr. Thwaites describes no bracts to the male inflorescence, and if the male flowers are all solitary the species must be near *T. dioica*, *Roxb.*

DOUBTFUL SPECIES.

T. MACROSIPHON, *Kurz in Journ. As. Soc.* 1172, pt. ii. 308, from Tenasserim, in the absence of both the male inflorescence and the fruit cannot be identified from the description. It might be *T. cordata*, *Roxb.*

TRICHOSANTHES SP. *Griffith* (No. 2543 Kew Distrib.); nearly glabrous, tendrils 2-fid, leaves 3-foliolate very coriaceous, leaflets lanceolate nearly entire the central one somewhat obovate the lateral ones unequally auricled on the outer base, petiole nearly 2 in., petiolules $\frac{1}{2}$ in., fruit oblong-ovate but nearly spherical red with yellowish streaks, seeds very many in green pulp brown compressed, margin somewhat angular at the hilum end.—Malacca, *Griffith*.—This imperfect description is drawn up from a fragment with leaves and from Griffith's note of the fruit attached thereto. The characters appear nearly those of *Telfairia*, but the habit and texture are those of *Hodgsonia*; while from Griffith's description of the fruit it appears he did best by placing it provisionally in *Trichosanthes*.

3. **GYMNOPETALUM**, Arn.

Twining herbs, tendrils usually simple or 2-fid. *Leaves* petioled, 5-angular, nearly entire or deeply lobed. *Flowers* white (or yellow ?), somewhat large; monœcious at least sometimes: male peduncles in fully developed plants 2 from each axil, the earlier 1-flowered, the later longer racemose, either often suppressed; bracts in the racemes persistent, large lanceolate incised or small; females 1-flowered usually in separate axils. **MALE**: calyx-tube long, contracted near the mouth, limb of 5 lanceolate segments; petals 5, not fimbriate on margin; stamens 3; anthers included, connate, elongate, 1-celled, 2-celled, cells conduplicate; rudiments of the ovary 1, or 3, small, linear. **FEMALE**: calyx and corolla as in the male; ovary oblong; style long, stigmas 3 short linear; ovules horizontal, many; placentas 3, long, vertical. *Fruit* ovate-oblong, acute at both ends. *Seeds* many or few, ellipsoid, compressed, margined, nearly smooth.—**DISTRIB.** Species 5; in India, China and Malaya.

1. **G. cochinchinense**, Kurz in *Flora* 1871, 295; leaves 5-angled or lobed about half-way down, bracts to the male racemes prominent narrowed at the base deeply lacerate at the apex. *Bryonia cochinchinensis*, Lour. *Fl. Cochinch.* 595; *DC. Prodr.* iii. 305. *Momordica tubiflora*, Roxb. *Fl. Ind.* iii. 711, not of Wallich. *Tripodanthera cochinchinensis*, Roem. *Synops.* ii. 48. *Scotanthus tubiflorus*, Naud. in *Ann. Sc. Nat.* ser. 4, xvi. 172, t. 3. *Trichosanthes cucumerina*, Wall. *Cat.* 6690 E. T. ? Fatoa, Ham. in Wall. *Cat.* 6695. *Bryonia grandis*, Wall. *Cat.* 6700 K, L.

SIKKIM, up to 2000 ft. alt. ASSAM, CACHAR and BENGAL, common. CHOTA NAGPORE. TENASSERIM; Helfer.—**DISTRIB.** Malaya, China.

Stems slender, 5-angular, more or less scabrous-hairy. *Leaves* 2-3 in. diam., scabrous on both surfaces; tendrils simple or 2-fid. Male racemed *peduncle* sometimes 6-8 in., usually shorter; bracts $\frac{3}{4}$ in., incise-serrate, lobes often again incised. *Calyx-tube* $\frac{3}{4}$ in., villous, closed by deflexed hairs within above the stamens. Rudiments of the ovary in the male flower 3. *Petals* $\frac{1}{2}$ in., ovate, entire or somewhat crenate. *Fruit* 2 by $\frac{3}{4}$ in., orange-red, somewhat scabrous, with 10 longitudinal ribs, pulp greenish, not very succulent. *Seeds* $\frac{1}{4}$ by $\frac{1}{12}$ and $\frac{1}{20}$ in. thick.

2. **G. quinquelobum**, Miq. *Fl. Ind. Bat.* i. pt. i. 681; leaves suborbicular deeply 5-lobed lobes often subpinnatifid, bracts of the male racemes oblong serrate. *Scotanthus Porteanus*, Naud. in *Ann. Sc. Nat.* ser. 5, v. 25. ? *G. heterophyllum*, Kurz in *Trimen Journ. Bot.* 1875, p. 326.

RANGOON; McClelland. PINANG; Porter. MALAY PENINSULA; Griffith. SINGAPORE; G. Thomson.—**DISTRIB.** Malaya to Borneo.

Agrees very closely with the last species: the segments of the leaves are here narrow, subsinuate, 3-fid or pinnatifid, but graduate towards the half-lobed form of *G. cochinchinensis*.—Kurz's *G. heterophyllum* agrees as described with the present species; it is perhaps a specimen with poorly developed male racemes. Kurz says the flower is white, and quotes *Bryonia heterophylla*, Wall. *Cat.* 6711, which obscures the whole matter, for that plant is *Bryonia palmata*, Wall. (now *Cephalandra*) while *B. heterophylla*, Wall. No. 6704 (and of which there is a solitary sheet) differs altogether from Mr. Kurz' description and is a *Cerasiocarpum*.

3. **G. Wightii**, Arn. in *Hook. Journ. Bot.* iii. 278; leaves 5-angled or -lobed, bracts of the male racemes small simple linear. *Thwaites Enum.* 127. *G. zeylanicum*, Arn. l.c. *Bryonia tubiflora*, W. & A. *Prodr.* 347. *Cucurbita umbellata*, Wall. *Cat.* 6724.

SOUTH DECCAN PENINSULA; *Wight*; CANARA, *Hohenacker* No. 662. CEYLON, ascending to 5000 ft., *Walker, Gardner, Thwaites*.

Leaves 2 in. diam., more or less pubescent on both surfaces, denticulate, lobes acute or obtuse or 0; petiole 1 in. Male racemed *peduncle* 2 in.; flowers crowded, subumbellate; bracts $\frac{1}{4}$ in., linear, pedicels often $\frac{1}{4}$ in.; peduncle of the female flowers $\frac{3}{8}$ in. *Calyx-tube* $\frac{3}{4}$ in., slender, with scattered hairs or very pilose, lobes small. *Petals* $\frac{1}{4}$ in. (yellow according to Arnott and Hook. f., white according to Thwaites). Rudiment of the *ovary* in the male flower simple. *Fruit* $1\frac{1}{2}$ –2 in., red, more or less hairy, not ribbed. *Seeds* $\frac{1}{4}$ by $\frac{1}{12}$ in., without corrugations or angles.—*Bryonia tubiflora*, *Wight* No. 1118 has the calyx-tube pubescent and is nowise distinguishable from the Ceylon plant as Mr. Thwaites surmised in *Enum.* p. 127.

4. **G. integrifolium**, *Kurz in Flora* 1871, 295; leaves cordate-ovate nearly entire, male peduncles 1-flowered solitary without bracts. *Cucumis integrifolius*, *Roxb. Fl. Ind.* iii. 724; *Wall. Cat.* 6730. *Trichosanthes officinalis*, *Wall. Cat.* 6694. *T. integrifolia*, *Kurz in Journ. As. Soc.* 1877, pt. ii. 99.

BENGAL; *Roxburgh*. Ponlong (IRRAWADDY estuary); *Wallich*.

Stem scabrid; tendrils undivided in *Wallich's* specimen (2-fid in *Roxburgh's* drawing. *Leaves* 3 in. diam., very harshly scabrous above, densely villous beneath, margin undulate scarcely denticulate; petiole 1 in. *Flowers* monœcious, all solitary, white; male peduncle $1\frac{1}{2}$ in., female peduncle $\frac{1}{4}$ in. MALE: calyx-tube elongate, densely brown-villous, teeth 5, lanceolate; corolla divided nearly to the base, lobes obovate, entire, yellow-veined, pubescent. FEMALE: calyx and corolla as in the male; stigmas 3, oblong. *Fruit* from *Roxburgh's* figure $\frac{5}{8}$ – $\frac{3}{4}$ in. diam., orange-red, globular, smooth.—*Wall. Cat.* 6694 consists of three leaves with one male peduncle and calyx, and a detached fruit; the leaves resemble those of *Trichosanthes dioica*, *Roxb.*

4. **WAREA**, *C. B. Clarke*.

Extensively scandent, tendrils 2–3-fid. *Leaves* long-petioled, ovate or deeply 5-lobed. *Flowers* large, yellow, diœcious; males frequently two peduncles from one axil, one early deciduous 1-flowered, the other bearing a raceme without bracts; females solitary on long peduncles. MALE: calyx-tube cylindric, narrow, then suddenly widened campanulate subhemispheric, teeth 5, linear; petals 5, ovate, nearly separate, entire; stamens 3; anthers connate, included, one 1-celled, two 2-celled, cells conduplicate. FEMALE: calyx and corolla as in the male; ovary oblong; style long, with 3 wide stigmatic lobes; ovules horizontal, many, placentas 3, vertical. *Fruit* oblong, attenuate at both ends, 3-angular, 6-ribbed, 3-valved nearly to the base. *Seeds* in each cell about 16, in two rows, horizontal, compressed, ellipsoid, smooth.

Differs from *Gymnopetalum* by the large campanulate mouth to the calyx, by the divided tendrils, and the anthers exerted from the tubular portion of the calyx. Named after *J. Ware Edgar, C.S.I.*

1. **W. tonglensis**, *C. B. Clarke in Journ. Linn. Soc.* xv. 129. *Gymnopetalum* sp. No. 6, *Herb. Ind. Or., H. f. & T.*

SIKKIM, alt. 6000–10,000 ft., very common; *H. f. J. D. H.*; Tonglo N., *C. B. Clarke*.

Stem and peduncles nearly glabrous. *Leaves* 6–9 by 4–5 in., polymorphous, cordate, denticulate, nearly glabrous, ovate acute or 5-lobed or cut nearly to the base into narrow segments; petiole 4 in. Male *peduncle* 8 in., pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in. *Calyx-tube* $1\frac{1}{4}$ in., pubescent, cylindric portion more than $\frac{3}{4}$ in. *Petals* $\frac{3}{4}$ in. *Fruit* 4 by $1\frac{1}{2}$ in. *Seeds* $\frac{3}{8}$ in., packed in a fibrous almost juiceless pulp.—This is one of the three species included in *Herpetospermum* by *J. Hooker* in *Gen. Pl.* i. 834.

5. **HERPETOSPERMUM**, Wall.

Extensively scandent, tendrils 2-3-fid. *Leaves* long-petioled, cordate, ovate, little lobed. *Flowers* large, yellow, dioecious; males frequently two peduncles from one axil, one early deciduous 1-flowered the other racemose without bracts; females solitary on very short peduncles. MALE: calyx-tube elongate, cylindric at the base, above narrow funnel-shaped; teeth 5, long, linear; petals 5, elliptic, nearly separate, entire; stamens 3; anthers connate, included, one 1-celled, two 2-celled, cells conduplicate. FEMALE: calyx and corolla as in the male; ovary oblong, 3-celled, style long, with three oblong bifid stigmatic lobes; ovules pendulous, 4-6 in each cell. *Fruit* broad-oblong, narrowed at both ends, 3-angular, irregularly sinuate-costate, valves 3 separating from the axis nearly to the base. *Seeds* in two rows in each cell, flat, oblong, pendulous, the lower end corrugate or almost 3-lobed.

1. **H. caudigerum**, Wall. Cat. 6761. Bryonia? pedunculosa, Seringe in DC. Prodr. iii. 306. Rampinia herpetospermoides, C. B. Clarke in Journ. Linn. Soc. xv. 130.

TEMPERATE HIMALAYA, from SIMLA and KUMAON to BHOTAN, alt. 5000-8000 ft.; very common in Sikkim. KHASIA Mts.; Wallich.

Stem and peduncles more or less pubescent. *Leaves* 4-6 in. long and broad, usually pubescent on both surfaces, serrate, acuminate; petiole 2-4 in. Male peduncle 8 in., pedicels 1 in., hairy. *Calyx-tube* 1 in., pubescent without. *Petals* often 1 in. Rudiment of the ovary in the male linear, simple. *Fruit* 3 by 1½ in., more or less pubescent. *Seeds* usually 12 sometimes 18, ½ by ¼ and ⅓ in., thick, often exhibiting (when dried) wavy marks on the surface, packed in a fibrous almost juiceless pulp.—Wallich's Khasia specimen exhibits ripe seeds which are very narrow, incised at the lower end so that the middle lobe appears as a spinous tooth. Lady Dalhousie's examples collected at Simla are nearly glabrous with smaller flowers. *Herpetospermum* of Bth. & Hk. f. Gen. Pl. i. 834, described from imperfect materials, includes *H. caudigerum*, *Warea tonglensis* and *Edgaria darjeelingensis*. The generic character did not fit *Warea* or *Edgaria* and required emendation as to the ovules and seeds of Wallich's *Herpetospermum*.

6. **LAGENARIA**, Seringe.

Large climbers, pubescent, tendrils 2-fid. *Leaves* ovate or orbicular, cordate, dentate; petiole long, with two glands at its apex. *Flowers* large, white, solitary, monoecious or dioecious, the males long- the females short-peduncled. MALE: calyx-tube funnel-shaped subcampanulate, teeth 5 narrow; petals 5, free, obovate; stamens 3; anthers connate, included, one 1-celled, two 2-celled, cells conduplicate; rudiment of ovary 0. FEMALE: calyx and corolla as in the male; ovary oblong, style short with 3 bifid stigmatic lobes; ovules many, horizontal; placentas 3, vertical. *Fruit* large, ultimately thick membranous or almost woody, indehiscent, polymorphous, usually broader upwards. *Seeds* very many, horizontal, compressed, with a marginal groove, smooth.

1. **L. vulgaris**, Seringe in DC. Prodr. iii. 299; W. & A. Prodr. 341; Wight Ill. t. 105*; Kurz in Journ. As. Soc. 1877, pt. ii. 100. *L. vittata*, hispida and idolatrica, Seringe l. c. 299. Cucurbita Lagenaria, Linn.; Lamk. Ill. t. 795; Roxb. Fl. Ind. iii. 718; Wall. Cat. 6719.—Rheede Hort. Mal. viii. t. 5.

Cultivated throughout INDIA.—DISTRIB. Cultivated in the tropics and warm temperate zones of the whole world.

Leaves often 6 in. diam., softly pubescent on both surfaces, more or less 5-angular or 5-lobed. Male *peduncle* often 6 in., female 1 in. *Calyx-tube* $\frac{1}{2}$ in., pubescent. *Petals* 1–2 in. *Fruit* often $1\frac{1}{2}$ ft., in India usually bottle- or dumb-bell-shaped. *Seeds* $\frac{3}{4}$ by $\frac{3}{8}$ and $\frac{1}{8}$ in. thick, with an impressed groove parallel to and near the margin.

7. **LUFFA**, Cav.

Climbers, large or small, pubescent or nearly glabrous; tendrils 2–5-fid. *Leaves* cordate, usually 5-angular or 5-lobed; petiole without glands at its apex. *Flowers* yellow or white, monœcious, males and females often from the same axil; females solitary or panicled, males on long or short racemes or clustered. MALE: calyx-tube top-shaped, lobes 5, triangular or lanceolate; petals 5, obovate; stamens 3, rarely 5, filaments 3 free or connate; anthers exserted free, one 1-celled, the others 2-celled, cells sigmoid often on the margin of the broad connective. FEMALE: calyx-tube shortly produced above the ovary; lobes and corolla as in the male; ovary oblong, style cylindric, stigma 3-lobed; ovules very many, horizontal. *Fruit* large or small, oblong (not spherical), smooth or angular or spinous, ultimately fibrous, not succulent, 3-celled, usually circumsciss near the top. *Seeds* many, oblong, compressed.—DISTRIB. Species 10, in the warmer regions of the Old World several widely cultivated, one indigenous in America.

* *Stamens* 5.

1. **L. graveolens**, Roxb. *Fl. Ind.* iii. 716; male pedicels clustered in the axils without bracts, females often in the same axils 1–3 on the peduncle each 1-bracteate, fruit with numerous soft bristles. *Wall. Cat.* 6752; *Naud. in Ann. Sc. Nat.* ser. 4, xii. 124; *Kurz in Journ. As. Soc.* 1877, pt. ii. 101.

SIKKIM, alt. 1000–2000 ft.; J. D. H. RAJMAHAL HILLS; Roxburgh. Plain of EAST BENGAL; C. B. Clarke. CHITTAGONG; Kurz.—DISTRIB. North Australia.

Stems long, little villous; tendrils 3–5-fid. *Leaves* 3 in. diam., reniform-orbicular, 5-angled, denticulate, punctulate, scabrous above, pubescent on the nerves beneath; petiole 2–3 in. Male *pedicels* few, much shorter than the petiole; *petals* 5, $\frac{1}{4}$ in., yellow, entire; stamens 5. Female *peduncle* short, sometimes divided with 2–3 flowers, each pedicel carrying a small ovate entire thick bract $\frac{1}{8}$ in. *Fruit* 2 by 1 in., covered with papillæ, scarcely spinous, obscurely 10-striate, dehiscing horizontally near the top, stopple without papillæ. *Seeds* scarcely $\frac{1}{4}$ in., very many, packed in fibres, smooth, not margined.

2. **L. ægyptiaca**, Mill. ex Hook. f. in Oliv. *Fl. Trop. Afr.* ii. 530; male flowers racemed on long peduncles, fruit elongate clavate smooth 10-ribbed or somewhat 10-angular. *DC. Prodr.* iii. 303. L. pentandra, Roxb. *Fl. Ind.* iii. 712; *W. & A. Prodr.* 343; *Wall. Cat.* 6751; *Wight. Ic.* t. 499. L. racemosa, Roxb. l. c. 715. L. clavata, Roxb. *Hort. Beng.* 104, *Fl. Ind.* iii. 714. L. acutangula, W. & A. l. c., not of Roxb. L. cylindrica, Roem. *Synops.* ii. 63; *Naud. in Ann. Sc. Nat.* ser. 4, xii. p. 119; *Kurz in Journ. As. Soc.* 1877, pt. ii. 100. L. Petola and Cattu-picinna, Seringe in *DC. l. c.* L. Parvala, Wall. *Cat.* 6758. L. Gosa, hederacea and Satpatia, Wall. *Cat.* 6753, 6755, 6757. Bryonia cheirophylla, Wall. *Cat.* 6715 A. Momordica Luffa, Linn.—Rheede *Hort. Mal.* viii. t. 8, with many other synonyms for which see Naudin l. c.

Throughout INDIA very common, often cultivated.—DISTRIB. Cultivated throughout the tropics, native country uncertain (Naudin).

Extensively climbing hairy; tendrils 2-3-fid. *Leaves* 4 in. diam., reniform-orbicular, 5-angled or somewhat 5-lobed, dentate, usually scabrous, punctate on both surfaces, pubescent on the nerves beneath; petiole 2 in. Male *peduncle* 6 in., flowers often approximate near the summit; pedicels short, each carrying a small ovate viscid entire bract sometimes obsolete. *Petals* 5, $\frac{3}{4}$ -1 in., yellow, often with elevated hairy green veins. *Stamens* 5. Female *flower* solitary, peduncle 1-3 in. *Fruit* 5-12 in. *Seeds* $\frac{3}{8}$ by nearly $\frac{1}{4}$ in., usually black, very narrowly winged, smooth or very sparingly tubercled.—The pedicels are rarely elongated (*L. Satpatia*, Wall.); one example of Falconer's has the racemes compound. The fruit being the part eaten and attended to in cultivation is hence very variable: and no good character founded on it can be drawn between this species and *L. acutangula*.

** *Stamens* 3.

3. *L. acutangula*, Roxb. *Fl. Ind.* iii. 713; fruit elongate 10-angled not covered by spines or papillæ. *DC. Prodr.* iii. 302; *Wall. Cat.* 6759; *Hook. f. in Oliv. Fl. Trop. Afr.* ii. 530, excl. syn.; *Kurz in Journ. As. Soc.* 1877, pt. ii. 101, excl. many syn. *Cucumis acutangulus*, Wall. *Cat.* 6736.

NORTH-WEST INDIA; Royle. SIKKIM; J. D. H. ASSAM; Masters. Plain of EAST BENGAL; C. B. Clarke. CEYLON; Thwaites.—DISTRIB. Malaya.

Very near *L. pentandra* from which it differs by having 3 stamens as noted by Roxburgh and verified by Thwaites. The fruit is usually smaller, often only 3-4 in.—The figure of *L. fetida* in Cav. Ic. i. t. 9, shows clearly 5 stamens and is not Roxburgh's plant. *Rheede Hort. Mal.* viii. t. 7, is much more probably *L. ægyptiaca* than this species. *L. acutangula* No. 1106 in *Herb. Wight* is pentandrous and is *L. ægyptiaca* exactly. All these, and all descriptions founded on them, are not here included in *L. acutangula*, Roxb.

VAR. *amara*, Roxb. *Fl. Ind.* iii. 715 (sp.); fruit oblong 10-angled without spines or papillæ. *Wall. Cat.* 6754 A; *W. A. Prodr.* 343; *Dalz. & Gibs. Bomb. Fl.* 102; *Naud. in Ann. Sc. Nat.* ser. 4, xii. 123. *L. Plukenetiana*, DC. *Prodr.* iii. 302. *Momordica tubiflora*, Wall. *Cat.* 6749.—From nearly all India especially the Western side. Naudin, who retains *L. amara* as a species, says it is "exceedingly near *L. acutangula* but distinguished by the leaves a little smaller and sometimes whitish." The typical *L. amara* has the leaves softly pubescent at least while young, for they become in age scabrous.

4. *L. echinata*, Roxb. *Hort. Beng.* 104; *Fl. Ind.* iii. 716; fruit ellipsoid densely covered with bristles. *Wall. Cat.* 6756; *W. & A. Prodr.* 343; *Dalz. & Gibs. Bomb. Fl.* 102; *Kurz in Journ. As. Soc.* 1877, pt. ii. 101. *L. Bindaal*, Roxb. *Hort. Beng.* 104; *Fl. Ind.* iii. 717.

GUJERAT; Dalzell. SCINDE; Stocks. PURNEAH (Bengal); Kurz. DACCA; C. B. Clarke.—DISTRIB. Tropical Africa.

Climbing not extensively, sparingly scabrous-pilose; tendrils 2-fid. *Leaves* 1-2 in. diam., cordate, reniform-orbicular, entire or obscurely 5-angular or 5-lobed, or cut almost to the base into 5 narrow sinuate-pinnatifid segments, dentate; petiole 1-2 in. Male *peduncles* normally paired, one 1-flowered the other racemed very long 6 in. or more, pedicels 1 in.; flowers small, white, without bracts. *Filaments* 3, two with 2-celled anthers. *Peduncle* of the solitary female very short. *Fruit* $1\frac{1}{4}$ by $\frac{3}{8}$ in., ribs not visible; spines $\frac{1}{4}$ in., ciliate; stopple without spines, calyx-teeth persistent. *Seeds* $\frac{1}{2}$ in., many, slightly scabrous.

VAR. *longistylis*, Edgw. in *Journ. As. Soc.* 1852, p. 270 (sp.); male raceme shorter than the leaves, spines of the fruit fewer themselves glabrous.—Banda, Edgeworth.—The leaves are not more dissected than in some Bengal typical *L. echinata*, nor are the styles longer. The whole male raceme is much shorter than the accompanying 1-flowered male peduncle.

5. **L. Kleinii**, *W. & A. Prodr.* 344; young fruit spinous, spines densely woolly. *L. umbellata*, *Roem. Synops.* ii. 63. *Cucurbita umbellata*, *Heyne in Herb. Rottler*; *Wall. Cat.* 6724; *DC. Prodr.* iii. 318.

TRAVANCORE; Klein. COROMANDEL (?) Wight.

Agrees closely with *L. echinata* and may be a variety of it, but the *stamens* differ; the filaments being three, of which two are bifid below the anthers.

8. **BENINCASA**, *Savi*.

A large climber, softly hairy, tendrils 2-fid. *Leaves* cordate, reniform-orbicular, more or less 5-lobed; petiole without glands. *Flowers* large, yellow, monœcious, all solitary, without bracts. MALE: calyx-tube campanulate, lobes 5, leaf-like, serrate; petals 5, nearly separate, obovate; stamens 3, inserted near the mouth of the tube; anthers exsert, free, one 1-celled, two 2-celled, cells sigmoid. FEMALE: calyx and corolla as in the male; ovary oblong, densely hairy; style thick, with 3 flexuose stigmas; ovules numerous, horizontal; placentas 3. *Fruit* large, fleshy, oblong, pubescent, indehiscent. *Seeds* many, oblong, compressed, margined.

1. **B. cerifera**, *Savi*; *DC. Prodr.* iii. 303; *W. & A. Prodr.* 344; *Miq. Fl. Ind. Bat.* i. pt. i. 665; *Naud. in Ann. Sc. Nat.* ser. 4, xii. 87; *Kurz in Journ. As. Soc.* 1877, pt. ii. 101. *Cucurbita Pepo*, *Lour. Fl. Cochinc.* 593; *Roxb. Fl. Ind.* iii. 718. *C. hispida*, *Wall. Cat.* 6723. *C. farinosa*, *Blume Bijl.* 931. *Gymnopetalum* ? *calyculatum*, *Miq. Fl. Ind. Bat. Suppl.* 332.—*Rheede Hort. Mal.* viii. t. 3.

Throughout INDIA cultivated.—DISTRIB. Cultivated in Malaya, China, Japan, Tropical Africa; where wild uncertain.

Leaves 4–6 in. diam.; petiole 3–4 in. Male *peduncle* 3–4 in., female *peduncle* 1–2 in. *Calyx-teeth* when young often narrow, scarcely serrate. *Fruit* 1–1½ ft., cylindric, without ribs, hairy, ultimately covered with a waxy bloom. *Seeds* ½ by ¼ in.

9. **MOMORDICA**, *Linn.*

Climbing, with simple tendrils. *Leaves* cordate, petioled, undivided in the Indian species. *Flowers* yellow or white, monœcious or dioecious, females solitary peduncled, males solitary or racemed, bracteate or not. MALE: calyx-tube short, campanulate (with 2–3 basal oblong incurved scales ex Hook. f.) lobes 5; *corolla* 5-partite nearly to the base; stamens 3 (2 in *M. Cymbalaria*): filaments short; anthers at length free, one 1-celled, one or two 2-celled, cells conduplicate, or in *M. Cymbalaria* horse-shoe-shaped. FEMALE: calyx and corolla as in the male; ovary oblong; style long, stigmas 3; ovules very many, horizontal placentas 3. *Fruit* oblong or spherical, rough or smooth, indehiscent or 3-valved, many- or few-seeded. *Seeds* obovate or complanate, smooth corrugate or sculptured.—DISTRIB. Species 26, chiefly in the warmer parts of Africa, several in Tropical Asia, few in Tropical America.—The genus is here artificially separated from *Luffa* by its simple tendrils.

* *Male peduncles* 1-flowered.

1. **M. Charantia**, *Linn.*; *DC. Prodr.* iii. 311; monœcious, bract about the middle of the male peduncle orbicular entire, fruit ovoid narrowed to both ends many-ribbed covered with triangular tubercles. *Roxb. Fl. Ind.* iii. 707;

Wall. Cat. 6746; *W. & A. Prodr.* 348; *Bot. Mag.* t. 2455; *Miq. Fl. Ind. Bat.* i. pt. i. 663; *Wight Ic.* t. 504; *Dalz. & Gibs. Bomb. Fl.* 102; *Naud. in Ann. Sc. Nat.* ser. 4, xii. 131; *Kurz in Journ. As. Soc.* 1877, pt. ii. 102. *M. humilis*, *Wall. Cat.* 6747. *M. muricata*, *DC. l.c.*; *Roxb. l.c.*; *Wall. Cat.* 6745; *Miq. l.c.* *M. senegalensis*, *Lamk.*; *DC. l.c.* *Cucumis africanus*, *Bot. Reg.* t. 980.—*Rheede Hort. Mal.* viii. t. 9, 10.

Throughout INDIA, cultivated.—DISTRIB. Malaya, China, Tropical Africa.

Leaves 1-3 in. diam., orbicular, glabrous or slightly pubescent, cut nearly to the base into 5-7 narrow sinuate or subpinnatifid lobes. Male *peduncle* 2-4 in., slender, bract. *Calyx-lobes* ovate, acute. *Petals* $\frac{3}{8}$ - $\frac{3}{4}$ in., yellow. Female *peduncle* 2-4 in., slender, bracteate near the base; ovary fusiform, muricate. *Fruit* 1-3 in., rostrate. *Seeds* $\frac{1}{3}$ in., compressed, corrugate on the margin, somewhat sculptured.

2. ***M. Balsamina***, *Linn.*; *DC. Prodr.* iii. 311; monœcious, bract very near the top of the male *peduncle* orbicular denticulate variegated, fruit ovoid narrowed to both ends smooth. *Miq. Fl. Ind. Bat.* i. pt. i. 664; *Boiss. Fl. Orient.* ii. 757, *excl. syn.* *Wight*; *Hook. f. in Oliv. Fl. Trop. Afr.* ii. 537, *not of Wallich*, nor of *W. & A. Prodr.* 349.

PUNJAB; *T. Thomson, Edgeworth.* NORTH-WEST INDIA; *Royle.* SCINDE; *Stocks.*—DISTRIB. Malaya, Australia, Western Asia, Africa to the Cape.

Glabrous or nearly so. *Leaves* $1\frac{1}{2}$ -3 in. diam., orbicular, palmately 3-5-lobed to about the middle, lobes acutely lobulate, punctulate on both surfaces; petiole $\frac{3}{4}$ -1 $\frac{1}{2}$ in. Male *peduncle* 1-3 in.; calyx-lobes ovate or oblong, acute; petals $\frac{1}{4}$ - $\frac{1}{2}$ in., yellowish, black at the base. Female *peduncle* short, less than $\frac{1}{2}$ in., ebracteate. *Fruit* 1-3 in., rostrate, red, usually quite smooth, in the example of *Edgeworth's* obscurely ribbed and slightly muricate. *Seeds* $\frac{1}{3}$ in., compressed, nearly smooth.

3. ***M. dioica***, *Roxb. Fl. Ind.* iii. 709; dicecious, petiole without glands, bract near the top of the male *peduncle*, flowers large yellow, fruit densely covered with soft spines. *DC. Prodr.* iii. 312; *W. & A. Prodr.* 348; *Wight Ic.* tt. 505, 506; *Dene. in Jacq. Voy. Bot.* t. 71; *Dalz. & Gibs. Bomb. Fl.* 102; *Naud. in Ann. Sc. Nat.* ser. 4, xii. 133; *Thwaites Enum.* 126, *as to var. a.*; *Kurz in Journ. As. Soc.* 1877, pt. ii. 102. *M. Balsamina*, *Wall. Cat.* 6741; *W. & A. Prodr.* 349, *not of others.* *M. Wallichii*, *Roem. Synops.* ii. 58; *Miq. Fl. Ind. Bat.* i. pt. i. 664. *M. renigera*, *Hamiltoniana*, and *Heyneana*, *Wall. Cat.* 6743, 6744, 6748. *M. Missionis*, *Wall. Cat.* 6739; *Dennst. in Miq. l.c.* *M. subangulata*, *Blume ex Kurz in Journ. As. Soc.* 1877, pt. ii. 102. *Trichosanthes Russeliana*, *Wall. Cat.* 6696. *Bryonia grandis*, *Wall. Cat.* 6700 L.

Throughout INDIA, from the HIMALAYA to CEYLON and SINGAPORE, ascending to 5000 ft. alt. on the hills.—DISTRIB. Malaya.

Leaves 2-4 in. long and broad, cordate, ovate, acute, entire, denticulate or more or less 3-5-lobed, glabrous, often punctate beneath; petiole 1-2 in. Male *peduncle* 2-6 in.; bract large, cowl-like, embracing the expanded flower, glabrous, thin or (in *M. Missionis*) thick soft pubescent; calyx-lobes oblong with a narrow termination; petals 1 in., full-yellow, the two 2-anthered filaments 2-fid half way down. Female *peduncles* as long as the male, bract small usually near the base. *Fruit* 1-3 in., ellipsoid, acute, without ribs. *Seeds* nearly $\frac{1}{2}$ in., many, compressed, broad-oblong, with a few well-marked corrugations on the margins, nearly smooth on the surface.—The large succulent Lower Bengal form cannot well be confounded with any other; but both from the Deccan Peninsula and Punjab there is a much slenderer form, the males of which have been referred to *M. Balsamina* (the intense spinousness of the young ovary prevents the female plants being mistaken): they usually have the leaves much less dissected, and *M. Balsamina* almost invariably exhibits both male and female flowers on the same branch. *M. Missionis*, *Wall.*, is the slender form

with a glabrous small bract to male flower: *M. renigera*, Wall. has a large woolly bract: *M. Heyneana*, Wall. has the leaves deeply 3-lobate: *M. Hamiltoniana*, Wall. has the bract foliaceous crumpled serrate. *M. Balsamina*, Wall. is the typical *M. dioica*, Roxb. Thwaites' *M. dioica* β *denudata* is altogether remote from *M. dioica* (see No. 5).

4. ***M. cochinchinensis***, Spreng. *Syst.* iii. 14; dioecious, petioles glandular, bract near the top of the male peduncle, flowers large white, fruit muricated, seeds large. *Kurz in Journ. As. Soc.* 1877, pt. ii. 102. *M. mixta*, Roxb. *Fl. Ind.* iii. 709; *W. & A. Prodr.* 349; *Miq. Fl. Ind. Bat.* i. pt. i. 664; *Bot. Mag.* t. 5145; *Naud. in Ann. Sc. Nat.* ser. 4, xii. 132. *M. dioica*, Wall. *Cat.* 6750 A, B, C, D, E, F. *Muricia cochinchinensis*, Lour. *Fl. Cochinch.* 733; *DC. Prodr.* iii. 318.

BENGAL to TENASSERIM, common. DECCAN PENINSULA; *Wight*. CANARA; *Law*.—DISTRIB. Formosa, Philippines.

Leaves 4–5 in. diam., cordate, ovate, usually 3-lobed, glabrous or a little pubescent, often punctate beneath, little dentate; petiole 2–3 in., almost invariably glandular on its middle as well as apex. Male *peduncle* 2–6 in., bract often pubescent, embracing the expanded flower; petals 1–2 in., white tinged with yellow, 3 with black spots at the base 2 with yellow glands; the two 2-anthered filaments not 2-fid. Female *peduncle* 1–2 in., bract small about the middle. *Fruit* 4–5 in., ovate, pointed, bright red, very fleshy, without ribs, covered with conical points nearly $\frac{1}{8}$ in. high. *Seeds* $\frac{7}{8}$ by $\frac{5}{8}$ and $\frac{1}{5}$ in. thick, many, horizontal, irregular, ovate, compressed, black, corrugated on the margins, sculptured on the faces.

** *Male peduncles several-flowered*.

5. ***M. denudata***, Thwaites *Enum.* 126; dioecious, leaves ovate-lanceolate, flowers small, many males on one raceme with inconspicuous bracts, filaments 3, anthers conduplicate, fruit ovoid rostrate muricated with triangular papillæ.

CEYLON; alt. 3000–4000 ft.; *Gardner, Thwaites, Walker*.

Slender, climbing, nearly glabrous; tendrils simple. *Leaves* 2–4 by 1–2 in., deeply cordate, often 3–5-angled or sparingly 3–5-lobed, central lobe always long acute; petiole 1 in. Male *peduncle* 2 in., often somewhat paniced nearly from the base and 10–20 mostly pedicelled flowered; bracts at the base of the pedicels minute; sepals ovate, acuminate; petals $\frac{1}{5}$ – $\frac{1}{3}$ in.; filaments inserted near the top of the calyx-tube, anthers much exsert. Female *peduncle* 1-flowered, about as long as the male, bract minute near the middle. *Fruit* $\frac{3}{4}$ in. long and broad, suddenly rostrate.

This species is evidently closely allied to the next which Sir J. Hooker removed from *Luffa* (where Roxburgh placed it) because of its simple tendrils. But the exsert anthers, the shape of the flowers and their being pedicelled, all ally *M. denudata* and *M. Cymbalaria* with *Luffa* rather than *Momordica*.

6. ***M. Cymbalaria***, Fenzl in *Pl. Kotschy*, No. 147; monœcious, leaves reniform-orbicular, flowers small, males few on one raceme with inconspicuous bracts, filaments 2, anthers horseshoe-shaped, fruit obovate-oblong acute 8-ribbed smooth. *Hook. f. in Oliv. Fl. Trop. Afr.* ii. 540. *Luffa tuberosa*, Roxb. *Hort. Beng.* 104; *Fl. Ind.* iii. 717; *W. & A. Prodr.* 344. *L. amara*, Wall. *Cat.* 6754 B.

DECCAN PENINSULA; *Wight*. MYSORE; *Heyne*. Concan; *Stocks*.—DISTRIB. Tropical Africa.

Root a large woody tuber as in many others of the genus. *Leaves* 1–2 in. broad, 5-angular or slightly 5-lobed, middle lobe not elongated, glabrous or slightly pubescent, often punctulate on both surfaces, dentate; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in. Male *raceme* 1–2 in., with usually only 2–4 flowered; calyx-lobes lanceolate; petals $\frac{1}{4}$ in., yellow; filaments 2,

one 2-fid one 3-fid so each with one anther-cell; filaments inserted near the top of the calyx-tube, anthers completely exsert. Female *peduncle* $\frac{3}{4}$ -2 in., 1-flowered, ebracteate. *Fruit* $\frac{3}{4}$ by scarcely $\frac{1}{4}$ in. *Seeds* $\frac{1}{6}$ - $\frac{1}{4}$ in., few, shortly obovoid, smooth, shining.

10. CUCUMIS, Linn.

Climbing herbs, hispid or scabrous; tendrils simple. *Leaves* petioled, palmately 3-7-lobed or 5-angled or entire, dentate or serrate. *Flowers* yellow, monœcious, males clustered in the axils, females solitary, all shortly peduncled. MALE: calyx-tube top-shaped or campanulate, lobes 5. *Stamens* 3; anthers free, one 1-celled, two 2-celled, cells conduplicate or much flexuose, connective produced in a crest. FEMALE: calyx and corolla as in the male; ovary ovoid, style short, with three obtuse stigmas; ovules very many, horizontal; placentas 3. *Fruit* fleshy, indehiscent, large or small, spherical or elongate, smooth or tuberculate. *Seeds* very many, oblong, compressed, mostly smooth.—DISTRIB. Species 25, of which half are African, a few in the tropical regions of Asia, Australia and America, and several widely cultivated of doubtful origin.

1. **C. trigonus**, Roxb. *Fl. Ind.* ii. 722; leaves and petioles scabrid not softly hairy, petioles $\frac{1}{4}$ - $\frac{3}{8}$ in., flowers small, ovary hairy sometimes densely white woolly or silky, fruit about 1½ in. ultimately glabrous ellipsoid or obovoid round or obscurely trigonous. *W. & A. Prodr.* 342; *Wight Ic.* t. 497; *Wight Ill.* t. 105; *Boiss. Fl. Orient.* ii. 758; *Dalz. & Gibs. Bomb. Fl.* 103; *Naud. in Ann. Sc. Nat.* ser. 4, xi. 30. *C. turbinatus*, Roxb. *Fl. Ind.* iii. 723; *W. & A. Prodr.* iii. 342; *Miq. Fl. Ind. Bat.* i. pt. i. 671. *C. maderaspatanus*, Roxb. *l. c.* 723; *Wall. Cat.* 6734. *C. Melo* var. *agrestis*, *Naud. l. c.* 73. *C. pubescens*, *Wall. Cat.* 6729; *W. & A. Prodr.* 342; *Royle Ill.* t. 47; *Wight Ic.* t. 496; *Dalz. & Gibs. Bomb. Fl.* 103, perhaps not of Willd. and others. *C. pseudo-colocynthis*, *Royle Ill.* t. 47. *C. eriocarpus*, *Boiss. Diagn.* ii. 59. *Bryonia callosa*, *Herb. Rottler*; *Wall. Cat.* 6710.

Throughout INDIA.—DISTRIB. Malaya, North Australia, Afghanistan, Persia.

Root perennial, by which character alone it can be distinguished from *C. Melo* according to Naudin, but the examples seen and collected in India are almost invariably less than one year old. *Stem* in the typical examples scabrid; tendrils short. *Leaves* 1-2 in. diam., orbicular subpentangular, in the typical plant deeply palmately-lobed, lobes very scabrid and often narrow; in the more flaccid *C. pubescens* the hairs more scattered, the leaves entire, 5-angled 5-lobed; petiole $\frac{1}{4}$ -1½ in. *Peduncles* of males and females $\frac{1}{2}$ -1 in. *Fruit* sometimes with a few scattered hairs, often with 10 stripes.—The plants marked by Indian botanists as *C. pubescens* are reduced to *C. trigonus* by Naudin in the Kew Herbarium. Kurz (in *Journ. As. Soc.* 1877, pt. ii. 103) separates *C. trigonus* with solitary peduncles from *C. pubescens* with clustered peduncles and makes the latter a variety of *C. Melo*, Linn. *C. pubescens* of Thwaites *Enum.* (C.P. 3534) has remarkably acute lobes to the leaves and resembles *C. Hardwickii*, but there is no note of the fruit.

2. **C. prophetarum**, Linn.; *DC. Prodr.* iii. 301; leaves and petioles scabrid not softly downy, flowers small, petals $\frac{1}{4}$ in., ovary very tuberculate, fruit about 1 in. more or less tuberculate ellipsoid. *Wall. Cat.* 6733; *W. & A. Prodr.* iii. 342; *Boiss. Fl. Orient.* ii. 758; *Naud. in Ann. Sc. Nat.* ser. 4, xi. 14.

SCINDE; *Stocks*.—DISTRIB. Beloochistan, Arabia, Tropical Africa to Guinea.

Stem scabrid; tendrils short. *Leaves* 1-1½ in., reniform, subtriangular, much lobed; petiole $\frac{1}{2}$ -1 in. Female *peduncle* less than $\frac{1}{2}$ in., stout. *Fruit* green, with paler vertical stripes.

3. **C. Melo**, *Linn.*; *DC. Prodr.* iii. 300; leaves orbicular-reniform 5-angular or lobed lobes neither deep nor acute scabrid on both surfaces and also often with soft hairs, petals $\frac{5}{8}$ in., fruit glabrous or somewhat hairy not spinous nor tuberculate. *Roxb. Fl. Ind.* iii. 720; *Wall. Cat.* 6738; *W. & A. Prodr.* 341; *Jacq. Monog. du Melon*, t. 1-33. *C. utilissimus*, *Roxb. l. c.* 721; *Wall. Cat.* 6731; *W. & A. Prodr.* 342. *C. flexuosus*, *Linn.*; *DC. l. c.*; *W. & A. Prodr.* iii. 342. *C. maculatus*, *Willd.*; *DC. l. c.* 301; *W. & A. Prodr.* iii. 342. *C. Gurmia* and *C. Chata*, *Wall. Cat.* 6726? and 6727. *C. cicatrisatus*, *Stocks in Hook. Kew Journ. Bot.* iv. 148.

Throughout INDIA, cultivated.—DISTRIB. Cultivated in most hot countries, and perhaps the cultivated form of *C. trigonus*.

Stems scabrous. *Leaves* 3 in. diam.; petiole 2 in. Female *peduncle* sometimes 2 in. *Fruit* spherical ovoid elongate or contorted.—The *Melon*.

4. **C. sativus**, *Linn.*; *DC. Prodr.* iii. 300; leaves ovate 5-angular or slightly lobed, lobes acute hispidulous on both surfaces and also often with soft hairs, petals $\frac{5}{8}$ in., fruit glabrous sometimes tuberculated commonly elongate. *Lamk. Ill.* t. 795; *Roxb. Fl. Ind.* iii. 720; *Wall. Cat.* 6737; *W. & A. Prodr.* 342; *Miq. Fl. Ind. Bat.* i. pt. i. 671; *Naud. in Ann. Sc. Nat.* ser. 4, xi. 27; *Kurz in Journ. As. Soc.* 1877, pt. ii. 103. *C. muricatus*, *Wall. Cat.* 6735 A. *C. Hardwickii*, *Royle Ill.* t. 47.—*Rheede Hort. Mal.* t. 6.

Throughout INDIA, cultivated.—DISTRIB. In all warm and warm temperate countries, cultivated; where wild unknown.

Stems scabrous. *Leaves* 3-5 in. diam.; petiole 2-3 in. Female *peduncle* sometimes 2 in. Young *ovary* muricate with rigid prickles. *Fruit* commonly cylindric, 12 by $1\frac{1}{2}$ in.—The *Cucumber*.

VAR. *sikkimensis*, *Hook. f. Bot. Mag. t.* 6206; fruit 15 by 6 in. clavate with 5 placentas. Concombre du Sikkim, *Naud. in Ann. Sc. Nat.* ser. 4, xi. 28. Cultivated in Nipal and Sikkim, *J. D. H.*, &c.

11. CITRULLUS, Schrader.

Climbing herbs, hispid or scabrous; tendrils 2-3-fid. *Leaves* petioled, palmately 3-7-lobed, usually deeply with narrow sinuate-pinnatifid segments, but sometimes little lobed. *Flowers* monœcious, all solitary, tolerably large: MALE: calyx-tube campanulate, lobes 5; stamens 3, short; anthers scarcely cohering, one 1-celled, two 2-celled, cells conduplicate, connective not produced FEMALE: calyx and corolla as in the male; ovary ovoid; style short, stigmas 3, reniform; ovules very many, horizontal; placentas 3. *Fruit* globose or ellipsoid, smooth, fleshy, indehiscent. *Seeds* very many, oblong, compressed, smooth.—DISTRIB. Species 2, widely cultivated.

1. **C. Colocynthis**, *Schrader. in Linnæa* 1833; 414; leaves deeply divided harshly scabrid, fruit globose rarely 3 in. diam. intensely bitter. *Arn. in Hook. Journ. Bot.* iii. 276; *Wight Ic. t.* 498; *Miq. Fl. Ind. Bat.* i. pt. i. 662; *Naud. in Ann. Sc. Nat.* ser. 4, vol. xii. 99; *Dalz. & Gibs. Bomb. Fl.* 101; *Boiss. Fl. Orient.* ii. 759. *Cucumis Colocynthis*, *Linn.*; *DC. Prodr.* iii. 302; *Roxb. Fl. Ind.* iii. 719; *Wall. Cat.* 6732; *W. & A. Prodr.* iii. 342.

Throughout INDIA, cultivated and also very often apparently wild.—DISTRIB. Western Asia, Arabia, all Africa except the Cape, Spain.

Whole plant scabrid. *Leaves* $2\frac{1}{2}$ by scarcely 2 in. in the typical wild very scabrous form, larger in the cultivated forms approaching *C. vulgaris*, ovate, middle segment compound-pinnatifid; petiole 1 in. *Petals* $\frac{1}{2}$ in., obovate, light yellow. *Ovary* villous. *Fruit* smooth, variegated green and white. *Seeds* $\frac{1}{8}$ - $\frac{1}{4}$ in., not margined.

2. **C. vulgaris**, Schrad. in *Linnaea* 1848, 412; leaves deeply divided or but moderately lobed glabrous or somewhat hairy hardly scabrid, fruit often 10 in. diam. sometimes much smaller. Naud. in *Ann. Sc. Nat.* ser. 4, xi. 100; Dalz. & Gibs. *Bomb. Fl.* 102; Kurz in *Journ. As. Soc.* 1877, pt. ii. 103. *C. fistulosus*, Stocks in *Hook. Kew Journ. Bot.* iii. t. 3. *Cucumis Citrullus*, DC. *Prodr.* iii. 301. *Cucurbita Citrullus*, Linn.; Roxb. *Fl. Ind.* iii. 319; Wall. *Cat.* 6717; W. & A. *Prodr.* 351.

Throughout INDIA, cultivated.—DISTRIB. In all warm countries of the world, cultivated.

Said to be annual while *C. Colocynthis* is perennial; but the distinction between the cultivated form of *C. Colocynthis* and the divided-leaved forms of the water-melon is very small. The water-melon has either sweet or bitter fruit: when the latter, it is *Citrullus amarus* of authors.—*C. fistulosus*, Stocks, has thick stems, leaves sparingly lobed, and is plentifully supplied with long somewhat hispid hairs.—The *Water-Melon*.

12. CEPHALANDRA, Schrader.

Climbing herbs, scarcely hairy; tendrils simple. *Leaves* petioled, 5-angular or 5-lobed, toothed. *Flowers* dicecious, moderately large, all solitary and white in the Indian species, ebracteate. MALE: calyx-tube campanulate, short, limb 5-lobed; corolla campanulate, 5-lobed about half-way down; stamens 3; anthers exsert, connate, one 1-celled, two 2-celled, cells conduplicate. FEMALE: calyx and corolla as in the male; ovary oblong, style long with 3 bifid stigmas; ovules many, horizontal; placentas 3, vertical. *Fruit* fleshy, indehiscent, cylindric, smooth. *Seeds* many, ovoid, compressed, margined.—DISTRIB. Species 12; all African, one extending to India and Malaya.

1. **C. indica**, Naud. in *Ann. Sc. Nat.* ser. 5, v. 16; leaves 5-angular occasionally 5-lobed, fruit 1-2 by $\frac{1}{2}$ -1 in. Kurz in *Journ. As. Soc.* 1877, pt. ii. 103. *Momordica monadelpha*, Roxb. *Fl. Ind.* iii. 708. *Bryonia grandis*, Linn. f. *Suppl.* 126; Wall. *Cat.* 6700, except D, I, K, L. *B. palmata*, Wall. *Cat.* 6711 A, B, C. *Coccinia indica*, W. & A. *Prodr.* 347; Wight *Ill.* t. 105; DCne. in *Jacq. Voy. Bot.* t. 72; Hook. *Ic. Pl.* t. 138; Miq. *Fl. Ind. Bat.* i. pt. i. 673; Dalz. & Gibs. *Bomb. Fl.* 103. *C. Schimperii*, Naud. l.c. ser. 4, xii. 16. *C. Wightiana*, Roem. *Synops.* ii. 93; Miq. l.c. 674.—Rheede *Hort. Mal.* viii. t. 14.

Throughout INDIA, common.—DISTRIB. Malaya, Africa.

Leaves 2-4 in. diam., 5-angular, papillose, scabrid; petiole 1 in. MALE: peduncle 1 in., jointed below the flower; calyx-lobes linear-oblong; corolla nearly 1 in., lobes long-triangular. Female *peduncle* about $\frac{1}{4}$ in. *Ovary* smooth. *Fruit* bright scarlet.

VAR. *palmata*, W. & A. *Prodr.* 348; leaves deeply lobed segments sometimes narrow and sinuate. *B. alceaefolia*, Herb. *Rottler*.—Principally in the Deccan Peninsula. Hook. f. in *Oliv. Fl. Trop. Afr.* ii. 551 keeps *C. quinqueloba* (Schrad. in Eckl. & Zeyh. *Enum.* 280) distinct from this var., but it is not easy to do so.—Whether this plant is *Bryonia grandis*, DC. *Prodr.* iii. 305 with aculeate fruit, or *B. Mormoi* of the same work, also said to have aculeate fruit, is perhaps now not material.

13. CUCURBITA, Linn.

Large climbing herbs, hispid or hairy; tendrils 2-4-fid. *Leaves* petioled, cordate, ovate, 5-angular or lobed. *Flowers* monœcious, all solitary, yellow, very large. MALE: calyx-tube campanulate, lobes 5, linear or foliaceous; corolla

campanulate, 5-lobed hardly half-way down; stamens 3, inserted low in the calyx-tube, anthers connate, one 1-celled, two 2-celled, cells conduplicate. FEMALE: calyx and corolla as in the male; ovary oblong, style short, stigmas 3, bifid; ovules very many, horizontal; placentas 3. *Fruit* fleshy, indehiscent, often large. *Seeds* ovoid or oblong, compressed, margined or not.—DISTRIB. Species 5, whereof 4 are cultivated, 1 is said to be wild in Africa.

1. **C. maxima**, *Duchesne in Lamk. Dict.* ii. 151; leaves with 5 shallow lobes or subentire sinus between the lobes narrow, hairs of the petiole equal not pungent, calyx-segments lanceolate-linear, fruiting peduncle stout corky striated not grooved. *DC. Prodr.* iii. 316; *Wall. Cat.* 6720; *Naud. in Ann. Sc. Nat.* ser. 4, vi. 17.

Throughout INDIA, cultivated.—DISTRIB. Cultivated in all warm and temperate parts of the globe.

Annual. *Leaves* 4–6 in. diam., hispidulous and also with much soft hair, denticulate; petiole often nearly as long as the blade. Male *peduncle* 4 in., female 1½ in. *Corolla* 3–4 in.—The *Common Gourd*.

2. **C. moschata**, *Duchesne*; *DC. Prodr.* iii. 317; hairs of the petiole equal not pungent, calyx-segments spatulate or foliaceous. *Naud. in Ann. Sc. Nat.* ser. 4, vi. 47; *Kurz in Journ. As. Soc.* 1877, pt. ii. 104. *C. maxima*, *W. & A. Prodr.* 351; *Wight Ill.* t. 105; *Wight Ic.* t. 507. *C. Melopepo*, *Roxb. Fl. Ind.* iii. 719; *Wall. Cat.* 6725. *C. Camolenga*, *Wall. Cat.* 6718.—*Rheede Hort. Mal.* viii. t. 2.

Throughout INDIA, cultivated.—DISTRIB. Widely cultivated in tropical and sub-tropical regions.—The *Musk-Melon*.

3. **C. Pepo**, *DC. Prodr.* iii. 317; leaves 5-lobed sinus between the lobes broad, hairs on the petiole beneath rigid almost prickly, fruiting peduncle woody strongly grooved. *Roxb. Fl. Ind.* iii. 718; *W. & A. Prodr.* 351; *Naud. in Ann. Sc. Nat.* ser. 4, vi. 29; *Wall. Cat.* 6722.

Throughout INDIA, cultivated.—DISTRIB. Cultivated in all warm and temperate parts of the globe.

Annual. *Leaves* 4–6 in. diam., with much soft hair, hispidulous on the nerves beneath, denticulate, lobes acute often slightly lobed; petiole often nearly as long as the blade. Male *peduncle* 4 in. or more, female 1½ in. *Corolla* 3–4 in.—The *Pumpkin*.

14. **BRYONIA**, *Linn.*

Climbing herbs, scabrid or glabrous; tendrils 2-fid in the Indian species. *Leaves* petioled, palmately 5-lobed or 3–5-angular. *Flowers* small, yellowish, males and females clustered in the same axils (in the Indian species shortly pedicelled). MALE: calyx-tube widely campanulate, 5-toothed; corolla 5-partite; stamens 3, inserted low down the calyx-tube, anthers free, two 2-celled one 1-celled; cells curved or somewhat sigmoid, never quite conduplicate, connective not produced; rudiment of ovary 0. FEMALE: calyx and corolla as in the male; ovary ovoid; style slender, 3-fid at the top, no disc at the base in the Indian species; ovules many, horizontal, placentas 3. *Berry* spherical, indehiscent. *Seeds* not very many, oblong or ovoid, compressed.—DISTRIB. Species 12, in the warm and temperate regions of the old world.

1. **B. laciniosa**, *Linn.*; *DC. Prodr.* iii. 308; scabrous or nearly glabrous, leaves generally deeply palmately 5-lobed sinus sometimes shallow, fruit nearly

sessile often 2-3 together, seeds ovoid with a thickened corrugate margin often with large protuberances on the faces. *Roxb. Hort. Beng.* 104; *Fl. Ind.* iii. 728; *Blume Bijl.* 927; *Wall. Cat.* 6699; *Wight Ic.* t. 500; *W. & A. Prodr.* 345; *Miq. Fl. Ind. Bat.* i. pt. i. 660; *Dalz. & Gibs. Bomb. Fl.* 101; *Kurz in Journ. As. Soc.* 1877, pt. ii. 104. *Bryonopsis courtallensis*, *Arn. in Hook. Journ. Bot.* iii. 274. *B. erythrocarpa*, *Naud. in Ann. Sc. Nat.* ser. 4, xviii. 194. *B. laciniosa*, *Hook. f. in Oliv. Fl. Trop. Afr.* ii. 556. *Cucumis verrucosus*, *Herb. Rottler.*

From the HIMALAYA to CEYLON. PEGU; *Kurz*.—DISTRIB. Trop. Africa, Mauritius, Malaya, Australia.

Stems angular, slender, usually glabrous or nearly so. *Leaves* often scabrous, punctate above, lobes 2-3 in., with a broad or narrow sinus; petiole often longer than the blade, sometimes mucronate near the apex. Male *pedicels* less than 1 in., usually glabrous, female still shorter. *Calyx-teeth* subulate. *Fruit* $\frac{3}{4}$ in. diam., green with white vertical stripes. *Seeds* $\frac{1}{4}$ in.

15. MUKIA, Arn.

Scabrous climbing herbs; tendrils simple. *Leaves* 3-7-angular, not deeply lobed, cordate, petioled and subsessile on the same plant. *Flowers* small, yellow, males and females clustered in the same axils; males very short-peduncled, females subsessile. MALE: calyx campanulate, teeth 5, subulate; corolla 5-partite; stamens 3, inserted low in the calyx-tube, anthers free, two 2-celled one 1-celled; cells straight, connective not produced. FEMALE: calyx and corolla as in the male; disk annular; ovary ovoid, hispid; style thick, apex 3-2-lobed; ovules not very many, horizontal; placentas 3-2. *Berry* globose, small, indehiscent. *Seeds* not very many, ovoid, compressed, strongly margined, faces rough or smooth.—DISTRIB. Species 2; one South Indian; the other African, Asiatic, and Australian.

1. *M. scabrella*, *Arn. in Hook. Journ. Bot.* iii. 276; very scabrous, leaves rough hispid beneath, seeds rough on their faces. *Naud. in Ann. Sc. Nat.* ser. 4, xii. 142; *Dalz. & Gibs. Bomb. Fl.* 100. *M. maderaspatana*, *Kurz in Journ. As. Soc.* 1877, pt. ii. 104. *Bryonia scabrella*, *Linn. f. Suppl.* 424: *DC. Prodr.* iii. 306; *Wall. Cat.* 6708; *W. & A. Prodr.* 305; *Wight Ic.* t. 501; *Roxb. Fl. Ind.* iii. 724; *Miq. Fl. Ind. Bat.* i. pt. i. 658. *B. Wightiana*, *Wall. Cat.* 6703. *B. maderaspatana* and *althæoides*, *DC. l. c.* 306. *Cucumis maderaspatanus*, *Linn. Sp. Pl.* 1438. *Karivia javanica*, *Miq. l. c.* 661. *Trichosanthes dioica*, *Wall. Cat.* 6692 C.

Throughout INDIA, common: ascending the hills as far as subtropical warmth extends.—DISTRIB. Africa, Malaya, Australia.

Stem angular, slender, hispid or scabrid. *Leaves* 1-3 in., serrate; petiole often very short, sometimes 1 in. or more. *Flowers* $\frac{1}{8}$ - $\frac{1}{6}$ in. diam. *Ovary* very hispid. *Fruit* $\frac{3}{8}$ - $\frac{1}{2}$ in. diam., bright red.

VAR. *gracilis*; leaves $4\frac{1}{2}$ by $2\frac{1}{2}$ in. hastate elongate very acute wide at the base long-petioled nearly entire. *Bryonia gracilis*, *Wall. Cat.* 6714.—Pagamew (BURMA); *Wallich*. Possibly a distinct species.

2. *M. leiiosperma*, *Thwaites Enum.* 125; scabrous, leaves hispid beneath and with much long soft hair, seeds smooth on their faces. *Bryonia leiiosperma*, *W. & A. Prodr.* 345. *B. mysorensis*, *Miq. in Herb. Hohenack.*

DECCAN PENINSULA; Pulney Mts., *Wight*. Nilghiris, *G. Thomson*, *Hohenacker*. CEYLON; alt. 4000-5000 ft., *Thwaites*.

Nearly allied to *M. scabrella*. Leaves densely softly villose beneath when young and often when old, elongated acute at the apex.—Mr. Thwaites says the rudimentary pistil in the male flowers is more developed than in *M. scabrella* and is surrounded at the base with an annulus.

16. ZEHNERIA, Endl.

Climbing herbs; tendrils simple. Leaves long- or short-petioled, dentate, angular or deeply lobed, polymorphous. Flowers small, yellowish, monœcious or diœcious, males in a peduncled corymb, females solitary on short peduncles or sometimes subcorymbose on a longer peduncle; bracts 0 or very small. MALE: calyx tubular-campanulate, teeth 5 small; corolla divided nearly to the base into 5 triangular segments; stamens 3, inserted low in the calyx-tube, filaments glabrous or hairy (in the same species), anthers free, all 2-celled or (in the same species) one 1-celled; anther-cells curved or (in the same species) flexuose or sigmoid; connective often papillose at the top, scarcely produced. FEMALE: calyx and corolla as in the male; ovary globose or oblong, glabrous or very hairy; style cylindric, 3-lobed, surrounded at the base by an annular disc; ovules many, horizontal; placentas 3. Fruit succulent, indehiscent, globose ellipsoid or cylindric. Seeds many or few, obovoid rounded or compressed, with or without a margin, faces smooth or somewhat tubercular or pitted.—DISTRIB. Species 15 (according to Bth. & Hk. f.) or 5 only; in tropical Asia, Australia, and Africa, with one species in South America.

1. **Z. Baueriana**, Endl. *Iconogr.* t. 116, 117; leaves cordate acute simple or 3-5-lobed half way down, petiole longer than the auricles, fruit $\frac{1}{2}$ by $\frac{3}{8}$ in. when dry reticulate-rugose ellipsoid, seeds much compressed oblong margined smooth or slightly tuberculate on the faces. *Z. mucronata*, *Miq. Fl. Ind. Bat.* i. pt. i. 656. *Bryonia mucronata*, *Blume. Bijl.* 923. *B. mysorensis*, *Wall. Cat.* 6702; *W. & A. Prodr.* 345; *Wight Ic.* t. 758; *Dalz. & Gibs. Bomb. Fl.* 101. ? *B. filiformis*, *Roxb. Fl. Ind.* iii. 727. *Karivia samoensis*, *A. Gray in Seem. Fl. Viti* 103.

DECCAN PENINSULA: *Wight*; *Heyne*; Nilghiris, *G. Thomson*; Canara, *Stocks*; Belgaum, *Ritchie*.—DISTRIB. Malaya, Japan, Norfolk Island, Feejees; but the area cannot be separated from that of the next species.

Weak, nearly glabrous. Leaves 2 in. diam., generally sharply denticulate; petiole $\frac{3}{4}$ in. or short. Flowers frequently monœcious in the same axils, sometimes apparently diœcious; male peduncle usually 1-2 in., female less than $\frac{1}{4}$ in., undivided in all the Indian examples, but occasionally the female peduncle is elongate umbellate according to *Wight*.—*Roxburgh's Bryonia filiformis* perhaps belongs here, but the ripe fruit is said to be near 1 in. It has been referred to *Melothria indica*, but the inflorescence is quite unlike that, as are the yellow flowers and stamens of *Roxburgh's* picture.

2. **Z. Hookeriana**, *Arn. in Hook. Journ. Bot.* iii. 275; leaves cordate acute simple or angular or 3-5-lobed half-way down, petiole longer than the auricles, fruit $\frac{3}{8}$ in. diam. when dry reticulate-rugose globose, seeds much flattened oblong margined smooth or slightly tuberculate on the faces. *Kurz in Journ. As. Soc.* 1877, pt. ii. 105. *Z. exasperata*, *Miq. Fl. Ind. Bat.* i. pt. i. 655. *Z. scabra*, *Harv. & Sond. Fl. Cap.* ii. 486; *Bryonia Hookeriana*, *W. & A. Prodr.* 345. *B. cissoides*, *Wall. Cat.* 6698. ? *B. oxyphylla*, *Wall. Cat.* 6697 (no flowers).

NORTH BENGAL; common in SIKKIM, ASSAM, KHASIA, and CACHAR, ascending to 5000 ft. alt. DECCAN PENINSULA and CEYLON, common; apparently always in the lower hills.—DISTRIB. Ava, Malaya, Africa.

Very near *Z. Baueriana* and possibly not distinct: but the ovary is globose even before the expansion of the flower. The leaves are also generally asperous above and sometimes much more hairy beneath than in any undoubted examples of *Z. Baueriana*. The African distribution of this cannot be defined, as *Z. scrobiculata* and even *Pilogyne lucida*, Naud. can hardly be distinguished from it.

3. *Z. umbellata*, *Thwaites Enum.* 125; leaves cordate or hastate rounded angled lobed or 3-5-partite nearly to the base, petiole usually shorter than the auricles, fruit $\frac{3}{4}$ -1½ in. smooth or shortly silky cylindric not rugose, seeds few obovoid only slightly compressed margin obscure rounded faces quite smooth or slightly rough. *Kurz in Journ. As. Soc.* 1877, pt. ii. 105. *Z. hastata* and connivens, *Miq. Fl. Ind. Bat.* i. pt. i. 656. *Karivia umbellata*, *Arn. in Hook. Journ. Bot.* iii. 275; *Miq. l. c.* 661. *K. Rheedii*, *Roem.*; *Miq. l. c.* 661. *Momordica umbellata*, *Roxb. Fl. Ind.* iii. 710. *Bryonia umbellata*, *Klein*; *DC. Prodr.* iii. 305; *Wall. Cat.* 6705; *W. & A. Prodr.* 345; *Dalz. & Gibs. Bomb. Fl.* 101. *B. sinuosa*, *Wall. Cat.* 6716, partly. *B. amplexicaulis*, *Lamk. Dict.* i. 496; *DC. l. c.* 306; *W. & A. Prodr.* 346. *B. sagittata* and *Rheedei*, *Blume*; *DC. l. c.* 305, 306. *Harlandia bryonioides*, *Hance in Walp. Ann.* ii. 648.—*Rheede Hort. Mal.* viii. t. 26.

Throughout INDIA and CEYLON, very common.—DISTRIB. Malaya, China, North Australia.

Stem and *leaves* usually nearly glabrous, or leaves scabrous above; petiole short, often hispid. *Leaves* polymorphous; sometimes 6 by scarcely 1 in., narrow triangular-lanceolate, sometimes cordate-oblong much rounded, often palmate nearly to the base with 3-5 narrow divaricate segments; basal lobes usually produced strongly backwards, rounded subacute or most acute. *Inflorescence* usually diœcious, male corymbose on a peduncle 2-4 in. or sessile; *pedicels* glabrous or hairy, subbracteate; females solitary, very short peduncled. Young *ovary* narrow-oblong, glabrous or somewhat pubescent. *Fruit* bright-red, usually much larger than that of the two preceding species. *Seeds* about 12; sometimes only 4-6 in the typical *Z. umbellata*, as said always in *Z. amplexicaulis* by W. & A.—Wight says that *Z. umbellata* may be distinguished from *Z. amplexicaulis* by having small oblong bracts on the middle of the pedicels, but these cannot be made out even in Wight's own specimens.

VAR. nepalensis, leaves deeply 5-palmate with narrow lobes, scattered glands, young ovary densely velvety, seeds oblong slightly compressed quite smooth and rounded with no trace of a margin. *Bryonia nepalensis*, Seringe in *DC. Prodr.* iii. 307.—Temperate Western Himalaya, alt. 4000-7000 ft.; *Royle*; *Thomson*; *Jacquemont*; *Strachey & Winterbottom*, &c.—A variety many times collected but only within a very limited area in Gurwhal, Kumaon and Kunawur.

17. MELOTHRIA, Linn.

Climbing herbs; tendrils simple or 2-fid. *Leaves* petioled, deltoid, truncate or hastate, entire or deeply 3-lobed, little hairy, often punctate. *Flowers* small, white, usually monœcious, males and females often from the same axil; male pedicels long, clustered (rarely subsolitary) in the axils, or clustered on long racemes resembling branches without leaves; female long-pedicelled. *MALE*: calyx-tube short, teeth 5, small; corolla 5-partite; stamens 3, inserted in the middle of the calyx-tube; anthers free, one 1-celled, two 2-celled; cells free, straight, simple, more or less lateral, connective prolonged, undivided, glabrous. *FEMALE*: calyx and corolla as in the male; ovary oblong, style long, stigmas 3 subglobose; ovules many, horizontal; placentas 3, vertical. *Fruit* indehiscent, globose, acute, or fusiform subrostrate. *Seeds* many, small, oblong, much compressed, obscurely margined, smooth or very nearly so.—DISTRIB. Species 25, all tropical.

* *Fruit fusiform, subtrigonus.*

1. **M. zeylanica**, *C. B. Clarke*; tendrils simple, leaves not lobed little cordate, male pedicels clustered in the axils, fruit $1\frac{3}{4}$ in. fusiform. *M. deltoidea*, *Thwaites Enum.* 124. *Æchmandra deltoidea*, *Arn. in Hook. Journ. Bot.* iii. 274. *Bryonia deltoidea*, *Arn. Pugill.* 19.

CEYLON; common up to 5000 ft., *Walker*; *Gardner*.

Nearly glabrous, stems thin. *Leaves* 2 by $1\frac{1}{2}$ in., acute, often punctate on both surfaces; petiole 1 in. *Pedicels* of males and females about as long as the petioles. *Corolla* hairy round the throat; rudimentary ovary of the male depressed-globose. *Ovary* fusiform; stigma large, 3-lobed. *Fruit* $\frac{1}{2}$ in. broad, obtusely trigonous, almost rostrate. *Seeds* $\frac{1}{8}$ in., packed in three columns.—The name *M. deltoidea* is preoccupied by *Benth. in Flora Nigrit.* 368 for a different plant.

2. **M. Wallichii**, *C. B. Clarke*; tendrils simple, leaves not lobed little cordate, male peduncle racemed, fruit 2 in. fusiform. *Bryonia odorata*, *Wall. Cat.* 6706 D.

PROME (Burmah); *Wallich*.

Stem glabrous. *Leaves* 2-3 by $2\frac{1}{2}$ - $3\frac{1}{2}$ in., very broadly deltoid, sharply triangular, sinuous scarcely denticulate, scabrous above with flat round glands, slightly hispid beneath. Male *raceme* nearly as in *M. odorata*. *Fruit pedicel* $\frac{3}{4}$ in. *Fruit* rostrate, attenuate at the base, resembling closely that of *M. zeylanica* but rather larger. *Seeds* nearly $\frac{1}{4}$ in., larger than those of *M. zeylanica*, many, oblong, very complanate, hardly margined, smooth on the faces.

** *Fruit globose, subquadrate, obtuse.*

3. **M. indica**, *Lour. Fl. Cochinch.* 43; tendrils simple, leaves more or less cordate entire or somewhat 3-lobed, male pedicels clustered in the axils, fruit $\frac{1}{2}$ in. ellipsoid pointed. *DC. Prodr.* iii. 313; *Naud. in Ann. Sc. Nat.* ser. 4, xvi. 169, with a fig.; *Kurz in Journ. As. Soc.* 1877, pt. ii. 105. *M. Regelii*, *Naud. l. c.* ser. 5, v. 35. *Æchmandra indica*, *Arn. in Hook. Journ. Bot.* iii. 274; *Miq. Fl. Ind. Bat.* i. pt. i. 658. *Bryonia tenella*, *Roxb. Fl. Ind.* iii. 725.

SIKKIM, alt. 3000 ft.; *C. B. Clarke*. SILHET in the Jheels; *H. f. & T.* CHITTAGONG; *Kurz*.—DISTRIB. Malaya to the Philippines, China, Japan.

Nearly glabrous, stem slender. *Leaves* $1\frac{1}{2}$ by $1\frac{1}{2}$ in., acuminate or scarcely acute, often punctate on both surfaces; petiole 1 in. *Pedicels* of males and females about as long as the petioles. Point of the *connective* short. *Fruit* white, seeds strongly margined (*ex Naudin*).—This appears exceedingly rare in India; but it may be doubted whether the next is other than a form of it: see *Benth. Fl. Hongk.* 125.

4. **M. odorata**, *Hk. f. & T. in Herb.*; tendrils simple, leaves more or less cordate entire or somewhat 3-lobed, male pedicels in distant clusters on long racemes, fruit $\frac{3}{8}$ - $\frac{1}{2}$ in. globose quadrate very obtuse. *Bryonia odorata*, *Ham. in Wall. Cat.* 6706 A. B. C.

NORTH-WEST HIMALAYA; *Royle*. Throughout the plain of EAST BENGAL, common, and ascending the hills to 7000 ft. alt.

Nearly glabrous, stem often stouter than in *M. indica*. *Leaves* 2-3 by $1\frac{1}{2}$ - $2\frac{1}{2}$ in., acute, often punctate on both surfaces; petiole $1-1\frac{1}{2}$ in. Male *peduncle* long, somewhat zigzag, with a cluster of pedicels (each $\frac{1}{2}$ - $\frac{3}{4}$ in.) at each angle; female pedicel as long as the petiole. *Corolla* white, with much hair round the throat. *Connective* not much produced; rudiment of ovary in the male flower globose depressed. *Seeds* $\frac{1}{8}$ - $\frac{1}{6}$ in., not or very obscurely margined.—This species has been separated from *M. indica* by the long raceme of the male flowers, which, however, does not essentially differ. The fruit appears very obtuse, the degree of margination of the seeds can hardly be relied on.

VAR. *triloba*; lobes of leaf divaricating sometimes very narrow and long, petiole often shorter than in the type. *Bryonia triflora*, *Wall. Cat.* 6707.—East Bengal;

Soorma Bank, *Griffith* (Kew Distrib. No. 2530).—The male inflorescence and the fruit are altogether those of *M. odorata*; the leaves unlike.

5. *M. bicirrhusa*, C. B. Clarke; tendrils 2-fid, leaves deeply cordate ovate caudate-acuminate, male inflorescence elongate racemed.

BIRMA; *Griffith* (Kew Distrib. No. 2522).

Nearly glabrous; stem like that of *M. odorata*; tendrils stout all 2-fid. Leaves 4 by 3 in.; petiole 2-3 in. Inflorescence exactly as in *M. odorata*. Male flower altogether of the genus, anthers lateral on the connective which is long produced above them: rudiment of the ovary depressed globose. Fruit not seen.—This appears as an excessively developed *M. odorata*.

18. *RHYNCHOCARPA*, Schrader.

Climbing herbs; tendrils simple. Leaves petioled, orbicular and undivided in the Indian species. Flowers monœcious or dioecious, very small; males subcorymbose on a short peduncle; females solitary (rarely aggregated), subsessile, sometimes in the same axil with the male. MALE: calyx-tube campanulate, teeth 5, small; corolla 5-partite; stamens 3 (rarely 5); anthers free or united one 1-celled, the others 2-celled; cells straight; connective crested 2-lobed or long-produced in two points. FEMALE: calyx and corolla as in the male; ovary ovoid, beaked; style ending in 2 rarely in 3 long stigmas; ovules not many, horizontal; placentas 2 rarely 3, vertical. Fruit ovoid, rostrate, indehiscent. Seeds ovoid, compressed, not very many.—DISTRIB. Species 5; in warmer Africa, one also in Western India.

1. *R. foetida*, Schrad. in *Linnaea*, xii. 404; foetid, scaberulous-pubescent, stigmas 2, fruit $\frac{1}{2}$ in. globose pubescent beak nearly $\frac{1}{2}$ in., seeds 4-6. Naud. in *Ann. Sc. Nat. ser. 4*, xii. 146. *R. rostrata*, Kurz in *Journ. As. Soc.* 1877, pt. ii. 105. *Æchmandra rostrata*, Arn. in *Hook. Journ. Bot.* iii. 274; Dalz. & Gibs. *Bomb. Fl.* 100. *Bryonia pilosa*, Roxb. *Hort. Beng.* 104, *Fl. Ind.* iii. 726. *B. filicaulis*, Wall. *Cat.* 6713. *B. rostrata*, Rottler; DC. *Prodr.* iii. 304; Wall. *Cat.* 6701; W. & A. *Prodr.* 346. *B. Perottetiana*, Seringe in DC. l. c. *Trichosanthes foetidissima*, Jacq. *Ic. Rar.* t. 624, *Melothria foetida*, Lamk. *Dict.* iv. 87. *Cyrtanema convolvulacea* and *divergens*, Rich. *Fl. Abyss.* i. 286.

GUZERAT; Dalzell. DECCAN PENINSULA; Rottler; Wight. Malabar Hills? Stocks; Dr. Ritchie. AYA, Wallich.—DISTRIB. Tropical Africa and Natal.

Stem somewhat stout, pubescent. Leaves 2 in. diam., orbicular or ovate, cordate, dentate; petiole $\frac{1}{2}$ -1 in. Male racemes small, scarcely 1 in. Calyx hairy with subulate teeth. Connective of each anther produced into a long curved pointed horn. Fruit bright red, 2-celled. Seeds $\frac{1}{2}$ in., distinctly margined.

SPECIES IMPERFECTLY KNOWN.

R.? DELTOIDEA, Kurz in *Journ. As. Soc.* 1877, pt. ii. 105; leaves deltoid with spreading acute basal lobes rough above, berries smooth glabrous.

Upper TENASSERIM, Attaran, Brandis; PEGU and PROME, Kurz.

Not seen; from the description it may be a variety of *R. foetida*.

19. *CORALLOCARPUS*, Welw.

Climbing or prostrate herbs, scabrid or submentose; tendrils simple. Leaves petioled, roundish-cordate, somewhat thick, entire lobed or palmate. Flowers

very small, monœcious; males in a small corymb at the apex of a long peduncle; females short-pedicelled or subsessile, solitary or clustered. MALE: calyx-tube campanulate, lobes 5, short; corolla 5-partite; stamens 3, nearly sessile at the mouth of the calyx-tube, anthers free, all 2-celled or one 1-celled; cells straight, oblong, lateral on the thin connective which is not produced; ovary rudimentary. FEMALE: calyx and corolla as in the male; ovary ovoid; disc 0; stigmas 3 or 2; ovules not very many, horizontal; placentas 3-2, vertical. *Berry* ovoid, circumsciss near the base, usually rostrate. *Seeds* not very many, ellipsoid or nearly globose, somewhat compressed, smooth or nearly so, little margined.—DISTRIB. Species 6, in Tropical Africa, the Persian Gulf, and Western India.

1. **C. epigæa**, *Hook. f. in Gen. Pl. i.* 831; leaves punctate or scabrid with minute hairs, fruit ellipsoid or ovoid suddenly contracted into the beak distinctly pedicelled, seeds ellipsoid slightly margined. *Æchmandra epigæa*, *Arn. in Hook. Journ. Bot. iii.* 274; *Wight Ic. t.* 503; *Dalz. & Gibs. Bomb. Fl.* 100. *Bryonia epigæa*, *Rottler; Willd. Sp. Pl. iv.* 619; *Wall. Cat.* 6709; *W. & A. Prodr.* 346. *B. glabra*, *Roxb. Hort Beng.* 104, *Fl. Ind. iii.* 725. *B. sinuata*, *Wall. Cat.* 6711 D.

PUNJAB, Rawul Pindee; *J. E. T. Aitcheson*. SCINDE and GUJERAT; *Dalzell*. DECCAN PENINSULA; *Rottler; Wight*. Belgaum; *Ritchie*. CEYLON; *Thwaites*.

Leaves 2 in. diam., nearly entire 3-5-angular or 3-5-lobed; lobes usually broad sometimes narrow, commonly roundish or sinuous on the margin; petiole 1 in. Male *peduncle* $1\frac{1}{2}$ -2 in., female $\frac{1}{4}$ - $\frac{1}{2}$ in. or sometimes 1 in. *Fruit* $\frac{3}{8}$ in., beak $\frac{1}{4}$ in. more. *Seeds* about six, much longer than broad.

2. **C. conocarpa**, *Hook. f. in Gen. Pl. i.* 831; leaves with minute white hairs on both surfaces hardly scabrid, fruit sessile conical not suddenly contracted into the beak, seeds ellipsoid not margined. *Æchmandra conocarpa*, *Dalz. & Gibs. Bomb. Fl.* 100? *C. Fenzlii*, *Hook. f. in Oliv. Fl. Trop. Afr. ii.* 565.

GUJERAT, near Malpor and Gundar; *Dalzell*. Also in *Stocks'* collection probably from Scinde.—DISTRIB. Central Africa.

Hardly differs from *C. epigæa* but in the points specified in the diagnosis. The leaves are 5-lobed, the lobes lanceolate, acute, narrow at each end.

3. **C. velutina**, *Hook. f. in Gen. Pl. i.* 831; leaves shortly villous on both surfaces, peduncles pedicels and calyx villous, fruit ellipsoid sessile suddenly narrowed into a short beak, seeds globose compressed hardly margined. *Æchmandra velutina*, *Dalz. & Gibs. Bomb. Fl.* 100. ? *C. ethaicus*, *Hook. f. in Oliv. Fl. Trop. Afr. ii.* 567.

SCINDE; *Dalzell*.—DISTRIB. Persian Gulf and Tropical Africa?

Whole plant villous. *Leaves* 2 in. diam., subentire or more or less 3-5-lobed, lobes rounded; petiole $\frac{3}{4}$ in. Male *peduncle* 3 in. with 12 flowers at the top. Male and female *flowers* as in *C. epigæa*. *Fruit* $\frac{1}{2}$ in. the beak $\frac{1}{2}$ in. *Seeds* about 12, $\frac{1}{8}$ in. diam.

20. CERASIOCARPUM, *Hook. f.*

Climbing glabrous herbs; tendrils simple. *Leaves* long-petioled, oblong, cordate, nearly entire. *Flowers* very small, monœcious; male peduncle carrying a few clustered flowers at the top; female flower sessile, solitary, often in the same axil with the male. MALE: calyx-tube short campanulate with 5 minute teeth; corolla 5-partite; stamens 3; anthers subsessile, distinct, one 1-celled, two 2-celled; cells oblong, lateral on the connective which is not produced;

rudiment of the ovary 0. FEMALE: calyx and corolla as in the male; ovary ovoid; disc 0, stigmas 3; ovules few, horizontal; placentas vertical. Fruit ellipsoid, sessile, indehiscent, without a beak. Seeds 2-6, ovoid, smooth, slightly compressed.

1. *C. zeylanicum*, Hook. f. in Gen. Pl. i. 832, female flower subsessile, seeds ovoid smooth slightly compressed. *Æchmandra zeylanica*, Thwaites Enum. 125.

CEYLON; alt. 3000-5000 ft.; Thwaites.

Leaves 3-6 in., obtuse or acute, cordate or hastate, almost 3-lobed, entire or undulate-denticulate; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in. Flowers $\frac{1}{4}$ - $\frac{1}{2}$ in. diam., yellow; petals broad, acuminate. Berry at most $\frac{1}{2}$ in. diam. Seeds $\frac{1}{8}$ - $\frac{1}{4}$ in. diam., little compressed, incompletely margined, 2-6 to each fruit.

DOUBTFUL SPECIES.

2. C.? PENANGENSE, C. B. Clarke; female peduncle $\frac{3}{4}$ -1 $\frac{1}{2}$ in., seeds much compressed somewhat rugose on the faces. *Bryonia heterophylla*, Wall. Cat. 6704.

PINANG; Wallich.

Stems rather strong, minutely pilose; tendrils simple. Leaves cordate-oblong, acute, entire slightly denticulate, scabrous above minutely hispid beneath. Flowers monœcious, all peduncled, solitary female and racemed males from the same axil; male peduncle 1 $\frac{1}{2}$ in. with 8 small pedicels at the summit. Fruit $\frac{3}{4}$ -1 in. diam., smooth, nearly globose. Seeds 4 to 6, $\frac{1}{8}$ in., somewhat margined, oblong.—Closely resembles *C. zeylanicum* except as to the peduncled female: but there are no flowers on Wallich's example.

3.? C. MAINGAYI, C. B. Clarke; leaves 3-lobed and entire, female peduncle $\frac{1}{2}$ - $\frac{3}{4}$ in., seeds margined not much compressed very rugose pitted on the faces.

MALACCA; Maingay No. 1268.

Stems nearly glabrous; tendrils simple. Leaves 2 by 1 $\frac{1}{2}$ in., with three divaricate lanceolate lobes or entire, not much cordate, scabrous on both surfaces; petiole $\frac{1}{2}$ in. Male peduncle 1 $\frac{1}{2}$ in. with 8 minute pedicels at the summit; female from the same axil. Stamens of the genus. Fruit $\frac{5}{8}$ by less than $\frac{3}{8}$ in., oblong, subacute. Seeds 10-12, less than $\frac{1}{2}$ in.—This may be a *Melothria*, but the long male peduncle with short pedicels and the unproduced connective do not suit. The capsule and seeds do not suit *Cerasiocarpum*.

21. CTENOLEPIS, Hook. f.

Climbing or prostrate scabrous herbs, turning black in drying; tendrils simple. Leaves cordate, orbicular, 5-7-lobed; stipuliform bracts at the axils of the leaves large round or elliptic, ciliate or dentate. Flowers minute, monœcious; males in small racemes on inconspicuous axile peduncles; female solitary, short-peduncled, in the same axil with the male. MALE: calyx-tube short, campanulate, lobes 5, subulate; corolla 5-partite; stamens 3, filaments very short; anthers free, one 1-celled, two 2-celled; cells straight, connective not produced; rudiment of ovary 0. FEMALE: calyx and corolla as in the male; ovary ovoid; 1-celled; disc 0; style columnar, stigmas 2 or 3; ovules 2 or 3, horizontal; placentas parietal. Fruit small, globose or subquadrate, oblique, indehiscent. Seeds 2 or 3, ellipsoid, much compressed, acutely margined, somewhat boat-shaped.—DISTRIB. Species 3; in India, Tropical Western Asia and Tropical Africa. The remarkable stipuliform bracts are characteristic of this genus.

1. *C. Garcini*, Naud. in Ann. Sc. Nat. ser. 5, vi. 13; middle lobe of the

leaf not very acute nor much longer than the others, male peduncle less than $\frac{1}{2}$ in., fruit not longer than broad. *Bryonia Garcini*, DC. *Prodr.* iii. 308; *Roxb. Fl. Ind.* i. 127; *Wall. Cat.* 6712; *W. & A. Prodr.* 344. *Zehneria Garcini*, *Stocks in Hook. Kew Journ. Bot.* iv. 149; *Dalz. & Gibs. Bomb. Fl.* 99.

BUNDELKUND; *Edgeworth*. DECCAN PENINSULA; *Rottler, &c.* CEYLON; *Thwaites*.

Annual; stem not elongate, more or less scabrous and punctate, scarcely at all hairy. *Leaves* 1– $1\frac{1}{2}$ in. diam., lobes often sinuate and lobed; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in.; stipuliform bracts $\frac{1}{4}$ in. and more, elliptic, with long cilia. *Fruit* $\frac{1}{2}$ by $\frac{1}{4}$ in.

2. ***C. cerasiformis***, *Naud. in Ann. Sc. Nat.* ser. 5, vi. 13; middle lobe of the leaf acute longer than the others, male peduncle $\frac{1}{2}$ –1 in., fruit ellipsoid not in the least narrowed into the peduncle. *Zehneria cerasiformis*, *Stocks in Hook. Kew Journ. Bot.* iv. 149.

SCINDE; *Stocks*. GUJERAT; *Dalzell*.—DISTRIB. Tropical and Southern Africa.

Hardly distinguishable from *C. Garcini*. *Leaves* usually larger, sometimes 3 in. diam.

22. **DICHELOSPERMUM**, C. B. Clarke.

A climbing scabrous herb; tendrils simple. *Leaves* petioled, cordate or hastate, ovate, acute, little lobed. *Flowers* minute; males and females clustered in the same axils, short-pedicelled. MALE: calyx-tube short, campanulate, teeth 5, minute; corolla 5-partite; stamens 3, filaments very short, anthers free, one 1-celled, two 2-celled; cells oblong, straight; connective not produced. *Fruit* small, membranous, obovoid, subtrigonus, 1-celled, with 3 basal erect seeds. *Seeds* with three parallel equal cells, the two lateral empty.

1. ***D. Ritchiei***, C. B. Clarke.

BELGAUM; *Ritchie*. Also in Herb. *Stocks* doubtless from Western India.

Exceedingly like *Mukia scabrella* except as to the seeds, and the flowers are smaller. *Leaves* $2\frac{1}{2}$ by $1\frac{3}{4}$ in., scabrid and somewhat hispid on both surfaces; petiole $\frac{3}{4}$ in. *Fruit* $\frac{1}{4}$ in. diam. *Seeds* $\frac{1}{8}$ by $\frac{1}{5}$ and $\frac{1}{10}$ in. thick, attached to the very bottom of the fruit, erect.—Female *flowers* not seen.

23. **THLADIANTHA**, Bunge.

Climbing herbs; tendrils simple, rarely 2-fid. *Leaves* petioled, entire or tripartite, deeply cordate, denticulate, softly pubescent or nearly glabrous. *Flowers* dioecious, yellow, large or small. Male *peduncles* in the fully developed plant paired, one 1-flowered ebracteate caducous, the other racemed the flowers with or without bracts; female peduncle elongate, 1-flowered, ebracteate. MALE: calyx-tube shortly campanulate, the bottom shut by a horizontal scale; segments 5, lanceolate; corolla campanulate, 5-partite, segments revolute about half-way down; filaments 5, inserted near the mouth of the calyx-tube; anther 1-celled, narrow-oblong, straight. FEMALE: calyx and corolla as in the male; ovary oblong, style deeply 3-fid with 3 reniform stigmas; ovules many, horizontal; placentas 3, vertical. *Fruit* ellipsoid, obtuse, indehiscent, green, cylindric with vertical ribs. *Seeds* many, horizontal, small, obovoid, compressed, smooth.—DISTRIB. Species 2, Bengal, Malaya, China.

The generic character is here widened to include the *Khasia* species. As in most Cucurbits with paired male peduncles, either the simple or the racemed one is often wanting, and the two do not flower together; the simple peduncle generally falls off

by the time the racemed one is in blossom. The corolla is slightly oblique; in *T. dubia* besides the normal large male flowers much smaller imperfect ones are often found.

1. **T. dubia**, *Bunge Enum. Pl. Chin. Bor.* 29; leaves deeply cordate ovate acute undivided, male racemes with prominent bracts, petals $\frac{3}{4}$ in. golden yellow. *Naud. in Ann. Sc. Nat.* ser. 4, xii. 150, t. 10; *Bot. Mag. t.* 5469; *Kurz in Journ. As. Soc.* 1877, pt. ii. 102. *Momordica calcarata*, *Wall. Cat.* 6740. *Gymnopetalum Horsfieldii* and *piperifolium*, *Miq. Fl. Ind. Bat. i.* pt. i. 680.

Plain of EAST BENGAL common, ascending to 8000 ft. in the hills. The female plant is rare and has never been collected in the plains. *PEGU*; *Kurz*.—*DISTRIB.* Malaya, China.

A large climber. *Leaves* 4 by $2\frac{1}{2}$ in., denticulate, not at all angular, usually villous beneath sometimes nearly glabrous; petiole $1\frac{1}{2}$ in. *Tendrils* simple in all the wild examples, but in Naudin's strong cultivated plants bifid. Male racemes 2-3 in., flowers approximated, bracts serrate or incise-serrate; calyx-teeth very narrow; filaments minutely hairy. Female peduncle 2-3 in., more or less hairy; young ovary densely woolly. *Fruit* $1\frac{1}{2}$ by $\frac{3}{4}$ in., glabrous, obtuse at both ends. *Seeds* scarcely $\frac{1}{4}$ in.—There is an admirable picture of this plant amongst Roxburgh's drawings.

2. **T. Hookeri**, *C. B. Clarke*; leaves deeply cordate-ovate acute entire and tripartite with lanceolate segments, male racemes without bracts, petals less than $\frac{1}{2}$ in.

ASSAM; *Griffith* (Kew Distrib. No. 769, 2553). KHASIA Mts., alt. 4000-6000 ft.; Myrung and Nunklow; *H. f. & T.*

A large climber; tendrils simple. *Leaves* polymorphous, acute, resembling altogether those of *T. dubia*, but generally less hairy and thinner, or tripartite, with segments 4 by $1\frac{3}{4}$ in., the two lateral lobes very cordate and auricled on the outer base; petiolules hardly $\frac{1}{8}$ in.; petiole 2 in. The female flower in Griffith's example resembles that of *T. dubia* but is smaller though the petals are slightly more than $\frac{1}{2}$ in.; peduncle about 1 in. Male racemes $1\frac{1}{2}$ in., slender; flowers pedicelled, scattered, yellow; petals scarcely $\frac{1}{4}$ in.; these small flowers probably correspond to the small imperfect males often found in *T. dubia*; if so the large perfect males of *T. Hookeri* are as yet unknown. *Fruit* (and seeds) altogether like those of *T. dubia*, but rather smaller, $1\frac{1}{2}$ in.—The ebracteate male raceme of this with pedicels $\frac{1}{2}$ in. is exceedingly unlike that of *T. dubia*: but in all other points they appear congeneric, and the habit is the same.

24. **EDGARIA**, *C. B. Clarke.*

A large scandent herb; tendrils 2-fid. *Leaves* petioled, entire, ovate, acute, deeply cordate, more or less pubescent. *Flowers* large, diœcious, yellow. Male peduncles paired, one 1-flowered caducous, the other racemed; bracts 0 or inconspicuous; female peduncle elongate, 1-flowered. MALE: calyx-tube elongate, funnel-shaped, teeth 5, subulate; corolla deeply 5-partite, with obovate acute segments; stamens 3, included in the calyx-tube; filaments exceedingly short; anthers connate into a cylindric tube, one 1-celled, two 2-celled; cells straight, linear-oblong, connective not appendaged. FEMALE: calyx and corolla as in the male; ovary narrow-obovoid, 3-celled; style long, stigmas 3, oblong, 2-fid; ovules 1-3 superimposed in each cell, horizontal or subpendulous. Capsule large, broadly fusiform, trigonous, 3-celled, fibrous, dry, 3-valved, valves dehiscing downwards and leaving the trigonous central axis. *Seeds* 1-3 in each cell, pendulous, compressed, subquadrate, large, corrugate or somewhat 3-lobed at the lower end and faces when dry.

1. **E. darjeelingensis**, C. B. Clarke in Journ. Linn. Soc. xv. 114. *Gymnopetalum* sp. 5, *Herb. Ind. Or., H. f. & T.*

GURWHAL; *Falconer*. SIKKIM, alt., 5000–8000 ft., very common; *J. D. H.*; *C. B. Clarke*.

Leaves 4 by $3\frac{1}{2}$ in., serrate and denticulate; petiole 3 in. Male raceme 6 in., female 3–4 in. Calyx-tube $\frac{3}{4}$ in. Petals $\frac{3}{4}$ in., widely patent. Fruit 3 by $1\frac{1}{4}$ in., somewhat pilose, with 2 wavy vertical ribs on each face. Seed $\frac{1}{2}$ by $\frac{1}{2}$ and $\frac{1}{10}$ in. thick.

25. GOMPHOGYNE, Griff.

Climbing, weak, succulent herbs, tendrils 2-fid or simple. Leaves petioled, pedate, with 5–7 lanceolate serrate leaflets. Flowers small, monœcious (sometimes at least), males racemed; females paniced or clustered. MALE: calyx rotate, 5-partite, with oblong segments; corolla 5-partite, with elongate erose segments; stamens 5, filaments united at the base; anthers globose, 1-celled, straight. FEMALE: calyx produced above the ovary and corolla as in the male; corolla-segments caudate; ovary top-shaped, 1-celled; styles 3, 2-fid at the apex; ovules 3, pendulous. Capsule top-shaped, 3-valved at the wide truncate summit, crowned by the persistent styles. Seeds 3 (2–1), ellipsoid, little compressed, black, obscurely margined.—DISTRIB. Species 2, one in the Himalaya one in Burma.

1. **G. cissiformis**, Griff. *Pl. Cantor.* p. 26; capsule somewhat succulent $\frac{1}{2}$ in. wide at the summit, seeds $\frac{1}{4}$ in. oblong with scaly tubercles on the rounded faces.

GURWHAL, alt. 7500 ft.; *Madden*. KUMAON; alt. 7000 ft.; *Edgeworth, Strachey & Winterbottom*. SIKKIM, alt. 5000–7000 ft.; *Lachong, J. D. H.*; *Doobdi, C. B. Clarke*.

Leaves $2\frac{1}{2}$ in. diam., glabrous or slightly pubescent; petiole $1-1\frac{1}{2}$ in. Male racemes 1–6 in., often compound (or appearing so), towards the end of leafless branchlets. Females clustered near the axils or on panicles 2–4 in. Capsule $\frac{3}{4}$ in.

2. **G. heterosperma**, Kurz in Journ. As. Soc. 1878, pt. ii. 105; capsule dry 9-ribbed $\frac{1}{5}$ in. wide at the summit, seed $\frac{1}{8}$ in. ovoid rugose-lacunose. *Zanonia?* heterosperma, *Wall. Cat.* 3728.

BURMA; at Taong-dong; *Wallich*.

The leaves and inflorescence closely resemble *G. cissiformis*. The capsule is $\frac{1}{2}$ in., but narrow linear-oblong.

26. ACTINOSTEMMA, Griff.

A climbing weak herb; tendrils simple and 2-fid. Leaves petioled, deeply cordate or hastate, elongate, much toothed, nearly glabrous. Flowers small, monœcious, in lax axillary panicles, pedicels jointed about their middle; panicles frequently male with a few females near the base. MALE: calyx rotate, 5-partite, with lanceolate-linear segments; corolla 5-partite, segments lanceolate-caudate; stamens 5, free; connective dilated-papillose on one side with a narrow straight oblong anther-cell on the other. FEMALE: calyx and corolla as in the male; ovary subglobose, verrucose, 1-celled; style short, with 2 reniform stigmas; ovules 2–4, pendulous, subparietal. Capsule ovoid-conical, half-superior, covered with rough points, circumsciss above the middle. Seeds 2–4, compressed, ovate, corrugated and denticulate on the margin.

1. **A. tenerum**, *Griff. Pl. Cantor.* 25; *Naud. in Ann. Sc. Nat. ser.* 5, v. 39. *Mitrosicyos lobatus*, *Maxim. in Prim. Fl. Amur.* 112, t. vii. *Pomasterion japonicum*, *Miq. Ann. Mus. Lugd. Bat.* ii. 80. *Sicyos oxyacanthus*, *Wall. Cat.* 6683. *Momordica Paina*, *Wall. Cat.* 6742. Cucurbitaceæ, *Wall. Cat.* 9060.

Plain of EAST BENGAL, frequent. ASSAM. SILHET.—DISTRIB. Amurland, Japan. *Leaves* 4 by 2½ in., acute, scarcely lobed in the Bengal specimens, palmately lobed in *Maximowicz*; petiole often 2 in. *Panicles* 3–6 in. *Fruit* ¾ by ½ in., not at all trigonous, upper part muricated as well as the lower. *Seeds* ½ by ⅔ in.

27. **GYNOSTEMMA**, *Blume.*

A climbing herb; tendrils simple. *Leaves* pedate; leaflets 3–5, ovate-lanceolate, serrate, membranous. *Flowers* small, diœcious, in axillary diffuse panicles, greenish. MALE: calyx short, with 5 small lobes; corolla rotate, 5-partite, with lanceolate segments; stamens 5, filaments connate below; anthers 2-celled; cells long, straight. FEMALE: calyx and corolla as in the male; ovary spherical, 3–2-celled; styles 3–2, united at the base, at the apex 2-fid; ovules in each cell 2; pendulous. *Fruit* globose, size of a pea, umbonate, indehiscent, 1–3-seeded. *Seed* not winged, verrucose, submuricate.

1. **G. pedata**, *Blume Bijl.* 23; leaflets glabrous beneath or slightly pubescent, panicles more or less pubescent. *Miq. Fl. Ind. Bat.* i. pt. ii. 687. *G. cissoides*, *pedata* and *Wightiana*, *Bth. & Hk. f. Gen. Pl.* i. 839. *Enkylia digyna* and *trigyna*, *Griff. Pl. Cantor.* 27. *Zanonia Wightiana*, *Arn. in Hook. Journ. Bot.* ii. 272. *Z. cissoidea* and *laxa*, *Wall. Pl. As. Rar.* ii. 28, 29; *Wall. Cat.* 3726, 3727. *Z. pedata*, *Miq. Fl. Ind. Bat.* i. pt. i. 683. *Pestalozzia pedata*, *Zoll. et Mor. Syst. Verz.* 31. *P. laxa*, *Thwaites Enum.* 124.

KUMAON; *Strachey & Winterbottom*. NIPAL; *Wallich*. SIKKIM, ASSAM, KHASIA, common up to 5000 ft. alt. CEYLON; *Thwaites*.—DISTRIB. Malaya, Japan.

Glabrous or pubescent. *Leaflets* 5 or 3 by 1½–2 in., lanceolate or obovate-lanceolate; petiolules ⅓–½ in.; petiole 1–1½ in., often pubescent with a line of crisped hairs. *Panicles* usually 3–6 in., sometimes 15 in. by nearly a foot broad, leafless. *Styles* 3 and 2 on the same plant. *Fruit* ½ in. diam., glabrous or puberulous. *Seed* ½ in., ellipsoid, subtrapezoid.

28. **ZANONIA**, *Linn.*

Climbing herbs; tendrils simple. *Leaves* long-petioled, simple, ovate or oblong. *Flowers* diœcious, in large compound pendulous racemes, males pedicelled, females subsessile. MALE: sepals 3, oblong or orbicular, concave; corolla rotate, 5-partite, segments subacute; stamens 5, free, inserted on a fleshy disc, filaments very short; anthers 1-celled, transversely oblong. FEMALE: calyx and corolla as in the male; ovary subclavate, at first 3-celled, styles 3, spreading, 2-fid at the apex; ovules in each cell 2 or many, pendulous, attached in 2 series to a fleshy parietal placenta. *Capsule* large, elongate-cylindric, clavate, 3-valved at the truncate apex. *Seeds* large, oblong, pendulous, compressed, surrounded by a large membranous wing.—DISTRIB. Species 2–3, extending from India to Borneo.

1. **Z. indica**, *Linn.*; *DC. Prodr.* iii. 298; leaves ovate rounded or cordate at the base glabrous or nearly so, fruit 4 in., seeds few pendulous from the summit of the fruit (*Dalzell*) wing 2–3 in. *Lamk. Ill.* t. 816; *Blume Bijl.* 937;

W. & A. Prodr. 340; *Wight Ill.* t. 103; *Dalz. & Gibs. Bomb. Fl.* 99; *Miq. Fl. Ind. Bat.* i. pt. i. 682.—*Rheede Hort. Mal.* viii. t. 47, 48, 49.

ASSAM and EAST BENGAL; *Griffith.* DECCAN PENINSULA; *Wight.* MALABAR MTS.; *Stocks, Law, Dalzell.* CEYLON; not uncommon up to 2000 ft., *Thwaites*.—DISTRIB. Malaya.

Leaves 6-8 by 3-4 in., usually acute; petiole 1 in. Male flowers very small, pedicels $\frac{1}{8}$ - $\frac{1}{4}$ in.; female flowers including the ovary $\frac{1}{2}$ in. *Ovary* early becoming 1-celled by the separation of the 3 fleshy placentas which only at first meet in its centre. *Seeds* much compressed, hardly $\frac{1}{10}$ in. thick.

DOUBTFUL SPECIES.

? *ZANONIA*; leaves 5 by 2 in. narrow-oblong rounded at the base, tendrils lateral.

CHITTAGONG; *H. f. & T.*—The example contains neither flowers nor fruit, but has all the appearance of *Zanonia* to which genus the collectors referred it in the field.—The only other species of the genus (collected by Beccari in Borneo) has the seed (including the wings) 6 in. broad curved lunate.

29. *ALSOMITRA*, *Bth. & Hk. f.*

Large climbers; tendrils simple or 2-fid. *Leaves* with 3 oblong entire leaflets. *Flowers* small, dioecious, white, in compound panicles, with filiform branches. MALE: calyx rotate, 5-partite, segments oblong, acute; corolla rotate, 5-partite, segments obtuse; stamens 5, filaments short, near together at the base; anthers small, oblong, straight, 1-celled. FEMALE: calyx and corolla as in the male; ovary elongate-clavate, 1-celled; styles 3-4, conical, with semi-lunate stigmas; ovules very many, pendulous; placentas 3, thick, vertical, parietal. *Capsule* large, elongate-clavate, truncate and 3-valved at the apex. *Seeds* very many, compressed, vertical, in six rows, much corrugated, incised or horned on the margin with a terminal membranous wing longer than the seed or 0.—DISTRIB. Species 3-5, extending from Nipal through Malaya to North Australia.

1. *A. sarcophylla*, *Hook. f. in Gen. Pl.* i. 840; leaves very fleshy, fruit $1\frac{1}{4}$ by $\frac{3}{8}$ in. at the top, seeds including the wing $\frac{5}{8}$ in. very verrucose on the rounded faces. *Kurz in Journ. As. Soc.* 1878, pt. ii. 106. *Zanonia sarcophylla*, *Wall. Pl. As. Rar.* t. 133; *Cat.* 3724.

BIUMA; from MANDALAY to PROME, *Wallich, Kurz*.—DISTRIB. Siam.

Leaflets $2\frac{1}{2}$ by $1\frac{1}{2}$ in., obtuse; petiolule scarcely $\frac{1}{4}$ in. *Seeds* black, not much compressed, narrowed nearly to a point at the base with 2 flat thin (not 2-fid) curved horns at the apex, between which rises the wing.

2. *A. clavigera*, *Hook. f. in Gen. Pl.* i. 840; leaves herbaceous, fruit 3 by $\frac{3}{4}$ in. at the top, seeds including the wing 1 in. slightly muricate on the flat faces. *Zanonia clavigera*, *Wall. Pl. As. Rar.* ii. p. 28, partly?; *Cat.* 3725.

SIKKIM, ascending to 4000 ft., *J. D. H., Gamble, C. B. Clarke.* KHASIA MTS., alt. 3000-4000 ft.; *H. f. & T.* SILHET; *Wallich.* TENASSERIM; *Helper* (Kew Distrib. No. 2520).

Leaflets 3 by $1\frac{1}{2}$ in., acute; petiolule often exceeding $\frac{1}{4}$ in. *Seeds* yellowish-white, much flattened, with several deep triangular spinose teeth at the apex, teeth of 2 lamellæ, between which the wing is inserted, split in the plane of complanation of the fruit, and the wing springing from these narrow splits.—*Wallich's* description of the seed of *Z. clavigera* is incorrect and appears to be taken from that of *Z. indica*, which grows in the same locality.

VAR.? *Hookeri*; seeds without any wing.—Khasia Mts., alt. 3000–4800 ft.; *J. D. H.*—The example is a stout leafless one with large ripe fruits. The seeds are in situ in the capsule so that the wing cannot have been broken off (as happens with seeds of *Zamia* kept separate). This may be an accidental var. of *A. clavigera* or it may be a new species.

ORDER LXVI. BEGONIACEÆ. (By C. B. Clarke.)

Succulent herbs or undershrubs; stem often reduced to a rhizome or tuber. *Leaves* alternate (sometimes falsely whorled in *B. verticillata*), more or less unequal-sided, entire toothed or lobed; stipules 2, free, frequently deciduous. *Peduncles* axillary, divided into dichotomous cymes, the branches and bracts at their divisions generally opposite. *Flowers* white rose or yellow, showy, sometimes small, monœcious. **MALE**: perianth (of the only Indian genus) of 2 outer valvate opposite sepaloïd segments, and 2–0 inner smaller segments; stamens indefinite often very many, free or monadelphous, anthers narrowly obovoid. **FEMALE**: perianth (of the only Indian genus) of 5–2 segments. *Ovary* inferior (in *Hildebrandia* half-superior), 2–3–4-celled; placentas vertical, axile (at the time of æstivation), divided or simple; styles 2–4, free or combined at the base, stigmas branched or tortuous; ovules very many. *Fruit* capsular, more rarely succulent, often winged, variously dehiscent or irregularly breaking up. *Seeds* very many, minute, globose or narrow cylindric, testa reticulated: albumen very scanty or 0.—**DISTRIB.** Species 400 (of which 398 belong to the genus *Begonia*), in all tropical moist countries; not yet met with in Australia.

1. BEGONIA, Linn.

Character of the Order.

SECT. I. Casparya. *Stamens* numerous, shortly monadelphous; anthers narrowly oblong, connective slightly produced, obtuse. *Ovary* 4-celled (in *B. Candollei* 3-celled), placentas 2-fid or 2-partite. *Fruit* more or less fleshy, not dehiscent on the faces; carpels not much compressed, nor having their backs produced into a thin wing. (None small: leaves in all very unequal at the base.)

1. **B. Roxburghii**, *A. DC. Prodr.* xv. pt. i. 398; stem lengthened with inflorescence clustered near the axils, leaves ovate nearly glabrous sinuate-toothed scarcely serrate, fruit subpyramidal 4-celled very succulent angles obtuse ending in 4 small horns upwards. *Kurz in Journ. As. Soc.* 1877, pt. ii. 107. *B. malabarica*, *Roxb. Fl. Ind.* iii. 648, not of *Lamk.* *Diploclinium Roxburghii*, *Miq. Fl. Ind. Bat.* i. pt. i. p. 692. *Casparya?* *oligocarpa* and *polycarpa*, *DC. Prodr.* xv. pt. i. 276, 277.

From NIPAL to BURMA; not uncommon in NORTH and EAST BENGAL with ASSAM, ascending to 4000 ft.

Root fibrous, not tuberous. *Stem* usually 1–3 ft., erect, succulent, glabrous or minutely pubescent when young. *Leaves* 6–9 in., acuminate, glabrous or minutely pubescent on the nerves of both surfaces; petiole 2–5 in.; stipules lanceolate, glabrous, deciduous. *Cymes* short, axillary, dichotomous, with narrow lanceolate linear bracts, often few-flowered, producing but one or two fruits from each axil. **MALE FL.**: sepals 2, large, glabrous, nearly white; petals usually 2, smaller than the sepals, white or nearly so; stamens about 50. **FEMALE**: ovary cells 4; placentas very

thick, succulent, equally 2-partite; styles 4, 2-fid nearly from the base, stigmas winding spirally with 3 turns. *Fruit* $\frac{1}{2}$ – $\frac{3}{4}$ in. diam pendent; walls very thick, succulent, indehiscent or finally dehiscent at the angles. *Seeds* shortly ellipsoid, somewhat obovoid.—Cathcart *lc. Ined.* represents the cells of the ovary as occasionally 3 which is not improbable, or his artist may have confounded *B. Candollei* (No. 4) with the present species.

2. ***B. silhetensis***, C. B. Clarke; stemless, inflorescence shorter than the petioles, leaves ovate finely denticulate hardly serrate or lobed, fruit globose thick-walled 4-celled densely covered with shaggy brown hair. *B. gigantea*, Wall. Cat. 3677 *B. Casparya?* *silhetensis*, A. DC. Prodr. xv. pt. i. 277. *Begonia* sp., Wall. Cat. 9107.

KHASIA Mts.; Wallich. EAST BENGAL; Griffith (Kew Distrib. No. 2569). CACHAR; Keenan.

Rootstock short, thick, fibrous on all sides, scarcely tuberous. *Leaves* 6 in., broadly ovate, not acuminate, shaggy on both surfaces in Griffith's examples, only slightly hairy in Wallich's. *Petiole* 6–18 in., hirsute in Griffith's examples, less hairy in Wallich's. *Scapes* 2–4 in., 1–7-flowered. MALE: sepals 2, hairy without, $\frac{1}{2}$ in. in Griffith's examples, smaller nearly glabrous in Wallich's; petals 2, smaller than the sepals, glabrous; stamens numerous, shortly monadelphous, anthers narrowly oblong. FEMALE: styles bifid with tortuose stigmas. *Fruit* $\frac{1}{2}$ in. and upwards in diam., globose or ovoid, without angles or protuberances. *Seeds* many, shining brown, shortly ellipsoid.—Griffith's No. 2569 (with which Wallich's No. 3677 B agrees), differs considerably in hairiness and in size of the flower from Wallich's No. 9107 on which A. DC. founded his *Casparya?* *silhetensis*: two species are possibly here mixed, but the material is not sufficient to justify a new species.

3. ***B. tessaricarpa***, C. B. Clarke; nearly stemless, inflorescence much shorter than the petioles, leaves ovate nearly glabrous sinuate-denticulate hardly serrate, fruit subpyramidal 4-celled laxly hairy, carpels acutely keeled and ending upwards in a short linear patent horn.

ASSAM; Griffith (Kew Distrib. No. 2586).

Creeping stem 0–2 in. *Leaves* 2–4 in., broadly ovate, glabrous or minutely pubescent on the nerves beneath; petiole 6–12 in., pubescent upwards. *Inflorescence* 2–4 in. *Flowers* much smaller and fruit less succulent than in *B. Roxburghii*. *Fruit* about $\frac{3}{4}$ in. diam., slightly pubescent.—This solitary example may be possibly a stunted example of *B. Roxburghii*, from which it does not differ in any essential particular though it is very unlike it in general aspect; the seeds are alike.

4. ***B. inflata***, C. B. Clarke; stem lengthened, inflorescence axillary, leaves oblong-lanceolate glabrous or nearly so sinuate-dentate scarcely serrate, fruit 3-celled.

DARJEELING, alt. 3000 ft.; C. B. Clarke. BHOTAN? Griffith (Kew Distrib. No. 2587).

Erect, 3–4 ft., branched. *Leaves* 4 by $1\frac{1}{4}$ – $1\frac{1}{2}$ in., acuminate, very unequally cordate; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in.; stipules lanceolate-subulate, glabrous. *Flowers* in short axillary dichotomous cymes from several axils on each branch; bracts lanceolate-subulate. MALE: sepals 2, white, obovate, glabrous; petals 2, linear-obovate; stamens about 50, scarcely monadelphous; anthers narrow-oblong; connective produced, obtuse. FEMALE: perianth of 4 segments; ovary 3-celled, placentas 2-fid. *Fruit* $\frac{3}{8}$ in. diam., trigonous or almost triquetrous; carpels round, as it were inflated, with a narrow line down the back, glabrous or nearly so, indehiscent or probably at length dehiscing down the ridges as in *B. Roxburghii*. *Seeds* short, ellipsoid somewhat obovoid.—Griffith's examples are in good fruit but the locality is doubtful: his ticket is marked "Umb. ascent. 4 day."

5. **B. Dux**, C. B. Clarke; stem lengthened, inflorescence axillary not diffuse, leaves ovate with scattered hairs above denticulate somewhat ciliate.

MOULMEIN; Moolee alt. 6000 ft.; Parish.

Stem exceeding a foot, succulent, tubercular. *Leaves* 8 in., acuminate, much auricled on one side at the base, somewhat angular, pubescent on the nerves beneath; petiole 4 in., pubescent upwards; stipules $\frac{3}{4}$ in., ovate-lanceolate, glabrous, persistent. *Flowers* (all male in the solitary example) large, glabrous, in short few-flowered cymes with bracts resembling the stipules. *Sepals* 2, round; petals 2, narrower. *Stamens* very many, shortly monadelphous; anthers narrow-oblong; connective hardly produced.—The section is doubtful, the female flowers being unknown: it may be a *Platycentrum*: Parish remarks that it looks like *B. Rex*; but the thick erect tall stem differs.

SECT. II. **Alæcida**. *Fruit* triquetrous, faces with a medial line; carpels dehiscing dorsally, angles with short subequal wings below the middle; placentas divided.—Small small-flowered plants; filaments monadelphous; styles connate.

6. **B. alæcida**, C. B. Clarke; stem branched, cymes elongate subproliferous laxly pubescent, fruit inflated glandular-pubescent.

MOULMEIN; Parish.

Rootstock small, fibrous. *Stem* 3 in., nearly glabrous. *Leaves* $1\frac{1}{2}$ – $4\frac{1}{2}$ in. diam., cordate, round, minutely denticulate, puberulous-punctate above, nearly glabrous beneath; petiole 1– $2\frac{1}{2}$ in.; stipules ovate, acute, minute. *Cymes* 3–6 in., weak, somewhat panicle; bracts small, ovate, persistent, with lax hairs. **MALE**: sepals 2, round; petals 2, narrow-oblong; stamens not very many; anthers very short, obovoid; connective not produced. **FEMALE**: styles united a long way, stigmas lunate; ovary with glandular hairs. *Capsule* scarcely $\frac{1}{4}$ in. broad including the wings, ripe green, with 6 lines equally diverging from the base of the styles. *Seeds* short, ellipsoid.

7. **B. tricuspidata**, C. B. Clarke; stem short or 0, leaves ovate crenate puberulous on the nerves beneath, scape pubescent, capsule stellately tricuspidate glabrous.

MOULMEIN; Parish.

Rootstock small, fibrous. *Stem* sometimes 1–2 in., pubescent. *Leaves* round or ovate, somewhat cordate, crenate or nearly entire, with scattered minute hairs above; petiole $\frac{1}{4}$ –1 in., pubescent; stipules minute. *Cymes* 2–3 in., minutely pubescent; bracts ovate, minute. **MALE**: sepals 2, obovate; petals 2, narrowly obovate; stamens not many; anthers very short, ovoid; connective not produced. **FEMALE**: perianth of 4 segments, much as in the male; styles combined below, each with two curved branches. *Capsule* less than $\frac{1}{4}$ in. broad including the wings, with six lines equally diverging from the base of the styles, wings acute. *Seeds* very small, shortly ellipsoid.

8. **B. triradiata**, C. B. Clarke; stem short or 0, leaves ovate serrate or doubly crenate glabrous and white beneath, scape glabrous, capsule stellately 3-rayed glabrous.

MOULMEIN; Parish.

Rootstock a small cluster of tubers. *Stem* 0– $\frac{1}{2}$ in., glabrous. *Leaves* $\frac{1}{2}$ – $1\frac{1}{2}$ in., somewhat cordate, incise-crenate, minutely pilose above; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in., glabrous; stipules small, lanceolate. *Cymes* 2–3 in., glabrous; bracts small, lanceolate, glabrous, persistent; flowers pink. *Flowers* fruit and seeds closely resembling those of *B. tricuspidata*.

SECT. III. **Knesebeckia**. *Capsule* 3-celled, triquetrous, the angles produced into three often unequal papery wings; faces flat with a rib or line down

the middle; dehiscing by the falling away of 2 or 3 of the faces; placentas 2-fid. *Stamens* very shortly monadelphous, anthers obovoid, connective not produced.

A. Segments of female flower 5 (rarely 6), imbricate, inner smaller, innermost often smallest or 0. Sect. *Knesebeckia* A. DC.

* *Ovary and young capsule very pubescent.* (See also 12. *B. Josephi*.)

9. **B. picta**, Sm. *Exot. Bot.* t. 101; leaves ovate acuminate, capsule with one wing much elongate. *Hook. Exot. Fl.* ii. t. 89; *Wall. Cat.* 3685 B and part of A; *Bot. Mag.* t. 2962; *A. DC. Prodr.* xv. pt. i. 312. *B. echinata*, *Royle Ill.* 313, t. 80. *B. erosa*, *Wall. Cat.* 3688, partly.

HIMALAYA, alt. 2000–6000 ft.; from KUNAWUR to BHOTAN, frequent. KHASIA MTS., alt. 3000–4000 ft.; *H. f. & T.* Throughout CHOTA NAGPUR, alt. 1000–4200 ft.; C. B. Clarke.

Rootstock of one or few tubers; plant 6–15 in., the inflorescence scarcely exceeding the leaves, stem glabrous or obscurely pubescent. *Leaves* 3–5 by 2–3 in., nearly equally cordate, doubly finely serrate, pilose above, villous on the nerves beneath; petiole of the cauline leaf usually 1 in. at least; stipules lanceolate, hairy, scarcely exceeding the leaves. *Peduncle* more or less pubescent upwards; bracts oblong-lanceolate, persistent, pubescent. *MALE*: outer segments 2, pubescent; petals 2, smaller; stamens shortly monadelphous, about 30; anthers obovoid; connective not produced. *FEMALE*: perianth of 5 segments, outer larger, pubescent. *Styles* 3, nearly separate, divided half way up into two tortuose branches. *Capsule* large, 1 in., usually pubescent, sometimes nearly glabrous when quite ripe; one wing $\frac{1}{2}$ in. broad, another $\frac{1}{4}$ in., the third $1\frac{1}{2}$ in. in a large example; styles persistent; wings slightly ascending, dehiscing by the three faces falling off. *Seeds* light brown, shortly ellipsoid.—Flowers pale rose, medium large; leaves often variegated.

10. **B. Satrapis**, C. B. Clarke; leaves reniform or shortly ovate-cordate not acute, capsule with 3 wings no one of them greatly elongate.

SIKKIM; above the Rungait, alt. 2000 ft.; *Herb. Griffith*, C. B. Clarke, Dr. Treutler.

Rootstock of a few tubers. *Stem* erect, usually elongate above the leaves, pubescent, whole plant 12–18 in. *Leaves* 2–3 by 3–4 in., nearly equally cordate, minutely denticulate-ciliate, closely pubescent above, rufous-villous on the nerves beneath; petiole of the cauline leaf usually short often less than 1 in.; stipules lanceolate, pubescent. *Peduncle* elongate, very pubescent, bright rose-red, often rising 6 in. above the highest leaf; bracts oblong-lanceolate, persistent, very hairy, laciniated, sometimes divided to the base. *MALE*: sepals 2, pubescent; petals 2, smaller; stamens shortly monadelphous, about 50; anthers obovoid; connective not produced. *FEMALE*: perianth of 5 (or 6) segments, outer larger, pubescent; styles 3, nearly separate, each divided half-way up into two tortuose branches. *Capsule* large, very pubescent, length $\frac{1}{2}$ in., wings not very unequal about $\frac{1}{4}$ in. broad (but the capsule not well ripe). *Seeds* (not well ripe) like those of *B. picta* but narrower.—A very beautiful plant with bright rose flowers.

** *Ovary and capsule glabrous* (except sometimes in 12, *B. Josephi*).

11. **B. Evansiana**, Andr. *Bot. Rep.* t. 627; stem elongate, leaves ovate-cordate acute unequal at the base, bracts glabrous oblong-obovate, capsule with three unequal wings. *Bot. Mag.* t. 1473; *A. DC. Prodr.* xv. pt. i. 313. *B. obliqua*, *Thunb.*; *Banks Ic. Kämpf.* t. 20. *B. sinensis*, *A. DC. l. c. ex descr.*

PINANG; *Evans* ex Andrews.—DISTRIB. Java, China, Japan.

Rootstock tuberous (ex A. DC.). *Stem* 2 ft., nearly glabrous; peduncles from the upper axils, elongate, several times dichotomous. *Leaves* 3-6 in., somewhat angular and denticulate; petiole 2-6 in.; stipules ovate-lanceolate, glabrous. *Flowers*, bracts, and pedicels rose. *MALE*: sepals 2, round, glabrous; petals 2, smaller; stamens very many (more than 50), long monadelphous; anthers obovoid; connective not produced. *FEMALE*: perianth-segments 5, glabrous, inner smaller; styles 3, nearly distinct, divided about half-way into two tortuous branches. *Capsule* $\frac{3}{4}$ by $1\frac{1}{4}$ in. including the wings, the faces ribbed down the middle; styles persistent; wings slightly ascending; capsule dehiscing by two valves on each face, one valve on either side of the central rib.—There is no example from Pinang in the Kew Herbarium.

12. **B. Josephi**, A. DC. *Prodr.* xv. pt. i. 313; little hairy, leaves ovate little unequal at the base peltate (at least when young), capsule 3-winged, one wing much the longer. *B. scutata*, Wall. *Cat.* 3686 A, not of A. DC.

SIKKIM, alt. 3000-8000 ft., the commonest species. KHASIA Mts., alt. 4000-6000 ft.; *H. f. & T.*

Very variable in size and habit, stemless or stem leafy, always easily recognised by the peltate leaves. *Rootstock* of one or few tubers. *Stem* generally 0. Radical leaves (on petioles 4-10 in.) often 6 in., sometimes nearly regularly ovate acuminate, acutely 3-lobed or orbicular with numerous acute lobes, serrate or doubly serrate or less often almost entire, usually nearly glabrous but often slightly pubescent on the nerves beneath sometimes weakly pilose above; stipules ovate, deciduous, glabrous or nearly so. *Scape* 1 ft., usually repeatedly dichotomous with long lower branches, soon entirely naked; bracts caducous, caulescent and leafy; flowers rather small, rose. *MALE*: sepals 2, caducous; petals 2, smaller; stamens shortly monadelphous, sometimes 8-30; anthers obovoid; connective not produced. *FEMALE*: perianth-segments 4-6; styles 3, nearly separate, 2-fid near the top, stigmas in large specimens 2 tortuous, in small simple lunate. *Capsule* $\frac{1}{2}$ by $\frac{3}{4}$ in. including the wings, styles persistent, upper margin of the wing horizontal, narrow between the two very narrow wings, the other faces broader below; dehiscing first by 4 lines, two on either side of each of the two narrow wings. *Seeds* short-ellipsoid.—All three varieties are equally common in Sikkim and pass into each other: only the typical has been collected in Khasia. The plant is believed to be very plentiful in West Bhotan and East Nipal, but all the numerous Himalayan examples at Kew are from Sikkim itself. As regards the name: Wallich's Begonias are greatly mixed: even on the same sheets. The three sheets of No. 3686 at Kew are *B. scutata*, A. DC., but the type sheet of *B. scutata* No. 3686 in the Linnean Society's Herbarium is *B. Josephi*, A. DC., which is also mixed with *B. picta* in the sheet of 3685 A.

VAR. 1. *typica*; peduncles elongated, leaves large often lobed, ovary flowers and capsule glabrous. *B. Josephi*, A. DC. l. c.

VAR. 2. *macrocarpa*, A. DC. l. c.; ovary flowers and capsule with lax hairs.—Both large and very small plants occur with a hairy ovary; the fruit is not larger than in the typical form.

VAR. 3. *minima*; scape 2-3 in., leaf small without lobes, ovary usually glabrous.

13. **B. pedunculosa**, Wall. *Pl. As. Rar.* 82, t. 97; *Cat.* 3672 A not B; caulescent with subterminal inflorescence, leaves narrow-oblong acute from an unequally cordate base pilose above, stipules and bracts persistent. A. DC. *Prodr.* xv. pt. i. 314.

KHASIA Mts., alt. 3000-6000 ft., frequent. BHOTAN; *Griffith*.

Rootstock tuberous, or elongate woody. *Stem* erect, 4-8 in., usually with some brown hairs and zigzag, not unfrequently bearing bulbils in the upper axils. *Leaves* 2-3 in., sharply doubly-serrate, pubescent on the nerves beneath; petiole usually short (less than 1 in.) but sometimes elongate; stipules $\frac{3}{4}$ -1 in., ovate, acute, ciliate. *Cyme* repeatedly dichotomous; bracts ovate, acute, ciliate; flowers small, rose-red.

MALE: sepals 2, glabrous or nearly so; petals 2, smaller; stamens shortly monadelphous, about 30, anthers obovoid, connective not produced. **FEMALE**: perianth, lobes 4-5, persistent, somewhat enlarged on the fruit; ovary glabrous; styles 3 nearly separate, divided near the top into two curved branches. *Capsule* scarcely $\frac{1}{4}$ by $\frac{3}{8}$ in. including the wing, upper margin of the longest wing horizontal; capsule dehiscing by its three faces falling off. *Seeds* short-ellipsoid.

14. **B. surculigera**, Kurz in *Flora* 1871, 296; weak, caulescent with terminal inflorescence, leaves cordate-ovate crenate and denticulate, bracts minute ovate persistent, capsule with 3 subequal wings.

BRITISH BURMA; Akyab and Arracan, on low sandstone hills, Kurz.

Weak, succulent, 3-10 in., glabrous or slightly glandular-pubescent, frequently proliferous, or the peduncle going off into a runner. *Leaves* 1-1 $\frac{1}{2}$ by 1-1 $\frac{1}{4}$ in., nearly glabrous, obscurely acuminate, obtuse at the apex, base equal or unequal; petiole $\frac{1}{4}$ in.; stipules small, ovate, glabrous. *Peduncle* weak, terminal, dichotomous, lax, slightly glandular-pubescent. *Flowers* small (white ex Kurz). **MALE**: sepals 2, obovate, glabrous or with few paleaceous hairs; petals 2, much smaller; stamens monadelphous, about 8, anthers obovoid, connective apiculate, but not produced. **FEMALE**: perianth-segments 5; ovary 3-celled, glabrous, placentas bipartite (Kurz); styles 3, nearly distinct, divided only near the top, stigmas lunate. *Capsule* less than $\frac{1}{5}$ by $\frac{3}{8}$ in. including the wings, styles deciduous in the few examples seen, upper margin of the wings convex, dehiscing by its three faces. *Seeds* short-ellipsoid.

15. **B. modestiflora**, Kurz in *Flora* 1871, 296; caulescent, inflorescence terminal elongate and paniced in fruit, leaves ovate-acuminate from a very oblique base denticulate-serrate nearly glabrous, capsule unequally 3-winged. *B. parviflora*, Wall. Cat. 3674.

MORUNG HILLS, NIPAL; Hamilton. BRITISH BURMA: Akyab on sandstone rocks, Kurz. MOULMEIN on limestone rocks, Parish.—DISTRIB. YUNAN.

Glabrous or nearly so. *Rootstock* tuberous. *Stem* erect, sometimes a foot. *Leaves* 3-4 by 2 in., not lobed, caudate-acuminate, base very unequally cordate or very obliquely subtruncate; petiole 1 $\frac{1}{2}$ -2 $\frac{1}{2}$ in.; stipules small, lanceolate. *Cymes* elongate, narrow, slightly paniced; bracts small, lanceolate, ciliate, caducous; flowers numerous, small, white. **MALE**: sepals 2, petals 2, smaller; stamens (about 12), free ex Kurz (distinctly monadelphous ex Parish), anthers obovoid, connective slightly produced in a triangular point. **FEMALE**: perianth-segments 5, much enlarged in fruit; ovary glabrous, 3-celled, placentas 2-partite; styles 3, nearly distinct, broader upwards, stigma lunate. *Capsule* rather more than $\frac{1}{2}$ by 1 in. including the wings; styles deciduous; 3 wings prominent, their upper margins horizontal, one often very greatly produced; capsule dehiscing by the three faces. *Seeds* short-ellipsoid.—Kurz placed this species next *B. scutata*, but the 5 female perianth segments refer it to *Knesebeckia* proper, and not to *Trilobaria*, A. DC. Possibly two species are mixed here. Wallich's very immature specimen has exceedingly small flowers and weak inflorescence and is referred by Meissner in ms. to *B. hydrophila*.

16. **B. parvuliflora**, A. DC. *Prodr.* xv. pt. i. 355; stem with 1 or no leaf, leaves round or ovate-cordate subequal at the base, capsule 3-winged one of the wings very long produced. *B. Lobbiana*, A. DC. ms. not *B. Lobbii*, Hassk. *B. velutina*, Parish ms.; Kurz in *Journ. As. Soc.* 1873, pt. ii. 81.

MOULMEIN and MARTABAN; T. Lobb; on limestone rocks, Parish. TENASSERIM; Dr. Stoliczka (ex Kurz).

Rootstock of 1 or 2 tubers. *Stem* 0-2 in., glabrous or nearly so, whole plant 6-12 in. *Leaves* 1-3 in. diam., softly pubescent above and on the nerves beneath, sometimes nearly glabrous, doubly serrate-ciliate or simply crenate; petiole of the cauline leaf $\frac{1}{2}$ -1 in., of the radical leaves often much longer, slightly pubescent; stipules very

small, lanceolate. *Peduncles* 4–10 in., nearly glabrous, laxly dichotomous; bracts $\frac{1}{8}$ – $\frac{1}{4}$ in., lanceolate, sometimes fimbriate; flowers not many, small, white tinged with rose. **MALE**: sepals 2, broad-elliptic, glabrous or with a few scattered hairs; petals 2, narrowly oblong; stamens about 25, monadelphous, anthers obovoid, connective not produced. **FEMALE**: perianth of 5 or 4 segments; styles 3, somewhat combined, each divided into two curved branches. *Capsule* $\frac{1}{2}$ by $\frac{1}{2}$ in. including the wings, one wing very long, margins of all extended horizontally from the summit of the capsule, dehiscing on all three faces. *Seeds* short-ellipsoid.—Kurz (*in Journ. As. Soc.* 1877, pt. ii. 107) keeps *B. parvuliflora* “a caulescent wholly glabrous herb” distinct from *B. velutina* “a scapigerous herb with leaves pilose above:” but A. DC.’s type of *B. parvuliflora* (marked by him *B. Lobbiana*) has the leaves decidedly pilose above and the stems not more caulescent than some of Parish’s *B. velutina*. The only difference between the two is that in *B. velutina* the leaves are often beautifully variegated and doubly serrated; but not always Parish’s specimens.

17. **B. gemmipara**, Hook. f. *Ill. Him. Pl.* t. 14; caulescent, leaves incise-serrate or lobed, peduncles axillary short few-flowered, 2 large round persistent bracts on each pedicel near the flower, seeds with adpressed papillæ. *A. DC. Prodr.* xv. pt. i. 314.

SIKKIM, alt. 6000–11,000 ft.; plentiful round Darjeeling.

Rootstock tuberous. *Stem* 6–16 in., succulent, glabrous. *Leaves* ovate-cordate, acuminate, often with acute or lanceolate lobes, glabrous beneath, often pilose above; petiole 1–3 in.; stipules ovate. *Peduncles* short, axillary, little divided, pedicels longer; flowers pendulous, medium-sized, white or with rose stripes, usually monœcious. **MALE**: sepals 2; petals 2, narrower; stamens numerous, shortly monadelphous, anthers obovoid, connective not produced. **FEMALE**: perianth-segments 5, nearly equal, persistent; styles 3, nearly distinct, broader upwards, stigmas lunate. *Capsule* $\frac{1}{2}$ by $\frac{1}{2}$ in. including the wings, somewhat inflated, with a medial line on each face; wings nearly equal, upper margins horizontal.—In some of the axils the peduncle instead of producing flowers is very shortly once or twice divided, each branch terminating in 4 quadrangular cups, each packed closely with oblong viviparous bulbils. Alph. DC. gives diœcious as a character of his section *Putzeysia*, but this, the only species of that section is, as all other Indian Begonias, monœcious or occasionally diœcious.

18. **B. cordifolia**, Thwaites *Enum.* 129; stemless, leaves orbicular-cordate crenate-serrate, capsule with 3 subequal not broad wings. *A. DC. Prodr.* xv. pt. i. 328; *B. Arnottiana*, *A. DC. l. c.* 322. *Diploclinium Arnottianum* and *cordifolium*, *Wight Ic.* t. 1815, 1816.

SOUTH DECCAN PENINSULA; Courtallum; Wight. CEYLON; Thwaites.

Rootstock tuberous. *Leaves* $1\frac{1}{2}$ –3 in. diam., rarely subacute, nearly equal at the base, pilose above, laxly pubescent on the nerves beneath; petiole 2–5 in., laxly pubescent; stipules $\frac{3}{8}$ in., ovate-lanceolate, glabrous. *Scape* 6 in., repeatedly dichotomous; flowers medium-sized, numerous; bracts $\frac{1}{4}$ in., lanceolate. **MALE**: sepals 2, round; petals 2, smaller, narrow; stamens numerous, shortly monadelphous, anthers obovoid, connective not produced. **FEMALE**: perianth-segments 5–4 (3 in. Wight’s Icon 3-lobed); styles 3, nearly separate, divided half way up into two curved branches. *Capsule* $\frac{3}{8}$ by $\frac{3}{8}$ in. including the wings, perianth deciduous, styles persistent; wings narrow, upper margin rounded or shortly horizontal, dehiscing on all three faces. *Seeds* shortly ellipsoid.—Wight finally united his *D. Arnottianum* with his *D. cordifolium*. Alph. DC. separated them again on the sole ground that *D. Arnottianum* had 4 segments to the female perianth, *D. cordifolium* only 3. But in Wight’s specimens of *B. cordifolium* all the female flowers examined have 5. The var. *insularis* of A. DC. founded on Mr. Thwaites’ No. 3584 has the leaves acute with the nerves beneath more shaggy than in the type.

B. Segments of female flower 3, with sometimes a small fourth; two outer large, third small lateral. (*Trilobaria*, A. DC.)

19. **B. amoena**, Wall. Cat. 3682; leaves ovate or oblong caudate-acuminate equally cordate, capsule-wings nearly equal, seeds slender cylindric, tip curved acute. A. DC. Prodr. xv. pt. i. 327. B. tenella, Don Prodr. 223; Wall. Cat. 3681. B. erosa, Wall. Cat. 3688, partly.

Temperate Central and Western HIMALAYA; alt. 5000-7000 ft. from DALHOUSIE to SIKKIM; among the commonest species at Simla.

Rhizome tuberous. *Stem* usually 0 or very short, in Wallich's specimen nearly 1 ft. *Leaves* 3 by 2 in., glabrous, crenate-serrate; petiole 2-3 in.; stipules ovate, glabrous. *Scape* 3-8 in., glabrous, loosely dichotomous, few-flowered; bracts ovate-oblong, caducous; flowers medium-sized. *MALE*: sepals 2, ovate; petals 2, elliptic, smaller; stamens numerous, shortly monadelphous; anthers obovoid, connective not produced. *FEMALE*: perianth-segments 2, large, ovate, opposite, and one smaller lateral, all enlarged and persistent on the fruit; styles 3, nearly separate, divided near the top into two curved branches. *Capsule* $\frac{3}{8}$ by nearly $\frac{3}{4}$ in. including the wings, styles persistent, upper margins of wings horizontal, dehiscing on all the faces. *Seeds* smooth, reticulated; far more elongate than those of any other Indian species.

20. **B. scutata**, Wall. Cat. 3686, partly; leaves ovate cordate-acuminate often unequal at the base, capsule-wings unequal, larger one much ascending. A. DC. Prodr. xv. pt. i. 328; ? Kurz in Journ. As. Soc. 1877, pt. ii. 108. B. rubella, Wall. Cat. 3687.

NIPAL; Wallich. East Nipal, alt. 4000 ft.; J. D. H. SIKKIM, alt. 4000 ft.; C. B. Clarke. ? BURMA, Kurz.

Nearly glabrous. *Rootstock* tuberous. *Stem* in fruit often leafless, scape-like. *Leaves* 2-6 in., sinuate-toothed or slightly angular not serrate, glabrous or minutely pubescent on the nerves beneath; petiole very long, of the radical leaves often 6 in.; stipules ovate-lanceolate, deciduous. *Scape* or stem reaching 9 in., laxly dichotomous upwards; bracts oblong, acute, caducous; flowers medium-sized, many or few. *MALE*: sepals 2, round; petals 2, narrower; stamens numerous, shortly monadelphous; anthers obovoid, connective not produced. *FEMALE*: perianth-segments 3, 2 larger round opposite, the third smaller lateral, all deciduous; styles 3, nearly distinct, divided about half-way up into two curved branches. *Capsule* nearly $\frac{1}{2}$ by $\frac{3}{4}$ in. including the wings; styles persistent; upper margin of the wings concave, dehiscing by all three faces. *Seeds* short-ellipsoid.

21. **B. ovatifolia**, A. DC. Prodr. xv. pt. i. 328; stem short or 0, leaves ovate sometimes acute more or less serrate equal or scarcely unequal at the base, capsule-wings unequal the larger slightly ascending. B. subovata, Wall. Cat. 3688.

SIKKIM, alt. 4000 ft.; J. D. H.; alt. 1000 ft.; C. B. Clarke, Dr. Treutler. KHASIA Mts., alt. 4000 ft.; H. f. & T.

Rootstock of several tubers; whole plant rarely exceeding 6 in. *Cauline leaf* 1 or 0. *Leaves* 1-2 $\frac{1}{2}$ in. diam., roundish or ovate, cordate or scarcely rounded at the base, pubescent on the nerves beneath; petiole 1-4 in., pilose above, usually pubescent towards its summit; stipules very small, lanceolate. *Peduncles* lax, succulent, glabrous or slightly pubescent, 4-8-flowered; bracts oblong or lanceolate; flowers rather small, white or rose. *MALE*: sepals 2, obovate; petals 2, narrow-obovate; stamens about 20, shortly monadelphous, anthers obovoid, connective not produced. *FEMALE*: perianth-segments 3, 2 obovate subequal, 1 lateral much smaller, deciduous; styles 3, nearly distinct, divided half-way up into two curved branches. *Capsule* $\frac{1}{2}$ by 1 in. including the wings, styles persistent, upper margin of longer wing straight or convex upwards, capsule dehiscing on all three faces. *Seeds* short-ellipsoid.

VAR. *cretacea*; leaves stouter shaggy on the nerves beneath, peduncles firmer, female perianth of 4 segments (almost exactly like the male).—Bhotan; *Griffith*. (Kew Distrib. No. 2583.) Limestone rocks near Cherra in Khasia, alt. 4000 ft.; *C. B. Clarke*.

22. *B. subperfoliata*, *Parish ms.*; *Kurz in Journ. As. Soc.* 1877, pt. ii. 109; stemless, glabrous, leaves ovate crenate-dentate subpeltate prominently reticulated on both surfaces, bracts laciniated acutely.

MOULMEIN, on limestone rocks; *Parish*.

Root tuberous. **Leaf** solitary, radical, $3\frac{1}{2}$ by 2 in., acute not acuminate, hardly serrate, equal at the base, peltate or the auricles only overlapping; petiole 2-4 in. **Peduncle** 3 in. with about 10 small flowers; bracts $\frac{1}{2}$ in., persistent, divided to near the base or sharply serrate. **MALE**: sepals 2, elliptic; petals 2, narrow-oblong; stamens about 25, much monadelphous, anthers obovoid, connective not produced. **FEMALE**: perianth very nearly as in the male; styles 3, combined half-way up, stigmas lunate. **Capsule** 3-celled, $\frac{3}{8}$ by $\frac{1}{2}$ in. including the wings, styles persistent, wings 2 short 1 longer, upper margin of each horizontal, dehiscing by all three faces. **Seeds** short-ellipsoid.

23. *B. moulmeinensis*, *C. B. Clarke*; stemless, very pubescent throughout, leaves ovate serrate, bracts incise-serrate or laciniate.

MOULMEIN; *T. Lobb* No. 380.

Closely resembling *B. subperfoliata*. The specimens which are in bud differ in pubescence and in the leaf being slightly cordate (not at all peltate), serrate, almost lobed, and not prominently reticulate on either surface.

24. *B. fallax*, *A. DC. Prodr.* xv. pt. i. 329; glabrous or nearly so, leaves elliptic acuminate angular toothed very unequal at the base, capsule equally 3-winged wings narrow their upper margins shortly horizontal. *Diploclinium Lindleyanum*, *Wight Ic.* t. 1817.

SOUTH DECCAN PENINSULA; **COURTALLUM** and **MALABAR**; *Wight*.

The branch figured by *Wight* is 8 in. long with a peduncle from a lower axil and *A. DC.* conjectures the plant may be suffrutescent. **Leaves** 4 by 2 in.; petiole 1 in.; stipules oblong, deciduous. **Peduncle** many times dichotomous, many-flowered, shorter than the leaf; bracts numerous, minute; flowers medium-sized. **MALE**: sepals 2, rounded; petals 2, narrow-elliptic; stamens numerous, shortly monadelphous, anthers obovoid, connective not produced. **FEMALE**: perianth-segments 3, 2 large round, 1 small narrow lateral; styles 3, nearly separate, divided half-way up into two curved branches. **Capsule** $\frac{1}{2}$ - $\frac{3}{4}$ in. long and broad including the wings. **Seeds** shortly-ellipsoid, somewhat obovoid.—Not seen: the above is drawn up from *Wight's* figure: the plant is of the section *Trilobaria* if all *Wight's* details are without error.

SECT. IV. *Platycentrum*. **Capsule** 2-celled compressed, triquetrous, having one broad and two narrow papery wings; dehiscing by the falling away of the faces between the wings; placentas 2-fid.

A. Female perianth-segments 4-3.—Genus *Meziera*, *A. DC.*

25. *B. gigantea*, *Wall. Cat.* 3677; stem tall unbranched glabrous upwards, peduncles from the upper axils glabrous, male sepals 2. *Meziera nepalensis*, *A. DC. Prodr.* xv. pt. i. 406.

NIPAL; *Wallich*. **SIKKIM**, alt. 3000-6000 ft.; *Herb. Griffith, J. D. H.*; alt. 1000-4000 ft., frequent, *C. B. Clarke*.

Rootstock thick, woody, not tuberous. **Stem** 2-3 ft., rarely branched. **Leaves** 9-12 by 3 in., caudate-acuminate (sometimes larger and ovate), undulate, toothed,

pubescent on the nerves beneath otherwise glabrous, base very unequal deeply auricled on one side; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in.; stipules narrow-lanceolate, glabrous, deciduous. *Peduncles* short, dichotomous, with many rather small white or pale pink flowers; bracts ovate, acute, deciduous. **MALE**: sepals 2, ovate, subacute, glabrous; petals 0; stamens about 40, shortly monadelphous, anthers obovoid, connective not produced. **FEMALE**: perianth-segments 3, 2 outer ovate subacute resembling but smaller than the male sepals, inner small lateral; ovary (at the time of expanding of the flower) completely 2-celled with 2-fid placentas (exactly as in *Platycentrum*); styles 2–3 (sometimes 4, A. DC.) nearly free, or one free the other two combined, sometimes simply branched upwards, often 3–4-fid and more or less contorted. *Capsule* $\frac{3}{4}$ by 1 in. including the wing, styles persistent, oblong, concave upon its narrow face (between the two very narrow wings), broad wing extending the whole length of the capsule, its upper margin horizontal convex, narrow face first falling away. *Seeds* ellipsoid.—This is the largest Indian *Begonia*: the description and remarks of Alph. DC. must have been founded upon very imperfect materials.

26. *B. episcopalis*, C. B. Clarke; stem tall much branched pubescent upwards, peduncles axillary, male sepals 4. *Mezierea Griffithiana*, A. DC. *Prodr.* xv. pt. i. p. 407.

BHUTAN; *Griffith* (Kew Distrib. No. 2504, 2573). **KHASIA MTS.**, alt. 4000 ft.; *H. f. & T.*, C. B. Clarke.

Leaves 6 by 1 in., narrow-lanceolate, cordate, toothed, membranous, with scattered pubescence above, very pubescent or almost glabrous on the nerves beneath, base very unequal deeply auricled on one side; petiole $\frac{1}{2}$ – $1\frac{1}{2}$ in.; stipules $\frac{3}{4}$ in., very persistent, lanceolate, subulate, glabrous. *Inflorescence* often from the middle and lower axils in short dichotomous peduncles, usually pubescent; bracts oblong-lanceolate, glabrous, persistent; flowers somewhat numerous, rather small. **MALE**: sepals 2, ovate; petals 0; stamens about 40, shortly monadelphous, anthers obovoid, connective not produced. **FEMALE**: perianth-segments 4, 2 outer ovate, 2 inner narrow-oblong; styles 3 or 2, nearly free at the base, divided into long curved branches. *Capsule* as in *B. gigantea* but the upper margin of the larger wing is concave and somewhat descending. *Seeds* short-ellipsoid.—In Griffith's Bhotan examples, the stems upwards peduncles and leaves on both surfaces are very pubescent, and the petioles are $\frac{1}{2}$ – $\frac{1}{4}$ in.; Clarke's examples (from Bishop's Falls, Shillong) are very nearly glabrous with the petioles $1\frac{1}{2}$ in. The Khasia examples of *H. f. & T.* are intermediate.

B. Female perianth-segments 4–6.—Sect. *Platycentrum*, A. DC.

* *Connective produced above the anther-cells.*

27. *B. xanthina*, Hook. Bot. Mag. t. 4683; leaves large ovate denticulate and angular not ciliate-serrate, petiole hairy, cyme and ovary nearly glabrous, flowers yellow. A. DC. *Prodr.* xv. pt. i. 347. *B. xanthina*, var. *pictifolia*, *Bot. Mag. t. 5102*. *B. xanthina*, var. *Lazuli*, *Bot. Mag. t. 5107*.

EAST SIKKIM, alt. 4000–5000 ft.; *J. D. H.* Dumsong, **BHUTAN**, alt. 6000 ft.; C. B. Clarke.

Rhizome thick. *Stem* (in the wild examples) 0. *Leaves* 6–8 in., acute, unequally cordate at the base, pubescent on the nerves beneath, otherwise nearly glabrous; petiole 3–4 in.; stipules ovate, acute, glabrous or pubescent. *Scape* 1 ft. with spreading hairs below, nearly glabrous upwards; bracts at its first division $\frac{3}{4}$ in., oblong-lanceolate, glabrous; flowers medium large, full yellow (in the wild examples). **MALE**: sepals 2, round; petals 2, elliptic; stamens about 100, shortly monadelphous; connective produced, triangular. **FEMALE**: perianth-segments 5, outer round, inner gradually smaller; styles 2, shortly combined below, each dividing half-way up into two tortuous branches; ovary (in the wild specimens) glabrous. *Capsule* with the unequal wing very much elongated, descending, its upper margin concave.—In some cultivated specimens, the stem is elongated and leafy.

28. **B. rubro-venia**, Hook. Bot. Mag. t. 4689; caulescent, leaves elliptic or lanceolate acuminate entire or slightly angular undulate outer perianth-segments white with rose-red veins. A. DC. Prodr. xv. pt. i. 347. B. barbata, Wall. Cat. 3679 B, partly.

SIKKIM, BHOTAN and KHASIA Mts., alt. 3000-6000 ft., frequent.

Rootstock thick. *Plant* 8-16 in., stem puberulous or minutely pubescent. *Leaves* 3-6 in., usually narrow, sometimes elliptic, shortly pubescent on the nerves beneath otherwise glabrous, base unequal rounded scarcely cordate; petiole 1-2 in.; stipules persistent, lanceolate, caudate, glabrous. *Peduncles* axillary, 3-6 in., usually divided only near the top and few-flowered; bracts like the stipules and persistent; flowers medium-sized. *MALE*: sepals 2, rounded; petals 2, narrower, white; stamens numerous, very shortly monadelphous; connective produced, obtuse. *FEMALE*: perianth-segments 5, 3 inner gradually smaller, white; ovary glabrous; styles 2, combined at the base, very tortuous. *Capsule* $\frac{1}{2}$ - $\frac{5}{8}$ by 1-1 $\frac{1}{2}$ in. including the wings, often recurved in fruit, the broad wing much descending its upper edge concave; broader faces first falling away. *Seeds* ellipsoid.

VAR. Meisneri, Wall. Cat. 6294; shortly caulescent, leaves linear-lanceolate very tomentose on the nerves beneath.—Khasia Mts., Wallich; alt. 3500 ft., C. B. Clarke. —*Leaves* 2-4 by $\frac{1}{2}$ - $\frac{1}{2}$ in.; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in., pubescent, tomentose. *Flowers* and *capsules* like those of *B. rubro-venia* but smaller. Wallich's type examples look like a distinct species, but the examples of *C. B. Clarke* connect the two.

29. **B. laciniata**, Roxb. Fl. Ind. ii. 649; caulescent, leaves roundly ovate acutely lobed with soft pubescence, petioles brown-tomentose, outer perianth-segments rose-red pubescent on the back, ovary pubescent. Bot. Mag. t. 5021; A. DC. Prodr. xv. pt. i. 347; Wall. Cat. 3678; Kurz in Journ. As. Soc. 1877, pt. ii. 107. ? *B. palmata*, Don Prodr. 223. *B. Bowringiana*, Champ. in Hook. Kew Journ. iv. 120; Bot. Mag. t. 5182.

NIPAL to BURMA; ascending in SIKKIM to 7000 ft. Very common in KHASIA and CHITTAGONG.—DISTRIB. South China.

Rootstock long, creeping, neither woody nor tuberous. *Stem* 6-24 in., more or less brown-tomentose. *Leaves* 4-6 in. diam., always more or less lobed, lobes usually many, caudate-acuminate, often 2 in. long, ciliate, usually but slightly serrate, rounded or cordate more or less unequally at the base, pilose above, pubescent on the nerves beneath and more or less villous or tomentose; petiole 1 $\frac{1}{2}$ -4 in.; stipules $\frac{3}{4}$ in., persistent, lanceolate, mucronate, pubescent. *Peduncles* 3-6 in., usually from one or two uppermost axils, tomentose; bracts large, oblong, tomentose; flowers medium, not very many, always more or less glandular-pubescent on the back, from nearly white to deep rose. *MALE*: sepals 2, long-elliptic; petals 2, narrowly obovate; filaments nearly free, about 50, anthers obovoid; connective little produced, obtuse. *FEMALE*: perianth-segments 5-4, inner gradually smaller; ovary with pubescent, not mere glandular, roughness; styles 2, divided from near the base into 2 much contorted branches. *Capsule* $\frac{1}{2}$ by 1 in. including the wings, often recurved in fruit, with a descending wing; dehiscing by 4 lines adjacent to, and one on each side of, the two narrow wings. *Seeds* ellipsoid, somewhat obovoid.

VAR. ? flava; flowers full yellow, leaves green finely serrate, ovary and sepals pubescent or nearly glabrous.—Sikkim, alt. 5000 ft.; J. D. H., Treutler; Darjeeling, 7000 ft. alt.; C. B. Clarke; Herb. Griffith (Kew Distrib. No. 2577).—Perhaps a species: the plant has not the brown-red tint of *B. laciniata*, the leaves are thinner and less softly hairy. Alph. DC. doubts the correctness of the colour of the flowers; it is a full deep yellow as noted on the specimens of J. D. H. and C. B. Clarke, and as shown in the excellent figure of Cathcart preserved at Kew.

VAR. tuberculosa; ovary with glandular tubercles not pubescent, flowers pale pink glabrous.—Sikkim, alt. 6000 ft.; J. D. H., Treutler.

30. **B. barbata**, Wall. Cat. 3679 A and part B; caulescent, leaves not lobed, ovate acuminate hispid beneath denticulate ciliate, bracts cyme and ovary pubescent. *A. DC. Prodr.* xv. pt. i. 348; *not of Kurz.*

From SILHET and CACHAR to BURMA, alt. 0–2000 ft. CHITTAGONG, abundant in the hills.

Rootstock creeping, not thick, nor tuberous. *Stem* decumbent, usually short, with much spreading brown hair. *Leaves* 2–5 in., unequal cordate at the base, hispid on both surfaces, margin very entire; petiole 1–4 in., with spreading hairs; stipules persistent, lanceolate-subulate, ciliate. *Peduncles* from the upper axils, not more than 3 in., pubescent to the summit except in ripe fruit, few-flowered; flowers medium, white to pink. *MALE*: sepals 2, ovate, pubescent; petals 2, narrowly obovate; stamens 50 or more, scarcely monadelphous, anthers obovoid; connective much produced, ovate-oblong. *FEMALE*: perianth-segments 5, outer pubescent, inner gradually smaller; ovary shaggy. *Capsule* $\frac{1}{2}$ by 1 in. including the wings, hairy at least until the seeds are scattered, recurved in fruit with a descending wing, dehiscing by four lines one on either side of the two narrow wings. *Seeds* ellipsoid, brown.

31. **B. megaptera**, *A. DC. Prodr.* xv. pt. i. 348; caulescent, glabrous or very nearly so, leaves cordate-ovate acuminate undulate angular hardly serrate. *Kurz in Journ. As. Soc.* 1877, pt. ii. 108. *B. malabarica*, Wall. Cat. 3676 D.

NIPAL; Wallich. SIKKIM, alt. 2000–8000 ft., frequent. EAST BENGAL, Patkoye summit, Griffith. MARTABAN HILLS; *Kurz.*

Rootstock thick, woody. *Stem* erect, 12–18 in. when well developed. *Leaves* 4–6 in., unequal at the base, nerves beneath and petiole unusually glabrous; petiole 1–4 in.; stipules lanceolate-subulate, glabrous, persistent. *Peduncles* elongate, from the upper axils, often 8 in.; bracts large, oblong, glabrous, caducous; flowers large, not very many, pink. *MALE*: sepals 2, ovate; petals 2, ovate, little smaller; stamens 50 or more, monadelphous, anthers obovoid; connective produced, obtuse. *FEMALE*: perianth-segments 5, nearly equal; styles 2, long, combined at the base, with long tortuous branches. *Capsule* and seeds as in *B. rubro-venia*.

32. **B. sikkimensis**, *A. DC. Prodr.* xv. pt. i. 349; caulescent, glabrous or nearly so, leaves round lobed often nearly to the base lobes often again incised or lobed.

SIKKIM, alt. 3000–7000 ft.; *J. D. H.*; *C. B. Clarke.*

Rootstock thickened, woody. *Stem* erect, 12–18 in. when well developed. *Leaves* 4–6 in. diam., not very unequal nor very cordate at the base, denticulate-ciliate; petiole 1–4 in., glabrous; stipules nearly 1 in., lanceolate-linear. *Peduncles* from the upper axils, elongate, often 6–9 in.; bracts elliptic, deciduous, bright-red, as are the pedicels and flowers; flowers medium, not very many. *MALE*: sepals 2, ovate; petals 2, elliptic, smaller; stamens 50 or more, monadelphous; anthers obovoid; connective produced, triangular, obtuse. *FEMALE*: perianth-segments 5, inner bright-red gradually smaller; styles 2, combined at the base, branches very tortuous. *Capsule* and seeds as in *B. rubro-venia*.

33. **B. Cathcartii**, Hook. f. *Ill. Him. Pl.* t. 13; caulescent, leaves cordate-ovate acute glabrous beneath except a few paleaceous hairs on the nerves, peduncles and petioles with deflexed paleaceous hairs, ovary pubescent. *A. DC. Prodr.* xv. pt. i. 349. *B. nemophila*, *Kurz in Journ. As. Soc.* 1877, pt. ii. 108. *Begonia* sp. *Griff. Notul.* iv. 583 and *Ic.* t. 612.

SIKKIM, alt. 3000–8000 ft.; *J. D. H.*; *C. B. Clarke.* BIRMA; Griffith (Kew Distrib. No. 2582); *Kurz.* MOULMEIN; *Parish, Thos. Lobb.*

Near *B. barbata* and best distinguished by the hairs on its stems petioles and peduncles, which are numerous but scattered, long from a lanceolate paleaceous base

and deflexed, by the leaves much less hairy beneath, often quite glabrous; stipules nearly or quite glabrous. Flowers fruit and seeds as in *B. barbata*.

34. **B. Thomsonii**, *A. DC. Prodr.* xv. pt. i. 349; caulescent, leaves ovate acuminate hispid beneath denticulate-ciliate not lobed, petioles densely shaggy, bracts cyme and ovary shaggy.

KHASIA Mts., alt. 3000-4000 ft.; *Griffith* (Kew Distrib. No. 2570); *Hk. f. & T.*; *C. B. Clarke*.

This only differs from *B. barbata* by being everywhere more hairy, the petioles are densely shaggy as is the stem.—One example referred here of Griffith's has the stem and petioles covered with a close brown tomentum without any spreading hairs, and appears much more different from *B. Thomsonii* than is *B. Thomsonii* from *B. barbata*.

35. **B. Griffithii**, *Hook. Bot. Mag.* t. 4984; stemless, leaves cordate-ovate acute pubescent beneath hardly ciliate on the margin, peduncle bracts ovary and flowers pubescent. *A. DC. Prodr.* xv. pt. i. 349.

BHOTAN; *Griffith* No. 2505 (Kew Distrib. No. 2571).

Appears to be a variety of *B. barbata* or *B. Thomsonii* with an abbreviated stem. The capsules are not ripe but are very like unripe capsules of *B. barbata*. The leaves are much less ciliate barbate on the margin than in *B. barbata*. But for the great authority of Alph. DC., the three *B. barbata*, *B. Thomsonii* and *B. Griffithii* might be united.

36. **B. Rex**, *Putzeys in Fl. des Serres*, t. 1255, 1256; stemless, leaves cordate-ovate acute pubescent on the nerves beneath, peduncle upwards bracts ovary and flowers glabrous. *Bot. Mag.* t. 5101; *A. DC. Prodr.* xv. pt. i. 350.

ASSAM and MISHMEE; *Griffith* (Kew Distrib. No. 2588, 2589, 2591, 2592); *Masters*.

Leaves 4-6 in., unequal at the base, undulate, ciliate-denticulate, with a few scattered hairs above; petiole 1-4 in. with spreading hairs. Scapes 4-9 in., glabrous except a few hairs near the base; flowers medium, rose, not very many. MALE: sepals 2, ovate; petals 2, elliptic; stamens numerous, monadelphous, anthers ob-ovoid; connective produced, acutely triangular. FEMALE: perianth-segments 5, inner gradually smaller; styles 2, combined below, branches very tortuous. Capsule $\frac{1}{2}$ - $\frac{3}{4}$ by 1-1 $\frac{1}{2}$ in. including the wings: much as that of *B. rubro-venia*.—The whole plant is much less hairy than *B. barbata* and the allied species: the capsule is glabrous and its body is less than half the diameter of the pubescent capsules of *B. Griffithii*.

37. **B. brevicaulis**, *A. DC. Prodr.* xv. pt. i. 350; stemless, leaves cordate broad-ovate obtuse or scarcely acute, petioles scape flowers and ovary glabrous or very nearly so.

KHASIA; Terai, alt. 1000 ft.; *H. f. & T.*

Flowers and fruit much smaller than in any of the preceding species of this section. Rootstock tuberous. Leaves 1-3 $\frac{1}{2}$ in., nearly orbicular, not very unequal at the base, crenate-denticulate, hardly ciliate, glabrous or with a few scattered hairs above, rarely with minute pubescence on the nerves beneath; petiole 1-3 in., succulent; stipules oblong, acute, glabrous. Scape 3-6 in., sometimes with a small leaf above the base, weak, succulent, with few small flowers; bracts ovate, acute, very small. MALE: sepals 2, round; petals 2, narrower; stamens about 25, shortly monadelphous, anthers oblong; connective much produced, obtuse. FEMALE: not seen. Capsule $\frac{1}{2}$ by $\frac{1}{2}$ in., recurved, styles deciduous; two smaller wings very narrow, broader wing descending its upper margin concave very thin; dehiscing by 4 lines one on either side of each of the two narrower wings. Seeds short-ellipsoid.—This species resembles in habit many of the sections *Parvibegonia* and *Knesebeckia*, and is very unlike any *Platycentrum* with a produced connective.

** *Connective not produced above the anther-cells.*

38. **B. integrifolia**, Dalz. in Hook. *Kew Journ.* iii. 230; caulescent, leaves ovate-oblong nearly entire ciliate very unequally cordate, petioles succulent laxly pubescent, inflorescence glabrous. *A. DC. Prodr.* xv. pt. i. 351; Dalz. & Gibs. *Bomb. Fl.* 104.

Western Ghauts from BOMBAY to MYSORE; Law, Dalzell, &c. MOULMEIN; Parish.

Rootstock tuberous. *Stem* 6-12 in., succulent. *Leaves* 3-6 in., hardly acute, pilose above, laxly pubescent on the nerves beneath, finely ciliate; petiole 1-5 in.; stipules lanceolate, upper ones glabrous lower with lax hairs. *Peduncle* as though terminal; flowers white, medium-sized, not very many; bracts broad, ovate, lower with some lax hairs, upper glabrous. *MALE*: sepals 2, round; petals 2, narrow-oblong; stamens about 50, monadelphous, anthers obovoid. *FEMALE*: perianth-segments 5, inner gradually smaller; styles 2, combined below, branched and much twisted upwards. *Capsule* $\frac{3}{8}$ by $\frac{3}{8}$ - $\frac{1}{2}$ in. including the wings, recurved, smaller wings very narrow, broad wing descending, dehiscing primarily by the narrow face. *Seeds* short-ellipsoid.—Alph. DC. gives Ceylon as a locality, quoting Thwaites No. 2597, which is Thwaites's *B. subpeltata*.

39. **B. guttata**, Wall. *Cat.* 3671 A; caulescent, leaves ovate-oblong nearly entire not ciliate, petioles pubescent, inflorescence glabrous. *A. DC. Prodr.* xv. pt. i. 352.

PINANG; Wallich. MALAYA; Maingay No. 675 partly.

Differs from *B. integrifolia* only in having the leaves nearly without cilia: the flowers appear somewhat smaller, but the two species are probably one. Wallich's specimen is very large with a thick woody rootstock, the petioles 10 in.

40. **B. procridifolia**, Wall. *Cat.* 6292; nearly glabrous, stem erect simple, leaves subsessile oblong acuminate entire or denticulate. *A. DC. Prodr.* xv. pt. i. 352; Kurz in *Journ. As. Soc.* 1877, pt. ii. 108.

MARTABAN; near Tavoy, Wallich.

Rootstock fibrous. *Stem* 6-9 in., weak. *Leaves* 3-5 by $\frac{1}{2}$ -1 $\frac{1}{2}$ in., very unequal at the base, glabrous beneath, sometimes with a few scattered hairs above; petiole $\frac{1}{10}$ - $\frac{1}{4}$ in.; stipules $\frac{1}{2}$ in., oblong, acuminate. *Peduncles* from the upper axils, hardly so long as the leaves; bracts ovate, deciduous. *MALE*: sepals 2, $\frac{1}{8}$ in., round, rose-coloured; petals 2, smaller, narrow-obovate; stamens many, monadelphous, anthers obovoid; connective not produced. *FEMALE*: not known. *Capsule* more than $\frac{1}{2}$ by $\frac{1}{2}$ in. exclusive of the wings, recurved; styles deciduous; the two narrow wings ovate the broad wing much descending.—This may, in the absence of female flowers, belong to the section *Mezierea*, but the ovate narrow wings of the capsule suggest the present section where it has been placed by Alph. DC.

41. **B. goniotis**, C. B. Clarke; nearly glabrous, stem elongate branching, leaves narrow-oblong caudate excessively unequal at base.

BURMA, alt 3700-4000 ft.; Griffith (*Kew Distrib.* No 2579).

Stem 2 ft. *Leaves* 5-6 by $\frac{3}{4}$ -1 in., nearly entire or serrate near the apex, one auricle excessively produced backwards often in an angular or quadrate form; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; stipules persistent, ovate, acute, mucronate not acuminate, cordate. *Peduncles* axillary, few-flowered, glabrous; bracts deciduous. *Flowers* not seen. *Capsule* $\frac{1}{2}$ by 1 $\frac{1}{4}$ in. including the wings, glabrous, recurved; styles deciduous; the two narrower wings more than $\frac{1}{2}$ in. broad towards the top of the capsule, the larger descending, dehiscing by 4 lines, one on either side of the narrower wings. *Seeds* short-ellipsoid.—The breadth of the narrower wings of the capsule renders it unlikely that this is a *Mezierea*; but the habit is that of *B. piscopolis*, No. 26.

42. **B. sandalifolia**, C. B. Clarke; nearly glabrous, stem elongate, leaves oblong acute very unequal at the cordate base.

BURMA; Griffith (Kew Distrib. No. 2585).

Rootstock not much thickened, nor tuberous. Stem 15 in., glabrous except the extremities of the branches. Leaves 5-6 by $1\frac{1}{2}$ -2 in., nearly entire or serrate, pubescent on the nerves beneath, otherwise glabrous; petiole $\frac{1}{2}$ -1 in., pubescent; stipules oblong, acute, persistent, glabrous. Peduncles near the end of the branches, few-flowered, not elongated; bracts large, elliptic, glabrous; pedicels slightly pubescent. MALE: sepals 2, round, nearly $\frac{3}{4}$ in. diam., with some pubescence; petals 2, oblong; stamens 50 or more; anthers obovoid, emarginate. FEMALE: not seen. Capsule $\frac{3}{4}$ by 1 in. including the wings, glabrous, recurved; styles deciduous; the two narrower wings $\frac{1}{4}$ in. broad and nearly an equal breadth for the whole length of the capsule, the broad wing descending, dehiscing by 4 lines one on either side of the two narrower wings.

SECT. V. **Papyraceæ**. Capsule 2-celled (3-celled in *B. delicatula*), papyraceous dehiscing by the very thin faces breaking up irregularly, placentas 2-fid.—Small plants with small flowers.

A. Ovary 2-celled. Capsule winged, the wings not much produced above or below the cells. Sects. *Parvibegonia*, *Lauchea* and *Monophyllon*, Alph. DC.

43. **B. verticillata**, Hook. Ic. Pl. t. 811; radical leaf 0 at the time of flowering, cauline leaves often whorled, bracts ovate marginal with stalked glands. A. DC. Prodr. xv. pt. i. 353; Kurz in Journ. As. Soc. 1877, pt. ii. 108.

MOULMEIN; Lobb No. 382; Parish.

Glabrous, or the leaves slightly pilose above. Rootstock small, tuberous. Stem erect, 2-6 in., whole plant sometimes 1 ft. Leaves 1-2 in., 3-8 in. a whorl at the summit of the stem, or alternate, oblong-lanceolate, rounded and nearly equal at the base, coarsely crenate-serrate; petiole $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; stipules minute, lanceolate. Peduncles 1-4 axillary, slender, with numerous small white flowers; bracts persistent. MALE: sepals 2, round; petals 2, linear-oblong; stamens about 8, long-monadelphous, anthers oblong, connective not produced. FEMALE: perianth-segments usually 4, inner 2 considerably smaller; styles 2, combined at the base, clavate upwards, branches two short simple curved. Capsule less than $\frac{1}{4}$ by $\frac{1}{4}$ - $\frac{3}{8}$ in. including the wings, the two smaller wings exceedingly narrow-linear the larger triangular, its upper margin slightly descending. Seeds shortly-ellipsoid, minutely papillose on the margins of the reticulations of its surface.

44. **B. prolifera**, A. DC. Prodr. xv. pt. i. 353; glabrous, radical leaf 0 at the time of flowering, cauline solitary sessile, peduncles 1-4 axillary. Kurz in Journ. As. Soc. 1877, pt. ii. 108. ? B. Finlaysoniana, Wall. Cat. 3684.

MOULMEIN; Lobb No. 381; on limestone rocks, Parish. ? PINANG, Finlayson.

Rootstock a tuber. Stem $\frac{1}{2}$ -4 in. Leaf 3-8 in. diam., round-ovate, acute, nearly equally deeply cordate. Peduncles 2-10 in., repeatedly dichotomous; bracts hardly $\frac{1}{4}$ in., ovate. MALE: sepals 2, broad-elliptic, rose-coloured, sometimes slightly hairy; petals 2, oblong; stamens about 12, much monadelphous, anthers oblong, connective not produced. FEMALE: perianth of 5 much imbricated segments; styles 2, branches two incurved. Capsule $\frac{1}{2}$ by $\frac{1}{2}$ in. including the wings, recurved; styles deciduous; two smaller wings very narrow above, enlarged and produced below, the upper margin of the larger nearly horizontal from the top of the capsule. Seeds globose.—A. DC. describes this plant as stemless, on theoretic grounds, considering that the apparent stem is formed by a complete adhesion of the petiole to the scape, and supporting this view by the statement that there are no stipules at the point whence the peduncles spring. If there were none at that point it would not establish the

above view, but there are two small ovate acute bracts placed at that point.—*B. Finlaysoniana* possibly belongs here: but the example is very imperfect and the leaves are 2-3, some of them petioled.

45. ***B. paleacea***, Kurz in *Flora* 1871, 297; cauline leaf 1 obliquely cordate-ovate or orbicular, petioles and inflorescence with short paleaceous hairs, capsule winged below.

MARTABAN; Attaran Valley; Brandis.

An erect low herb, simple or nearly so, succulent; rootstock tuberous. Leaf 3-6 in., sometimes proliferous, obtuse or obtusely acuminate, entire or deeply crenate, often finely ciliate, membranous, glabrous or sometimes papillose and hairy on the nerves beneath; petiole $\frac{1}{2}$ -1 in. or 0; stipules lanceolate, acuminate, pilose. Cymes long-peduncled, slender, few-flowered, springing from the base of the ribs of the leaves; pedicels capillary, glandular-pubescent; flowers small, white; bracts of the male flowers $\frac{1}{2}$ in., broad-ovate, obtuse, glabrous, deciduous, the female smaller, lanceolate, acuminate, pilose, more persistent. MALE: sepals $\frac{1}{2}$ in., broadly round, slightly hairy without; petals a little smaller; stamens many, monadelphous, anthers obovoid, emarginate. FEMALE: styles 2, connate, shortly 2-lobed. Capsule nearly $\frac{1}{2}$ in., glabrous or slightly hairy, oblong, 2-celled, 3-winged; wings $\frac{1}{2}$ in. broad, truncate at the apex, or the medial wing twice as broad; placentas 2-fid.—The above copied from Kurz, who has placed the species between *B. prolifera* and *B. sinuata*; the very imperfect specimen communicated seems *B. integrifolia*, No. 38.

46. ***B. sinuata***, Wall. Cat. 3680; caulescent, leaves cordate-ovate covered on both surfaces by minute but thickly placed stellate hairs, capsule winged below. A. DC. Prodr. xv. pt. i. 354; Kurz in Journ. As. Soc. 1877, pt. ii. 108. Diplocinium biloculare, Wight Ic. t. 1814. *B. guttata*, elongata, and subrotunda, Wall. Cat. 3671 B, 6291, 6293.

PINANG; Wallich, &c. TENASSERIM, Parish, &c. MALAYA; Maingay No. 674.

Rootstock small with small tubers. Whole plant 10 in. but more often quite small, covered (except the upper part of the cymes) with much minute stellate pubescence. Stem 1-6 in. Leaves 1-5 in. diam., nearly equal at the base, denticulate-sinuate; petiole $\frac{1}{2}$ -3 in. or 0; stipules less than $\frac{1}{2}$ in., lanceolate, acuminate, stellately pubescent. Cymes weak; lower bracts lanceolate, stellately hairy; upper often quite glabrous, sometimes lobed; flowers not very numerous, small, pink, glabrous. MALE: sepals 2, roundish; petals 2, narrower, obovate; stamens about 20, much monadelphous, anthers obovoid, connective not produced. FEMALE: perianth-segments 5, inner gradually smaller; styles 2, combined half-way up, stigmas lunate. Capsule $\frac{1}{4}$ by $\frac{3}{8}$ in. including the wings; wings from the lower part of the capsule, two smaller triangular acute. Seeds short-ellipsoid, somewhat obovoid.

47. ***B. andamensis***, Parish ms.; caulescent, nearly glabrous, leaves cordate-orbicular shortly petioled or the upper sessile; capsule winged below.

ANDAMANS and MOULMEIN; Parish.

Rootstock tuberous. Stem erect, whole plant 6-10 in. Leaves 1-4 in. diam., entire or minutely closely denticulate, equal at the base, with few lax hairs on the nerves beneath, sometimes minutely pilose above; petiole of the radical leaves elongate, of the cauline usually 0- $\frac{3}{4}$ in.; stipules small, ovate, acute, glabrous. Peduncles very glabrous upwards; bracts very small, ovate, acute; flowers not very many, rose-coloured, rather larger than in the allied species. Flowers capsule and seeds almost identical with those of *B. sinuata* but the styles are less combined.—The capsule is quite membranous but shows a tendency to dehisce along either side of the narrow wings, exactly as in *Platycentrum*: and the present species (with *B. sinuata*) seems closely allied to the small species of that section. This species is reduced to *B. sinuata* by Kurz, but it does not exhibit the stellate hairs on the upper surface of the leaf and the flowers are much larger.

48. **B. martabanica**, A. DC. *Prodr.* xv. pt. i. 354; caulescent, leaves petioled cordate-ovate, petioles and nerves of the leaves beneath pubescent. *Kurz in Journ. As. Soc.* 1877, pt. ii. 108.

MOULMEIN; *Lobb* No. 393; *Helpfer* (Kew Distrib. No. 2575).

This differs from *B. sinuata* by the absence of the stellate pubescence: and from *B. andamensis* in the leaves being longer-petioled, none sessile, more acute with a serrate ciliate margin; and in the generally greater pubescence; the stipules being pubescent and the lower bracts often ciliate or fimbriate.

49. **B. Parishii**, C. B. Clarke; cauline leaves 1-3 all sessile cordate orbicular with lax scattered pubescence above and on the nerves beneath, capsule winged above.

MOULMEIN; on limestone rocks; *Parish*.

Tuber rather large. Erect, nearly 1 ft., stem and lower part of the peduncle with some lax pubescence. *Leaves* $1\frac{1}{2}$ - $3\frac{1}{2}$ in. diam., subequal at the base, crenate-serrate; petiole of the cauline 0, of the radical 2-8 in.; stipules of the cauline $\frac{1}{2}$ in., ovate, acute, ciliate. *Pedicels* and flowers glabrous; lower bracts $\frac{1}{2}$ in., ciliate or fimbriate, ovate, acute. *Flowers* few, medium, rose-coloured. MALE: sepals 2, $\frac{1}{2}$ in., round; petals 2, obovate, narrower, rather shorter; stamens about 40, long-monadelphous, anthers elongate-obovoid, connective not at all produced. FEMALE: perianth of 4 (perhaps of 5) segments; styles 2, long combined, stigmas curved complex. *Capsule* (only half ripe) more than $\frac{1}{4}$ in.—The ripe capsule not being seen, this species may be a *Platycentrum*, as the size of the flowers indicates, but the styles are combined nearly to the base of the stigmas.

50. **B. flaccidissima**, *Kurz in Journ. As. Soc.* 1872, pt. ii. 308; caulescent, minutely sparsely pubescent, leaves petioled cordate orbicular obtuse, petals in the male 0.

TENASSERIM; *Kurz*.

A tender very flaccid herb, 4-5 in. high. *Leaves* 2 in. diam., deeply crenate-dentate, almost lobed; petiole 2-3 in.; stipules hyaline, obtuse, about $\frac{1}{2}$ in. *Cymes* dichotomous, minutely sparsely pubescent; bracts linear, minute; flowers small, white, on capillary pedicels. MALE: sepals 2, $\frac{1}{6}$ - $\frac{1}{4}$ in., rotund-ovate; petals 0; stamens many, very monadelphous, anthers subovoid. FEMALE: perianth-segments 4; styles 2, free from the base, each dilated into a concave semilunate stigma; ovary sparsely and crisply pilose, 2-celled. *Capsule* unknown.—Plant not seen. The above copied from Mr. Kurz. The general description is like that of *B. delicatula*, No. 54.

B. *Ovary* 2-celled. *Capsule* winged, wings irregular and much produced below the cells. *Perianth* accrescent on the fruit. Sect. *Dysmorphia*, A. DC.

51. **B. crenata**, *Dryand. in Trans. Linn. Soc.* i. 162, t. 14, fig. 3; pedicels and young ovary often with minute scattered glandular pubescence, sepals of the male $\frac{1}{4}$ - $\frac{1}{2}$ in. A. DC. *Prodr.* xv. pt. i. 356; *Dalz. & Gibs. Bomb. Fl.* 104. B. *minima*, *Bedd. Ic. Pl.* t. 110.

MALABAR coast, alt. 0-3000 ft., from BOMBAY to WYNAAD. ?TENASSERIM, *Helpfer*, No. 2584.

Nearly glabrous. *Rootstock* slender, tuberous. *Stem* slender, 4-10 in., 1-4 leaved. *Leaves* $1\frac{1}{2}$ -2 in. (sometimes much smaller), ovate, slightly cordate at the base, crenate or serrate, glabrous or with slight pubescence on the nerves beneath; petiole $\frac{1}{2}$ -2 in.; stipules small, ovate, acute, glabrous. *Peduncles* weak; bracts less than $\frac{1}{2}$ in., ovate, acute, glabrous; flowers not numerous, white or pinkish. MALE: sepals 2, elliptic; petals 2, narrower; stamens 8-16, very monadelphous, anthers oblong, connective not produced. FEMALE: perianth-segments 5, outer elliptic, inner oblong, soon becoming larger than the male flower; styles 2, combined at base,

stigmas lunate. *Capsule* scarcely $\frac{1}{4}$ by $\frac{1}{2}$ in., membranous, crowned by the accrescent perianth. *Seeds* short-ellipsoid.—Col. Beddome's *B. minima* is reduced by inspection of his figure merely. Helfer's No. 2584 is in fruit and is either this or some very closely allied species.

52. **B. canarana**, *Miq. Anal. Bot. Ind.* iii. p. 18; pedicels and ovary glabrous, sepals of the male $\frac{1}{2}$ in. *A. DC. Prodr.* xv. pt. i. 356. *B. rubella*, *Miq. in Pl. Hohenack.* No. 843, not of Ham.

MANGALOR, in Canara; *Hohenacker*.

Closely resembling the preceding species: but the leaves flower and fruit are rather smaller. The styles in *B. canarana* are combined higher up (ex *A. DC.*).

C. Ovary 3-celled. *Capsule* membranous, globose, wingless.

53. **B. delicatula**, *Parish ms*; styles long combined.

MOULMEIN; *Parish*.

Rootstock small, fibrous. *Stem* 5–12 in., slightly dividing, with several leaves and peduncles from all the axils, glabrous, weak. *Leaves* 2–3 in. diam., broad-orbicular, cordate, subequal at the base, doubly serrate, very delicate, with weak scattered pubescence above and on the nerves beneath; petiole of the cauline leaves long, attaining 3–4 in.; stipules less than $\frac{1}{2}$ in., lanceolate, glabrous. *Peduncles* repeatedly dichotomous, with very many flowers; bracts numerous, small, hyaline, subsistent, oblong, ciliate or fimbriate, pedicels and young ovary with minute sparse lax pubescence. *MALE*: sepals 2, $\frac{1}{4}$ in., round; petals 0; stamens 20, much monadelphous, anthers narrow-obovoid, connective not produced. *FEMALE*: perianth of 4 segments, inner two obovate, not very narrow; styles 3, stigmas lunate. *Capsule* $\frac{1}{6}$ in. diam., almost exactly globose, very membranous, breaking up irregularly, wingless. *Seeds* shortly ellipsoid.

SECT. VI. **Uniplacentales**. *Placentæ* undivided. *Capsule* 3-celled with 3 thin not very unequal wings, dehiscing by lines within the margins of its three faces.

* *Stemless, or stemmed having the peduncles long and from the upper axils only.*

54. **B. fibrosa**, *C. B. Clarke*; cauline leaves 2 orbicular sessile with many peduncles from the axils of each.

MOULMEIN; on limestone rocks; *Parish*.

Rootstock fibrous, no root-leaves in the dried examples; plant 6–10 in., glabrous or nearly so. *Leaves* orbicular, larger 6–8 in. diam., nearly entire. *Peduncles* rather stout, as many as 7 from one axil, minutely sparsely puberulo-pubescent; bracts foliaceous; lower $\frac{3}{4}$ in., elliptic, glabrous, often petioled; upper smaller. *MALE*: sepals 2, $\frac{1}{4}$ in., ovate; petals 2, oblong, smaller; stamens about 10, nearly free, anthers short-obovoid, connective not produced. *FEMALE*: perianth of 3 segments; styles 3, combined less than half their length, each dividing into two curved branches. *Capsule* $\frac{3}{8}$ by $\frac{1}{2}$ in. including the wings, upper margin of the broader wing horizontal or somewhat descending. *Seeds* small, ellipsoid.

55. **B. tenera**, *Dryand. in Trans. Linn. Soc.* i. 169, t. 16; stemless, leaves ovate, petioles peduncles and young ovary with much lax pubescence. *A. DC. Prodr.* xv. pt. i. 386. *B. Thwaitesii*, *Hook Bot. Mag.* 4692; *A. DC. l. c.*

CEYLON, *Walker*. Pas-dom Corle; *Thwaites*.

Rootstock somewhat thick, tuberous. *Leaves* 2–4 in. diam., obtuse or subacute,

subequally cordate at the base, minutely denticulate not serrate, with scattered weak pubescence on both surfaces, the young leaves very shaggy; petiole 2-5 in.; stipules nearly $\frac{1}{2}$ in., ovate, acute, glabrous. *Peduncles* 3-6 in., not exceeding the leaves, with a few flowers towards their summits; bracts ovate, acute, ciliate, pubescent or the lower ones glabrous. **MALE**: sepals 2, $\frac{1}{4}$ - $\frac{3}{8}$ in., round, pubescent on the back; petals 2, oblong; stamens about 40, anthers obovoid, connective not produced. **FEMALE**: perianth of 5 segments, inner narrower; styles 3, nearly free, 2-lobed near their summit. *Capsule* $\frac{1}{2}$ by $\frac{1}{2}$ in. including the wings, wings not very unequal, their upper margins straight from the top of the capsule slightly descending. *Seeds* short-ellipsoid.—The example of Walker marked *B. tenera*, *Dryand.* in the writing of M. Alph. DC. is identical with Thwaites' No. 2808.

56. **B. subpeltata**, *Wight Ic.* t. 1812; stemless, leaves ovate, petioles pubescent, pedicels and young ovary glabrous. *A. DC. Prodr.* xv. pt. i. 386.

SOUTH DECCAN PENINSULA; probably Malabar or Travancore, *Wight*. CEYLON, *Thwaites*.

This differs from *B. tenera*, *Dryand.* in the glabrous pedicels and ovaries, in the larger flowers, in the somewhat angular leaves which are slightly more serrate. (See *Thwaites Enum.* p. 128.) It is hardly distinct from *B. tenera*.

57. **B. concanensis**, *A. DC. Prodr.* xv. pt. i. 314; caulescent, glabrous or nearly so, leaves ovate serrate and sometimes lobed. *Dalz. & Gibs. Bomb. Fl.* 104.

CONCAN, tropical region, *Stocks*. BOMBAY, above the Ghats, *Law*.

Rootstock a tuber. *Stem* elongated, whole plant sometime 1 ft. *Leaves* 3-5 in., acute not acuminate, cordate, subequal at the base, young leaves with a little lax pubescence beneath, the older leaves with a few scattered hairs or quite glabrous; petiole of the cauline leaves 1-2 $\frac{1}{2}$ in., of the radical often very long; stipules $\frac{1}{2}$ in., ovate, acute. *Peduncles* elongate, dichotomous; bracts lanceolate; flowers rose-coloured, not very many. **MALE**: sepals 2, nearly $\frac{1}{2}$ in., elliptic; petals 2, smaller, narrower; stamens about 40, nearly free, anthers obovoid, connective not produced. **FEMALE**: perianth of 5 segments, 3 inner much narrower; styles 3, nearly free, bifid near the apex. *Capsule* $\frac{1}{2}$ - $\frac{3}{8}$ by $\frac{2}{3}$ - $\frac{3}{4}$ in. including the wings, wings from the upper part of the capsule, their upper margins slightly descending. *Seeds* ellipsoid.—This slightly differs from *subpeltata* by having a distinct (often elongate) stem and the petioles without patent hairs. As to the placentas which are taken as bipartite by Alph. DC., but are at least sometimes undivided, it is curious that the example of *B. concanensis* at Kew authenticated in A. DC.'s handwriting is typical *B. trichocarpa*.

58. **B. trichocarpa**, *Dalz. in Hook. Kew Journ. Bot.* ii. 230; caulescent, leaves ovate serrate, flowers large, ovary with much lax pubescence. *A. DC. Prodr.* xv. pt. i. 350; *Dalz. & Gibs. Bomb. Fl.* 104.

MALABAR GHATS; CONCAN, CANARA, MYSORE, MALABAR, frequently collected.

Rootstock large, tuberous. *Stem* elongate, often exceeding 1 ft., glabrous or nearly so. *Leaves* 3-5 in., acute scarcely acuminate, cordate, subequal at the base, with scattered pubescence on both surfaces; petiole of the cauline leaves often 3-4 in., little pubescent; stipules $\frac{1}{2}$ in., ovate, lanceolate. *Peduncles* scarcely elongate, repeatedly dichotomous; bracts $\frac{3}{8}$ in., lanceolate, ciliate, pubescent; pedicels and ovary with lax long hairs; flowers white. **MALE**: sepals 2, elliptic, sometimes exceeding $\frac{3}{4}$ in., more or less pubescent without, usually entire, sometimes fimbriate or ciliate; petals 2, narrower, shorter; stamens 40 or more, nearly free, anthers oblong-obovoid, connective not produced. **FEMALE**: perianth of 5 segments, inner narrower; styles 3, nearly free, each divided into two branches. *Capsule* $\frac{1}{2}$ - $\frac{5}{8}$ by nearly 1 in. including the wings, ultimately glabrous, wings not much unequal, their upper margins from the summit of the capsule slightly ascending; placentas undivided.

59. **B. nivea**, *Parish ms.*; *Kurz in Journ. As. Soc.* 1873, pt. ii. 81; radical leaf solitary elliptic-oblong doubly serrate, petiole 0- $\frac{1}{2}$ in., scape leafless or with two very small leaves near its base.

MOULMEIN; *Parish*.

Rootstock tuberous. Radical leaf 2-3 $\frac{1}{2}$ in., obtuse, subequal scarcely cordate at the base, glabrous, white beneath, with scattered very coarse bristles above. *Scape* 6-8 in., glabrous, leafless, or with a pair of opposite leaves near its base which resemble the radical leaf but are less than 1 in., divided near the summit; bracts ovate or oblong, very obtuse, entire, glabrous; flowers medium-large, white. MALE: sepals 2, $\frac{3}{8}$ - $\frac{1}{2}$ in., round; petals 2, not much shorter but narrow; stamens about 10, much monadelphous, anthers oblong, connective not produced. FEMALE: perianth of 5 (or 6) segments; styles 3, much combined, each ending in two curved branches. *Capsule* $\frac{1}{2}$ by $\frac{1}{2}$ - $\frac{5}{8}$ in. including the wings, wings not very unequal, their upper margins horizontal.

60. **B. albo-coccinea**, *Hook. Bot. Mag.* t. 4172; stemless, leaves broadly round peltate entire. *A. DC. Prodr.* xv. pt. i. 389. *B. Grahamiana*, *Wight Ic.* t. 1811. *B. Wightiana*, *Wall. Cat.* 3673.

COURTALLUM; *Wight*. MYSORE and CARNATIC, alt. 1000 ft.; *G. Thomson*.

Rootstock elongate, thick. *Leaves* 3-4 $\frac{1}{2}$ in., usually broader than long, nearly glabrous when mature but often ciliate on the margin; petiole 3-6 in., pubescent often tomentose; stipules large, sometimes exceeding 1 $\frac{1}{2}$ in., lanceolate, glabrous. *Scapes* 4-9 in., usually glabrous below, above with the bracts and pedicels pubescent; bracts $\frac{1}{2}$ in., lanceolate; flowers many, bright rose-coloured. MALE: sepals 2, $\frac{3}{8}$ in., round; petals 2, elliptic; stamens 40, very shortly monadelphous, anthers shortly obovoid, connective not produced. FEMALE: young ovary almost tomentose; styles 3, little combined below, 2-lobed and much contorted above. *Capsule* $\frac{1}{2}$ by $\frac{1}{2}$ in. including the wings; wings equal, continued at nearly equal breadth entirely round the capsule which is thus exactly elliptic in outline. *Seeds* ellipsoid.

61. **B. floccifera**, *Bedd. Ic. Pl. Ind. Or.* 111; scape elongate far above the leaves many-flowered, leaves broadly rounded with whitish tomentum beneath.

TRAVANCORE and SOUTH TINNEVELLY HILLS, alt. 3000 ft.; *Beddome*.

Leaves 1 $\frac{1}{2}$ -3 in., broader than long, subequally cordate at the base, denticulate or nearly entire, thickly coriaceous, with close whitish or yellowish tomentum on both surfaces, becoming at length nearly glabrous above; petiole 1-3 in., with similar tomentum; stipules $\frac{3}{4}$ in., broad-elliptic, acute, scarious. *Scape* 18 in., very firm, branching at 15 in. high into a very compound cyme; bracts many, small, lanceolate, glabrous, persistent; pedicels and flowers glabrous. MALE: sepals 2, scarcely $\frac{1}{4}$ in., round; petals 0; stamens 40, shortly monadelphous, anthers obovoid, connective not produced. FEMALE: perianth of 4 nearly equal segments, persistent on the fruit; styles 3, nearly free, 2-lobed near the apex. *Capsule* $\frac{1}{2}$ by $\frac{3}{8}$ in. including the wings; wings subequal, rounded, broadest at the height of half the capsule. *Seeds* ellipsoid.

62. **B. Brandisiana**, *Kurz in Flora* 1871, 295; radical leaves long-petioled deeply 5-7-lobed, cauline small, perianth both of male and female of 2-segments.

MARTABAN; Attaran Valley; *Dr. Brandis*.

Rootstock tuberous; stem succulent, nearly glabrous and simple. Radical leaves 5-7 in., rather broader than long, membranous, base subcordate, lobes acuminate and obtusely repand-toothed; petiole 5-8 in., glabrous; cauline leaves much smaller and shorter-petioled, usually 5-lobed. *Peduncle* very long, subradical, many times dichotomous; pedicels capillary; bracts lanceolate, minute; flowers very many, white.

minute. *Sepals* of either sex 2, $\frac{1}{10}$ in., round, emarginate, a little broader than long; *petals* of either sex 0; *stamens* many, free, anthers oblong. *Styles* 3, bifid at the apex. *Capsule* $\frac{1}{2}$ – $\frac{3}{4}$ in., ovate, acute, glabrous, 3-winged; wings retrorsely produced below the cells, 2 broad-oblong obtuse, the other linear-oblong; placentas undivided. *Seeds* small, short, ellipsoid.

** *Stem elongate with lateral inflorescence.*

† *Perianth of the male flower of 4 segments.*

63. **B. Wallichiana**, A. DC. *Prodr.* xv. pt. i. 383; young parts pedicels and ovary with short viscid pubescence.

Morung Mountains; *Hamilton* ex Wall. Cat.

Branch more than 10 in. long, dividing repeatedly, with many leaves, and flowers from the lowermost as well as the upper axils. *Leaves* 2–3 in., cordate, ovate, very unequal at the base, dentate-serrate, with very short viscid pubescence on both surfaces; petiole $\frac{1}{2}$ –1 in., viscidly pubescent; stipules $\frac{1}{2}$ in., ovate, acute, ciliate. *Peduncles* 2 in., few-flowered; bracts $\frac{1}{2}$ in., ovate, acute, scarious, pubescent, persistent. **MALE**: sepals 2, $\frac{1}{4}$ in., round-elliptic; petals 2, narrower; stamens (ex A. DC.) monadelphous, anthers ovoid, connective not produced. **FEMALE**: styles 3, free, each ending in two long curved and twisted branches. *Capsule* $\frac{3}{4}$ by $\frac{5}{8}$ in. including the wings, at length glabrous, wings subequal, broadest near the base of the capsule, their margin everywhere rounded. *Seeds* ellipsoid.—The locality of this plant is very doubtful. By *Morung* Hamilton understood the Terai from the river Teesta to the Kooshee (see *Hamilton's Nepal* p. 151): this tract has been explored by very good collectors (J. Scott, Gamble, &c.) since, and no plant at all corresponding to the present large species has been obtained: indeed Alph. DC. doubts (and with reason) whether any such plant has ever been found in Asia.

†† *Perianth of the male flower of 2 segments only.*

64. **B. malabarica**, Lamk. *Dict.* i. 393, not of Roxb.; flowers medium large, capsule more than $\frac{1}{2}$ in. Wall. Cat. 3676, excl. D; A. DC. *Prodr.* xv. pt. i. 392; *Thwaites Enum.* 128 (β) only. *B. dipetala*, Grah. in *Bot. Mag.* t. 2849; *Lodd. Bot. Cab.* t. 1730; *Lindl. & Paxt. Flow. Gard.* i. t. 14; *Wight Ic.* t. 1813; A. DC. l.c. 391. *B. tuberosa*, Herb. Mad.; Wall. Cat. 3675. *B. hydrophila*, Mig. in *Flora* 1853, 769; A. DC. l.c. 392.

MALABAR MTS.; common, ascending to 6000 ft.; and in CEYLON.

Stem often 2 ft., repeatedly dividing, with many leaves. *Leaves* 2–4 in., cordate, acute, very unequal at the base, crenate or serrate, pilose above and sometimes pubescent beneath, or altogether glabrous; petiole 1–5 in.; stipules $\frac{3}{8}$ in., persistent, ovate, acute, glabrous. *Peduncles* axillary, rarely exceeding 2–3 in., glabrous or nearly so; bracts $\frac{3}{8}$ in., lanceolate, acute; flowers rose-coloured, not very many on one peduncle. **MALE**: sepals 2, $\frac{3}{4}$ – $\frac{1}{2}$ in., round, glabrous; petals 0; stamens 40, shortly monadelphous, anthers obovoid, connective not produced. **FEMALE**: perianth nearly as in the male; styles 3, little combined at the base, each dividing into two curved and twisted branches. *Capsule* $\frac{3}{4}$ by $\frac{3}{4}$ in. including the wings; wings little unequal, continued all round the capsule, rounded altogether or having an obtuse angle at the outer upper margin. *Seeds* ellipsoid, slightly obovoid.—The following are distinguished as species by Alph. DC.

VAR. 1. dipetala; leaves pilose above and sometimes pubescent beneath, capsule without any angle on the wings.—This is the old *B. tuberosa* of the Madras Herbarium and *B. dipetala vera* of Thwaites. But there are examples at Kew in ripe fruit which have most of the capsules round-winged, others on the same stem angularly winged; and in the large series of examples the pubescence is often evanescent or all but so.

VAR. 2. hydrophila; leaves pilose above, capsule shorter than in var. 1, the wings broader and more unequal.

VAR. 3. *malabarica*; leaves glabrous, capsules large slightly subquadral rather than elliptic.—As to *Rheede Hort. Mal.* ix. t. 86 referred here, it may be the present plant as it is difficult to guess what other species Rheede could have got in Malabar: though it differs not merely in the points mentioned by Alph. DC.; but in the male flowers with two sepals and two petals.

DOUBTFUL AND EXCLUDED SPECIES.

65. *B. KHASIANA*, C. B. Clarke; flowers minute, capsule less than $\frac{1}{4}$ in. *B. pedunculosa* Wall. Cat. 3672 B.

SYLHET Mts. (which means Khasia); *Wallich*.

Branches weak, succulent, scarioso winged, repeatedly divided with many leaves. *Leaves* $1\frac{1}{2}$ –2 in., cordate, acute, very unequal at the base, serrate, pilose above, laxly sparsely villous on the nerves beneath; petiole $\frac{1}{4}$ – $\frac{3}{4}$ in.; stipules $\frac{1}{4}$ in., persistent, oblong, acute, glabrous. *Peduncles* from the lower as well as from the upper axils, 1 – $1\frac{1}{2}$ in., few-flowered; bracts minute, elliptic, acute, ciliate, fimbriate. **MALE:** sepals 2, scarcely $\frac{1}{8}$ in., round, glabrous; petals 0; stamens about 8, anthers oblong, connective not produced. **FEMALE:** perianth of 5 segments; styles 3, divided upwards. *Capsule* $\frac{1}{4}$ by $\frac{1}{4}$ in. including the wings; wings 3, one about twice as broad as the others, its margin from the top of the capsule first horizontal then rounding away without angles; capsule dehiscing by marginal lines within the margins of its faces; placentas not seen.

B. TENUIFOLIA, *Dryand. in Trans. Linn. Soc.* i. 162, from Pulo Pontangh, is not a Pulo Pinang plant as A. DC. suspects from the similarity of the names (see *Prodr.* xv. pt. i. 351).

ORDER LXVII. **DATISCEÆ.** (By C. B. Clarke.)

Trees or herbs. *Leaves* petioled, simple or pinnate; stipules 0. *Flowers* small, dioecious in the Indian species, clustered racemed or paniced. **MALE:** calyx-tube short, teeth 3–9; petals 0; stamens 4–25. **FEMALE:** calyx-tube adnate to the ovary, lobes 3–8 short; petals 0; ovary 1-celled, open or closed at the vertex; styles lateral, alternating with as many parietal placentæ, simple or 2-partite; ovules very many, ascending or horizontal. *Capsule* coriaceous or membranous, opening at the vertex between the styles. *Seeds* very many, small, albuminous; embryo straight, radicle next the hilum.—**DISTRIB.** Species 4; natives of the Mediterranean, Central Asia, Java, and North-West America.

Herb. Styles 3, deeply divided. Lower leaves pinnate 1. **DATISCA.**

Tree. Styles 4, simple. Leaves all simple 2. **TETRAMELES.**

1. **DATISCA**, *Linn.*

Tall glabrous erect herbs. *Leaves* 3-partite or unequally pinnate, the uppermost undivided; leaflets lanceolate, strongly serrate. *Flowers* dioecious, axillary, clustered, short-pedicelled. **MALE:** Calyx-tube very short, lobes 4–9, unequal; stamens 9–25; no rudiment of the ovary. **FEMALE:** Calyx-tube ovoid, trigonous upwards; styles 3, divided nearly to the base into two linear stigmas. *Capsule* narrow-oblong, trigonous, coriaceous, opening at the vertex between the styles. *Seeds* many, ellipsoid, coarsely reticulated.—**DISTRIB.** Species 2, one in Western Asia, the other in California.

1. **D. cannabina**, *Linn.*; *Boiss. Fl. Orient.* ii. 763; leaves from the flowering branches long-petioled very narrowly linear-lanceolate attenuated at

both ends, flowers fascicled, rarely on short lateral branches and falsely racemed. *Lamk. Ill.* t. 823; *Wall. Cat.* 4664; *A. DC. Prodr.* xv. pt. i. 410; *Sibth. Fl. Græc.* t. 960. *D. nepalensis*, *Don Prodr.* 203.

Temperate and Subtropical Western Himalaya from KASHMIR to NIPAL, alt. 1000–6000 ft.; *Wallich, Thomson, &c.*, not very common.—DISTRIB. Westward to the Levant.

Stem 2–6 ft., stout, branching. *Lower leaves* 1 ft., pinnate; leaflets 7–11, 6 by $1\frac{1}{2}$ in., petioluled; upper much smaller and less divided; floral simple, 3 by $1\frac{1}{4}$ in. *Pedicels* often carrying linear bracts. *Anthers* oblong, rather large; filaments very short. *Styles* $\frac{1}{4}$ in. *Capsule* $\frac{1}{3}$ by less than $\frac{1}{8}$ in.

2. TETRA MELES, *R. Br.*

A large tree. *Leaves* petioled, ovate, pubescent beneath at least on the nerves. *Flowers* dioecious, appearing before the leaves; males panicked, females in elongate racemes, clustered near the ends of the branchlets. MALE: Calyx-lobes short; teeth 4, ovate, one or two smaller teeth sometimes added; petals 0; stamens 4, opposite the calyx-teeth, inserted round a depressed disc; rudiment of the ovary 0 or quadrangular. FEMALE: Calyx-tube ovoid; teeth 4, short; petals 0; styles 4, short, stigmas simple somewhat club-shaped. *Capsule* ovoid, with 4 lines or slight ridges, membranous, opening at the top between the styles. *Seeds* very many, minute, flattened, ellipsoid, testa very lax and extending much beyond the nucleus as a loose ragged large-reticulated membrane.

1. **T. nudiflora**, *R. Br. in Benn. Pl. Jav. Rar.* 79, t. 17; *A. DC. Prodr.* xv. pt. i. 411; *Bedd. Fl. Sylv.* t. 212; *Brand. For. Fl.* 245; *Kurz For. Fl.* 535. *T. Grahamiana*, *Wight Ic.* t. 1956; *A. DC. l.c.* *T. rufinervis*, *Miq. Fl. Ind. Bat.* i. pt. i. 726; *A. DC. l.c.* *Anictoclea Grahamiana*, *Nimmo in Grah. Cat. Bomb. Pl.* 252.—Indeterminata, *Wall. Cat.* 9045.

SIKKIM, alt. 2000 ft.; *J. D. H.* WESTERN GHATS from BOMBAY to CEYLON. BURMA, TENASSERIM and ANDAMANS, frequent, *Kurz*.—DISTRIB. Java.

Attains 100–150 ft. *Leaves* 5–6 by 4–5 in. roundly ovate, shortly acuminate, serrate or nearly entire, pubescent on both surfaces when young, glabrescent when old, glabrous in Mr. Kurz's Andaman plant except the nerves beneath. *Racemes* and *panicles* pubescent; flowers sessile or nearly so, bracts minute or 0. *Anthers* small, roundish; filaments long. *Capsule* $\frac{1}{5}$ by $\frac{1}{8}$ in., glandular.

ORDER LXVIII. CACTEÆ. (By C. B. Clarke.)

Herbs, shrubs, or trees; branches often thickened, striated, or angled. *Leaves* usually represented by tufts of spines, or by prickles or small tubercles. *Flowers* solitary, sessile, hermaphrodite, regular. *Calyx-tube* adnate to the ovary, lobes 3– ∞ , small, imbricate. *Petals* ∞ , free or shortly united at the base, imbricate. *Stamens* ∞ , free or adnate to the base of the petals; filaments filiform. *Ovary* 1-celled; style filiform or cylindric, stigma 2– ∞ rayed; ovules very many on parietal placentas, horizontal. *Berry* 1-celled, placentas pulpy. *Seeds* very many, oblong or reniform; albumen plentiful, or scanty, or almost 0; embryo straight or curved.—DISTRIB. Species 1000, confined to America, except *Rhipsalis cassytha*.

OPUNTIA DILLENII, *Haw.*; *DC. Prodr.* iii. 472; *Cactus indicus*, *Roxb. Hort. Beng.* 37, *Fl. Ind.* ii. 475; *Wight Ill.* 114; an American plant, is naturalised in India, and

is nearly or quite the same species as that on which cochineal is tended in Teneriffe; see *Lowe Fl. Madeira*, 313-319; *Brand. For. Fl.* 245-247. Roxburgh states that the cochineal "insects" brought from America thrive and multiplied abundantly on his *Cactus indicus*.

1. **RHIPHALIS**, Gaertn.

Small fleshy shrubs; branches long, terete, or flattened and leaf-like. *Leaves* represented by small scales. *Flowers* lateral, small. *Calyx-tube* not produced above the ovary, lobes 3- ∞ . *Petals* 6-10, spreading, oblong. *Ovary* smooth; style filiform, stigma 3- ∞ -rayed. *Berry* globose, smooth; the placentas projecting inwards nearly to the axis. *Seeds* obovoid; albumen 0.—**DISTRIB.** Species 30, confined to Tropical America, except the one species below.

1. **R. Cassytha**, Gaertn. *Fruct.* 137, t. 28. fig. 1; branches round pendulous whorled, petals 5-6. *DC. Prodr.* iii. 476; *Lodd. Bot. Cab.* t. 865; *Hook. Exot. Fl.* t. 2; *Bot. Mag.* t. 3080; *Thwaites Enum.* 129.

CEYLON; upon rocks and trees throughout the Central Province and certainly indigenous, *Walker*; *Thwaites*.—**DISTRIB.** Mauritius, South and Central Africa, Tropical America.

Calyx-segments 4-5, acute, very unequal, tinged with red at the apex. *Corolla* white. *Stamens* about 20. *Placentas* 3-4; stigma 3-4-rayed. *Berry* size of a pea, transparent, white. *Seeds* oblong, shining, black, obscurely striate.

ORDER LXIX. **FICOIDEÆ**. (By C. B. Clarke.)

Herbs. *Leaves* simple, often fleshy, usually opposite or whorled; stipules 0 or scarious. *Flowers* usually in cymes or clusters, rarely solitary, regular, hermaphrodite rarely polygamous. *Calyx* of 4-5 segments, united into a tube or nearly distinct, free from the ovary in the Indian genera, often persistent. *Petals* usually wanting, when present small. *Stamens* perigynous or hypogynous, definite or indefinite; staminodes sometimes present. *Ovary* free (except in *Mesembryanthemum*), 2-5-celled, syncarpous (except in *Gisekia*); styles as many as the carpels; ovules many in each carpel and axile, or solitary basal. *Fruit* usually capsular, splitting dorsally or circumsciss, more rarely the carpels separate into cocci. *Seeds* many or 1 in each carpel, usually reniform, compressed; embryo curved or annular, surrounding the farinaceous albumen, radicle next the hilum.—**DISTRIB.** Species 450, chiefly African, a few are scattered through most tropical and subtropical regions.

TRIBE I. **Aizoideæ**. *Calyx-tube* elongate. *Stamens* inserted on the calyx-tube.

* *Carpels* dehiscing dorsally.

Hairy woody small herbs. 1. AZOON.

** *Capsule* circumsciss.

Ovary (and capsule) 3-5-celled. 2. SESUVIUM.

Ovary (and capsule) 1-2-celled. 3. TRIANTHEMA.

TRIBE II. **Molluginææ.** *Calyx* deeply 5-partite. *Stamens* hypogynous.

† *Carpels* dehiscing dorsally.

Petals many, small, hypogynous 4. ORYGIA.
 Petals 0. Stipules scarious, fugacious 5. MOLLUGO.

** *Capsule* of separate cocci.

Carpels 3-5, separate in the flower 6. GISEKIA.
 Carpels 2, combined in the flower 7. LIMEUM.

1. AIZOON, Linn.

Spreading procumbent herbs, or small shrubs. *Leaves* alternate or falsely opposite, entire; stipules 0. *Flowers* axillary, solitary or in spikes or cymes. *Calyx-tube* short; lobes 5-4, spreading, yellow within. *Petals* 0. *Stamens* many, inserted near the top of the calyx-tube. *Ovary* free, 5-4-celled, depressed, nearly included in the calyx-tube; styles 5-4, free, subulate; ovules several in each cell. *Capsule* almost woody, surrounded by the persistent calyx, 5-celled, cells splitting from the top downwards dorsally. *Seeds* 2 or several in each cell, reniform; embryo annular.—DISTRIB. Species 8, from Europe to S. Africa, and from the Canaries to Scinde: one aberrant species in Australia.

1. **A. canariense**, Linn.; Boiss. *Fl. Orient.* ii. 765; leaves petioled hairy elliptic, capsules sessile numerous, the valves inflexed. DC. *Pl. Grass.* t. 136, *Prodr.* iii. 453.

SCINDE; *Stocks*, Vicary.—DISTRIB. Afghanistan, Arabia, Africa.

Small, woody, closely procumbent, repeatedly dividing. *Leaves* 1-1½ in., papillose and simply hairy or tomentose, petiole 0-¼ in. *Flowers* in nearly every axil. *Calyx-lobes* ⅔ in. ovate. *Capsule* ⅔ in. broad, the summit when looked down upon pentagonal. *Seeds* black, smooth, with a few continuous raised ridges concentric with regard to the unappendaged hilum.

2. SESUVIUM, Linn.

Succulent branching herbs. *Leaves* opposite, fleshy; stipules 0. *Flowers* axillary, sessile or peduncled, solitary, rarely in cymes. *Calyx-tube* short; lobes 5, triangular-lanceolate, persistent, often coloured. *Petals* 0. *Stamens* many or 5, inserted round the summit of the calyx-tube. *Ovary* free, 3-5-celled; styles 3-5; ovules many, axile. *Capsule* ovate-oblong, membranous, 3-5-celled, circumsciss. *Seeds* many in each cell, reniform; embryo annular.—DISTRIB. Species 4, littoral in warm climates.

1. **S. Portulacastrum**, Linn.; Roxb. *Fl. Ind.* ii. 509; glabrous, styles 3-5, seeds black shining smooth. Dalz. & Gibs. *Bomb. Fl.* 15; Kurz in *Journ. As. Soc.* 1877, pt. ii. 110. S. repens, Willd.; DC. *Prodr.* iii. 453; Wall. *Cat.* 6836; W. & A. *Prodr.* 361; Wight in. Hook. *Comp. Bot. Mag.* ii. 71, t. 23. Psammanthe marina, Hance in Walp. *Ann.* ii. 660.

Seashores of INDIA, from BOMBAY to CALCUTTA and SINGAPORE.—DISTRIB. Tropical and subtropical seashores.

Small, or extensively creeping and rooting in sand. *Leaves* ½-2 in., from obovate to linear spatulate or subcylindric; petiole often dilated at base with scarious mar-

gins. *Flowers* solitary, axillary pedicel $\frac{1}{4}$ in. *Calyx* within a bright rose; segments $\frac{1}{4}$ in., cuspidate. *Stamens* 15–40, free or nearly so. *Styles* 3, less commonly 4 or 5. *Capsule* $\frac{1}{2}$ in. *Seeds* not very many, obtusely keeled on the margin.

3. **TRIANTHEMA**, Linn.

Diffuse prostrate branched herbs, glabrous or papillose. *Leaves* petioled, opposite, unequal, from linear to ovate or obovate, entire; petioles connected at base by their dilated membranous margins; stipules 0. *Flowers* small, axillary, sessile or peduncled, solitary or in cymes or clusters. *Calyx-tube* short or long, lobes 5, often cuspidate, coloured within. *Petals* 0. *Stamens* 5–10 or more, inserted near the top of the calyx-tube. *Ovary* free, 1–2-celled; styles 1 or 2, subulate; ovules 1 or many, basal. *Capsule* membranous or coriaceous, clavate, circumsciss, the upper portion often carrying away 1 or 2 seeds attached to or enclosed in it, the lower portion 2– ∞ -seeded. *Seeds* reniform; embryo annular.—**DISTRIB.** Species 10, tropical and subtropical.

* *Style* 1.

1. **T. monogyna**, Linn. *Mant.* 69; calyx-tube scarious thin closely sheathed by the base of the petiole, stamens about 15. *DC. Prodr.* iii. 352, *Pl. Grass.* t. 109. *T. obcordata*, Roxb. *Hort. Beng.* 34, *Fl. Ind.* ii. 445; *Wall. Cat.* 6837, excl. F; *W. & A. Prodr.* 355; *Wight Ic.* t. 228; *Dalz. & Gibs. Bomb. Fl.* 14; *Kurz in Journ. As. Soc.* 1877, pt. ii. 110. *T. pentandra* β . *obcordata*, *DC. Prodr.* iii. 352.

Throughout INDIA and CEYLON, common.—**DISTRIB.** Malaya, Western Asia, Africa, Tropical America.

Glabrous. *Leaves* $\frac{1}{2}$ –1 $\frac{1}{2}$ in., obovate; petiole $\frac{1}{2}$ in. *Flowers* solitary. *Calyx-lobes* obtuse, cuspidate. *Stamens* 10–20. *Capsule* $\frac{1}{2}$ in., scarious below, beak exserted coriaceous somewhat mitriform adnate to the enclosed seed, lower part 3–5-seeded. *Seeds* black, scarcely shining, with concentric broken undulating raised lines.

2. **T. crystallina**, Vahl. *Symb.* i. 32; calyx-tube herbaceous with many ribs not sheathed by the base of the petiole, stamens 5. *Roxb. Hort. Beng.* 34, *Fl. Ind.* ii. 444; *Wall. Cat.* 6840; *W. & A. Prodr.* 355; *Edgw. in Journ. Linn. Soc.* vi. 203; *Dalz. & Gibs. Bomb. Fl.* 14; *Kurz in Journ. As. Soc.* 1877, pt. ii. 110. *T. triquetra*, *Rottl.*; *DC. Prodr.* iii. 352. *T. sedifolia*, *Visian. Pl. Æg.* t. 3. *Papularia crystallina*, *Forsk. Fl. Æg. Arab.* 69.

From the PUNJAB to CEYLON: not in Bengal.—**DISTRIB.** Throughout Africa.

Minutely papillose or glabrous. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., narrowly oblanceolate or elliptic; petiole very short or obscure. *Flowers* often very many, solitary densely clustered. *Calyx-lobes* triangular, cuspidate. *Capsule* $\frac{1}{2}$ in.; beak a circular corky flat disc depressed in the centre, deciduous often with one seed attached beneath or imperfectly included by a membrane. *Seeds* 2, super-imposed, discoid, black, scarcely shining, with concentric broken undulating raised lines.

** *Styles* 2.

3. **T. pentandra**, Linn. *Mant.* 79; stamens 5, beak of the fruit mitriform separating into two 1-seeded parts, lower portion of the fruit 2-seeded.. *DC. Prodr.* iii. 352; *Edgw. in Journ. Linn. Soc.* vi. 202; *Boiss. Fl. Orient.* ii. 766. *T. obcordata*, *Wall. Cat.* 6837 F. *T. Govindia*, *Wall. Cat.* 6838.

The PUNJAB, SCINDE and plains of NORTH-WEST INDIA.—**DISTRIB.** Western Asia and Tropical Africa.

Papillse or nearly glabrous. *Leaves* 1-1½ in., oblong or elliptic; petiole ¼ in. *Flowers* in sessile clusters. *Calyx-lobes* ovate, often scarious on the margin, bracts scarious. *Capsule* ½ in.; beak consisting of two lanceolar portions acute upwards, coriaceous, closely adnate to the included seed. *Seeds* in the lower half of the capsule 2, dull black, roughly puberulous, the concentric lineation very obscure.

4. **T. decandra**, *Linn. Mant.* 70; stamens 10, beak of the fruit truncate consolidated with the two included seeds indehiscent or only finally splitting. *Roxb. Hort. Beng.* 34, *Fl. Ind.* ii. 444; *DC. Prodr.* iii. 352; *Wall. Cat.* 6839; *W. & A. Prodr.* 355; *Wight Ic.* t. 296; *Dalz. & Gibb. Bomb. Fl.* 15; *Kurz in Journ. As. Soc.* 1877, pt. ii. 110. *Zaleya decandra*, *Burm. Fl. Ind.* t. 31, fig. 3.

DECCAN PENINSULA and CEYLON.—DISTRIB. Timor; Ava (*ex Kurz*).

Glabrous or minutely papillose. *Leaves* 1-1½ in., oblong or elliptic; petiole ¼-½ in. *Flowers* in nearly sessile clusters. *Calyx-lobes* ovate, usually obtuse, often scarious on the margins; bracts scarious. *Capsule* ½ in., beak a truncate solid cylinder, not at all or very obscurely mitriform. *Seeds* 4, 2 lower dull black puberulous, with numerous faint concentric raised lines.—Closely allied to the preceding species.

5. **T. hydasgica**, *Edgw. in Journ. Linn. Soc.* vi. 203; stamens 5-7, beak of the fruit conical thin not completely enclosing a seed. *T. polysperma*, *Hochst. in Oliv. Fl. Trop. Afr.* ii. 588.

MOOLTAN; *Edgeworth*. SCINDE; *Stocks*. BOMBAY; *Law*.—DISTRIB. East Tropical Africa.

Minutely papillose or glabrous. *Leaves* ½-1 in., oblong or elliptic, often with scarious margins; petiole ¼-½ in. *Flowers* sessile, solitary and clustered. *Calyx-tube* 10-ribbed; lobes triangular-elongate, acute, dilated at base so that there appear to be 5 intersected auricles. *Capsule* ½ in.; beak elongate-conical, hollow. *Seeds* about 10-15, dull black, with puberulous raised undulating lines that radiate from the centre (and thus are in a direction at right angles to the lines on the seeds of the four preceding species).—Flowers separated, or clustered. *T. polysperma*, *Oliv.* is undistinguishable from some of *Stocks'* Scinde specimens. *Diplochonium sesuvioides*, *Fenzl. in Harv. & Sond. Fl. Cap.* ii. 473 is separated by the very numerous stamens and shining seeds, as *Edgeworth* has noted.

4. **ORYGIA**, *Forsk.*

A rigid branched glabrous herb. *Leaves* opposite and alternate, fleshy, entire; stipules 0. *Cymes* terminal and leaf-opposite, lax, few-flowered. *Sepals* 5, nearly free, ovate. *Petals* 0. *Staminodes* many, small, subhypogynous. *Stamens* 12 or more, subhypogynous. *Ovary* free, globose, 5-ribbed, 5-celled; styles 5, filiform; ovules many, axile. *Capsule* globose, papery, wrapped in the persistent sepals; cells 5, dehiscing dorsally. *Seeds* many, reniform, strophiolate; embryo annular.

1. **O. decumbens**, *Forsk. Fl. Æg. Arab.* 103; *DC. Prodr.* iii. 455; *Boiss. Fl. Orient.* i. 755. *Glinus trianthemoides*, *Heyne in Roth Nov. Sp.* 231; *DC. l. c.*; *W. & A. Prodr.* 362; *Wight Ill.* t. 113. *G. mucronata*, *Klotzsch. in Peters Reis. Mossamb. Bot.* 140, t. 25. *Portulaca decumbens*, *Vahl Symb.* i. 33. *Talinum decumbens*, *Willd. Sp. Pl.* ii. 864. *Axonotichium trianthemoides*, *Fenzl. in Ann. Wien. Mus.* i. 354.

Dry and hot INDIA from the PUNJAB and SCINDE to MYSORE and Coimbatore. Not in Bengal.—DISTRIB. Western Asia and the whole of Africa.

Stems 6–18 in., somewhat angular or trigonous. *Leaves* $\frac{3}{4}$ –1 in., obovate, cuspidate; petiole $\frac{1}{2}$ in. *Cymes* with small lanceolate bracts at their divisions; flowers $\frac{1}{2}$ in. diam., pedicelled. *Sepals* purplish-green, with scarious edges, acute. *Capsule* $\frac{1}{2}$ in. diam. *Seeds* black, not shining, with numerous concentric elevated lines.

5. **MOLLUGO**, Linn.

Herbs, branched, often dichotomous. *Leaves* often falsely whorled, or alternate, or all radical, from linear to obovate, entire; stipules quickly disappearing. *Flowers* axillary, sessile or pedicelled, clustered or in cymes or racemes, small, greenish; bracts inconspicuous. *Sepals* 5, persistent. *Petals* 0; staminodes 0 or small in the same species. *Stamens* 5–3, rarely many. *Ovary* free, globose or ellipsoid, 3–5-celled; styles 3–5, linear or very small; ovules many, axile. *Capsule* membranous, sheathed by the sepals, 3–5-celled, dehiscing dorsally. *Seeds* several in each cell, rarely 1, reniform, appendaged or not at the hilum; embryo annular.—DISTRIB. Species 12, tropical and subtropical.

* *Seeds with an appendage at the hilum, inflorescence in axillary clusters.*

1. **M. hirta**, Thunb. *Fl. Cap.* 120; flowers sessile or pedicelled, appendage of the seed a membranous scale from which proceeds a linear bristle that curls half round the seed. *DC. Prodr.* i. 391. *M. Glinus*, *A. Rich. Fl. Abyss.* i. 48; *Kurz in Journ. As. Soc.* 1877, pt. ii. 110. *Glinus lotoides*, Linn.; *Lamk. Ill.* t. 413; *DC. Prodr.* iii. 455; *Wall. Cat.* 1517; *W. & A. Prodr.* 362; *Sibth. Fl. Græc.* t. 472; *Dalz. & Gibs. Bomb. Fl.* 16; *Boiss. Fl. Orient.* i. 755. *G. dictamnoides*, Linn. *Mant.* 243; *DC. l. c.*; *Wall. Cat.* 1518; *W. & A. Prodr.* 362. *Boiss. l. c.* i. 756. *G. parviflora*, *Wall. Cat.* 1519. *Pharnaceum pentagonum*, *Roxb. Hort. Beng.* 22, *Fl. Ind.* ii. 103. *Tryphera prostrata*, *Blume*; *A. DC. Prodr.* xiii. pt. ii. 424.

Throughout INDIA and CEYLON, common.—DISTRIB. All warm regions.

Stellately woolly, sometimes less hairy, rarely glabrous. *Stem* prostrate, much branching, leafy. *Leaves* $\frac{1}{2}$ –1 in., opposite or whorled, usually obovate but vary from round to narrow-lanceolate; petiole 0– $\frac{1}{4}$ in. *Flowers* usually sessile or nearly so; pedicels sometimes $\frac{3}{4}$ in. *Sepals* $\frac{1}{2}$ – $\frac{3}{4}$ in., elliptic or oblong, acute. *Staminodes* linear or 0. *Stamens* usually 10 or more but vary to 5. *Styles* 3–5, linear, short. *Capsule* a little shorter than the sepals, oblong. *Seeds* many, covered with raised tubercular points; the appendage sometimes carrying more than one bristle.—A variable weed of which the following are the most notice-worthy varieties.

VAR. 1. *typica*; flowers sessile, sepals $\frac{1}{2}$ in. more or less stellately tomentose. *Glinus dictamnoides*, *W. & A. Prodr.* 362.

VAR. 2. *lotoides*, *W. & A. Prodr.* 362 (sp.); pedicels of the flowers $\frac{1}{2}$ – $\frac{3}{4}$ in., sepals $\frac{1}{4}$ in. stellately tomentose.—Hills of the DECCAN PENINSULA.

VAR. 3. *Keenani*; stem slightly pubescent, leaves glabrous petioled lanceolate, flowers sessile, sepals $\frac{1}{2}$ in. glabrous with scarious margins, capsule oblong the seeds clearly seen through the walls, seeds exactly of Var. 1 but smaller than usual.—Cachar, *R. L. Keenan*; possibly a good species but it can be nearly matched out of the African bundles of Var. 1.

2. **M. Spergula**, Linn.; *DC. Prodr.* i. 391; glabrous or nearly so, flowers pedicelled, seed appendaged by a minute short subulate bristle. *Wall. Cat.* 653; *W. & A. Prodr.* 44; *Kurz in Journ. As. Soc.* 1877, pt. ii. 111. *M. verticillata*, *Roxb. Hort. Beng.* 9, *Fl. Ind.* i. 360, not of Linn. *M. parviflora*, *DC. Prodr.* i. 391. *Pharnaceum parviflorum*, *Roth, Nov. Sp.* 186. *P. Mollugo*, Linn. *Mant.* 561; *Roxb. Hort. Beng.* 22, *Fl. Ind.* ii. 102. *Glinus Mollugo*, *Fenzl in Ann. Wien. Mus.* i. 359.—*Rheede Hort. Mal.* x. t. 24.

From the base of the EASTERN HIMALAYA to CEYLON and BURMA; common. (No example from North-West India, the Punjab or Scinde.)—DISTRIB. Tropical Africa and Australia.

Stem branching, diffuse, leafy. *Leaves* $\frac{1}{2}$ –1 in., usually whorled, spathulate lanceolate or elliptic; petiole 0– $\frac{1}{2}$ in. *Pedicels* $\frac{1}{2}$ – $\frac{1}{3}$ in. *Sepals* $\frac{1}{2}$ – $\frac{1}{3}$ in., oblong, margins often membranous. *Stamens* 5–10. *Stigmas* 3, minute. *Capsule* ellipsoid, a little shorter than the sepals. *Seeds* many, covered with raised tubercular points, the appendage sometimes comprises a second, yet more minute, bristle.

** *Seeds not appendaged, inflorescence in terminal cymes or racemes.*

3. **M. stricta**, Linn.; DC. Prodr. i. 391; glabrous, stems much branched leafy, seeds covered with raised tubercular points. Wall. Cat. 649; W. & A. Prodr. 44; Dalz. & Gibs. Bomb. Fl. 16; Kurz in Journ. As. Soc. 1877, pt. ii. 111. M. triphylla, Lour. Fl. Cochinc. 79; DC. Prodr. i. 392; Roxb. Hort. Beng. 9, Fl. Ind. i. 360; Wall. Cat. 651; W. & A. Prodr. 44. M. Linkii, Seringe in DC. l.c. M. pentaphylla, Linn.; DC. Prodr. i. 391; Roxb. l.c.; Wall. Cat. 650; W. & A. Prodr. 44; Dalz. & Gibs. l.c. Pharnaceum strictum, triphyllum and pentaphyllum, Spreng. Syst. i. 949.—Rheede Hort. Mal. x. t. 26.

Throughout INDIA and CEYLON, very common.—DISTRIB. Eastward to Malacca, China, Japan, Fiji.

Often a foot high. *Leaves* $\frac{3}{4}$ –1 $\frac{1}{2}$ in., whorled or opposite, varying from lanceolate acute to obovate obtuse, much narrowed at the base; petiole hence obscure. *Cymes* compound, the branches sometimes racemed so that the inflorescence becomes like that of *M. disticha*. *Sepals* $\frac{1}{16}$ in., elliptic or round. *Stamens* 3–5, filaments dilated. *Styles* 3, short, linear. *Capsule* as long as the sepals, globose, many-seeded, the walls thin. *Seeds* dark chestnut-coloured; embryo curled into three-quarters of a complete circle.

4. **M. Cerviana**, Seringe in DC. Prodr. i. 392; glabrous, branched, cauline leaves linear-oblong, seeds reticulated without tubercular raised points. Wall. Cat. 7128; W. & A. Prodr. 44; Boiss. Fl. Orient. i. 756. M. umbellata, Seringe l.c. Pharnaceum Cerviana, Linn.; Lamk. Ill. t. 214.

From the PUNJAB to CEYLON, in the hotter drier parts of India; not in Bengal.—DISTRIB. Asia, Africa to the Cape, Australia.

Stems 3–6 in., erect, usually several. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., radical tufted spathulate or obovate, cauline linear-oblong often 4–8 in a whorl, whence spring umbellately many branches. *Peduncles* trichotomous or umbellate-cymose. *Sepals* $\frac{1}{2}$ in., elliptic or round. *Stamens* 5. *Styles* very small. *Capsule* as long as the sepals, globose, many-seeded. *Seeds* pink-chestnut or yellowish, covered with slightly elevated oblong reticulations, bluntly ridged on the back; embryo curled through less than a semicircle.

5. **M. disticha**, Seringe in DC. Prodr. i. 392; glabrous, branched, cauline leaves lanceolate, seeds smooth. Wall. Cat. 652; W. & A. Prodr. 44; Wight Ic. t. 3. Pharnaceum distichum, Linn. Mant. 221.

SOUTH DECCAN PENINSULA and CEYLON.

Stems often 12–18 in. *Leaves* $\frac{1}{2}$ –1 in., usually whorled, tapering almost to the base. *Flowers* in cymes, the branches often ultimately prolonged as racemes. *Sepals* $\frac{1}{6}$ – $\frac{1}{8}$ in., ovate. *Stamens* 5. *Styles* 3, short. *Capsule* as long as the sepals, globose or shortly ellipsoid, many-seeded. *Seeds* obscurely reticulated, shining chestnut, bluntly ridged on the back; embryo curved through three-quarters of a circle.—Wight's figure represents this plant as hairy: it is glabrous or sometimes microscopically puberulo-glandular.

6. **M. nudicaulis**, Lamk. *Dict.* iv. 234; glabrous, stems many leafless rising from a tuft of radical leaves. *DC. Prodr.* i. 391; *Wall. Cat.* 648; *W. & A. Prodr.* 43. *M. bellidifolia*, Seringe in *DC. Prodr.* i. 391. *Pharnaceum spathulatum*, Spreng. *Syst.* i. 948.—*Alsine*, Burm. *Fl. Zeyl.* t. 8.

From the PUNJAB to CEYLON in the hotter drier parts of India; not in Bengal.—DISTRIB. New Caledonia, Tropical Africa, Cuba.

Leaves 1–2 in., elliptic, tapering to the base. *Scapes* 3–8 in., wiry, repeatedly dichotomous. *Sepals* $\frac{1}{2}$ in., oblong. *Stamens* 5–3 (Oliver). *Stigmas* 3, very small. *Capsule* as long as the sepals, somewhat ellipsoid, many-seeded. *Seeds* black, a microscopic scale appendaged to the hilum, obscurely ridged on the back, shining, closely densely reticulated, very obscurely rough not tuberculated; embryo curved through half a semicircle—New Caledonian examples have the seeds rougher, and a very short linear spur added to the appendage. Cuban examples resemble generally the Indian, but one of them has the stem very woody thick branched densely packed with leaves.

6. **GISEKIA**, Linn.

Diffuse branched herbs. *Leaves* opposite or falsely whorled, fleshy, spatulate, abounding in raphides; stipules 0. *Flowers* sessile and pedicelled, hermaphrodite or polygamous, small, greenish or purplish, in axillary cymes. *Sepals* 5, nearly free, ovate, herbaceous with membranous margins. *Petals* 0. *Stamens* (in the Indian species) 5, hypogynous. *Carpels* 5–3, distinct; each ending in a short simple style and containing one basal ovule. *Fruit* of 5, free, membranous, papillose, indehiscent, carpels. *Seeds* vertical, subreniform; embryo curved.—DISTRIB. Species 5, in India, Arabia, and Africa.

1. **G. pharnaceoides**, Linn. *Mant.* 562; cymes dense, carpels covered with papillæ. *Roxb. Cor. Pl.* t. 183 (not good); *Wight Ic.* t. 1167; *A. DC. Prodr.* xiii. pt. ii. 27; *Kurz in Journ. Linn. Soc.* 1877, pt. ii. 111. *G. moluginoides*, *Wight Ic.* t. 1168. *G. linearifolia*, Schum.; *A. DC. Prodr. l. c.* *Pharnaceum occultum*, Forsk. *Fl. Æg. Arab.* 58.

The PUNJAB, SCINDE, SOUTH DECCAN PENINSULA and CEYLON.—DISTRIB. Afghanistan, Africa, Ava (*Wallich*).

Glabrous. *Stems* 8–18 in. *Leaves* $\frac{3}{4}$ –1 $\frac{1}{2}$ in., oblong or elliptic, entire, narrowed at the base; petiole 0– $\frac{1}{4}$ in. *Sepals* $\frac{1}{8}$ in. *Filaments* dilated below. *Carpels* usually 5, in fruit as long as the sepals. *Seeds* blackish, smooth, minutely glandular-punctate; embryo curved less than a semicircle.

7. **LIMEUM**, Linn.

Branched, mostly prostrate herbs; glandular or glabrous. *Leaves* alternate or subopposite; stipules 0. *Flowers* bracteate, cymed, hermaphrodite or unisexual, small, green. *Sepals* 5, nearly free, ovate, herbaceous with membranous margins. *Petals* (in the Indian species) 3–5, small. *Stamens* 5–10, hypogynous; filaments dilated downwards and somewhat connate at the base. *Ovary* globose, 2-celled; stigmas 2, short; ovule 1 in each cell, basal. *Fruit* separating vertically into two coriaceous hemispherical cocci, which at length dehisce ventrally. *Seeds* vertical, reniform; embryo annular.—DISTRIB. Species 10, African, one reaching the west of India.

1. **L. indicum**. *Stocks ms. ex T. Anders. in Journ. Linn. Soc. v. Suppl.* 30; leaves spatulate round, capsule smooth. *Oliv. Fl. Trop. Afr.* ii. 596.

PUNJAB; *Edgeworth, Vicary, Aitcheson*. SCINDE; *Stocks*.—DISTRIB. Aden, Nubia.

Subprostrate, glandular-puberulous or glabrate; branches 8-18 in., much divided. *Leaves* $\frac{1}{4}$ - $\frac{1}{2}$ in., opposite or nearly so petiole $\frac{1}{2}$ in. *Cymes* sessile (or nearly so) at the nodes. *Sepals* $\frac{1}{2}$ in., roundish. *Petals* much shorter than the sepals, obovate, clawed, the upper margin incised or nearly fimbriate. *Stamens* 6-7 (Oliver). *Carpels* in fruit as long as the sepals, hemispheric, dehiscent ventrally; margins of the valves inflexed so as to retain the seed until moistened. *Seed* reniform, longer than broad, compressed, concavo-convex, perfectly smooth, whitish.

ORDER LXX. UMBELLIFERÆ. (By C. B. Clarke.)

Herbs (rarely in non-Indian species shrubs or trees). *Leaves* alternate, usually divided or dissected, sometimes simple, petiole generally sheathing at the base; stipules 0. *Flowers* hermaphrodite or polygamous, in compound umbels (simple in *Hydrocotyle* and *Bupleurum*), exterior of the umbel sometimes radiant; umbels with involucriform bracts at the base of the general one and bracteoles at the base of the partial ones (umbellules). *Calyx-tube* adnate to the ovary, limb 0 or 5-toothed. *Petals* 5, epigynous, often unequal, and with a median fold on the face, plane or emarginate or 2-lobed with the apex inflexed; imbricated in bud, in *Hydrocotyle* sometimes valvate. *Stamens* 5, epigynous. *Ovary* inferior, 2-celled, disc 2-lobed; styles 2, stigmas capitellate; ovules 1 in each cell, pendulous. *Fruit* of 2 indehiscent dorsally or laterally compressed carpels, separated by a commissure; carpels each attached to and often pendulous from a slender often forked axis (carpophore), with 5 primary ridges (1 dorsal, 2 marginal and 2 intermediate) and often 4 secondary ones intercalated between these; pericarp often traversed by oil canals (vittæ). *Seed* 1 in each carpel, pendulous, albumen cartilaginous; embryo small, next the hilum, radicle superior. — DISTRIB. Species 1,300, mainly in Europe, North Africa, West Central and North Asia; a few are North American, tropical, and natives of the Southern Hemisphere.

Tordylium is stated in *Gen. Pl.* i. 871 to be Himalayan. We have seen no specimens.

An umbellifer in flower, Edgw. No. 175 $\frac{1}{2}$ from the North-west Himalaya, alt. 6000-7000 ft., may be *Johrenia alpina*, Fenzl.

Clavis of the Genera (as to the Indian species only).

SERIES I. **Heterosciadiæ.** Umbels simple or irregularly compound. Vittæ 0.

Leaves undivided. Stipulate. Fruit laterally compressed	1. HYDROCOTYLE.
Leaves spinulose-serrate. Flowers capitate	2. ERYNGIUM.
Leaves compound not spinulose. Umbels subcorymbose	3. SANICULA.

SERIES II. **Haplozygiæ.** Umbels compound. Secondary ridges of the fruit inconspicuous (except in *Trachydium 9-jugum*).

TRIBE I. **Aminnæ.** Fruit laterally compressed, or at least constricted at the commissure, not or very obscurely winged.

* *Carpels* in outline ovate or oblong, not distinctly narrowed upwards, excavated or concave on the inner face; seed grooved or concave on the inner face.

Bracteoles simple, linear	4. VICATIA.
Bracteoles lobed or pinnatifid	5. TRACHYDIUM.
Bracteoles entire, lanceolate, white-margined	6. ELÆOSTICTA.

**** Carpels in outline ovate or oblong, not distinctly narrowed upwards, plane on the inner face; seed plane or concave on the inner face.**

Leaves entire. Flowers yellow or lurid	7. BUPLEURUM.
Umbels short-peduncled, leaf-opposed, ebracteolate	8. APIUM.
Ridges of the fruit thick, corky	9. CICUTA.
Stem rigid, branched, almost leafless. Fruit densely hairy	10. PITURANTHOS.
Ridges of the fruit slender, valleys 1-vittate	11. CARUM.
Ridges of the fruit obtuse, corky, valleys 2-3-vittate	12. SIUM.
Ridges of the fruit slender, valleys 2-3-vittate	13. PIMPINELLA.

***** Carpels in outline elongate oblong; seed in horizontal section nearly circular, grooved on the inner face.**

Ultimate segments of the leaves large, fruit attenuate at base	14. OSMORRHIZA.
Fruit oblong, narrowed upwards, distinctly ridged, glabrous	15. CHÆROPHYLLUM.
Fruit narrowed upwards into a long beak	16. SCANDIX.
Fruit oblong, narrowed upwards, obscurely ridged, hispid	17. ANTHRISCUS.

TRIBE II. Seselinæ. Fruit widest at the commissure, in horizontal section circular or somewhat dorsally compressed.

*** Primary ridges of the fruit more or less distinct, not alate.**

Fruit globose or subcylindric, ridges distinct. Petals white	18. SESELI.
Central flower of the umbellule sessile perfect, lateral male pedicelled	19. PYCNOCYCLA.
Leaves cut into filiform segments. Bracts 0. Petals yellow	20. FENICULUM.
Fruit $\frac{3}{4}$ in., roughly corrugate between the ridges	21. PRANGOS.
Fruit with all the ridges equal, broad, obtuse, corky	22. CENANTHE.
Bracts prominent. Fruit ovoid, vittæ ∞	23. SCHULTZIA.
Bracts 0, or small. Fruit ovoid, vittæ ∞	24. POLYZYGUS.

**** Primary ridges of the fruit (or the lateral only) more or less excurrent, winged.**

† Valleys next the dorsal ridge 2-3-vittate.

Petals emarginate. Fruit less than $\frac{1}{4}$ in.	25. LIGUSTICUM.
Petals subentire. Fruit $\frac{1}{4}$ in.	30. ARCHANGELICA.

†† Valleys next the dorsal ridge 1-vittate (very rarely 1 or 2 additional small superficial vittæ are present), in Pleurospermum Candollii 3-2-vittate.

Tall. Leaves very compound. Seed plane on the inner face	26. SELINUM.
Stemless, or short. Carpels much compressed dorsally	27. CORTIA.
Seed grooved or concave on the inner face	28. PLEUROSPERMUM.
Leaves compound pinnate with large segments. Fruit $\frac{1}{2}$ in.	29. ANGELICA.

TRIBE III. Peucedanæ. Fruit much dorsally compressed, dorsal ridges slightly excurrent lateral winged, wings of the opposite carpels closely applied face to face.

Petioles of the leaflets winged. Petals yellow. Fruit $\frac{1}{2}$ in.	31. FERULA.
Flowers not radiant. Ovary glabrous	32. PEUCEDANUM.
Ovary pubescent. Vittæ rarely reaching the base of the fruit	33. HERACLEUM.
Wings of carpels hyaline with a very thick border	34. ZOSIMIA.

SERIES III. **Diplozygiæ.** *Umbels* compound. Secondary ridges of the fruit prominent, primary equally or less prominent or inconspicuous.

* *Fruit glabrous.*

Fruit globose. Bracts 0 34.* CORIANDRUM.
Fruit narrowly oblong. Bracts slender, simple 34.** CUMINUM.

** *Fruit hirsute or setose.*

Bracts pinnate. Seed plane on the inner face 35. DAUCUS.
Bracts linear, or 0. Seed grooved on the inner face 36. CAUCALIS.
Bracts linear-lanceolate, membranous 37. PSAMMOGETON.

1. HYDROCOTYLE, Linn.

Prostrate herbs, rooting at the nodes. *Leaves* (in the Indian species) cordate or hastate, not peltate, round or 5-9-gonal, subentire or palmately lobed, palmate-nerved, long-petioled; stipules small, scarious. *Umbels* (in the Indian species) simple, small; bracts small or 0; flowers white, sometimes unisexual. *Calyx-teeth* 0 or minute. *Petals* entire, valvate or imbricate. *Fruit* laterally compressed, commissure narrow; carpels laterally compressed or subpentagonal; lateral primary ridges concealed within the commissure, or distant therefrom and prominent; vittæ 0, or most slender, obscure; carpophore 0. *Seed* laterally compressed.—DISTRIB. Species 70; in wet places in tropical and temperate regions, more numerous in the Southern Hemisphere.

SECTION I. **Eu-Hydrocotyle.** *Petals* acute, valvate. Secondary ridges 0. *Pericarp* not thickened.

1. **H. javanica**, Thunb. *Dissert.* ii. 415, t. 3; leaves 1-3 in. diam. cordate crenate, subentire or lobed to the middle, petiole laxly pubescent, peduncles long upper often clustered, fruit much compressed not pentagonal. *DC. Prodr.* iv. 67; *Miq. Fl. Ind. Bat.* i. pt. i. 734; *Kurz in Journ. As. Soc.* 1877, pt. ii. 113. *H. hispida*, Don *Prodr.* 183. *H. nepalensis*, Hook. *Exot. Fl.* t. 30; *Wall. Cat.* 561; *DC. l. c.* 65; *Miq. l. c.* 735. *H. zeylanica*, *DC. l. c.* 67; *W. & A. Prodr.* 366; *Miq. l. c.* 734. *H. hirsuta*, *Blume Bijl.* 884. *H. polycephala*, *W. & A. Prodr.* 366; *Wight Ic.* t. 1003. *H. hirta*, *R. Br. Var. acutiloba*, *F. Muell.*; *Benth. Fl. Austral.* iii. 340. *H. Heyneana*, *Wall. Cat.* 563. *H. strigosa*, *Ham. in Wall. Cat.* 7219.

HIMALAYA; from KASHMIR to BHOTAN, alt. 2000-8000 ft.; KHASIA Mts., alt. 2000-6000 ft., common. Mts. of MALABAR and CEYLON, common. PEGU and TENASSERIM, alt. 2000-5000 ft.—DISTRIB. Malaya to the Philippines and Australia, Mozambique.

Leaves 1-3 in. diam., pubescent or glabrous. *Peduncles* $\frac{1}{4}$ -2 in., lower solitary, leaf-opposed. *Umbels* many-flowered; bracts minute lanceolate scales among the pedicels; pedicels $0-\frac{1}{2}$ in., glabrous. *Fruit* $\frac{1}{10}$ in., orbicular or subquadrate, reticulate-rugose or smooth (sometimes deformed, enlarged, obovoid, corky); lateral primary ridges commissural, intermediate faint or 0; pericarp hard, thin.—*Fruits* exceedingly uniform even in minute characters from the Himalaya to Ceylon. Thunberg describes *H. javanica* as glabrous, but all the specimens so named from Java have at least the petioles and peduncles pubescent and are identical with the Indian. *H. hirsuta*, *Blume*, is a form with fulvous pubescence abundant in the Eastern Himalaya.—*H. polycephala*, *Wight Ill.* t. 117, fig. 1, represents the carpels as subpentagonal and little compressed laterally, and perhaps was taken from *H. rotundifolia*.

VAR. 1. *podantha*, Molkenboer in Pl. Jungh. 89 (sp.); pedicels $\frac{1}{4}$ in. *Miq. Fl. Ind. Bat.* i. pt. i. 732.—Sikkim, Bhotan, Khasia, frequent.—Peduncles sometimes 3 in. Fruits ovoid, intermediate primary ridges 0.—Referred to *H. podantha* from the description only; Molkenboer relies partly on the leaves being setulose, but so they are in typical *H. javanica*. *H. laxiflora*, *DC. Prodr.* iv. 61 (= *H. densiflora*, *DC. Prodr.* iv. 61), does not differ unless by the fruits being slightly less compressed.

VAR. 2. *Hookeri*; leaves very pentagonal little lobed, peduncles 6 in., fruit little compressed yellowish shining with red glandular dots.—Khasia, alt. 5000–6000 ft.; *H. f. & T.*—Leaves $2\frac{1}{2}$ in. diam., sparingly setulose. Fruit somewhat pentagonal, the immediate primary ridges more defined, nearly as in *H. rotundifolia*. This may be a distinct species.

2. *H. burmanica*, *Kurz in Journ. As. Soc.* 1871, pt. ii. 60, and 1877, pt. ii. 113; quite glabrous, leaves 5-lobed to the middle, lobes triangular acute crenate, peduncles long, pedicels $\frac{1}{8}$ in., fruit moderately compressed somewhat pentagonal.

UPPER TENASSERIM; alt. 3000–5000 ft.; *Brandis, Parish*.

Leaves $1-2\frac{1}{2}$ in. diam. Peduncles $1-2\frac{1}{2}$ in., lower solitary leaf-opposed, upper 2–3-nate. Umbels many-flowered; bracts minute. Fruit $\frac{1}{10}$ in., broadly orbicular, obscurely punctate not reticulate; lateral primary ridges commissural, intermediate appearing as slightly elevated angles; pericarp hard, thin.—Very near *H. javanica*, differing in its glabrousness, 5-gonous leaves, and less compressed fruits. It may be *H. javanica* (cf. *Hiern in Oliv. Fl. Trop. Afr.* iii. 4) when No. 1 must be called *H. hirsuta*, *Blume*.

3. *H. conferta*, *Wight Ic.* t. 1002; leaves cordate crenate subentire or lobed to the middle, petiole laxly pubescent, umbels subsessile, fruit somewhat compressed subpentagonal.

SOUTH DECCAN; Pulney Mts., *Wight*; Nilgherry Mts., *Gardner, Schmidt*.

Leaves $1-2\frac{1}{2}$ in. diam., setulose. Umbels 5–15-flowered; peduncle when visible glabrous, any bracts obscure. Fruit $\frac{1}{10}$ in., orbicular, obscurely punctate, not reticulate; lateral primary ridges commissural, intermediate, appearing as slightly elevated angles; pericarp hard, thin.—From the size and hairiness of the leaves this has been supposed near *H. javanica*, differing by its sessile clusters of fruit in the axils; but in the structure of its fruit it is exceedingly like *H. rotundifolia* with which indeed it is mixed by *Wight*; and from some forms of which it hardly differs but by the larger more hairy leaves.

4. *H. rotundifolia*, *Roxb. Hort. Beng.* 21, *Fl. Ind.* ii. 38; leaves orbicular-cordate subentire or lobed to the middle or lower, pedicels 0, fruit somewhat compressed pentagonal. *Wall. Cat.* 562; *DC. Prodr.* iv. 64; *Wight Ic.* t. 564. *H. nitidula*, *A. Richd.*; *DC. Prodr.* iv. 66; *Hook. Ex. Fl.* t. 29. *H. tenella*, *Don Prodr.* 183; *DC. l. c.* 64; *W. & A. Prodr.* 366. *H. ranunculoides*, *Blume Bijdr.* 884 (*vide Molkenboer*). *H. puncticulata*, *Miq. Fl. Ind. Bat.* i. pt. i. 733. *H. Zollingeri*, *Molkenb.*; *Miq. l. c.* 733. *H. perexigua*, *Hance in Walp. Ann.* ii. 691.

NORTH-WEST HIMALAYA; alt. 4000–7000 ft. BENGAL PLAIN, ascending to 4000 ft. in SEKKIM and KHASIA, frequent. Mts. of MALABAR and CEYLON, *Wight*.—DISTRIB. Throughout Malaya. Guinea.

Leaves $\frac{1}{2}-1$ in. diam., glabrous and shining or pubescent or subvillous on both surfaces. Peduncles glabrous, $0-\frac{3}{4}$ in., sometimes on the same specimen; bracts obscure; umbels 10–15-flowered. Fruit $\frac{1}{12}$ in., broadly orbicular, smooth, sometimes punctate; lateral primary ridges commissural (more prominent than in the three preceding species), intermediate forming elevated angles; pericarp hard, thin.—Easily separated from the three preceding species by the much smaller leaves. The multiplication of names is chiefly due to the variability in the length of the peduncle, the specimens

being in other respects very uniform. Some of the hill examples have shining glabrous subserrate leaves, the peduncles $\frac{3}{4}$ in.; other plains' examples closely procumbent on mud are villous with sessile umbels. *H. hirta*, R. Br. differs (if at all) by its laxly hairy peduncles: see *Benth. Fl. Austral.* iii. 340, as to *Var. pusilla* only. *H. sibthorpioides*, Lamk.; *DC. Prodr. l. c.* 66, which extends throughout South-Eastern Asia and Japan, only differs (from the form *nitidula*) by the rather larger leaves and longer peduncles.

SECTION II. **Gentella.** *Petals* obtuse, imbricate. Secondary ridges as distinct as the primary. *Pericarp* much thickened.

5. **H. asiatica**, Linn.; Roxb. *Hort. Beng.* 31, *Fl. Ind.* ii. 88; leaves orbicular-reniform entire crenate or lobulate, peduncle short, bracts small ovate embracing the flowers, pedicels 0, umbel 3-6-flowered. *Wall. Cat.* 560; *DC. Prodr.* iv. 62; *W. & A. Prodr.* 366; *Wight Ic.* t. 565; *Dalz. & Gibs. Bomb. Fl.* 105; *Kurz in Journ. As. Soc.* 1877, pt. ii. 113. *H. Wightiana*, *Wall. Cat.* 7220. *H. lurida*, *Hance in Walp. Ann.* ii. 690.—*Rheede Hort. Mal.* x. t. 46.

Throughout INDIA, alt. 0-2000 ft.; from the HIMALAYA to CEYLON and MALACCA; frequent.—DISTRIB. Tropical and subtropical regions.

Leaves $\frac{1}{2}$ -2 $\frac{1}{2}$ in. diam., usually glabrous or nearly so; petiole pubescent or glabrous. *Peduncles* about $\frac{1}{4}$ in., often 2-3-nate, laxly pubescent or glabrous; bracts $\frac{1}{8}$ - $\frac{1}{4}$ in., not scattered among the pedicels (as in *Eu-Hydrocotyle* and in *Araliaceæ*). *Fruit* $\frac{1}{8}$ - $\frac{1}{4}$ in. *Carpels* oblong, subcylindric, curved, slightly compressed, much longer than broad, reticulate-rugose, often crowned by the subsistent petals, each with 9 curvilinear subsimilar ridges, and 2 within the commissure; pericarp thickened, woody, white. *Seed* compressed laterally.—In this species it seems to be the endocarp that is so greatly thickened, and that is adnate to the exocarp, thus invalidating one of the most uniform distinctions between *Umbelliferae* and *Araliaceæ* (see *Gen. Pl.* i. 861).

2. **ERYNGIUM**, Linn.

Spinescent, glabrous, erect, perennial *herbs* (the Indian species). *Leaves* spinous-toothed, entire lobed or dissected. *Flowers* in simple heads, each bracteolate; bracts stellate, spinulose (in Indian species). *Calyx-tube* covered with ascending hyaline scales; teeth rigid, acute. *Petals* white, narrow, erect, emarginate, scarcely imbricate. *Fruit* ellipsoid, nearly cylindric: carpels dorsally subcompressed, subconcave on the inner face; primary ridges obtuse not prominent, secondary 0; vittæ in the primary ridges inconspicuous or 0, with some very slender scattered in the endocarp; carpophore 0. *Seed* semi-terete, dorsally subcompressed, subconcave on the inner face.—DISTRIB. Species 100, temperate and tropical; plentiful in Western Asia.

1. **E. cæruleum**, Bieb. *Fl. Taur. Cauc.* i. 200, *excl. syn.*; radical leaves long-petioled cordate-oblong undivided crenate not spinulose, upper cauline sessile palmately divided into lanceolate spinulose segments. *Boiss. Fl. Orient.* ii. 823.—*E. planum*, Lindl. in *Royle Ill.* 232, *not of Linn.*

KASHMIR, alt. 5000-6000 ft.; Falconer, T. Thomson, Levinge.—DISTRIB. Cabul, Persia, Turkestan.

Stems 2-3 ft., erect, undivided below, corymbose and often bluish above. Radical leaves 5 by 1 $\frac{3}{4}$ in., petiole 2-6 in.; lower cauline often similar smaller with shorter petioles, but more often subsessile, elliptic, acute, undivided, serrate or subspinulose. *Bracts* 5-6, 1 in., linear, with a few spines on the margins, sometimes short exterior spines alternating with them; *bracteoles* linear, spinulose, simple, exceeding the flowers; a few (in the outermost row but one) sometimes spinous, subtrifid. *Calyx-tube* densely scaly; teeth lanceolate-subulate, spinescent. *Fruit* $\frac{1}{8}$ in.—This

has been referred to *E. dichotomum*, Desf. which has the radical leaves oblong entire not spinulose and altogether differs. It is certainly Boissier's plant referred by him to Biebersteins.

2. **E. Billardieri**, Delaroche *Eryng.* 25, t. 2; radical leaves long-petioled 3-partite segments 3-fid or pinnatifid spinous-toothed, cauline sessile palmately 3-5-partite. *DC. Prodr.* iv. 88; *Boiss. Fl. Orient.* ii. 825. *E. Kotschy*, Boiss. *Diagn. ser.* 2, v. 97. *E. cærulescens*, Jacquem. *Journ.*

KASHMIR, alt. 5000-6000 ft.; Jacquemont, Falconer, &c. LADAK; T. Thomson, SCINDE; *Stocks*.—DISTRIB. Western Asia.

Stem 6-18 in., erect or branching from the base, corymbose often bluish above. *Radical leaves* 2-4 in. diam., often hastate; petiole 2-4 in.; lower cauline sometimes similar but short-petioled. *Bracts* 5-7, 1 in., linear, with few or 0 spines on the margins; short spines alternate with and somewhat exterior to the bracts; *bracteoles* linear, spinulose, simple, exceeding the flowers. *Calyx-tube* with lanceolate scales, teeth lanceolate-subulate spinescent. *Fruit* $\frac{1}{2}$ in.—The Indian examples are all smaller with smaller heads than the type-specimens of *E. Billardieri* and are perhaps *Var. meiocephalum*, Boiss. l. c. The bracts are frequently without spines, but the radical leaves are not narrowly dissected enough for *E. Heldreichii*, Boiss. l. c. 826. The radical leaves early disappear, it is then much like *E. cæruleum* but can generally be distinguished by its much less strict stem and dissected lower cauline leaves.

3. **SANICULA**, Linn.

Erect *herbs*. *Leaves* palmately 3-5-partite, segments toothed lobed or dissected. *Umbels* irregularly compound, rays few; bracts sessile, leaf-like; umbellules usually small with small bracteoles. *Flowers* mostly unisexual. *Calyx-tube* villous, subechinate; teeth herbaceous. *Petals* white, emarginate, slightly imbricate. *Fruit* echinate, ovoid or slightly compressed laterally, commissure broad, carpophore 0; carpels $\frac{1}{2}$ -terete or subterete, plane on the inner face, ridges all obscure, lateral primary commissural; vittæ small, solitary in each primary ridge, with some very slender scattered in the endocarp. *Seed* nearly terete.—DISTRIB. Species 10, 1 only in the Old World.

1. **S. europæa**, Linn.; *DC. Prodr.* iv. 84; leaves glabrous mucronate-serrate, bracteoles linear shorter than the fruits, perfect flowers sessile male usually pedicelled. *Boiss. Fl. Orient.* ii. 832; *Kurz in Journ. As. Soc.* 1877, pt. ii. 114. *S. elata*, Ham.; *Don Prodr.* 183; *Wall. Cat.* 559; *DC. l. c.* 85; *W. & A. Prodr.* 367; *Wight. Ill.* t. 117, fig. 2; *Wight Ic.* tt. 334, 1904. *S. javanica*, *Blume Bijl.* 882; *DC. l. c.* 85. *S. montana*, Reinw.; *DC. l. c.* 85. *S. hermaphrodita*, Ham.; *Don Prodr.* 183.

HIMALAYA; from KASHMIR to BHOTAN; alt. 4000-12,000 ft.; common. KHASIA Mts., alt. 3000-5500 ft.; common. BURMA. Mts. of MALABAR and CEYLON.—DISTRIB. Europe, Asia, Africa.

Height 1-3 ft. *Radical leaves* 2-6 in. diam., persistent; petiole 1-6 in. *Umbel* 2-3 to 18 in. diam.; rays divaricate, repeatedly 2-3-lobed. *Umbellules* few-flowered; male pedicels often $\frac{1}{2}$ in. *Calyx-teeth* lanceolate. *Fruit* $\frac{1}{10}$ in., densely covered with hooked bristles, slightly compressed laterally.

4. **VICATIA**, DC.

Perennial *herbs*, glabrous. *Leaves* pinnately compound, ultimate segments narrow. *Umbels* compound; bracts 1 linear, small, or 0; bracteoles several, linear. *Calyx-margin* obsolete. *Petals* obovate, emarginate, white pink or

purple-red. *Fruit* ovoid, narrowed at the apex, scarcely laterally compressed, distinctly constricted at the commissure. *Carpels* grooved on the inner face, subpentagonal or subterete, dorsally subcompressed; lateral primary ridges commissural, intermediate slender but distinct; vittæ 2-3 in each furrow, not large; carpophore entire or bifid. *Seed* subterete, grooved on the inner face.—**DISTRIB.** Species 2-3, Himalayan.

Separable from *Pimpinella* only by the deeper groove on the inner face of the mericarps as DC. states.

1. **V. conifolia**, DC. *Prodr.* iv. 243; ultimate segments of the leaves linear, carpels ovate broadly grooved on the inner face. Sison? *coniifolium*, Wall. *Cat.* 591. *Chærophyllum gracillimum*, Klotzsch in *Reis. Pr. Waldem. Bot.* 149, t. 46. *Ligusticum*? *meoides*, Jacquem. *Journ.*

HIMALAYA, alt. 6000-12,000 ft., from BALTISTAN and KASHMIR to NIPAL, common.

Stem 1-2 ft., ascending, divided, striate, sparingly leafy. *Leaves* usually 3-pinnate, ultimate segments linear or narrowly oblong-linear, acute. *Peduncle* 2-6 in. *Bract* rarely exceeding $\frac{1}{2}$ in., very rarely more than 1 or slightly divided; primary rays of the umbel 6-12, $\frac{3}{8}$ -2 in., rigid, angularly striate; bracteoles 3-6, often as long as the umbellule. *Fruit* $\frac{1}{8}$ - $\frac{1}{6}$ in., disc prominent, styles short.

2. **V. millefolia**, C. B. Clarke; ultimate segments of the leaves setaceous, carpels oblong narrowly grooved on the inner face. *Chærophyllum millefolium*, Klotzsch in *Reis. Pr. Waldem. Bot.* 149, t. 45.

KASHMIR; Tragbol, alt. 11,400 ft., C. B. Clarke. ? NIPAL; Hoffmeister. SIKKIM; Jongri, alt. 12,000-13,000 ft., C. B. Clarke.

Stem 4-6 in., rarely 12 in. *Cauline leaves* 2-4 in., 2-3-4-pinnate, ultimate segments scarcely $\frac{1}{2}$ in. *Fruit* $\frac{1}{16}$ - $\frac{1}{12}$ in., oblong or narrow-oblong; disc prominent; styles short.—United with *V. conifolia* by Bentham (*in Gen. Pl.* i. 883), but the fruit is very much smaller, less grooved on the inner face, and the leaves are much more finely cut.

3. **V. ? Stewartii**, C. B. Clarke; secondary pinnæ of the cauline leaves deeply cut into small narrow-lanceolate teeth, carpels plane on the inner face, seed with a T-shaped groove on the inner face.

GURWHAL, alt. 6500 ft., Stewart.

Bracts small or 0. *Bracteoles* linear, unequal, some overtopping the flowering umbellules. *Fruit* (not quite ripe) $\frac{1}{8}$ in., rather larger than that of *V. conifolia*, ridges obscure; vittæ in each furrow 3-4, small.

5. TRACHYDIUM, Lindl.

Perennial herbs, glabrous or minutely hirsute. *Leaves* 1-2- or 3-pinnate. *Umbels* compound, sometimes sessile, when the inflorescence appears to consist of simple umbels on clustered long peduncles; bracts several, foliaceous, lobed or pinnate; bracteoles 5-10, similar, often united at the base, sometimes white membranous on the margins, often equalling the rays. *Calyx-margin* obsolete or prominent, entire or nearly so. *Petals* white or pink, elliptic, subacute, or emarginate by the greater or less inflexion of the apex. *Fruit* ovoid or subquadrate, laterally subcompressed, slightly constricted at the commissure, smooth or tubercled; carpels terete; primary ridges distinct, sometimes thickened, spongy, rugose or tubercled, lateral at the commissure; secondary

ridges 0, or like the primary; vittæ 1-2 between each primary ridge; carpophore entire 2-fid or 2-partite. *Seed* subpentagonal, lunate, dorsally subcompressed, concave on the inner face.—**DISTRIB.** Species 10, Himalayan or Central Asiatic, and 1 Abyssinian.

SUBGEN. Enneazygon. *Fruit* truncate; calyx-margin spongy, patent; ridges of the carpels 9, equal, hollow, obtuse.

1. **T. novem-jugum**, C. B. Clarke; radical leaves pinnate, pinnæ orbicular crenate.—*Trachydium* sp. 5, *Herb. Ind. Or. H. f. & T.*

Sikkim, alt. 12,000-15,000 ft.; Lama Kangra, Tungu, and Yeumtong; *J. D. H.*
Stem 0-2 in., grooved, thick, hollow. *Radical leaves* 3 in.; pinnæ 7, $\frac{1}{2}$ in. diam., reticulate-nerved. *Bracts* like reduced leaves with narrower pinnæ; bracteoles linear-obovate, toothed lobed or subpinnatifid. *Umbels* often subsessile; rays 2-3 in., thick, often hollow; rays of the umbellule often 15-20. *Petals* lurid green. *Styles* very small. *Fruit* $\frac{1}{12}$ - $\frac{1}{10}$ in., ovoid, subquadrate, somewhat cordate at the base, slightly narrowed close under the calyx-margin which is wider than the summit of the fruit; style bases depressed, inconspicuous. *Carpels* semi-terete; primary and secondary ridges cellular, hollow, almost covering the carpel, smooth; vittæ about 8 (excluding those on the commissure); carpophore 2-partite. *Seed* $\frac{1}{2}$ -terete, dorsally subcompressed, slightly grooved on the inner face.

SUBGEN. Pentazygon. *Fruit* narrowed upwards or truncate; calyx-margin not prominent; ridges of the carpel 5, simple inflated rugose or tubercled, secondary wanting.

2. **T. Roylei**, Lindl. in *Royle Ill.* 232; radical leaves 2- sub-3-pinnate ultimate segments lanceolate-linear, ridges tubercled. *Dene. in Jacq. Voy. Bot.* 67, t. 79.

WEST TIBET; *Falconer*. **NORTH-WEST HIMALAYA**; *Lance*; Lanjar, alt. 17,500 ft., *Strachey & Winterbottom*. **KASHMIR**; alt. 11,000-14,000 ft.; in many places, C. B. Clarke.

Stem 0-2 in., thick, grooved, often hollow. *Radical leaves* 3 in. (including petiole), oblong-lanceolate. *Umbel* solitary, sessile, with some of the rays (peduncles of single umbels?) again umbelled; bracts leaf-like; bracteoles 6-10, 1-2-pinnate, with lanceolate acute ultimate segments, often white-membranous on the margin. *Fruit* $\frac{1}{8}$ - $\frac{1}{5}$ in., ellipsoid, narrowed upwards; primary ridges inflated, spongy, of cellular tissue, nearly covering the carpel, glistening when very young, then rugulose, lax, finally tubercled; vittæ usually 2 between the primary ridges. *Seed* $\frac{1}{2}$ -terete, dorsally subcompressed, subpentagonal.

3. **T. dissectum**, C. B. Clarke; radical leaves 2-pinnate, secondary pinnæ pinnatifid glabrous ultimate segments small linear acute, fruit small ovoid truncate, ridges narrow not rugose.—*Cortia*, sp. 3, *Herb. Ind. Or. H. f. & T.*

Sikkim; Tungu, alt. 13,000-14,000 ft. *J. D. H.*

Stem 0-7 in., not thickened. *Peduncles* 1-4 in.; bracts linear-oblong, pinnatifid, segments lanceolate-linear acute; bracteoles pinnate with narrow acute segments; primary rays $\frac{1}{2}$ -1 $\frac{1}{2}$ in. *Style*-bases prominent in the young fruit. *Fruit* $\frac{1}{12}$ in., slightly narrowed upwards; pericarp thin, slightly inflated; ridges hollow, much narrower than in the preceding species, furrows nearly covering the fruit, vittæ 1-2 in each furrow. *Carpophore* slender, 2-partite. *Seed* lunate, dorsally compressed.

4. **T. hirsutulum**, C. B. Clarke; radical leaves 2-pinnate, secondary pinnæ pinnatifid hirsute ultimate segments small linear acute, fruit small ovoid truncate ridges narrow not rugose.

SIKKIM; Tungu, alt. 13,000–14,000 ft., *J. D. H.*

Stem 0, crown greatly thickened. *Leaves* with ascending fine hairs on the midrib. *Umbel* solitary, sessile, with some of the rays again umbelled. *Bracteoles* 3–6, $\frac{1}{2}$ –1 in., 3-fid or pinnatifid. *Carpophore* stout, 2-fid. *Fruit* nearly as of *T. dissectum*, but the ridges less acute, the style-bases less prominent.

5. ***T. obtusiusculum***, *C. B. Clarke*; cauline leaves pinnate pinnæ pinnatifid ultimate segments lanceolate subacute, fruit ovoid-oblong narrowed upwards, ridges narrow undulated not rugose. *Ligusticum obtusiusculum*, *Wall. Cat.* 543. *Hymenolæna obtusiuscula*, *DC. Prodr.* iv. 246.—*Trachypodium* sp. 3, *Herb. Ind. Or. H. f. & T.*

NIPAL, Gossain Than; *Wallich*. SIKKIM, alt. 11,000–13,000 ft.; Tungu, Lachen, Jongri; *J. D. H.*; *C. B. Clarke*.

Stem (including the terminal peduncle) often 1 foot, grooved, hollow. *Radical leaves* (including the petiole) 3–4 by 1 in., in Sikkim examples twice as large as Nipal ones; pinnæ 7–11, segments oblong toothed or lobulate. *Bracts* of a dilated narrow oblong entire petiole and sub-bipinnate limb with narrow remote segments in Sikkim examples, ovate pinnatifid with approximate broad lanceolate segments in Nipal ones. *Fruit* $\frac{1}{8}$ in.; style-bases conical, prominent; primary ridges lax; pericarp thin, somewhat inflated; vittæ usually 2 between the primary ridges; carpophore 2-fid. *Seed* semiterete, dorsally subcompressed, hardly concave on the inner face.

VAR. stricta; ultimate segments and bracts more acuminate, primary rays shorter, fruit more truncate less narrowed upwards. *Trachydium*, sp. 6. *Herb. Ind. Or. H. f. & T.*—Sikkim, Chola Pass, alt. 10,000–12,000 ft., *J. D. H.* This may be a distinct species. *Stems* very erect, rays of the umbel 1–1½ in., not much divaricate; but the only distinction of importance is in the fruit which, though not well ripened, is unlike that of *T. obtusiusculum* at the same stage.

6. **ELÆOSTICTA**, Fenzl.

Annual *herbs*, glabrous, erect, corymbose upwards or simple. *Leaves* 1–3-pinnate, ultimate segments linear. *Umbels* compound; bracts and bracteoles several, scarious. *Calyx-teeth* 0. *Petals* obovate, emarginate. *Disc* depressed, inconspicuous. *Styles* short. *Fruit* elliptic, truncate, laterally compressed, didymous; primary ridges very slender or 0, vittæ in each furrow 3–1, minute; carpophore 2-partite or entire. *Seed* lunate, margins incurved, hence broadly grooved on the inner face.—*DISTRIB.* Species 4, in Western and Central Asia.

This genus is placed by Benthams (*Gen. Pl.* i. 896) under *Conopodium*, but differs in the short truncate fruit, the deeply grooved seed, and scarious bracts.

1. ***E. meifolia***, Fenzl in *Flora* 1843, 458; bracts 5–6 lanceolate, bracteoles similar but smaller, fruit broader than long. *Scaligeria meifolia*, *Boiss. Fl. Orient.* ii. 887. *S. elata*, *Boiss. & Haussk.*; *Boiss. l. c.* *Butinia libanotica*, *Boiss. in Ann. Sc. Nat.* ser. 3, ii. 62.

PUNJAB PLAIN; *Aitcheson*—*DISTRIB.* Persia, Syria.

Root fusiform. *Stem* 1–3 ft., erect, paniced upwards or (in the small Indian example) simple. Rays of the umbel 5–11, $\frac{3}{4}$ –1½ in. *Pedicels* 6–12, $\frac{1}{8}$ in. *Fruit* $\frac{20}{100}$ by $\frac{1}{16}$ in., depressed didymous; ridges obsolete; vittæ minute, 2–1 in each furrow.—The Indian solitary example may be a new species, but is more probably only a small specimen; the fruit is even smaller than in *E. meifolia* type, the carpophore subentire.

7. **BUPLEURUM**, Linn.

Glabrous *herbs*, or shrubs. *Leaves* entire. *Umbels* compound; bracts and bracteoles foliaceous, or setaceous, or 0. *Flowers* yellow or lurid, pedicelled or subsessile. *Calyx-teeth* 0. *Petals* obovate, emarginate. *Styles* short. *Fruit* laterally compressed, slightly constricted at the commissure; carpels terete or subpentagonal; primary ridges distinct, sometimes subalate, rarely obscure; secondary 0, or obscure; vittæ 1-3 between the primary ridges, rarely 0 or many; carpophore entire 2-fid or 2-partite. *Disc* depressed, rarely prominent in fruit. *Seed* terete, sometimes slightly grooved on the inner face.—**DISTRIB.** Species 60, European and temperate Asiatic: 1 South African, 1 Arctic American.

A genus at once recognised by its absolutely entire leaves.

1. **B. plantaginifolium**, *Wight Ic. t. 281*; upper cauline leaves broadly oblong obtuse mucronate, bracts 3-5 elliptic foliaceous, fruit $\frac{1}{3}$ in. oblong subquadrate subalate, furrows 1-vittate.

Mts. of the DECCAN PENINSULA; Nilghiris, alt. 6000-8000 ft., *Wight, &c.*

Stout, bushy, 2-7 ft. Lower leaves linear-oblong; upper cauline 2-4 by $\frac{3}{4}$ -1 $\frac{1}{4}$ in., subsessile, shortly narrowed at the base; nerves 10-30, subpalmate; secondary numerous, distinct, reticulate. Bracts $\frac{1}{3}$ -1 in., subequal; bracteoles 4-5, $\frac{1}{4}$ - $\frac{1}{2}$ in., oblong-elliptic, mucronate; rays 6-12, grooved; pedicels 4-12, shorter than the fruit. Carpels strongly pentagonal; ridges thick, obtuse, suborbicular, corky; furrows glaucescent, vittæ very large; carpophore 2-fid, often 2-partite. Seed subterete, deeply but obtusely 5-ridged.

2. **B. lanceolatum**, *Wall. Cat. 551*; middle cauline leaves petioled ovate or broadly lanceolate, bract 1 small lanceolate or 0, fruit ovoid-oblong, ridges obscure, furrows 3-vittate. *DC. Prodr. iv. 132.*

NORTH-WEST HIMALAYA; from KASHMIR to NIPAL, alt. 4000-9000 ft., common.

Perennial, 1-5 ft., erect, nearly simple, or sometimes subpanicled with spreading horizontal branches 1 foot long. Lower leaves long-petioled, lanceolate; middle cauline 3-5 by $\frac{1}{4}$ -3 in., ovate, acuminate, occasionally rounded at the base, nerves 5-7, subpalmate; secondary nerves numerous, distinct, reticulate. Bracts $\frac{1}{4}$ in., acute; bracteoles less than $\frac{1}{8}$ in., linear, usually obsolete in the fruit; rays 5-8, unequal; pedicels 6-12, $\frac{1}{2}$ in., subequal. Fruit $\frac{1}{6}$ - $\frac{1}{5}$ in. Carpels much incurved when ripe, yellowish-brown, subviscid; ridges distinct in imperfectly ripe fruit, small obsolete in the fully ripe; carpophore entire. Seed terete.

3. **B. Candollii**, *Wall. Cat. 552*; upper cauline leaves subsessile oblong or ovate hardly cordate lower linear-oblong, bracteoles 4-5 elliptic or oblong usually as long as the flowering umbellule, fruit ellipsoid-oblong, ridges prominent, furrows 3-vittate. *DC. Prodr. iv. 131.*

HIMALAYA, from KASHMIR to SIKKIM, alt. 8000-12,000 ft.; frequent.

Perennial, 1-3 ft., erect: more or less corymbose upwards. Lower cauline leaves 2-5 by $\frac{1}{5}$ - $\frac{1}{2}$ in.; upper 1-4 by $\frac{1}{4}$ - $\frac{3}{4}$ in., acute, rarely acuminate, narrowed shortly at the base, subsessile or sessile and amplexicaul; primary nerves 8-12, often subpinnate, oblique; transverse nerves numerous, distinct, reticulating. Bracts 2-3 or 0, $\frac{1}{4}$ -1 $\frac{1}{4}$ in., ovate or oblong, acute, foliaceous, angular; bracteoles $\frac{1}{6}$ - $\frac{1}{3}$ in., foliaceous, frequently longer than the fruiting umbellule; rays 5-8, rather short; pedicels about half as long as the carpels. Carpels $\frac{1}{8}$ in., yellowish-brown, semi-terete or dorsally subcompressed; ridges distinct, but not thick nor winged; carpophore entire.

Seed nearly terete.—The Kashmir and Chumba examples are much more slender than the Sikkim.

4. **B. jucundum**, *Kurz in Seem. Journ. Bot.* 1867, 240; lower cauline leaves short-petioled obovate upper ovate amplexicaul deeply cordate, bracteoles 4-5 oblong acute usually shorter than the umbellule, fruit elliptic-oblong, ridges prominent, furrows 3-vittate. *B. sachinalense*, *F. Schmidt Reis. Amurlande*, 135. *B. heterophyllum*, *Jacquem. mss.* (not of Link).

KASHMIR; Budrawur, alt. 7000 ft., *C. B. Clarke*. LAHUL; *Jaeschke*.—DISTRIB. Amurland.

Stems 1-2 ft., erect from a decumbent base, corymbose with long branches. Lower cauline leaves 1-1½ in., orbicular, petiole scarcely ½ in.; upper 1-2 in., orbicular or ovate-oblong, mucronate, not peltate; primary nerves 10-20, palmate; transverse nerves numerous, distinct, oblique, reticulating. *Bract* 1, ¼-¾ in., ovate, foliaceous, often amplexicaul or cordate, occasionally 0; bracteoles 4-5, usually ½ in., often 0; rays 5-8, somewhat stout, angular; pedicels about half as long as the carpels. *Carpels* nearly as in *B. Candollii*, but rather longer, ½ in.—*B. aureum*, *Fisch.*, differs in the much larger bracteoles, and the often perfoliate upper leaves.

VAR. *cachemirica*; lower cauline leaves linear-oblong or linear, upper ovate-lanceolate, ridges subulate.—Kashmir, alt. 7500-10,000 ft., *C. B. Clarke*; common. Lower cauline leaves 5 by ½ in. Bracts often 0; bracteoles of 1-4 oblong or linear frequently 0.—The extreme forms of this with tall simple stem corymbose near the summit, narrow leaves, and umbels nearly without bracts or bracteoles appear very distinct from *B. jucundum*, but there are numerous intermediate forms.

5. **B. Thomsoni**, *C. B. Clarke*; cauline leaves linear upper lanceolate or ovate cordate-amplexicaul, bracteoles 5-9 lanceolate acuminate or linear, carpels glaucous 5-winged, furrows 4-3-vittate.

KASHMIR; Sonamurg, alt. 9250 ft., *C. B. Clarke*. NORTH-WEST HIMALAYA, alt. 7000-9000 ft., *T. Thomson*.

Erect, 2-3 ft., corymbose. Upper cauline leaves 2-4 in., lanceolate, acuminate, uppermost sometimes ovate, transverse reticulating nerves obscure. *Bracts* usually 0, sometimes 1-2 lanceolate: rays of the umbel 6-10, 1-2½ in.; bracteoles usually as long as the flowering umbellules, caudate; rays of the umbellule often 20, about half as long as the mericarp. *Fruit* ⅝ in., oblong, subquadrate; carpels terete, wings more than half as broad as the nucleus; carpophore very thin, 2-partite.—This has been supposed to be allied to *B. diversifolium*; but the foliage seems nearer that of *B. jucundum*, var. *cachemirica*; it should be compared with *B. polyphyllum*, *Ledeb.*; *Boiss. Fl. Orient.* ii. 851, of which no authentic example is at Kew.

6. **B. diversifolium**, *Rochel Pl. Ban.* 68, t. 28, fig. 57; upper cauline leaves lanceolate caudate base ovate amplexicaul scarcely cordate, bracteoles 5-8 narrow-lanceolate acuminate shorter than the fruiting umbellules, ridges distinct, furrows 3-vittate. *Reich. Ic. Pl. Germ.* t. 1885.

NORTH-WEST HIMALAYA, alt. 7000-9000 ft., *Thomson*. KASHMIR and BALTIKISTAN, alt. 9000-12,000 ft., *C. B. Clarke*.—DISTRIB. West Asia, South-East Europe.

Lower cauline leaves linear, hardly broader upwards; middle cauline completely amplexicaul. *Bracts* 0, or 1, small, lanceolate: rays of the umbel 8-14; pedicels ⅓-½ in. *Fruit* ⅙ in. glaucous, in outline oblong; disc brown, subprominent.—United with *B. falcatum*, *Linn.* both by *Reichenbach l.c.* and in *Boiss. Fl. Orient.* ii. 850: it differs in the completely amplexicaul, usually inflated, base of the cauline leaves, the lower leaves linear not at all obovate, the fruits glaucous much more strongly ribbed. Whether regarded as a species or variety, India produces the plant of *Rochel* in its most characteristic form.

7. **B. falcatum**, Linn.; DC. Prodr. iv. 132; radical leaves linear broader upwards middle cauline linear acute narrowed at the base more or less amplexicaul, bracts 1-5 lanceolate small or 0, bracteoles 4-5 distinctly shorter than the fruiting umbellule, carpels narrowly oblong, ridges not prominent, furrows 3-vittate. Jacq. Fl. Austr. t. 158; Boiss. Fl. Orient. i. 850. B. imaicolum, A. Kerner Nov. Sp. Pl. dec. ii. 19.

HIMALAYA; alt. 3000-12,000 ft., from KASHMIR to BHOTAN, frequent. KHASIA Mts.; alt. 3000-6000 ft., frequent.—DISTRIB. Central and W. Asia, S. Europe.

Stem 1-4 ft., erect, corymbose upwards. Radical leaves spatulate-oblong in the typical European specimens, in the Indian (which belong to the form *B. gramineum* Vill.) they are but slightly broader upwards. Cauline leaves $\frac{1}{2}$ -amplexicaul or sessile, long acuminate, secondary nerves not prominent. Bracts usually 0 in the Indian forms, sometimes a few scarcely $\frac{1}{4}$ in.; bracteoles usually not longer than the flowering umbellule, narrowly lanceolate; rays 5-8, $1\frac{1}{2}$ in.; pedicels .5-1.5, usually less than half the length of the fruit. Fruit $\frac{1}{8}$ - $\frac{1}{4}$ in., brown; carpels terete, ridges distinct; disc yellow or brownish, not prominent.

VAR. 1. *marginata*, Wall. Cat. 566 (sp.); margins of the leaves prominently cartilaginous. DC. Prodr. iv. 132.—Himalaya and Khasia Mts.; the most frequent form.—Middle cauline leaves often completely amplexicaul, but narrowed not widened close to the base.

VAR. 2. *Hoffmeisteri*, Klotzsch in Reis. Pr. Waldem. Bot. 146, t. 52 (sp.); cauline leaves numerous less acuminate scarcely at all amplexicaul, carpels $\frac{1}{2}$ in. glaucous, ridges very prominent.—Kashmir, alt. 8000 ft., C. B. Clarke; Falconer.—Leaves somewhat suddenly acute, mucronate, glaucous, primary nerves strong, secondary subprominent.

VAR. 3. *nigrocarpa*, Jacquem. ms. (sp.); stems numerous from the crown, often procumbent, cauline leaves ovate-lanceolate or linear widest very near the amplexicaul base, bracts 3-4, $\frac{1}{2}$ in. lanceolate-linear, disc prominent on the half ripe fruit purple-black. B. virgatum, Wall. Cat. 555 not of W. & A. B. gracillimum, Klotzsch in Reis. Pr. Waldem. Bot. 148, t. 50 (sp.)—Baltistan, Kashmir, and N.W. Himalaya; alt. 10,000-14,000 ft. frequent. Sikkim; Yakla alt. 10,000 ft., C. B. Clarke.—This has all the appearance of an alpine variety of *B. falcatum*. The leaves vary a good deal in width; the lower always linear, the uppermost sometimes ovate. In habit it agrees with an authentic example of *B. baldense*, var. *æneum*, Boiss. Fl. Orient. ii. 849, but the leaves seem never oblong.

8. **B. mucronatum**, W. & A. Prodr. 370; cauline leaves linear or linear-oblong mucronate often subobtuse narrowed at the base, bracts 4-5 lanceolate prominent, carpels elliptic, ridges prominent, furrows 2-1- (rarely 3-) vittate. B. ramosissimum, W. & A. Prodr. 370; Wight. Ic. t. 1007. B. falcatum, Var. ramosissimum, Dalz. & Gibs. Bomb. Fl. 108. B. virgatum, W. & A. Prodr. 370, not of Wall. B. nervosum, Moon Cat. 22.

Mts. of the SOUTH DECCAN and CEYLON; alt. 5000-8000 ft.; plentiful.

Differs essentially from *B. falcatum*, Linn. in the fruit being elliptic instead of oblong, shorter, and narrowed at the apex. Also there are invariably present 4 or 5 bracts, often $\frac{1}{2}$ - $\frac{3}{4}$ in., the bracteoles are more prominent usually exceeding the flowering umbellules, and the upper cauline leaves are less acuminate. W. & A. have distinguished three forms as under:

VAR. 1 *typica*; stem little branched, upper leaves linear-oblong obtuse mucronate, bracteoles sometimes exceeding the fruiting umbellules, carpels strongly ridged, furrows usually with solitary large vittæ.—South Deccan.

VAR. 2. *ramosissima*, W. & A. l. c. (sp.); stem corymbose upwards, leaves less obtuse, bracteoles about as long as the flowering umbellules, carpels distinctly ridged, furrows usually 2-vittate.—South Deccan.

VAR. 3. *virgata*, W. & A. l. c. (sp.); habit nearly of *B. falcata* but the fruit very markedly ellipsoid, often only $\frac{1}{8}$ in. long and nearly as broad, ridges not very promi-

ment, furrows usually 3-vittate.—Ceylon.—*Stem* usually simple, erect, laxly corymbose above, cauline leaves subacute.—It is the existence of this var. that has led to the referring the South Indian species to *B. falcatum*. This Ceylon plant differs from the Himalayan *B. falcatum* not only in the shortened fruit but in the invariable presence of 4-5 bracts.

9. **B. distichophyllum**, *W. & A. Prodr.* 370; lower cauline leaves distichous bases closely imbricate sheathing, upper linear broadest at the base, fruit elliptic, ridges distinct, furrows generally 1-vittate. *Wight Ic. t.* 1006.

NILGHIRI MTS., alt. 7000 ft.; *Wight, &c.*

Stem 4-14 in., slender, erect; otherwise closely resembling *B. mucronatum* from which it differs chiefly in the very small fruits ($\frac{1}{12}$ in.). The lower distichous leaves are in the typical examples very closely packed, 12-16 in the space of 1 in.; but when these are absent it is difficult to distinguish from small examples of *B. mucronatum*.

10. **B. longicaule**, *Wall. Cat.* 557; lower cauline leaves linear or lanceolate acute upper often wider at the base, bracteoles 5-8 elliptic-acuminate foliaceous longer than the flowering umbellule, fruit oblong, ridges subalate, furrows 3-vittate. *DC. Prodr.* iv. 131. *B. rupestre*, *Edgw. in Trans. Linn. Soc.* xx. 52.

HIMALAYA, alt. 8-13,000 ft.; from KASHMIR to SIKKIM; common.

Stem 8-24 in., erect, corymbose upwards; sometimes branching from the root. *Leaves* very variable; in the Wallichian type narrow-linear acute, the uppermost (and the bracts) little wider, hardly broader at the base, transverse nerves not prominent; in other examples upper leaves (as the bracts) ovate, acute, with very prominent secondary nerves. *Bracts* 1-3; bracteoles 5-8, very prominent, with reticulating nerves, often longer than the fruiting umbellule; rays 3-8, 1-2½ in., somewhat stout, striate. *Petals and disc* usually black. *Fruit* $\frac{1}{8}$ - $\frac{1}{6}$ in.

VAR. 1. *himalensis*, Klotzsch in *Reis. Pr. Waldem. Bot.* 146, t. 51 (sp.); upper leaves ovate-lanceolate base amplexicaul ovate almost cordate, bracteoles 8-10 very broad imbricate.—Kashmir, alt. 12,000 ft., frequent.—Connected by imperceptible gradations with the Eastern plant.

VAR. 2. *Dalhousieana*; upper leaves and bracts ovate-lanceolate narrowed at the base, petals yellow, disc brown, fruit strongly ridged hardly winged usually thrice as long as the pedicel.—Dalhousie and Dhurmsala, alt. 8000-12,000 ft.; plentiful, *C. B. Clarke*.—Stems 4-8 in., sometimes erect 24 in., much divided or simple, corymbose at the top. Upper leaves and bracts with the transverse nerves obscure. Bracteoles smaller than in typical *B. longicaule*, less acuminate, and much less foliaceous, the transverse nerves far less prominent.—The true affinity of this form is very doubtful: it differs from *B. Candollii* in the cauline leaves being narrower with obscure secondary nerves, and by having all the leaves more acute: from *B. tenue* in the acute leaves, stout rays of the umbel, and much stronger umbellules.

VAR. 3. *stricta*; stems 12-15 in. usually simple terminated by a strict umbel, bracts and bracteoles elliptic-oblong hardly acute pendent in fruit.—Sikkim; Jongri, alt. 12,000-13,000 ft., *C. B. Clarke*. *Stem* very erect. Lower leaves linear, upper rather broader, all narrowed at the base. Bracts several, sometimes nearly 2 in.; bracteoles orbicular or oblong, sometimes $\frac{3}{4}$ in., longer than the fruiting umbellule; rays of the umbel stout, ascending not divaricate. *Fruit* longer than in any form of *B. longicaule*, sometimes $\frac{1}{5}$ in.—This is almost surely allied to Var. *Dalhousieana*: but it may be doubted whether it should be attached to *B. longicaule*, Wall.

11. **B. tenue**, *Don Prodr.* 182; upper leaves linear-oblong subobtuse mucronate narrowed at the base, bracts and bracteoles not prominent, primary rays of the umbel slender, fruit $\frac{1}{10}$ - $\frac{1}{8}$ in., ridges prominent, furrows 1-vittate. *Wall. Cat.* 553; *DC. Prodr.* iv. 128. *B. flexuosum*, *Wall. Cat.* 554.

HIMALAYA; from KASHMIR to SIKKIM, alt. 1-9000 ft.; common in the West, and in the lower hills, extending in the plains to Jullundur.

Stem 1-3 ft., solitary, erect, much branched upwards, usually with numerous umbels. *Lower leaves* linear; oblong leaves usually with 5-9 somewhat distant primary nerves and numerous prominent reticulating secondary ones. *Bracts* 1-4, $\frac{3}{8}$ - $\frac{1}{2}$ in., lanceolate or obovate-lanceolate; bracteoles 4-5, $\frac{1}{8}$ in., obovate-lanceolate, often as long as the fruiting umbellule or longer; rays 3-8, usually less than 1 in., never stout; pedicels rarely exceeding $\frac{1}{20}$ in. *Fruit* broadly oblong, yellowish brown; carpels terete; vittæ in each furrow solitary, sometimes obscure.—Distinguished from *B. Candollii* *Var. minor* by the delicate primary rays of the umbel and the much smaller fruit.

VAR. khasiana; upper leaves linear or lanceolate acute or acuminate, bracts and bracteoles narrow-lanceolate prominent, fruit rather longer.—Khasia Mts., alt. 4000-6000 ft.; common; Tenasserim; Martaban Hills, alt. 7000 ft., *Kurz.*—Stem often very bushy from the base, corymbosely dichotomous with ascending branches, whereas in *B. tenue* type there is a simple main stem with divaricate sub-horizontal branches. Bracts often $\frac{1}{2}$ in.; bracteoles overtopping the fruits.—This variety has always been referred to *B. tenue*, Don, with which the fruit closely agrees; it resembles *B. mucronatum*, var. *ramosissima* in its leaves bracts and bracteoles, but differs in its smaller, shorter pedicelled fruit. We have not seen Martaban specimens, but as *Kurz* (*Journ. As. Soc. 1877*, pt. ii. 114) gives *tenue*, Don, as a native, we assume he alludes to this variety.

12. **B. Maddeni**, *C. B. Clarke*; cauline leaves small linear acuminate narrowed at the base, bracteoles few not prominent, pedicels less than $\frac{1}{20}$ in., fruit $\frac{1}{8}$ in. oblong strongly ridged, furrows 2-3-vittate.—*Bupleurum* No. 8, *Herb. Ind. Or. H. f. & T.*

NORTH-WEST HIMALAYA; Mussoorie, *Madden, Jameson*; Simlâ, *Lady Dalhousie*; Kunawur, alt. 6000-8000 ft., *Thomson*.

Stems 1-2 ft., several from the root, erect, simple below, with numerous leafy branches upwards. *Lower leaves* linear, almost subulate; upper $\frac{1}{2}$ -1 $\frac{1}{2}$ in., scarcely amplexicaul. *Bracts* 1-3, $\frac{1}{8}$ in., lanceolate, often 0; bracteoles 3, less often 4-5, $\frac{1}{8}$ in., lanceolate or linear, rays 5-8, less than $\frac{1}{2}$ in. *Fruit* broadly oblong, glaucous.—*Thomson* regarded this as a new species near *B. tenue*, with which it agrees in having very small umbels with subsessile flowers, but it seems more closely allied to *B. falcatum*, var. *Hoffmeisteri*, of which it may possibly be a depauperated mountain form.

13. **B. setaceum**, *Fenzl in Tchih. As. Min.* i. 418; stem slender diffusely dichotomously branched, leaves setaceous, umbels simple few-flowered subracemed with capillary peduncles, fruit $\frac{1}{10}$ in. ellipsoid, ridges distinct, furrows 1-vittate. *Boiss. Fl. Orient.* ii. 847.

KASHMIR, alt. 4500 ft.; Kishtwar, *C. B. Clarke*; *Stewart*.—DISTRIB. Bithynia.

Annual. *Stem* 18 in., erect, above divaricately branched. *Cauline leaves* 1-1 $\frac{1}{2}$ in., uppermost $\frac{1}{4}$ in., setaceous, 3-nerved. *Peduncles* $\frac{1}{4}$ -1 $\frac{1}{4}$ in., usually springing as though from a bifurcation whereof one branch is arrested. *Bracts* 1-4, $\frac{1}{8}$ - $\frac{1}{6}$ in., narrowly linear-lanceolate, usually longer than the fruiting umbel; pedicels 1-4, less than $\frac{1}{24}$ in. *Fruit* obscurely transversely rugose between the ridges; vittæ large, distinct, alternating with the ridges; carpels terete, slightly pentagonal.—Identified with *B. setaceum* from Fenzl's description only. There are several closely allied species perhaps not really distinct: *B. trichopodum*, *Boiss. & Sprun.* (*Boiss. Fl. Orient.* ii. 864) is much less compound, and the fruits have the furrows 3-vittate.

8. **APIUM**, *Linn.*

Herbs, annual or perennial, glabrous. *Leaves* pinnate, 3-partite, or compound. *Umbels* compound, often leaf-opposed. *Bracts* and bracteoles 0 (in the Indian species). *Flowers* white. *Calyx-teeth* obsolete. *Petals* ovate, acute,

tip inflexed. *Fruit* orbicular or elliptic, slightly longer than broad, laterally subcompressed; carpels semi-terete, subpentagonal, plane on the inner face; primary ridges distinct, filiform; secondary 0; furrows 1-vittate; carpophore undivided, or shortly 2-fid. *Seed* semi-terete, dorsally subcompressed.—**DISTRIB.** Species 14, scattered throughout the world.

The genus is hardly separable from *Carum*; the one Indian species is easily recognized by its short-peduncled umbels opposite a leaf without bracts or bracteoles.

1. **A. graveolens**, *Linn.*; *DC. Prodr.* iv. 101; radical leaves pinnate with large deeply lobed segments, cauline 3-partite, segments once or twice trifid coarsely toothed. *Wall. Cat.* 7212; *W. & A. Prodr.* 367; *Boiss. Fl. Orient.* ii. 856.

Base of the NORTH-WEST HIMALAYA, and outlying hills in the PUNJAB; *Falconer, Jacquemont, &c.*—**DISTRIB.** Cabul, West Asia, Europe, North Africa.

Biennial. *Stem* 1–8 ft., erect, branched. *Peduncle* 0– $\frac{1}{4}$ in., leaf-opposed: rays of the umbel 5–10, $\frac{1}{2}$ – $1\frac{1}{2}$ in.; pedicels 6–16, $\frac{1}{4}$ – $\frac{1}{2}$ in. *Fruit* $\frac{1}{16}$ – $\frac{1}{12}$ in.; ridges narrow, vittæ broad, occupying the whole breadth of the furrows.—Wild celery.

9. **CICUTA**, *Linn.*

Herbs, perennial, tall, glabrous. *Leaves* usually compound-pinnate. *Umbels* compound, rays numerous. *Bracts* 0, or few; bracteoles many, small. *Flowers* white. *Calyx-teeth* acute, minute. *Petals* obovate, emarginate. *Fruit* ovoid, not longer than broad, subcompressed, distinctly narrowed at the commissure; carpels semi-terete, dorsally compressed, plane on the inner face; primary ridges broad, corky, obtuse; furrows very narrow, 1-vittate; carpophore 2-partite. *Seed* semi-terete, dorsally compressed.—**DISTRIB.** Species 3, in the North Temperate Zone.

1. **C. virosa**, *Linn.*; *DC. Prodr.* iv. 99; cauline leaves 2–3-pinnate, segments lanceolate serrate. *Engl. Bot.* t. 479; *Reich. Ic. Fl. Germ.* t. 1853. *Cicutaria aquatica*, *Lamk. Dict.* ii. 2, *Ill.* t. 195.

KASHMIR; *Falconer*; Srinuggur, alt. 5200 ft., *C. B. Clarke*.—**DISTRIB.** Throughout Europe and Temperate Asia; in marshes and ditches.

Stem 2–5 ft., striate, hollow. *Leaflets* 1–2 by $\frac{1}{8}$ – $\frac{1}{2}$ in. *Peduncles* 2–3 in., terminal and leaf-opposed. *Bracts* 0; bracteoles 2–8, $\frac{1}{2}$ in., linear or narrowly lanceolate-linear; rays often 15, $1\frac{1}{2}$ – $2\frac{1}{2}$ in.; pedicels often 30–40, $\frac{1}{4}$ – $\frac{1}{2}$ in. *Fruit* $\frac{1}{16}$ in. in Indian examples (often $\frac{1}{12}$ in. in European), lateral primary ridges commissural; commissure obscurely constricted, in some Indian examples.—Water hemlock.

10. **PITURANTHOS**, *Viv.*

Perennial *herbs*, branched, somewhat rigid. Radical *leaves* 2–3-pinnate, cauline much reduced. *Umbels* compound; bracts and bracteoles lanceolate-linear, small, or 0. *Calyx-teeth* obsolete. *Petals* white, ovate, emarginate. *Fruit* ovoid or oblong, more or less laterally compressed, usually hairy; carpels terete, subpentagonal; primary ridges distinct (when the hair is removed), obtuse; furrows 1-vittate; carpophore 2-partite.—**DISTRIB.** Species 5 African, 2 Indian.

SUBGEN. **Eriocycla**. *Lindley* (Gen.). *Stem and leaves pubescent. Disc conical, very prominent. Styles long, early divergent, recurved. Ovary and young fruit densely hairy. Fruit oblong, much longer than broad.*

1. **P. nuda**, *Benth. in Gen. Pl. i.* 890; much branched upwards with virgate almost naked branches, umbels long-peduncled, rays 3-6, fruit scarcely laterally compressed. *Eriocycla nuda, Lindl. in Royle Ill.* 232, t. 51.

NORTH-WEST HIMALAYA; Kunawur, alt. 10,000-11,000 ft., *Royle, T. Thomson; Jacquemont.*

Stem 2-3 ft., glabrescent upwards. Lower cauline leaves 2-pinnate, ultimate segments $\frac{1}{2}$ in., oblong, lobed and toothed; upper much reduced, often to oblong acute sheaths $\frac{1}{2}$ in. Bracts 1-5, $\frac{1}{4}$ in.; bracteoles 5-10, $\frac{1}{12}$ - $\frac{1}{4}$ in., linear; rays 1-4 in.; pedicels 8-12, $\frac{1}{12}$ - $\frac{1}{4}$ in., obscurely pubescent. Fruit $\frac{1}{8}$ in., at first densely hairy, ultimately much less so; carpels oblong, narrower upwards; lateral primary ridges marginal.

2. **P. Thomsoni**, *C. B. Clarke*; stem with many lateral branches and umbels, rays 4-8, fruit much laterally compressed.—*Eriocycla* sp. ? 2, *Herb. Ind. Or. H. f. & T.*

WEST TIBET; Piti, alt. 10,000-12,000 ft., *Thomson. HIMALAYA; Jacquemont.*

*Stem 12-18 in., grey-pubescent. Lower cauline leaves 2-pinnate; ultimate segments $\frac{3}{4}$ in., ovate, deeply pinnatifid, toothed; upper leaves greatly reduced. Umbels long- or short-peduncled, sometimes sessile; bracts 4-8, $\frac{1}{2}$ in., linear; rays $\frac{1}{2}$ - $1\frac{1}{2}$ in., pubescent, subtomentose; bracteoles and pedicels much as in *P. nuda*, but more hairy. Fruit $\frac{1}{8}$ in.; carpels oblong, hardly narrowed upwards; lateral primary ridges within the distinctly constricted commissure.*

11. **CARUM**, *Linn.*

Herbs, perennial or annual. Leaves pinnate, or decomposed. Umbels compound; bracts few or many, simple or rarely divided; bracteoles several or many, undivided. Flowers white (in Indian species), polygamous, sterile flowers often with enlarged or irregular petals. Calyx-teen small, or 0. Petals retuse or emarginate. Fruit ovoid ellipsoid or oblong, laterally compressed and more or less constricted at the commissure; carpels terete, subpentagonal, plane on the inner face; primary ridges slender, conspicuous or obscure, lateral commissural; furrows 1-vittate; carpophore 2-fid or 2-partite. Seed terete, dorsally subcompressed, plane or obscurely channelled on the inner face.—DISTRIB. Species 50 in Europe, Temperate Asia, S. Africa and N. America.

This genus as modelled by Mr. Bentham differs from *Pimpinella* in its solitary vittæ, from *Seseli* by the fruit being more or less constricted at the commissure. (See *Pimpinella cæspitosa* which has solitary vittæ.)

* *Fruit glabrous or very nearly so.*

1. **C. Carui**, *Linn.; DC. Prodr. iv.* 115; ultimate segments of the lower leaves lanceolate, of the upper linear, bracteoles small linear or 0, fruit elliptic-oblong. *Boiss. Fl. Orient. ii.* 879.

BALTIKISTAN, KASHMIR AND GURWHAL, alt. 9000-12,000 ft., *Royle, &c.*—DISTRIB. W. and N. Asia, Europe (often cultivated).

Glabrous. *Stem 1-3 ft., branched, erect or diffuse. Leaves 2-pinnate, finely dissected; ultimate segments of the lower leaves $\frac{1}{2}$ - $\frac{1}{6}$ in., of the upper $\frac{1}{4}$ -1 in. Bracts 1-3, small, linear, or 0, rarely divided; rays 3-8, $\frac{1}{4}$ -2 in., unequal; pedicels 3-8,*

$\frac{1}{20}$ – $\frac{1}{2}$ in., unequal. *Fruit* $\frac{1}{8}$ – $\frac{1}{6}$ in., yellowish-brown, almost viscid; carpels terete narrowed upwards, primary ridges thin but very distinct; vittæ solitary, rather large; carpophore entire, or shortly 2-fid.—*C. meifolium*, *Bieb. Boiss. Fl. Orient.* differs by its lower leaves with linear segments, its more numerous bracts; but is perhaps hardly distinguishable.—*Caraway*.

2. **C. ? diversifolium**, *C. B. Clarke*; upper leaves 3-partite, pinnæ narrow-oblong or linear entire, fruit elliptic-oblong prominently ridged. *Sison diversifolium*, *Wall. Cat.* 592. *Falcaria ? diversifolia*, *DC. Prodr.* iv. 110.

NIPAL; *Wallich*.

Glabrous. *Stem* 3 ft. or more, much branched, sparingly leafy upwards, *Leaves* 2–3 in.; pinnæ $\frac{3}{4}$ by $\frac{1}{10}$ in., acute, or in the upper leaves often linear. *Bracts* 1–3, $\frac{1}{2}$ in. linear or 0; bracteoles 0–5, $\frac{1}{6}$ in., linear; rays 8–14; pedicels numerous. *Flowers* minute, all fertile. *Calyx-teeth* 0. *Petals* obovate, slightly emarginate. *Styles* somewhat long on conical style-bases. *Fruit* immature, $\frac{1}{2}$ in., nearly terete, probably resembling that of *C. Carui*, but may become broad at the commissure when it may be referable to *Fœniculum*.

3. **C. nothum**, *C. B. Clarke*; ultimate segments of all the leaves short linear, bracteoles 4–5 linear-oblong exceeding the pedicels, fruit nearly as in *C. Carui*.

CEYLON ?

Glabrous. *Stem* 4–5 in., erect, branched. *Leaves* 2–3-pinnate, finely dissected; ultimate segments $\frac{1}{8}$ in., somewhat distant and rigid. *Bracts* 4–5, $\frac{1}{2}$ in., very narrowly oblong, subobtuse; rays 3–7, 1–1 $\frac{1}{2}$ in.; pedicels 3–8, rarely attaining $\frac{1}{2}$ in. *Calyx-teeth* minute. *Fruit* rather more strongly ribbed than that of *C. Carui*, less narrowed upwards; carpophore 2-partite.—There is little doubt regarding the genus of this plant, it having been originally referred to *Ptychotis* by Sir J. D. H. and having been again dissected by Bentham and marked *Carum*. The doubt is as to its birth-place; it is marked "Ceylon," but not on an original ticket, and there is no collector's name. Its aspect is Alpine Himalayan, not at all Cinghalese. There is another small specimen collected by T. Lobb in Mysore that seems the same thing.

4. **C. Bulbocastanum**, *G. D. J. Koch in Nov. Act. Acad. Cæs. Leop.* 1825, 121; ultimate segments of all the leaves linear, bracteoles 0–8 linear, fruit oblong not narrowed upwards. *DC. Prodr.* iv. 115. *Bunium Bulbocastanum*, *Linn.*

KASHMIR, alt. 6000–9000 ft.; *Jacquemont*, &c.—DISTRIB. Beloochistan, N. Asia, Europe, N. Africa.

Glabrous. *Root* tuberous. *Stem* 6–30 in., erect, branched. *Leaves* 2–3-pinnate, finely dissected, ultimate segments of the lower often $\frac{1}{2}$ –1 in., of the upper leaves very narrow. *Bracts* 0, or several, linear, sometimes divided; rays 6–16, 1 $\frac{1}{2}$ in.; pedicels 10–15, $\frac{1}{8}$ – $\frac{1}{2}$ in. *Fruit* $\frac{1}{8}$ – $\frac{1}{6}$ in., yellowish-brown, almost viscid; carpels exactly oblong, hardly widened at the middle, semi-terete, dorsally subcompressed; ridges thin, distinct; vittæ solitary, rather large.

5. **C. stictocarpum**, *C. B. Clarke*; ultimate segments of the lower cauline leaves narrowly linear-lanceolate, bracteoles 4–8 linear-lanceolate with scarious ciliate margins, fruit shining minutely pubero-punctate.—*Ptychotis* sp. 3, *Herb. Ind. Or. H. f. & T.*

CONCAN; *Stocks, Law*.

Glabrous or minutely hairy. *Root* fusiform. *Stem* 1–3 ft., erect, much branched. *Leaves* 2-pinnate, ultimate segments often 1 by $\frac{1}{12}$ in., upper often with linear segments. *Bracts* 3–6, $\frac{1}{4}$ – $\frac{1}{3}$ in., nearly linear; bracteoles $\frac{1}{4}$ in.; rays 6–12, $\frac{1}{2}$ –2 in., equal, slender; pedicels 8–20, $\frac{1}{8}$ – $\frac{1}{4}$ in. *Ovary* minutely pubero-pubescent. *Fruit*

$\frac{1}{34}$ – $\frac{1}{16}$ in., ovoid, ultimately shining, yellow, the dots microscopical, ridges faint; carpels semi-terete; vittæ solitary, small.

VAR. *hebecarpa*; fruit $\frac{1}{16}$ – $\frac{1}{12}$ in. hispidulous sometimes densely so and fuscous. Ptychotis sp. 4. *Herb. Ind. Or. H. f. & T.*—Concan; *Stocks, Law.*

** *Fruit hispid or muricate* (see also *C. stictocarpum* No. 4).

6. **C. Roxburghianum**, *Benth. in Gen. Pl. i.* 891; ultimate segments of the lower cauline leaves narrowly linear-lanceolate, bracteoles 4–8 linear-lanceolate with scarious ciliate margins, fruit hispid. *Kurz in Journ. As. Soc.* 1877, pt. ii. 114. *Apium involucratum*, *Roxb. Hort. Beng.* 22, *Fl. Ind.* ii. 97; *Fleming Cat. Ind. Med. Pl.* 6; *Wight Ic.* t. 567. *Pimpinella?* involucrata, *W. & A. Prodr.* 369; *Wight Ic.* t. 335; *Dalz. & Gibbs. Bomb. Fl.* 106. *Athamantha Roxburghiana*, *Wall. Cat.* 571. *Ptychotis Roxburghiana*, *DC. Prodr.* iv. 109.—*Phellandrium* sp., *Wall. Cat.* 7217, *fide W. & A.*

Throughout INDIA extensively cultivated from HINDOOSTAN and BENGAL to SINGAPORE and CEYLON. Not known wild.

Probably a cultivated form of *C. stictocarpum* which it exactly resembles except as to the fruit which is $\frac{1}{12}$ – $\frac{1}{10}$ in., the part used by man and therefore that which has varied under cultivation. This shows a wide difference in size, colour, and hairiness in the two forms, but there is a series of connecting links through the var. *hebecarpa*. In *C. Roxburghianum*, the fruit is more distinctly ridged, subpentagonal; the vittæ are most minute, *W. & A.* say several in each furrow, but they appear generally 1 or 0. The petals are hairy.—*Wight* doubts whether his t. 567 (which is copied from *Roxburgh*) is the *Pimpinella?* involucrata of *W. & A. Prodr.* 369; but a reference to his Herbarium shows that it is; the fruit varying somewhat in size and a good deal in hairiness. The only scrap *Wight* got of *C. stictocarpum* he arranged (without name) in *Ptychotis*.

7. **C. copticum**, *Benth. in Gen. Pl. i.* 891; ultimate segments of all the leaves linear, bracteoles 3–5 small linear, fruit muricate subhispid. *Ammi copticum*, *Boiss. Fl. Orient.* ii. 891. *Ligusticum Ajawain*, *Fleming Cat. Ind. Med. Pl.* 25. *L. Ajowan*, *Roxb. Hort. Beng.* 21, *Fl. Ind.* ii. 91. *Athamantha Ajowan*, *Wall. Cat.* 572. *Ptychotis coptica*, *DC. Prodr.* iv. 108. *P. Ajowan*, *DC. l. c.* 109; *W. & A. Prodr.* 368; *Wight Ic.* t. 566. *Bunium aromaticum*, *Linn. Mant.* 218. *Seseli ammoides*, *Jacq. Hort. Vind.* t. 52. *Sison Ammi*, *Jacq. Hort. Vind.* t. 200.

INDIA, extensively cultivated from the PUNJAB and BENGAL to the SOUTH DECCAN.—DISTRIB. *W. Asia, S. Europe, N.-E. Africa.*

Minutely pubescent, or the stem and leaves glabrescent. *Root* fusiform. *Stem* 1–3 ft., erect, branched, leafy. *Leaves* 2–3-pinnate; ultimate segments linear, often $\frac{1}{2}$ –1 in. *Bracts* several, linear, rarely 0, sometimes divided; rays 4–12, $\frac{1}{2}$ –1½ in.; pedicels 6–16, $\frac{1}{20}$ – $\frac{1}{4}$ in., more or less pubescent. *Fruit* $\frac{1}{12}$ in., ovoid; carpels subpentagonal, dorsally compressed, nearly plane on the inner face; ridges usually distinct; vittæ solitary, small.—The bracts are in the Indian *Ajowan* not rarely divided, when it is undistinguishable from the West Asian *C. copticum*. *Boissier l. c.* maintains that the genus should be *Ammi* because the petals are destitute of a transverse fold; but *W. & A.* are correct in saying (*Prodr.* 368) that they are just like those of other *Carums*.

8. **C. khasianum**, *C. B. Clarke*; lower leaves 3-partite pinnate or sub-2-pinnate ultimate segments oblong crenate-serrate, fruit very nearly as in *C. copticum*, but shorter.—*Ptychotis?* sp. *Wall. Cat.* 7218. *Ptychotis* sp. 9, *Herb. Ind. Or. H. f. & T.*

KHASIA Mts.; alt. 3000–5000 ft., common, *Wallich, &c.*

Pubescent throughout, or the lower part glabrescent. *Root* fusiform. *Stem* 2–4 ft.,

erect, corymbose upwards. Ultimate segments of the radical leaves often 2 by $\frac{1}{2}$ in., narrowed at the base, distinctly reticulate-nerved, of the upper narrower, sometimes filiform. Bracts 0-5; $\frac{1}{4}$ in., linear; rays 4-8, $\frac{1}{2}$ - $1\frac{1}{2}$ in., hispid; pedicels 8-16, $\frac{1}{8}$ - $\frac{1}{4}$ in., bracteoles shorter than the pedicels. Fruit $\frac{1}{16}$ in., ovoid, mucronate hispidulous, ridges prominent; carpels subpentagonous; dorsally subcompressed; vittæ solitary, small.

9. **C. anethifolium**, Benth. in Gen. Pl. i. 891; leaves 2-3-pinnate ultimate segments linear, bracts 4-5 linear, rays 15-40 very pubescent. *Athamanta anethifolia*, Wall. Cat. 569. *Ptychotis anethifolia*, DC. Prodr. iv. 108. *Pimpinella anethifolia*, Don Prodr. 184.

NIPAL, Wallich. KUMAON; Almora alt. 5000 ft., Strachey & Winterbottom.

Puberulo-pubescent. Root fusiform. Stem 2-4 ft., erect, leafy, corymbose upwards with long peduncles. Leaves 2-3-4-pinnate, ultimate segments $\frac{3}{8}$ - $\frac{1}{2}$ in., sometimes lanceolate-linear; rays $\frac{1}{2}$ - $1\frac{1}{4}$ in.; bracteoles 4-8, $\frac{1}{8}$ - $\frac{1}{4}$ in., linear; pedicels 15-30, $\frac{1}{8}$ - $\frac{1}{2}$ in.—Ripe fruit not seen; young very pubescent.

10. **C. Falconeri**, C. B. Clarke; leaves 2-3-pinnate ultimate segments linear, bracts 4-5 narrowly oblong-linear subobtuse, rays 3-7 glabrous or nearly so.—*Ptychotis* sp. 8, Herb. Ind. Or. H. f. & T.

GURWHAL; Falconer; alt. 7000-9000 ft., Edgeworth; Chiringa, alt. 7000 ft., Strachey & Winterbottom; Mussooree, Dr. Bacon.

Glabrous except the pedicels, flowers, and fruits. Root fusiform. Stem 2-4 ft., erect, corymbose upwards. Upper leaves reduced sometimes to the dilated sheaths; ultimate segments very long in all the leaves, sometimes 2-3 by $\frac{1}{16}$ in.; rays $\frac{1}{2}$ - $1\frac{1}{2}$ in.; bracteoles 4-6, $\frac{1}{8}$ in., oblong, subobtuse; pedicels 8-16, $\frac{1}{8}$ - $\frac{1}{4}$ in., with scattered hairs. Petals pubescent. Fruit $\frac{1}{12}$ in., ovoid, narrowed upwards, densely hairy.—Appears closely allied to *C. anethifolium*; possibly De Candolle's description of *P. anethifolia* (Prodr. iv. 108) was intended to include this.

12. SIUM, Linn.

Glabrous herbs. Leaves pinnate, pinnæ toothed. Umbels compound terminal and lateral; bracts and bracteoles several. Calyx-teeth acute, or obsolete. Petals white, emarginate. Fruit ovoid or oblong, laterally compressed, constricted at the commissure (but the constriction masked in the Indian species by the large corky lateral ridges); primary ridges prominent, obtuse, frequently thickened; furrows 3-2- (or 1-) vittate; carpophore (ex DC.) completely bipartite, each half adnate to the adjoining mericarp. Seed terete.—DISTRIB. Species 4, in the N. Temperate Zone: 1 in South Africa.

The generic character is here somewhat altered from Benth's (in Gen. Plant.), in order to retain the Indian species in *Sium* rather than in *Pimpinella*. *Sium* is here separated by the large simple pinnæ of the leaves, and the thickened prominent ridges of the fruit.

1. **S. latijugum**, C. B. Clarke; pinnæ of the lower leaves 1 in. ovate or ovate-lanceolate, calyx-teeth 0, fruit elliptic, ridges triangular obtuse corky much wider than the 1-vittate furrows.

KASHMIR and BALTISTHAN, in ditches, alt. 5000-9000 ft.; very common.

Root, stem, leaves, and flowers closely resembling *S. latifolium*, which differs in its smaller pinnæ, acute calyx-teeth, less thick ridges of the fruit, and many vittæ scattered nearly all round the carpels. *S. latijugum* is that plant which Benth (in Gen. Pl. ii. 893) refers to as that variety of *S. lancifolium* in which the ridges are broader nearly completely covering the furrows: but it can hardly belong to the

same genus as the true *S. lancifolium* in which the fruits are much smaller the ridges slender with broad 3-vittate furrows. *S. nipponicum*, Maxim. in Bull. Acad. Petersb. Mel. Biol. ix. 766, is very near *S. latijugum*, but its calyx-teeth are manifest, and there are vittæ scattered under the ridges besides the subsolitary vittæ in the furrows. In *S. multijugum* the lateral ridges are rather larger than the others, and form with the commissure a wide plane face, there are 2 vittæ only on the commissure close to its medial line. The 4 vittæ on the outer faces of the carpels are large, exactly occupying the furrows. The seed is very accurately terete.

13. PIMPINELLA, Linn.

Herbs, biennial or perennial. *Leaves* 1-2-pinnate or 1-2-ternate or decomposed, rarely undivided, toothed. *Umbels* compound; bracts few or 0; bracteoles usually linear, sometimes 0. *Flowers* hermaphrodite or polygamomonœcious. *Calyx-teeth* 0 or small, lanceolate. *Petals* usually emarginate, ovate acute or lanceolate caudate. *Fruit* laterally compressed, usually constricted at the commissure, ovate or ovate-oblong or narrow-oblong; carpels terete or subpentagonal, often dorsally compressed, plane on the inner face; ridges slender, obscure or prominent; furrows 2-3-vittate (in *P. cæspitosa* 1-vittate); carpophore entire 2-fid or 2-partite. *Seed* terete, $\frac{1}{2}$ -terete or dorsally subcompressed, inner face plane or nearly so. — **DISTRIB.** Species 70, in the northern hemisphere, with a few in S. Africa and S. America.

* *Fruit* glabrous or very nearly so. (See also No. 16, *P. diversifolia*, var. *alpina*).

1. **P. achilleifolia**, C. B. Clarke; glabrous, lower cauline leaves 3-4-pinnate ultimate segments linear-lanceolate, bracts 1-5 $\frac{1}{3}$ - $\frac{2}{3}$ in. linear, rays 6-10. *Athamanta achilleifolia*, Wall. Cat. 568. *Ptychotis achilleifolia*, DC. Prodr. iv. 109.

Temperate and subalpine HIMALAYA, Wallich, &c.; from KUMAON; Naini Tal, alt. 8500 ft., *Str. and Wint.*; to SIKKIM; Jongri, 13,000 ft., C. B. Clarke.

Stem 3-4 ft., erect, corymbose upwards, with long peduncles. Quaternary pinnæ $\frac{1}{4}$ - $\frac{1}{5}$ in., often 3-furcate, somewhat rigid, upper leaves reduced, sometimes almost to the inflated sheaths. *Bracteoles* 4-6, $\frac{1}{8}$ in., linear; rays $\frac{1}{2}$ -2 $\frac{1}{2}$ in.; pedicels 8-20, $\frac{1}{12}$ - $\frac{1}{4}$ in. *Fruit* $\frac{1}{10}$ in., elliptic, oblong, glabrous, laterally compressed, ridges distinct, furrows 2-3-vittate; disc conical, prominent.

2. **P. nervosa**, C. B. Clarke; cauline leaves twice 3-partite secondary pinnæ 1-2 in. broadly lanceolate serrate nerves beneath much elevated minutely scabrid.

KHASIA Mts.; Nonkreem, alt. 5500 ft., H. f. & T.

Nearly glabrous. *Stem* 2-3 ft., stout. *Peduncles* 1-6 in. *Bracts* 0; rays 6-12, 1-2 $\frac{1}{2}$ in.; bracteoles 3-8, linear, overtopping the umbellules. *Flowers* all hermaphrodite. *Calyx-limb* 0. *Petals* emarginate, white or purplish. *Styles* short. *Fruit* $\frac{1}{8}$ in., crowned by short conic style-bases, glabrous; carpels subpentagonal, dorsally subcompressed; ridges distinct, furrows 2-1-vittate.—This from its coarse habit and foliage may be an *Ægopodium*, but there are small vittæ in the unripe fruit.

3. **P. Heyneana**, Wall. Cat. 566; lower cauline leaves 3-partite or twice or thrice 3-partite, ultimate segments ovate or ovate-lanceolate narrowed at the base, fruit didymous broader than long. Kurz in Journ. As. Soc. 1877, pt. ii. 115. *Helosciadium*? *Heyneanum*, DC. Prodr. iv. 106; W. & A. Prodr. 368; Dalz. & Gibs. Bomb. Fl. 106. *Sium triternatum*, Moon Cat. 22. *Seseli*

zeylanicum, *Herb. Rottler & Klein*. *Anethum trifoliatum*, *Roxb. Fl. Ind. ii.* 96 ?.

CIRCARS, *Roxburgh*; DECCAN PENINSULA and CEYLON, frequent in the hills. CHITTAGONG; at Burkul, *C. B. Clarke*. PEGU, *Kurz*.

Nearly glabrous, or the leaves pilose. Stem 2-4 ft., erect, branched. Ultimate segments of the lower leaves often 1-2 by $\frac{1}{4}$ - $\frac{1}{2}$ in., serrate, of the upper narrower sometimes linear. Bracts 0; rays 6-12, 1-2 in., glabrous or nearly so; bracteoles 1-2, $\frac{1}{8}$ in., often 0; pedicels 6-10, $\frac{1}{10}$ - $\frac{1}{5}$ in. Fruit $\frac{1}{20}$ - $\frac{1}{16}$ in.; carpels ellipsoid, almost globose, ridges slender, rarely white and conspicuous; disc obsolete; carpophore 2-fid, sometimes deeply. Seed nearly terete, not concave on the inner face.—*Roxburgh's* description of *Anethum trifoliatum*, a native of the Circars, will apply to both *P. Heyneana* and *diversifolia*. Wallich identified it with his *trifoliata* (*diversifolia*, DC.) a Himalayan plant, but W. & A. with more probability refer it to *P. Heyneana*.

4. **P. sikkimensis**, *C. B. Clarke*; cauline leaves 2- sub-3-pinnate, ultimate segments oblong bristle-serrate, fruit $\frac{1}{8}$ in. elliptic longer than broad.—*Ptychotis* sp., *Herb. Ind. Or. H. f.*

SIKKIM; common in damp forests, alt. 4-7500 ft., *J. D. H.*, *C. B. Clarke*.

Glabrous or sparsely setulose. Stem 2-4 ft., corymbose. Leaves large, ovate; pinnae and pinnules ($\frac{1}{4}$ in.) opposite. Bracts 0 or 1-2, scarcely $\frac{1}{4}$ in., linear; rays 6-14, 1-3 in., stout, angular, divaricate; bracteoles few, scarcely $\frac{1}{6}$ in., linear; pedicels very many, but only 6-12 fruiting, $\frac{1}{2}$ - $\frac{3}{4}$ in. Calyx-teeth lanceolate. Petals emarginate, greenish-white; disc prominent; styles very short. Fruit slightly narrowed upwards; ridges not prominent; carpophore stout, undivided; carpels much dorsally compressed, inner face concave; vittæ usually solitary in the two dorsal furrows, and in pairs in the two lateral ones.

5. **P. Wallichii**, *C. B. Clarke*; cauline leaves 2-3-pinnate tertiary pinnae pinnatifid ultimate segments narrowly lanceolate, fruit ellipsoid broader than long.

NIPAL; *Wallich in Herb. Hook.* SIKKIM; alt. 4000-6000 ft., frequent, *C. B. Clarke*.

Glabrous. Stem 2-4 ft., erect, branched. Leaves large, ovate, pinnae and pinnules opposite, all similarly cut, ultimate segments $\frac{1}{10}$ - $\frac{1}{4}$ in., often 3-fid, not setulose. Bracts 0; rays 6-12, $\frac{3}{4}$ in., rigid; bracteoles 1-2, less than $\frac{1}{4}$ in., linear, or 0; pedicels 8-12, hardly $\frac{1}{6}$ in. Fruit $\frac{1}{12}$ in., laterally subcompressed; disc inconspicuous; ridges prominent; carpophore slender, 2-partite; carpels dorsally compressed, subpentagonal, plane on the inner face; vittæ externally somewhat conspicuous, usually 3 in each furrow and 4 on the commissure.

6. **P. Saxifraga**, *Linn.*; *DC. Prodr.* iv. 120; radical leaves pinnate pinnae round or elliptic toothed upper sub-2-pinnate, fruit ellipsoid rather longer than broad. *Boiss. Fl. Orient.* ii. 873.—*Var. dissectifolia*; pinnae (even of the radical and lower cauline leaves) deeply lobed, lobes lanceolate.

VAR. *dissectifolia*; KASHMIR; Tilail, alt., 13,000 ft., and WESTERN TIBET; KARAKORUM, alt 14,000 ft.; *C. B. Clarke*.—DISTRIB. Europe, Northern and Western Asia.

Glabrous or very nearly so, branched from the root. Stem 8-16 in., curved, striate, little leafy upwards. Leaves oblong, pinnae $\frac{1}{2}$ - $\frac{3}{4}$ in. diam. Bracts 0; rays 5-10, $\frac{1}{8}$ - $1\frac{1}{2}$ in., unequal, stout, ascending; bracteoles 3-5, $\frac{1}{6}$ in., linear; pedicels 5-10; $\frac{20}{100}$ - $\frac{10}{100}$ in. Petals often pink or purplish. Fruit $\frac{1}{4}$ in.; carpels $\frac{1}{2}$ -terete, subpentagonal, dorsally subcompressed; inner face plane; ridges thin, distinct; vittæ 2-3 in each furrow; carpophore stout, often 2-partite. Seed concave on the inner face.—This does not exactly agree in the cutting of the leaf with any described form of *P. Saxifraga* and the styles are very short; it may be *P. rhodantha*, *Roiss. in Tchih. As. Min.* i. 414, *Fl. Orient.* ii. 874.

7. **P. acuminata**, C. B. Clarke; lower cauline leaves 2-pinnate secondary pinnæ toothed or incised, pedicels slender, fruit terete. *Reutera acuminata*, Edgw. in *Trans. Linn. Soc.* xx. 52

FROM KASHMIR to KUMAON, alt. 4–8000 ft., frequent.

Glabrous, or the leaves obscurely pubescent. *Stem* 3–4 ft., corymbose upwards. Secondary *pinnæ* 1–2 in. *Bracts* 1–5, $\frac{1}{2}$ – $\frac{3}{4}$ in., linear; rays 5–10, 1–3 in.; bracteoles 3–5, $\frac{1}{2}$ in., linear; pedicels $\frac{1}{2}$ – $\frac{1}{2}$ in. *Petals* yellowish-green or nearly white. *Fruit* nearly globose, laterally compressed, yellowish-brown, subviscid; carpels terete, ridges slender, furrows 2–3-vittate; disc small.—Easily recognised by the long slender pedicels.

8. **P. bella**, C. B. Clarke; leaves all similarly cut 2-pinnate secondary pinnæ pinnatifid ultimate segments oblong entire mucronate, fruit narrowly oblong.

SIKKIM; alt. 10,000–12,000 ft., Thomson, C. B. Clarke, N. Gamble; on the watershed between Sikkim and Nipal.

Glabrous. *Rootstock* long, fusiform. *Stem* 1–3 ft., corymbose upwards. *Leaves* large, ovate, pinnæ and pinnales opposite, often white beneath. *Bracts* 0, or 1 linear, 1 in.; rays 10–15, 1–2 in., angular, stout; bracteoles 2–5, $\frac{1}{4}$ in., linear; pedicels 8–16, $\frac{1}{2}$ – $\frac{3}{4}$ in. *Calyx-margin* obsolete. *Petals* ovate-lanceolate, plane. *Disc* large, conical. *Carpophore* 2-partite. *Fruit* $\frac{1}{2}$ in.; carpels terete, subpentagonal, inner face hardly grooved; ridges slender, furrows 2–3-vittate.

9. **P. Hookeri**, C. B. Clarke; leaves pinnate sub-2-pinnate segments of the lower leaves oblong of the upper linear, fruit ovate as long as broad.—*Acronema* sp. 2, *Herb. Ind. Or. H. f. & T.*

SIKKIM, Northern valleys, Samdong and Lachen, alt. 8–11,000 ft., J. D. H.

Glabrous. *Root* tuberous. *Stem* 1–2 ft., slender, sparingly leafy, remotely corymbose or subvirgate. Lower *leaves* cut and whitened beneath as in *P. bella*, segments 1–2 in.; upper much reduced with very narrow segments. *Umbels* subracemose upwards, rays few and slender; bracts and bracteoles 0, or inconspicuous; pedicels 4–6, $\frac{1}{2}$ – $\frac{3}{4}$ in., slender. *Petals* very small, often elongate with a whip-like tail much exceeding their own length (but this does not appear uniformly present, some petals on the same plants being emarginate with a short inflexed point). *Fruit* $\frac{1}{16}$ – $\frac{1}{12}$ in. globose, narrowed at the apex, laterally subcompressed, yellow-brown; ridges obscure; furrows 2–3-vittate; disc evanescent; carpophore slender, 2-partite.

10. **P. tenera**, Benth. in *Gen. Pl.* i. 894; lower cauline leaves pinnate pinnæ ovate ultimate segments of the upper small, fruit ovate-oblong conspicuously narrowed upwards. *Sison* ? tener, Wall. Cat. 593. *Helosciadium* ? tenerum, DC. *Prodr.* iv. 105. *Acronema tenerum*, Edgw. in *Trans. Linn. Soc.* xx. 51.

HIMALAYA, alt. 8–15,000 ft.; from GURWHAL to SIKKIM; Wallich, Falconer, J. D. H., C. B. Clarke.

Root tuberous (not annual as Benth. l. c.). *Stem* 6–8, rarely 12 in. *Petals* often excessively elongate as in *P. Hookeri*. *Furrows* 2–3-vittate.—Closely resembling *P. Hookeri* but smaller, the ultimate segments of the upper leaves not exceeding $\frac{1}{4}$ in., the carpophore undivided thick; fruit $\frac{1}{16}$ in., elongated, narrower upwards.

VAR. *dissecta*; leaves 2–3-pinnate ultimate segments scarcely $\frac{1}{8}$ in. ovate acutely 3-lobed or longer linear subobtusely.—With the type.

11. **P. acronemæfolia**, C. B. Clarke; leaves 2–3-pinnate ultimate segments ovate acutely 3-lobed or longer linear subobtusely, peduncles 1–2 on each stem 2–6 in. stout, bracts 1–5 $\frac{1}{2}$ in. linear.

SIKKIM, alt. 11,000 ft., Chola, Lachoong, *J. D. H.*; Singaleh, alt. 10,000 ft., *C. B. Clarke.*

Glabrous, 3-8 in.; root tuberous. *Leaves* exceedingly like those of *P. tenera* var. *dissecta*; segments $\frac{1}{2}$ in. *Rays* 6-12, 1-1 $\frac{1}{2}$ in., stout; bracteoles small; pedicels 10-16, $\frac{1}{6}$ - $\frac{1}{3}$ in. *Petals* elliptic, obtuse, plane, white or pinkish. *Fruit* nearly as that of *P. tenera*.—This closely resembles *Vicatia millefolia*, but the plane petals exclude it from that genus.

12. **P. hastata**, *C. B. Clarke*; lower cauline leaves cordate or hastate triangular-lanceolate crenate serrate villous beneath, fruit ovate as broad as long.—*Pimpinella*, sp. 17, *Herb. Ind. Or. H. f. & T. Umbellifera*, No. 875, *Griff. Itin. Notes* 56.

KHASIA MTS.; Moflong, alt. 6000 ft., *Griffith, H. f. & T.*; Mairung, alt. 5000 ft., *C. B. Clarke.*

Root fusiform. *Stem* 3 ft., erect, obscurely pubescent, sparingly leafy, laxly corymbose upwards. *Leaves* 2-4 by 1-1 $\frac{1}{2}$ in., nearly glabrous above; upper cauline sometimes 3-partite with cordate ovate leaflets, uppermost sometimes reduced with narrow segments. *Bracts* 0; rays 5-8, 1-1 $\frac{1}{2}$ in., scabrid, subpubescent; bracteoles 0, or 1-2, $\frac{1}{6}$ in., linear; pedicels 5-10, $\frac{1}{10}$ - $\frac{1}{8}$ in. *Fruit* $\frac{1}{12}$ - $\frac{1}{10}$ in., brown, subdidymous, acute upwards, dorsally subcompressed, inner face slightly concave; ridges obscure, furrows 2-vittate; disc prominent, conical; carpophore 2-fid or 2-partite. *Seed* $\frac{1}{2}$ -terete, dorsally compressed, inner face slightly concave.

13. **P. Leschenaultii**, *DC. Prodr.* iv. 122; lower cauline leaves cordate orbicular serrate slightly pubescent beneath, fruit ovate-oblong glabrous or when young with a few scattered hairs. *W. & A. Prodr.* 369; *Wight Ic. t.* 1005; *Thwaites Enum.* 131.

NILGHIRIS, alt. 6-8000 ft.; *Wight, &c.* CEYLON, alt. 6000 ft., *Thwaites.*

Root fusiform, perennial. *Stem* 1-2 ft., virgate, obscurely pubescent. *Leaves* 1-2 in. diam., glabrous above or nearly so; upper reduced to sheaths, or 0. *Bracts* 0, or 1 small linear; rays 6-16, 1-1 $\frac{1}{2}$ in., scabrid-pubescent; bracteoles 1-3, $\frac{1}{6}$ in., linear; pedicels 6-12, $\frac{1}{8}$ - $\frac{1}{5}$ in. *Fruit* $\frac{1}{10}$ - $\frac{1}{8}$ in., narrowed upwards, strongly compressed, brown, finally glabrous; carpels $\frac{1}{2}$ -terete, not dorsally compressed, inner faces plane; ridges not prominent, furrows 3-vittate; disc prominent, conical.—*Thwaites* says his Ceylon examples are intermediate between *P. Leschenaultii* and *P. Candolleana*; but they are typical *P. Leschenaultii* with large laterally compressed fruits, &c.

** *Fruit papillose-scabrous or pubescent.* (See also No. 13, *P. Leschenaultii*).

14. **P. Candolleana**, *W. & A. Prodr.* 369; lower cauline leaves ovate-cordate serrate pubescent beneath, fruit ovate scabrid with clustered hairs when ripe. *Wight Ic. t.* 341.

Mts. of the SOUTH DECCAN, alt. 5-8000 ft., frequent.

Resembles generally *P. Leschenaultii* but is more pubescent. Lower leaves usually subacute, often pubescent above, sometimes 3-partite with petioluled leaflets; upper often 1-2-pinnatifid, ultimate segments oblong acute. *Fruit* very scabrid, shortly acute at the apex, very slightly compressed laterally, always much smaller and shorter than that of *P. Leschenaultii*; carpels $\frac{1}{2}$ -terete, dorsally subcompressed, inner face plane; ridges prominent, furrows 2-3-vittate; carpophore stout, entire.—*P. javana* *DC. Prodr.* iv. 122 is nearly allied to this but has the upper leaves reduced and not pinnatifid, and the fruits less strongly ribbed.

15. **P. monoica**, *Dalz. in Hook. Kew Journ.* iii. 212; lower cauline leaves 3-partite leaflets long-petioluled cordate-ovate, fruit terete papillose subscabrid.

Dalz. & Gibs. Bomb. Fl. 106. *Helosciadium Wallichianum*, *Miq. in Pl. Hohenack.* No. 633.—*Pimpinella* sp. 10, *Herb. Ind. Or. H. f. & T.*

MTS. of MALABAR and the SOUTH DECCAN; *Wight, &c.*

Minutely pubescent or nearly glabrous. *Stem* 7-8 ft. (*Dalzell*), much divided upwards. *Leaflets* 2-3 by 1-2 in., sharply serrate; petiolules $\frac{1}{2}$ -2 in.; upper leaves often much reduced, cut into setaceous linear segments. *Bracts* 0, rarely 1 linear; rays 6-12, $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; bracteoles 1-3, $\frac{1}{8}$ in., linear, or more often 0; pedicels 8-20, outer $\frac{1}{4}$ in. male, inner $\frac{1}{8}$ in. hermaphrodite. *Fruit* $\frac{1}{16}$ in., subdidymous, scarcely acute; carpels $\frac{1}{2}$ terete, inner face plane; ridges obscure, furrows 2-vittate; disc not prominent; carpophore entire, or very shortly 2-fid.

16. **P. diversifolia**, *DC. Prodr.* iv. 122; cauline leaves entire 3-partite or sub-2-pinnate leaflets ovate or cordate-lanceolate pubescent, fruit ovate narrowed upwards hispidulous papillose-rugose or finally nearly glabrous. *P. pubescens*, *Wall. Cat.* 567. *P. trifoliata*, *Wall. Cat.* 565. *P. sinica*, *Hance in Seem. Journ. Bot.* 1868, 113. *Helosciadium*? *trifoliatum* and *pubescens*, *DC. Prodr.* iv. 106.

Throughout the HIMALAYA, alt. 4-10,000 ft., very common. KHASIA Mts. alt. 3-6000 ft., common.—DISTRIB. China.

Villous, subtomentose, or scarcely pubescent. *Stem* 2-5 ft., corymbose upwards. Radical and lower cauline leaves often round-ovate; cauline often with 3-5-leaflets, or twice 3-partite or sub-2-pinnate; segments of the uppermost narrower, occasionally almost linear; leaflets usually 1-3 by $\frac{1}{2}$ -1 in., serrate, sometimes lacinate or subpinnatifid. *Bracts* 0, or 1-2, $\frac{1}{4}$ - $\frac{1}{2}$ in., linear; rays 6-16, $\frac{1}{2}$ -1 $\frac{1}{2}$ in., sometimes villous, never quite glabrous; bracteoles 3-8, $\frac{1}{8}$ in., or 0; pedicels 8-16, $\frac{1}{8}$ - $\frac{1}{2}$ in., all fruiting. *Petals* emarginate, white greenish or lurid. *Fruit* $\frac{1}{12}$ - $\frac{1}{10}$ in., laterally compressed, ridges never prominent sometimes quite obscure, furrows 2-3-vittate; disc not prominent; carpels $\frac{1}{2}$ -terete, scarcely subpentagonal, dorsally subcompressed, inner face plane.—A common and variable plant; the north-west examples frequently have the peduncles rays and fruits very villous and the leaves glabrous above. The Khasian have deeply cordate leaflets and papillose-rugose fruit: from these *P. monoica* *Dalz.* differs only by the minute fruits and the barren outer pedicels.

VAR. 1. alpina; petals ovate acute plane, young ovary glabrous, fruit shining yellow-brown glabrous much attenuated upwards. *P. trifoliata*, *Wall. Cat.* 565 (*type specimen*).—Sikkim, alt. 9-10,000 ft.—Rays of the umbel pubescent.

VAR. 2. divisa; lower cauline leaves pinnate and 2-pinnatifid, young fruit terete clavate upwards, disc yellow-brown. *Pimpinella* sp. 5 *Herb. Ind. Or. H. f. & T.*—Kashmir and Kistwar, alt. 7000-8000 ft., *Thomson*.—Probably a new species but there is no ripe fruit.

17. **P. Stracheyi**, *C. B. Clarke*; leaves simple and 3-partite leaflets ovate pubescent, fruit oblong narrowed at both ends, style-bases cylindric apex conical.—*Pimpinella* sp. 3, *Herb. Ind. Or. H. f. & T.*

KUMAON; Dhaulī River, Samangentha, alt. 7500 ft., *Strachey & Winterbottom*.

Generally resembling *P. diversifolia* on a small scale; stems 6-16 in., grey-villous, as the Kumaon examples of *P. diversifolia* generally are. *Fruit* $\frac{1}{2}$ in.; carpels terete, ridges slender, furrows 2-vittate. Young ovary villous. *Fruit* ultimately glabrescent shining yellow-brown.—Nearly allied to No. 22, *P. cæspitosa*.

18. ? **P. Parishiana**, *Kurz in Journ. As. Soc.* 1872, pt. ii. 309, and 1877, pt. ii. 115; leaves pinnate or 2-3-partite leaflets ovate acute serrate or lacinate, bracts 2-5 almost sheathing the rays, ovary minutely pubescent.

MOULMEIN, and MARTABAN, *Kurz*; on the Zwabakin; *Parish*.

Habit of *P. diversifolia*, much divided and very leafy upwards. *Leaflets* 1-2 by

$\frac{1}{2}$ –1 in., sparingly pubescent, very irregularly cut, sometimes pinnatifid. *Umbels* pubescent, nearly as in *P. diversifolia*, but with bracts and prominent bracteoles. *Bracts* $\frac{1}{8}$ – $\frac{1}{4}$ in., pubescent, lanceolate or the bases broad and subconnate; bracteoles very similar, exceeding the flowering umbellules. *Fruit* not seen.—This resembles *P. diversifolia*, differing in the more developed involucre: in the absence of ripe fruit, it may be a *Heracleum* or some other genus.

19. ***P. tomentosa***, Dalz. ms.; lower cauline leaves 2–3-pinnate ultimate leaflets ovate acutely lacinate, fruit narrowly oblong attenuate upwards scabrid with many ascending ovate small scales.—*Pimpinella* sp. 8, *Herb. Ind. Or. H. f. & T.* ? *Heracleum tomentosum*, Dalz. & Gibs. *Bomb. Fl.* 108, 313 (not of Smith).

BOMBAY (probably in the Ghats) Dalzell; Concan, Stocks.

Pubescent, somewhat villous upwards, hardly tomentose. *Stem* 2–4 ft., much branched upwards. Lower leaves large, ovate, ultimate leaflets 1 in., petioluled, serrated with very long teeth; upper often reduced to sheaths. *Bracts* 0; rays 4–8, 1 in.; bracteoles 0, or 1–2 very small linear; pedicels 3–10, $\frac{1}{12}$ – $\frac{1}{8}$ in. *Fruit* $\frac{1}{8}$ in., almost rostrate, laterally compressed, hardly constricted at the commissure; style-bases elongate, conical, yellow-brown; carpels terete, obscurely pentagonal; ridges very obscure, furrows 2–3-vittate; carpophore slender, 2-fid.

20. ***P. adscendens***, Dalz. in Hook. *Kew Journ.* ii. 261; lower cauline leaves oblong pinnate pinnæ ovate or round rarely 3-partite, fruit ovate minutely pilose. Dalz. & Gibs. *Bomb. Fl.* 106.

BOMBAY, Dalzell; Nasik, Edgeworth; BELGAUM, Dr. Ritchie; CONCAN, Stocks.

Minutely pubescent or glabrous. *Stems* many, 8–24 in. Lower leaves with 4–8 pair of pinnæ, terminal leaflet often large, pinnæ $\frac{1}{4}$ – $\frac{3}{8}$ in. diam., acutely serrate; upper leaves reduced, often more divided. *Bracts* 4–7, $\frac{1}{6}$ – $\frac{1}{8}$ in., linear; rays 4–12, 1 in., glabrous; bracteoles 4–7, $\frac{1}{8}$ in., linear, minutely ciliate-pubescent; pedicels 8–16, $\frac{1}{8}$ – $\frac{1}{2}$ in. *Fruit* $\frac{1}{16}$ in., brown, hardly acute, laterally compressed, disc not prominent; carpels terete, hardly pentagonal, not dorsally compressed; ridges obscure; furrows 2–3-vittate.

21. ***P. lateriflora***, Dalz. & Gibs. *Bomb. Fl.* 106; “leaves ternate leaflets twice ternate lobes of the lower leaves lanceolate of the upper linear all acute mucronate, fruit densely covered with small granular tubercles.” Dalz. l. c.

DECCAN; in ravines, common; Dalzell.

Puberulous, 1–1 $\frac{1}{2}$ ft., erect. *Peduncles* long, slender, leaf-opposed; umbels 3–10; bracts 3–7, subulate; bracteoles 7, subulate, as long as the pedicels. *Flowers* pink.—Not seen; the above copied from Dalzell.

22. ***P. cæspitosa***, Benth. in Gen. Pl. i. 895; pubescent, lower leaves oblong pinnate pinnæ ovate, bracts 4–5 linear-lanceolate villous, fruit oblong, furrows 1-vittate. *Petrosiadium cæspitosum*, Edgw. in Trans. Linn. Soc. xx. 51. ? *Thaspium foliosum*, Royle Ill. 40.

GURWHAL; Niti, alt. 12,000 ft., Edgeworth, Strachey & Winterbottom. KUNAWUR; above Rogi, alt. 9–10,000 ft., Thomson.

Rootstock short, woody, branched. *Stems* many, 4–8 in., sparingly leafy upwards. *Pinnæ* of the lower leaves $\frac{1}{4}$ – $\frac{3}{8}$ in. diam., coarsely serrate, hardly mucronate, sometimes lobed or 3-fid. *Bracts* $\frac{1}{4}$ – $\frac{1}{3}$ in.; rays 4–6, $\frac{3}{8}$ in., with much spreading soft white hair; bracteoles 4–6, $\frac{1}{8}$ in., lanceolate; pedicels 6–12, $\frac{1}{5}$ in. *Fruit* $\frac{1}{12}$ – $\frac{1}{10}$ in., very villous when young, ultimately glabrescent, laterally compressed; style-bases

large, subglobose on the young fruit; carpels $\frac{1}{2}$ -terete, dorsally compressed; ridges obscure; furrows 1-vittate on the few fruits available.—Strach. & Wint. suggest that this is the *Thaspium foliosum*, Royle.

14. OSMORRHIZA, DC.

Perennial herbs. *Leaves* twice 3-partite or sub-2-pinnate, ultimate segments large. *Umbels* compound, very lax; bracts few narrow, or 0; bracteoles much shorter than the pedicels. *Calyx-teeth* obsolete. *Petals* emarginate, white. *Fruit* linear-oblong, long-attenuate at base; laterally compressed, somewhat constricted at the commissure; carpels terete, subpentagonal, grooved on the inner face; primary ridges slender, distinct, secondary 0; furrows 2-3-vittate; carpophore slender, 2-fid. *Seed* $\frac{1}{2}$ -terete, dorsally subcompressed, inner face grooved.—DISTRIB. Species 4, North Asia, Japan, North America, Andes.

1. **O. Claytoni**, C. B. Clarke; leaves pubescent, bracts 1-5, fruit hispid below with erect adpressed bristles. *O. brevistylis*, DC. *Prodr.* iv. 232; *Royle* III. p. 233. *O. longistylis*, DC. l. c. 232. *O. laxa*, *Royle* III. 233 t. 52.

NORTH-WEST HIMALAYA, from KASHMIR to KUMAON, alt. 5000-8000 ft., frequent.—DISTRIB. N.E. Asia, Japan, temperate N. America.

Rootstock not tuberous. *Stem* 2-5 ft. *Leaves* large, ovate; ultimate segments 1-2 in. coarsely toothed, sometimes larger and pinnatifid. *Bracts* $\frac{1}{3}$ in., linear; rays 3-6, 1-4 in.; bracteoles 4-6, $\frac{1}{4}$ in., lanceolate; fruiting pedicels 3-6, $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; several other short abortive pedicels indicate male flowers. *Fruit* $\frac{3}{4}$ by $\frac{1}{12}$ - $\frac{1}{10}$ in., rather suddenly narrowed into conical style-bases; styles in fruit variable in length.—The Japanese examples have the pinnæ more pinnate, the Himalayan have the pinnæ generally 3-partite: the length of styles cannot be invariably connected with any other character, geographical or morphological.

15. CHÆROPHYLLUM, Linn.

Herbs, glabrous or hairy. *Leaves* pinnately decompose, or 2-pinnate with pinnatifid pinnules. *Umbels* compound; bracts 1-2, linear, or 0; bracteoles 3-6, lanceolate, or linear, or 0. *Flowers* white, usually polygamous; the central subsessile fertile, others pedicelled male or hermaphrodite. *Calyx-teeth* obsolete (Indian species). *Petals* emarginate. *Fruit* oblong, narrowed upwards, glabrous (in the Indian species), laterally compressed, narrowed at the commissure; primary ridges broad, obtuse, prominent (in *C. cachemiricum* obscure); furrows 1-vittate (or vittæ 0 in *C. capnoides*); carpels terete, inner face with a deep T-shaped groove; carpophore stout, undivided or shortly 2-fid; disc not prominent on the fruit. *Seed* terete, inner face with a deep narrow groove, widened into a hollow in the centre of the seed.—DISTRIB. Species 30; in temperate regions.

Technically separated from *Anthriscus* by the more prominent ridges of the fruit. As regards the Indian species, the only one referred to *Anthriscus* is easily distinguished by the very scabrid fruit.

1. **C. villosum**, Wall. *Cat.* 558 chiefly; stem with many long deflexed white hairs especially below, upper leaves 2-3-pinnate more finely divided than

the lower ultimate segments small, fruit oblong scarcely beaked. *DC. Prodr.* iv. 225.

HIMALAYA, from KASHMIR to SIKKIM; alt. 5000–12,000 ft., frequent. KHASIA Mts., alt. 4000–6000 ft., frequent.

Root fusiform. *Stem* 1–4 feet, erect, branched, always hispid below, often hairy upward. *Leaves* large, secondary pinnæ of the upper pinnate or pinnatifid, ultimate segments scarce $\frac{1}{2}$ in., with 2–4 lanceolate teeth, often with scattered hairs; segments of the lowest often 1–3 by 1 in. pinnatifid scarcely half-way down; upper sheaths usually inflated, hairy, with prominent white margins. *Bracts* 0; rays 3–6, 1–3 in., stout; bracteoles 2–5, $\frac{1}{2}$ – $\frac{3}{4}$ in., linear, often white margined, soon reflexed; pedicels 10–15, often 3–8 fruiting. *Fruit* $\frac{1}{2}$ in., equally broad its whole length, narrowed somewhat suddenly at the tip.

2. *C. reflexum*, *Lindl. in Royle Ill.* 232: glabrous or very sparsely pilose, upper leaves 2-pinnate more finely divided than the lower ultimate segments small, fruit oblong narrowed into a thick cylindric beak. *C. villosum*, *Wall. Cat.* 558 in part.

North-west HIMALAYA; from DALHOUSIE to KUMAON; alt. 5000–9000 ft., frequent.

Much less hairy than *C. villosum*, the fruit larger, and usually 1 (sometimes 2–3), ripen in each umbellule; pedicels of the other flowers being reflexed, as sometimes in a much less degree in *C. villosum*. *Fruit* $\frac{1}{2}$ – $\frac{3}{4}$ in., beak $\frac{1}{2}$ in.; vittæ of the commissure 2, in the narrow part of the groove.

3. *C. acuminatum*, *Lindl. in Royle Ill.* 232; more or less hairy, upper leaves 1–2-pinnate pinnæ large oblong closely regularly falcate-serrate, fruit oblong narrowed close under the style-bases.

HIMALAYA from KASHMIR to KUMAON; alt. 5000–9000 ft., frequent.

Stem 2–4 ft., usually with some long white hairs. Lower leaves often with ultimate pinnæ 2 by $\frac{1}{2}$ in., oblong, acute, upper reduced with narrower segments. *Umbels* bracts bracteoles and fruit much resembling those of *C. villosum*; petals somewhat larger, often somewhat radiant; fruits smaller ($\frac{1}{2}$ in.) fewer (often 2–3) to the umbellule.—Closely allied to *C. villosum*, though very different in the cutting of the leaves. *Lindley* puts it next *C. aromaticum*, *Jacq.*, but it more resembles *C. aureum*, *Linn.*

4. *C. capnoides*, *Benth. in Gen. Pl.* i. 898; root tuberous, leaves 1–2-pinnate ultimate segments oblong entire, fruit oblong-lanceolate vittæ 0. *Butinia capnoides*, *Decne. in Jacquem. Voy. Bot.* 70, t. 80.

KASHMIR; *Jacquemont*. KISHTWAR and BANAHAL; alt. 6000–8000 ft., *Thomson*.

Nearly glabrous. *Stem* 12–24 in. *Leaves* 4–8 in., lax, ovate; ultimate segments $\frac{1}{4}$ – $\frac{3}{4}$ by $\frac{1}{8}$ – $\frac{1}{2}$ in., undulate, mucronate. *Bracts* 0; rays 4–8, 1–3 $\frac{1}{2}$ in., stout; bracteoles 4–7, $\frac{1}{6}$ in., lanceolate; pedicels 6–12, $\frac{1}{2}$ –1 in., most of them fruiting. *Fruit* $\frac{1}{4}$ in., black, minutely punctate, very much constricted at the commissure, narrowed upwards, scarcely beaked; style-bases narrow, conical; carpels subtrapezoid from the extreme narrowing of the inner face; furrows subconcave, epicarp thin, no trace of vittæ.—The Algerian *Balansea Fontanesii*, *Boiss. & Reut.*, said hardly to differ from this by *Benth., l. c.*, apart from the crenate lobed leaflets, the large style-bases, and other prominent specific marks, has the fruits broadly grooved on the very wide commissure, and has large vittæ.

5. *C. cachemiricum*, *C. B. Clarke*; upper leaves sub-2-pinnate secondary pinnæ oblong deeply toothed or subpinnatifid, fruit oblong-lanceolate, ridges obscure.

NORTH-WEST HIMALAYAS; Dalhousie, alt. 7000 ft.; C. B. Clarke.

Stem 2-3 ft., hispid with reflexed hairs. *Bracts* 0; rays 5-8, $\frac{1}{2}$ -1 in.; bracteoles 1-4, $\frac{1}{2}$ in., linear, obscure; pedicels 12, the central alone fruiting. *Fruit* $\frac{1}{2}$ in.; carpels terete; ridges so obscure that the species should perhaps be referred to *Anthriscus*; furrows 1-vittate, no vittæ in the groove.

VAR. dissecta; glabrous, leaves 3-pinnate finely cut, fruit nearly $\frac{1}{4}$ in. sometimes 2 to the umbellule.—Kashmir, Sind Valley, alt. 12,000 ft., C. B. Clarke.—Rays longer and stouter than in the type. Perhaps a distinct species, but the fruit closely agrees with that of *C. cachemicum* except that it is a little larger.

16. **SCANDIX**, Linn.

Annual herbs. *Leaves* pinnately decompound, ultimate segments small, narrow. *Umbels* compound or simple; bracts 1 or 0, bracteoles several. *Flowers* white, polygamous, often radiant. *Calyx-teeth* 0, or minute. *Petals* emarginate. *Fruit* oblong, laterally compressed, beak many times longer than the seed; carpels terete or dorsally subcompressed, with a T-shaped groove on the inner face; primary ridges distinct, broad or narrow, secondary 0; vittæ solitary in each furrow, slender, or 0; carpophore undivided or 2-fid. *Seed* terete, dorsally subcompressed.—DISTRIB. Species 10; all northern, mostly Mediterranean.

1. **S. Pecten-veneris**, Linn.; DC. Prodr. iv. 221; bracteoles lanceolate often incised or lobed at the apex, beak of the fruit dorsally compressed hispidulous on the margins, fruit 1-2 in. Boiss. Fl. Orient. ii. 914.

KASHMIR; alt. 5000-6000 ft., Falconer, Thomson. PUNJAB; Salt Hills, Cleghorn, Aitchison, Jameson.—DISTRIB. Cabul to Western Europe.

Stem 6-12 in., glabrous or pilose as are the leaves. *Umbels* simple or compound, short-peduncled; bracteoles $\frac{1}{4}$ in., lanceolate, pubescent or ciliate; pedicels 3-8, hardly $\frac{1}{10}$ in. in fruit. Beak of fruit twice as long as the seed; ridges broad, obtuse.

17. **ANTHRISCUS**, Hoffm.

Herbs. *Leaves* 2-3-pinnate, ultimate segments pinnatifid or toothed, often broad. *Umbels* compound; bracts 1-2 or 0; bracteoles several, undivided. *Flowers* white, often polygamous. *Calyx-teeth* 0, or minute. *Petals* emarginate. *Fruit* oblong or ovate-oblong, narrowed shortly at the apex, laterally compressed, constricted at the commissure; often scabrous; carpels terete or dorsally subcompressed, with a T-shaped groove on the inner face; primary ridges not prominent, vittæ solitary in each furrow, minute, or 0; carpophore undivided or 2-fid. *Seed* terete, dorsally subcompressed.—DISTRIB. Species 10, the north temperate regions of the Old World, 1 extending to North-west America.

1. **A. nemorosa**, Spreng. Pl. Umb. Prodr. 27; rays 10-15 stout glabrous, bracteoles 5-7 lanceolate pubescent, fruit ovate-oblong clothed with ascending hispid hairs. DC. Prodr. iv. 223; Boiss. Fl. Orient. ii. 911.

KASHMIR, alt. 7000-11,000 ft.; plentiful.—DISTRIB. N. Asia to E. Europe.

Stem 5-8 ft., sparingly hairy. *Leaves* large with large pinnæ and segments, glabrous, or pubescent beneath. Bracteoles $\frac{1}{4}$ in. *Flowers* often radiant. *Fruits* $\frac{1}{2}$ in., numerous in each umbellule, black, minutely punctulate as well as prominently hispid, ridges acute at the apex.

18. **SESELI**, Linn.

Herbs, glabrous or pubescent. *Leaves* 2-3-pinnate or twice 3-partite. *Umbels* compound; bracts 0 few or many, undivided or pinnate; bracteoles several or many. *Calyx-teeth* minute, lanceolate or linear, or 0. *Petals* emarginate, white. *Fruit* oblong ovate or circular, not laterally compressed, broadest at the commissure; carpels $\frac{1}{2}$ -terete or (in *S. trilobum*) much dorsally compressed; inner face plane or (in *S. trilobum*) concave; ridges strong, obtuse or subacute, lateral hardly larger than the dorsal; vittæ in each furrow solitary, usually prominent; carpophore 2-partite, 2-fid or entire; disc not prominent on the fruit. *Seed* $\frac{1}{2}$ -terete; in *S. trilobum* dorsally compressed, inner face excavated.—**DISTRIB.** Species 40; in the N. temperate zone of the Old World; with 2 doubtful Australian.

1. **S. sibiricum**, Benth. in Gen. Pl. i. 901; lower leaves 2-pinnate secondary pinnæ large ovate toothed and pinnatifid sessile or decurrent, calyx-teeth triangular minute deciduous, fruit cylindric villous. Boiss. Fl. Orient. ii. 967.

WEST TIBET; Falconer. KASHMIR; Jacquemont. Kishtwar, alt. 7000-8000 ft., Thomson.—**DISTRIB.** Asia, Russia.

Minutely pubescent or nearly glabrous, 2-4 ft. Lower leaves often 1 ft., upper often pinnate; pinnæ somewhat firm in texture, subspinulose, secondary 1-2 in. Bracts usually 0 or 1; in the Siberian examples sometimes many; rays 15-40, 1-2½ in., pubescent; bracteoles 5-10, $\frac{1}{2}$ in. lanceolate; pedicels 10-25, $\frac{1}{4}$ - $\frac{1}{2}$ in. Young fruit $\frac{1}{2}$ in., densely villous, in age less so; carpels $\frac{1}{2}$ -terete, dorsally compressed, inner face plane; epicarp somewhat thickened, ridges strong, subequal, vittæ large; carpophore slender, 2-partite. *Seed* plane on the inner face.

2. **S. indicum**, W. & A. Prodr. 371; lower leaves 2-pinnate secondary pinnæ ovate lobed pubescent, calyx-teeth 0, fruit subglobose ridges thick. Cnidium diffusum, DC. Prodr. iv. 153; Wight Ic. t. 569. Athamantha diffusa, Wall. Cat. 570. Ligusticum indicum, Wall. Cat. 7215. L. diffusum, Roxb. Hort. Beng. 21, Fl. Ind. ii. 92.

Plains of INDIA; from the foot of the SIWALIKS to ASSAM and COROMANDEL; frequent in CENTRAL BENGAL.

Annual, erect or diffuse, 4-12 in., often much branched. *Leaves* all similarly cut, upper without linear segments. *Bracts* 4-5, $\frac{1}{2}$ in., narrowly lanceolate, caudate, pubescent; rays 8-16, $\frac{1}{4}$ -1 in.; bracteoles like the bracts but rather smaller; pedicels 8-16, $\frac{1}{6}$ in. *Flowers* white or pinkish. *Fruit* $\frac{1}{12}$ - $\frac{1}{10}$ in. (in Roxburgh's drawing copied in Wight Ic. t. 569) glabrous; in Wall. Cat. 7215, and W. & A. Prodr. 371, very hirsute (and hardly half as large); hairs often clubbed or stellate at the apex; carpels $\frac{1}{2}$ -terete; vittæ distinct; carpophore entire.—There are examples with fruit intermediate between the two extreme types above described.

3. **S. daucifolium**, C. B. Clarke; leaves 2-3-pinnate ultimate segments linear or narrowly lanceolate, bracts many often divided, fruit globose glabrous. Ammi daucifolium, Wall. Cat. 7209.—Discopleura sp., Benth. in Gen. Pl. i. 907.

EAST BENGAL; from BHOTAN and ASSAM to DACCA and CHITTAGONG; Wallich, &c.—**DISTRIB.** China.

Annual, erect, 8-16 in., glabrous or nearly so, very leafy upwards. Margin of the leaves minutely serrulate. *Peduncles* often leaf-opposed, short, stout; bracts $\frac{1}{2}$ - $\frac{3}{4}$ in., sometimes pinnate; rays 8-16, usually shorter than the bracts; bracteoles 6-12, $\frac{1}{2}$ in., linear; pedicels 10-25, $\frac{1}{8}$ - $\frac{1}{2}$ in. *Calyx-teeth* 0. *Petals* white or pinkish.

Fruit much like *S. indicum* but smaller and quite glabrous; ridges subequal.—Mr. Bentham did not possess well-ripened fruit when he referred this species to *Discopleura*. Hence referred the Chinese examples doubtfully to *Cnidium Monnieri*, Cuss.; *DC. Prodr.* iv. 152; to which *Seseli daucifolium* bears a general resemblance; but it is more leafy upwards with short peduncles, and the fruit is much smaller and not dorsally compressed.

4. ***S. trilobum***, Benth. in *Gen. Pl.* i. 901; lower leaves 2-pinnate or twice 3-partite, secondary pinnæ ovate lobed petioluled villous or tomentose beneath, calyx-teeth subulate minute deciduous, fruit ovate acute villous. *Sca-phespermum trilobum*, Edgw. in *Trans. Linn. Soc.* xx. 58.

North-West Himalaya; NITTI, alt. 8000–10,000 ft., Edgeworth. GURWHAL, *Falconer*. KUMAON; Millem, alt. 11,000 ft., *Strachey & Winterbottom*.

Stem 8–24 in., villous and little leafy upwards. *Leaves* minutely pubescent above; secondary pinnæ $\frac{1}{4}$ – $\frac{3}{4}$ in., crenate-serrate or irregularly lobed. *Bracts* 3–5, $\frac{1}{2}$ in.; rays 5–10, 1–2 in.; bracteoles 5–8, $\frac{1}{8}$ – $\frac{1}{4}$ in., linear; pedicels 10–20, $\frac{1}{8}$ – $\frac{1}{4}$ in. *Fruit* $\frac{1}{8}$ – $\frac{1}{4}$ in., but little longer than broad; carpels convexo-concave, much dorsally compressed; ridges strongly marked, subequal, vittæ prominent; carpophore deeply 2-fid. *Seed* excavated on the inner face, differing thus from all other species of *Seseli*.—Perhaps a *Pycnocycla*.

19. **PYCNOCYCLA**, Lindl.

Perennial herbs; branches rush-like, few-leaved. *Leaves* pinnately dissected, ultimate segments narrow. Rays of the umbels very short; bracts and bracteoles many, small; umbellules containing one central sessile fertile flower, and several pedicelled males. *Calyx-tube* hairy; teeth small, lanceolate, often unequal. *Petals* obovate, emarginate, hairy. *Fruit* oblong-lanceolate, hairy, terete (one carpel is frequently aborted), surrounded by the inflated pedicels of the barren flowers, receptacle not (or very obscurely) enlarged; carpophore 0; carpels $\frac{1}{2}$ -terete, inner face deeply grooved; primary ridges filiform, minute, lateral at the margin of the broad commissure; vittæ numerous, very slender, usually 1 under each primary ridge and several still more minute scattered in the endocarp. *Seed* lunate or with a T-shaped groove on the inner face.—DISTRIB. Species 7, in N.E. Africa and W. and Central Asia.

Whether one or more flowers in each umbellule perfect seed is hardly a character of generic importance in this order, as may be seen in *Cherophyllum*, wherein *C. reflexum* is hardly separable specifically from *C. villosum*. If this point be withdrawn from the generic character of *Pycnocycla*, it will include *Seseli trilobum*, Benth.

1. ***P. glauca***, Lindl. in *Royle Ill.* 232, t. 51; branches slightly pubescent, ultimate segments of the leaves long-linear subterete, umbels on long pubescent peduncles. *Hiern* in *Oliv. Fl. Trop. Afr.* iii. 8. *P. abyssinica*, *Hochst.*; *A. Rich. Fl. Abyss.* i. 333.

NORTH-WEST INDIA, *Royle*; Sutledge banks, *Falconer*. JUBBULPORE; *Beddome*. SATPURA HILLS, *G. Thomson*.—DISTRIB. Abyssinia.

Branched from the base, 1–2 ft.; branches terete, striate, subglaucous. Radical leaves long-petioled, pinnately dissected; segments remote, glabrous or nearly so; cauline similar, but smaller more shortly petioled. Umbels in flower $\frac{1}{2}$ in. diam., resembling those of a *Scabiosa*; bracts 5–6, $\frac{1}{2}$ in., oblong-linear or linear, hairy; bracteoles similar but smaller; rays $\frac{1}{4}$ in., hairy; pedicels hairy. Flowers in the umbellule about 9; petals white, with reddish midrib, hairy. *Fruit* $\frac{1}{4}$ by $\frac{1}{10}$ in.; carpel with a T-shaped groove on the inner face.—Beddome's examples have the two carpels producing perfect and similar seeds.

20. **FŒNICULUM**, *Adans.*

Glabrous *herbs*, biennial or perennial, tall. *Leaves* 2-3-4-pinnate, ultimate segments linear. *Bracts* 0; bracteoles 0, or few small linear. *Calyx-teeth* 0. *Petals* yellow, emarginate. *Fruit* not laterally compressed, oblong or ellipsoid; carpels $\frac{1}{2}$ -terete, ridges prominent subequal, furrows 1-vittate; carpophore 2-partite. *Seed* somewhat dorsally compressed, inner face slightly concave.—**DISTRIB.** Species 3-4, from the Canaries to Western Asia, 1 widely cultivated.

1. **F. vulgare**, *Gaertn. Fruct.* i. 105, t. 23, fig. 5; *DC. Prodr.* iv. 142; *W. & A. Prodr.* 371; *Wight Ic.* t. 515; *Kurz in Journ. As. Soc.* 1877, pt. ii. 115. *F. officinale*, *Allion.*; *Boiss. Fl. Orient.* ii. 975. *F. dulce*, *C. Bauh.*; *DC. l. c.*; *F. Panmorium*, *DC. l. c.*; *Wight Ic.* t. 570. *Anethum Fœniculum*, *Linn.*; *Roxb. Hort. Beng.* 22. *A. Panmorium*, *Roxb. Hort. Beng.* 22, *Fl. Ind.* ii. 94; *Fleming Cat. Ind. Med. Pl.* 6; *Wall. Cat.* 7211. *Ozodia fœniculacea*, *W. & A. Prodr.* 375.

Commonly cultivated throughout India, alt. 0-6000 ft.; often appearing wild.—**DISTRIB.** Widely cultivated.

The Indian examples have the ultimate segments of the leaves very long; the form *F. piperitum* *DC.*; *Boiss. Fl. Orient.* ii. 975; *Reich. Ic. Fl. Germ.* t. 1931 (with short linear ultimate segments) has not been communicated from India.

21. **PRANGOS**, *Lindl.*

Tall, perennial *herbs*. *Leaves* 3-4-pinnate. *Umbels* compound; bracts and bracteoles many. *Calyx-teeth* 0. *Petals* emarginate, yellow. *Fruit* oblong, commissure broad; carpels $\frac{1}{2}$ -terete, dorsally compressed, inner face nearly plane but the epicarp there thin, introflexed in a deep T-shaped groove; epicarp spongy; primary ridges large, subequal or the lateral larger; vittæ small, numerous; carpophore 2-partite. *Seed* dorsally compressed, inner face slightly concave, with a deep narrow T-shaped groove.—**DISTRIB.** Species 25, in the Mediterranean and West Asian regions.

1. **P. pabularia**, *Lindl. in Quart. Journ. Sc.* xix. (1824) 7; glabrous, ultimate segments of the leaves $\frac{1}{2}$ -1 in. setaceous, fruit ridges undulate furrows rough with corrugations. *DC. Prodr.* iv. 239; *Wall. Pl. As. Rar.* ii. 7, t. 212. *Laserpitium* sp. *Wall. in Trans. Agri. & Hort. Soc. Ind.* i. 74-82.

KASHMIR and **BALTISTHAN**, alt. 6000-11,000 ft., *Falconer, &c.*—**DISTRIB.** Cabul, Kashgar.

Stem 4-5 ft. *Leaves* 12-18 in., very compound. *Umbels* 6-18 in. diam., sometimes very compound. *Bracts* 4-8, $\frac{3}{4}$ in., linear. *Pedicels* 15-25, $\frac{1}{2}$ - $\frac{1}{4}$ in., whereof 4-8 may produce fruit. *Fruit* $\frac{1}{4}$ - $\frac{3}{8}$ in.; wings $\frac{1}{8}$ in. broad; style-bases depressed; styles short, early reflexed. *Seed* $\frac{1}{12}$ - $\frac{1}{10}$ in. diam.

22. **ŒNANTHE**, *Linn.*

Herbs, growing in wet places; root fibrous creeping or stoloniferous (in Indian species). *Leaves* 1-3-pinnate, ultimate segments large or linear or minute, rarely reduced almost to sheaths. *Umbels* compound; bracts 0-1 (in Indian species); bracteoles several linear. *Flowers* white, often polygamous, males sometimes radiant. *Calyx-teeth* small, acute. *Petals* emarginate. *Fruit*

glabrous, ellipsoid, longer than broad, or globose, nearly terete, commissure broad; carpels $\frac{1}{2}$ -terete, dorsally compressed, inner face plane; lateral primary ridges large, triangular, corky; dorsal and intermediate primary ridges much smaller, sometimes obsolete, or all subequal; furrows 1-vittate; carpophore 0; disc usually not prominent. *Seed* terete or dorsally compressed, inner face plane.—**DISTRIB.** Species 25, in the northern hemisphere and S. Africa.

1. **Æ. stolonifera**, Wall. Cat. 585; stoloniferous, stem long-decumbent often floating, leaves 1-2-pinnate secondary pinnae lanceolate or rhomboid-lanceolate serrate or lobed scarcely half-way down, peduncles usually elongate. *DC. Prodr.* iv. 138; *Wight Ic.* t. 571; *Kurz in Journ. As. Soc.* 1877, pt. ii. 115. *Æ. javanica*, *DC. Prodr.* iv. 138. *Phellandrium stoloniferum*, *Roxb. Hort. Beng.* 21, *Fl. Ind.* ii. 93. *Dasyloma latifolium*, *Lindl. in Royle Ill.* 232. *D. javanicum*, *Miq. Fl. Ind. Bat.* i. pt. i. 741. *D. sub-bipinnatum*, *Miq. in Ann. Mus. Lugd. Bat.* iii. 59. *Cyssopetalum javanum*, *Turcz. in Bull. Soc. Nat. Mosc.* 1849, pt. ii. 25.

Northern INDIA from KASHMIR and the PUNJAB to ASSAM and PEGU; alt. 0-5000 ft., frequent; common in the plains of BENGAL.—**DISTRIB.** Java, China, Japan.

Glabrous or nearly so, 2-4 ft., rooting freely from many of the lower nodes. *Leaves* from 3-partite to 2-pinnate; ultimate segments 1-2 by $\frac{1}{2}$ -1 in., those of the upper leaves never linear. *Rays* 6-30, $\frac{1}{2}$ -2 in., stout. *Carpels* $\frac{1}{2}$ by $\frac{1}{16}$ in., subquadrate-ellipsoid, sometimes shorter scarcely longer than broad; dorsal and intermediate ridges usually distinct, scarcely prominent. *Seed*, in horizontal section, nearly circular.—*Dasyloma japonica*, *Miq. in Ann. Mus. Lugd. Bat.* iii. 59, has the leaflets rather more lobed than any Indian examples, but is (*ex Maximowicz. ms.*) only a variety of *Æ. stolonifera*. From this *Æ. laciniatum*, *Miq. Fl. Ind. Bat.* i. pt. 741, does not appear to differ.

VAR. 1. khasiana; very large, secondary pinnae large, nerves beneath reticulated elevated scabrid subpubescent, rays 3 in.—Khasia Mts., near Moflong, alt. 6000 ft., *H. f. & T.*—Calyx-teeth less prominent than in the type; bracteoles much exceeding the flowering umbellules.—This may be a distinct species; but the examples do not exhibit fruit.

VAR. 2. corticata, *Edgw. in Trans. Linn. Soc.* xx. 53 (sp.); leaves often simply 3-partite, fruit scarcely $\frac{1}{12}$ in. subglobose.—Banks of the Delhi Canal, *Edgeworth*.

2. **Æ. benghalensis**, *Benth. in Gen. Pl.* i. 906; roots fibrous, stem erect divided often from the base, leaves 2-pinnate secondary pinnae lanceolate or ovate often deeply pinnatifid ultimate segments never linear, peduncles usually short often 0. *Kurz in Journ. As. Soc.* 1877, pt. ii. 115. *Seseli benghalensis*, *Roxb. Hort. Beng.* 22, *Fl. Ind.* ii. 94. *Dasyloma benghalense*, *DC. Prodr.* iv. 140; *Wight Ic.* t. 568. *D. glaucum*, *DC. Prodr.* iv. 140. *Biforis benghalensis*, *Wall. Cat.* 588. *B. glauca*, *Wall. Cat.* 587.

BENGAL PLAIN and ASSAM, common.—**DISTRIB.** Formosa, Bonin, Loo-choo.

Glabrous or nearly so; 8-16 in.; usually erect on muddy banks. Secondary pinnae $\frac{1}{2}$ -1 in., of the lower leaves often ovate, of the upper lanceolate. *Umbel* often sessile. *Bracts* 0; rays 4-6, rarely $\frac{3}{4}$ in., stout. *Calyx-teeth* small. *Carpels* $\frac{1}{12}$ - $\frac{1}{10}$ by $\frac{1}{16}$ in., subquadrate ellipsoid; dorsal and intermediate ridges usually distinct scarcely prominent. *Seed* nearly terete.—The Indian specimens of *Æ. stolonifera* are readily separated from *Æ. benghalensis*. *Æ. stolonifera* is usually much larger with thickened hollow stems; the leaves are less compound, the rays more numerous and longer, the fruits longer. It is more difficult to separate the Chinese and Japanese specimens.

3. **Æ. linearis**, Wall. Cat. 586; stem decumbent, nodes rooting freely, leaves 2-pinnate ultimate segments of the upper $\frac{1}{2}$ -1 in. linear, peduncles and umbels nearly as in *Æ. stolonifera*. *DC. Prodr.* iv. 138.

NIPAL; Wallich.

Closely allied to *Æ. stolonifera*, and only differing in the more narrowly cut leaves, ultimate segments of the uppermost often $\frac{3}{4}$ by $\frac{1}{16}-\frac{1}{12}$ in. Wallich's specimens have no fruit. Mr. Benthām (in *Gen. Pl.* i. 906) has admitted this plant to specific rank.

4. **Æ. Hookeri**, C. B. Clarke; stem decumbent, nodes rooting, leaves mostly reduced to a fistular rachis with a very few remote pinnæ, pinnæ $\frac{1}{4}$ in. linear often 0.—*Dasyloma* sp. 1, *Herb. Ind. Or. H. f. & T.* Umbellifera, No. 985, *Griff. Itin. Notes* 57.

KHASIA MTS., alt. 5000-6000 ft.; Griffith, H. f. & T., C. B. Clarke.

Glabrous, or the rays sometimes pubescent. Stem 2 ft., erect, fistulous, scarcely divided. Peduncles elongate. Bract 1, $\frac{1}{3}$ in., linear, or 0; rays 4-8, $\frac{1}{2}-2\frac{1}{2}$ in.; bracteoles often longer than the flowering umbellule. Calyx-teeth obsolete. Carpels $\frac{1}{16}-\frac{1}{12}$ by $\frac{1}{12}$ in., almost exactly as in *Æ. benghalensis*, much smaller than in *Æ. fistulosa*, which this plant resembles in habit.

5. **Æ. Thomsoni**, C. B. Clarke; leaves finely 3-4-pinnate ultimate segments scarcely $\frac{1}{8}$ in. linear, peduncle elongate, carpels dorsally compressed.—*Dasyloma* sp. 2, *Herb. Ind. Or. H. f. & T.* Umbellifera, No. 1001, *Griff. Itin. Notes* 65.

SIKKIM and BHOTAN, alt. 5000-8000 ft., frequent. KHASIA MTS., alt. 4500-6000 ft., frequent.

Glabrous, 2-3 ft., weak, diffuse, branched. Leaves 6 in., ovate, sometimes 5-pinnate. Rays 4-8, $\frac{1}{2}-1\frac{1}{2}$ in.; bracteoles not prominent. Carpels $\frac{1}{12}$ by $\frac{1}{12}$ in. dorsally compressed, otherwise much resembling *Æ. benghalensis* and *Æ. Hookeri*. Seed dorsally compressed.

23. SCHULTZIA, Spreng.

Glabrous perennial herbs. Leaves 1-2-pinnate, ultimate pinnæ toothed pinnatifid or multifid. Bracts several, entire or divided; bracteoles numerous. Calyx-teeth prominent (in Indian species). Petals obovate, emarginate, white. Fruit ovate-oblong, commissure broad; carpels dorsally compressed; primary ridges slender; furrows 2-4-vittate; carpophore 2-partite.—DISTRIB. Species 3 in Central Asia, 1 in India.

1. **S. ? Benthami**, C. B. Clarke. *Pimpinella involucrata*, Mig. in *Pl. Hohenack*. No. 657 not of W. & A.

CANARA; Hohenacker.

Calyx-teeth narrow-lanceolate, small. Fruit $\frac{1}{8}-\frac{1}{6}$ in. subquadrate, ellipsoid; ridges distinct, very slightly elevated, the two intermediate approximated to the dorsal. Carpels lunate, compressed, face somewhat excavate. Seed compressed, lunate, inner face concave.—The examples in ripe fruit have the aspect leaves and umbels of *P. involucrata*, W. & A., but the fruit (several still attached) is altogether different, and the plant is referred by Benth. (in *Gen. Pl.* i. 909) to *Schultzia* though the fruit does not quite fit that.—If not a *Schultzia*, the three approximate ridges on the back of the carpels must still bring the plant to this position in the Umbelliferous series.

24. POLYZYGUS, Dalz.

A glabrous herb; root tuberous. Leaves 2-pinnate or twice 3-partite, secondary pinnæ ovate lobed or deeply pinnatifid. Umbels compound; bracts 0, or few small; bracteoles few, small, linear. Calyx-teeth small, or the outer

slightly larger. *Petals* oblong, emarginate, white. *Fruit* ovoid, terete; commissure broad; primary ridges slender; furrows wide, 1-3-vittate; carpophore 2-partite. *Seed* $\frac{1}{2}$ -terete, dorsally compressed, inner face plane.

1. **P. tuberosus**, *Dalz. in Hook. Kew Journ.* ii. 260; *Dalz. & Gibs. Bomb. Fl.* 107.

BOMBAY and MALWA, *Dalzell*; CONCAN, *Stocks*; CANARA and MYSORE; *Law*.

Stems 8-18 in., several, weak. Secondary pinnæ of the leaves $\frac{1}{2}$ -1 $\frac{1}{2}$ in., ultimate segments lanceolate or ovate. *Rays* 3-8, $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; pedicels 6-12, $\frac{1}{8}$ - $\frac{1}{4}$ in. *Fruit* $\frac{1}{2}$ in.; style-bases depressed, inconspicuous.—This resembles a *Pimpinella*, but the habit is weak, straggling.

25. **LIGUSTICUM**, *Linn.*

Perennial herbs. *Leaves* 1-2-3-pinnate or twice 3-partite, ultimate pinnæ large minutely pubescent in the Indian species. *Umbels* compound, usually of many rays; bracts many, few, or 0; bracteoles many, rarely divided. *Calyx-teeth* obsolete. *Petals* obovate, emarginate, white. *Fruit* ovoid or ellipsoid, terete or dorsally subcompressed, commissure broad; carpels dorsally compressed, inner face plane; primary ridges very conspicuous, often subalate, subequal or the lateral wider; dorsal furrows at least 2-vittate, lateral at least 3-vittate; carpophore 2-partite. *Seed* dorsally compressed, about twice as broad as thick, inner face plane or slightly concave.—DISTRIB. Species 20, in the northern hemispheres.

1. **L. Thomsoni**, *C. B. Clarke*; leaves 1-pinnate pinnæ oblong lobed or pinnatifid, fruit ellipsoid terete, lateral ridges scarcely wider than the dorsal.—*Oreocome* sp. 2, *Herb. Ind. Or. H. f. & T.*

WEST TIBET, alt. 11,000-13,000 ft., *Thomson*.—DISTRIB. Afghanistan.

Nearly glabrous; top of the peduncle pubescent. *Stem* 2 ft. Lower leaves 6 by 2 in., oblong, primary pinnæ 1 by $\frac{3}{4}$ in., lobed, or sometimes deeply pinnatifid; upper leaves reduced nearly to sheaths, or small more finely cut. *Bracts* 5-8, $\frac{1}{3}$ - $\frac{2}{3}$ in., white-margined, deciduous; rays 10-20; bracteoles like the bracts but smaller. *Fruit* $\frac{1}{8}$ by $\frac{1}{10}$ - $\frac{1}{12}$ in.; ridges subalate; dorsal furrows 3-2-vittate, lateral 3-vittate, commissure 6-10-vittate.

VAR. *evolutior*; larger, leaves larger 2-pinnate nerves pubescent.—North Kashmir, alt. 6000-9000 ft., frequent. *Stem* usually 3-5 ft., often leafy upwards. *Umbel* very many-rayed, dense. *Fruit* exactly as in the type.

2. **L. marginatum**, *C. B. Clarke*; lower leaves pinnate pinnæ large deeply pinnatifid, carpels orbicular with prominent lateral ridges much dorsally compressed.

North-west HIMALAYA; alt. 7000-10,000 ft.; Simla and Naini Tal; *Thomson*.

Glabrous or nearly so, 2-4 ft., corymbose, nearly naked upwards. Lower cauline leaves 8-10 by 3 in., pinnæ 1-1 $\frac{1}{2}$ in. deeply pinnatifid, lower sometimes subpinnate; segments oblong, serrate or lobed, often minutely pubescent. *Peduncles* long, pubescent upwards. *Bracts* 1-5, $\frac{1}{4}$ in., linear; rays 12-20, $\frac{1}{2}$ -1 $\frac{1}{2}$ in.; bracteoles 4-8, $\frac{1}{8}$ - $\frac{1}{4}$ in., linear. *Fruit* larger than in *L. Thomsoni*, the lateral ridges much wider than the dorsal; vittæ 3 in each furrow, 8 on the commissure. *Seed* 4-6 times as broad as thick, inner face slightly convex.—Undistinguishable from *L. Thomsoni* in the absence of fruit.

3. **L. elatum**, *C. B. Clarke*; lower cauline leaves 2-pinnate secondary pinnæ 1-3 in. ovate pinnatifid, fruit elliptic much dorsally compressed. *Cortia*

elata, Edgw. in *Trans. Linn. Soc.* xx. 55. ? *Levisticum argutum*, Lindl. in *Royle III.* 232.

North-west Himalaya; Simla, alt. 7000-8000 ft., *Edgeworth*. LAHUL; *Jaeschke*.
Stem 2-3 ft. *Lower leaves* 12 by 8 in., secondary pinnæ distant; upper pinnate or reduced to sheaths. *Bracts* 1-4, $\frac{1}{2}$ in., linear, or 0; rays 12-40, 1-1 $\frac{1}{2}$ in.; bracteoles 6-12, $\frac{1}{2}$ in., linear; pedicels very many. *Fruit* $\frac{1}{8}$ - $\frac{1}{2}$ in., nearly as in *L. marginatum*, but the carpels are longer than broad; dorsal furrows 2-3-vittate, lateral 3-vittate, commissure 6-8-vittate. *Seed* 4-6 times as broad as thick, inner face plane.—*Edgeworth's* description is most accurate; the word *bivittatis* in the specific character being a misprint for *trivittatis*. He suggests that it may be the imperfectly described *Levisticum argutum*, Lindl.

26. SELINUM, Linn.

Perennial, branched herbs. *Leaves* pinnately compound. *Umbels* compound; rays numerous; bracts many, linear or pinnatifid, or few, small, or 0; bracteoles numerous, linear, serrate or pinnatifid, sometimes few small. *Calyx-teeth* obsolete, or lanceolate or linear. *Petals* obovate, emarginate, white or yellowish-green. *Fruit* ovoid or subquadrate, commissure broad, more or less dorsally compressed or complanate; lateral primary ridges winged, corky or papery, dorsal and intermediate ridges approximate, equal or unequal, as wide as the lateral or not, sometimes excurrent, not winged; dorsal furrows 1-vittate (or rarely 1 large deep-seated 2 small lateral superficial) or 0, lateral furrows 1-4 vittate; carpophore slender, 2-partite; style-bases not prominent in fruit. *Seed* subterete, or more or less dorsally compressed, inner face plane or slightly concave, not grooved.—*DISTRIB.* Species 35, chiefly north temperate, with a South African and Andean.

The Indian species are uniform in habit, having very compound leaves, large umbels with prominent involucre, three approximated ridges excurrent on the back of each carpel, and the seed not grooved on the inner face. *Ligusticum* differs by having the dorsal furrows 3-vittate. *S. tenuifolium* has the three dorsal ridges not excurrent, often subobsolete, and is therefore hardly different from *Angelica*. *Pimpinella sikkimensis* (p. 685) was referred to *Selinum* by Benth.

1. *S. striatum*, Benth. in *Gen. Pl.* i. 914; ultimate segments of the leaves $\frac{1}{8}$ in. narrowly oblong-lanceolate, fruit little dorsally compressed, ridges subequally winged, vittæ all solitary, seed about twice as broad as thick. *Laserpitium striatum*, Wall. *Cat.* 583 (not *Ligusticum striatum*, DC. *Prodr.* iv. 158).

NIPAL; *Wallich*. KHASIA MTS.; alt. 3500-6000 ft., abundant.

Glabrous or nearly so; 1-4 ft., frequently with many withered fibres at the base. *Leaves* 4-8 in., ovate, 3-4-pinnate, uppermost sheath often extending the whole length of the petiole. *Bracts* 4-6, $\frac{1}{4}$ - $\frac{3}{4}$ in., linear: rays glabrous or obscurely pubescent; bracteoles 4-8, $\frac{1}{4}$ in., linear, minutely white on the margin, hardly serrate, not divided. *Calyx-teeth* linear, oblong, twice as long as broad. *Fruit* $\frac{1}{8}$ - $\frac{1}{2}$ in., lateral furrows 1-vittate, vittæ twice as wide as those in the dorsal; commissural vittæ 2, wide apart. *Seed* obscurely 2-grooved on the inner face.—Easily recognised by the little-compressed fruits and seeds. All the specimens are Khasian, except *Wallich's*, which have the ultimate segments of the leaves less narrowly cut, showing the secondary nerves impressed: the fruit is exactly as in the Khasian examples. In *Ligusticum striatum*, DC. *Prodr.* iv. 158, the furrows are multi-vittate. Benth., l.c., assuming that DC. possessed the true *S. striatum*, points out that he was mistaken on this point. But DC. also says that his *Ligusticum striatum* had "leaves 2-pinnate the lobes acute entire seldom incised," so that his plant cannot be

referred to any Indian *Selinum*. Wallich must have distributed two plants mixed under one name in this as in so many other cases.

2. ***S. tenuifolium***, *Wall. Cat.* 579, chiefly; ultimate pinnæ $\frac{1}{2}$ in. broad-elliptic pinnatifid deeply into narrow lanceolate acute segments, fruit $\frac{1}{2}$ in. much dorsally compressed, lateral ridges much the broadest, dorsal furrows 1-vittate lateral 2-3-vittate, seed 4-6 times as broad as thick. *S. Candollii*, *Edgw. in Trans. Linn. Soc.* xx. 55, not of DC. *Peucedanum Wallichianum*, DC. *Prodr.* iv. 181. *Pleurospermum cicutarium*, *Lindl. in Royle III.* 233. *Oreocome Candolliana*, *Edgw. l. c.*

Himalaya; alt. 6000-13,000 ft., from KASHMIR to BHOTAN, very common.

Stem 2-6 ft. *Lower leaves* often 1 ft., in outline ovate, usually 3-pinnate, tertiary pinnæ 1-2-pinnatifid, glabrous or pubescent; upper leaves reduced, sheath often as long as the petiole. *Bracts* 4-8, $\frac{3}{4}$ -1 $\frac{1}{2}$ in., linear, often toothed or slightly lobed, rarely pinnate; rays generally villous; bracteoles 5-12, often longer than the umbellule, white-margined, often lobed rarely pinnate or 2-pinnatifid. *Calyx-teeth* linear; carpels slightly elliptic, longer than broad; dorsally compressed, subcomplanate, 3 dorsal ridges approximate, often hardly elevated (whence DC. considered the plant a *Peucedanum*); commissural vittæ 4-6, distant from the medial line. *Seed* complanate, inner face plane or subconvex.

VAR. 1. *filicifolia*; quaternary pinnæ pinnatifid into more remote lobes. *Oreocome filicifolia*, *Edgw. in Trans. Linn. Soc.* xx. 55. ? *Laserpitium conifolium*, *Wall. Cat.* 584.—Kashmir and N.W. Himalaya, alt. 6000-10,000 ft., frequent.—Wallich's *L. conifolium* is without fruit and the leaves appear to belong to two species. *Ligusticum conifolium*, DC. *Prodr.* iv. 158, from the description appears the same plant; DC. says that the furrows are multi-vittate; referring probably to the lateral ones, which have 2-4 vittæ.

VAR. 2. *elata*; quaternary pinnæ $\frac{1}{2}$ -1 in. broad-elliptic, fruit $\frac{1}{4}$ in. much dorsally compressed, dorsal and intermediate ridges distinctly winged, but less so than the lateral, dorsal furrows 1-vittate, lateral 2-3-vittate, seed 4 times as broad as thick. *Oreocome elata*, *Edgw. in Trans. Linn. Soc.* xx. 54.—North-west Himalaya, alt. 6000-10,000 ft.; from Kashmir to Kumaon; frequent.—This seems to differ from *S. tenuifolium* in the winged 3 dorsal ridges: the fruit also is somewhat larger. As regards Edgeworth's main character of "primary pinnæ of the upper leaves sessile at the apex of the sheath," it is common to *S. tenuifolium* and most other Indian species.

3. ***S. Candollii***, DC. *Prodr.* iv. 165; quaternary pinnæ $\frac{1}{2}$ - $\frac{3}{4}$ in. broad-elliptic pinnatifid deeply into narrow-lanceolate acute segments, fruit $\frac{1}{4}$ in. somewhat dorsally compressed, ridges all distinctly subequally winged, furrows all 1-vittate, seed 2 $\frac{1}{2}$ times as broad as thick. *Angelica* ? *Candollii*, *Wall. Cat.* 582.

KASHMIR; alt. 7000-8000 ft., *Thomson*. NIPAL and KUMAON; *Wallich*. SIKKIM; alt. 12,000 ft., C. B. Clarke.

Stem, leaves, bracts and umbels generally like *S. tenuifolium*, but the fruit very distinct. *Fruit* subquadrate, longer than broad; 3 dorsal ridges approximate; vittæ in the lateral furrows solitary, but twice as broad as the dorsal, commissural 2, thick, somewhat widely separated. *Seed* convexo-concave, margins obtuse.

4. ***S. vaginatum***, C. B. Clarke; secondary pinnæ mostly 1 in. lanceolate serrate scarcely lobed or pinnatifid, bracteoles 1-2-pinnate, fruit $\frac{1}{2}$ in. dorsally compressed, ridges all winged the lateral more broadly, vittæ obsolete, seed 3 times as broad as thick. *Cortia vaginata*, *Edgw. in Trans. Linn. Soc.* xx. 55.

From KASHMIR to KUMAON, alt. 6000-12,000 ft., frequent.

Glabrous, or nearly so, 2-4 ft. *Leaves* 4-10 in., elliptic; lower like *Sium lati-*

folium; upper reduced; primary pinnae sometimes sessile on the sheath. *Bracts* few, usually inconspicuous; bracteoles 8-12, $\frac{1}{2}$ -1 $\frac{1}{2}$ in., usually exceeding the umbellule. *Calyx-teeth* long linear lanceolate. *Fruit* subquadrate, longer than broad, 3 dorsal ridges approximate. *Seed* plane on the inner face, or slightly concave.—The Herbarium specimens are largely mixed with fruits of *S. elatum*: and Edgeworth's descriptions of the fruit and bracteoles seem taken from these: the true plant has very large compound bracteoles, and the above description of the fruit is of ripe ones attached to unmistakable leaves. Mr. Benthams has referred it to *Ligusticum*, from the leaves approaching the Indian *Ligusticum*s and the obsolete vittæ; but the compound bracteoles and long calyx-teeth refer it to *Selinum*.

5. ***S. papyraceum*, C. B. Clarke**; tertiary pinnae $\frac{1}{2}$ in. ovate serrate or half-pinnatifid into lanceolate segments, fruit $\frac{1}{2}$ in. much dorsally compressed, lateral wings papery wider than the 3 dorsal, dorsal furrows 1-vittate lateral usually 2-vittate, seed in horizontal section elliptic twice as broad as thick.

From BALTISTHAN and KASHMIR to SIKKIM, alt. 8000-12,000 ft.; frequent.

Resembling *S. tenuifolium* so closely that it is difficult to separate until the fruit is nearly ripe: the leaves are usually less compound, the rays less villous, the bracteoles not white-margined. *Fruit* often longer than the umbellule, subquadrate, rather longer than broad, very strongly compressed; lateral ridges, quite unlike the white corky wings of the other Indian *Selinums*: 3 dorsal ridges very close together, usually very small, but in some examples the intermediate ridges are developed, nearly as wide as the lateral, the dorsal remaining minute. *Seed* very narrow compared with the breadth of the carpel, commissural vittæ close to the carpophore.

DOUBTFUL SPECIES.

?*S. DISSECTUM*, Wall. Cat. 581; leaves pinnate segments twice pinnatifid, lobes linear-oblong acute, bracts 0, bracteoles few, flowers yellowish, fruit nearly orbicular narrowly margined, furrows 1-vittate, vittæ very distinct, commissural pair close to the carpophore. *Peucedanum dissectum*, DC. Prodr. iv, 178.—NIPAL; Gossain Than, Wallich. Habit of *Ethusa*.—The sheet in the Wallichian Herbarium contains—1, a good specimen in flower having 4-8 bracts and prominent bracteoles; 2, a young flowering specimen, exinvolucrate; 3, a detached umbel in fruit. DC.'s description, copied above, appears made up from 2 and 3, excluding 1; 1 certainly does not belong to 2, and it is possible that the fruit 3 belongs to neither.

27. **CORTIA, DC.**

Perennial herbs, often nearly stem-less. *Leaves* 3-4-pinnate, mostly radical, ultimate segments linear. *Umbels* compound, central one often sessile on the rootstock with numerous unequal rays; bracts rays and bracteoles many, often pinnate or 2-pinnate. *Calyx-teeth* prominent, sub-linear. *Petals* obovate, emarginate, white or purplish. *Fruit* orbicular or elliptic, much dorsally compressed; lateral ridges winged, dorsal and intermediate approximated much narrower sometimes hardly winged; dorsal vittæ solitary, lateral solitary or in pairs; carpophore 2-partite. *Seed* much dorsally compressed, inner face plane.—DISTRIB. Species 2; Himalayan.

This genus only differs from the Indian species of *Selinum* in the elongate unequal rays of the umbel; *C. Lindleyi* differs from all the *Selinums* by its compound pinnate bracteoles, *C. Hookeri*, by being stemless.

1. **C. Lindleyi**, DC. Prodr. iv. 187; bracteoles 2-pinnate, styles of the fertile flowers short; fruit commissure 4-vittate. *Schultzia*? *Lindley*, Wall. Cat. 589. *Athamantha depressa*, Don Prodr. 184 (ex Wall. Herb.).

From KUMAON to BHOTAN, alt. 12,000–16,000 ft; *Wallich*, &c.

Stem 0–8 in. *Leaves* glabrous or nearly so, ultimate segments rarely $\frac{1}{10}$ in., setaceous. *Umbel* often sessile; bracts (in the peduncled umbels) many large 2-pinnate; rays often pubescent, very unequal, sometimes 8–12 in. *Fruit* $\frac{1}{8}$ – $\frac{1}{6}$ in.; carpels elliptic, slightly cordate at base; 3-dorsal ridges slightly equally winged, much narrower than the lateral: dorsal furrows 1-vittate, lateral usually 2-vittate. *Seed* 4–5 times as broad as thick.

2. **C. Hookeri**, *C. B. Clarke*; bracteoles long simple or slightly lobed, styles of the fertile flowers very long, fruit commissure 2-vittate.—*Cortia* sp. 1, *Herb. Ind. Or. H. f. & T.*

SIKKIM; alt. 13,000–18,000 ft., Donkiah, Jongri, &c., *J. D. H.*; Yakla, alt. 16,000 ft., *C. B. Clarke*; Phaloot, *S. Kurz*.

Stemless, with the fruit packed in dense masses over the crown, and a few long umbel-rays often added. *Leaves* glabrous or minutely pubescent, ultimate segments $\frac{1}{12}$ – $\frac{1}{4}$ in., linear. *Rays* usually pubescent; bracteoles $\frac{1}{2}$ – $\frac{3}{4}$ in.; pedicels of the fruit $\frac{1}{12}$ – $\frac{1}{4}$ in., often ultimately thickened; umbellules generally unisexual, males with long stamens and obsolete styles. *Fruit* $\frac{1}{4}$ by $\frac{1}{8}$ in., depressed-circular, base cordate; 3 dorsal ridges slightly equally elevated, or the dorsal slightly winged, the intermediate nearly as broad as the lateral: furrows all 1-vittate, vittæ rather large. *Seed* 4–5 times as broad as thick.—The variation in the wings of the fruit of this species may be seen in one umbellule. But the great difference in the ultimate segments of the leaves is only seen in different plants, and may indicate two species: in one they are about $\frac{1}{12}$ in., in the other about $\frac{1}{4}$ in., and much more remote.

28. **PLEUROSPERMUM**, *Hoffm.*

Perennial or biennial *herbs*, glabrous or nearly so. *Leaves* 1–4-pinnate, ultimate pinnæ ovate, pinnatifid or multifid, setaceous. *Umbels* compound, rays many; bracts many, or few, often pinnatifid or compound, frequently white-margined; bracteoles many, broad, more or less white-margined, entire toothed or pinnatifid. *Calyx-teeth* small, or 0. *Petals* obovate, emarginate, white or dark purple. *Fruit* elliptic or oblong, terete or dorsally subcompressed; epicarp often lax; commissure broad; primary ridges winged, lateral narrower broader than the others; furrows 1-vittate, or the lateral 2-vittate, or vittæ many; carpophore 2-partite. *Seed* dorsally compressed, 2–3 times as broad as thick, inner face grooved concave or nearly plane.—*DISTRIB.* Species 16; Asiatic and Russian.

1. **P. Govanianum**, *Benth. in Gen. Pl.* i. 915; leaves pinnate pinnæ $\frac{1}{2}$ – $\frac{1}{2}$ in. toothed or pinnatifid, bracteoles obovate toothed or subpinnatifid at the apex, fruit $\frac{1}{2}$ in. lateral ridges narrowest. *Ligusticum Govanianum*, *Wall. Cat.* 546. *Hymenolæna Govaniana*, *DC. Prodr.* iv. 246; *Royle Ill.* 233, t. 52.

From KASHMIR to GURWHAH, alt. 10,000–15,000 ft., *Jacquemont*, &c.

Stem 1 foot or less, thick, hollow. *Leaves* 4–8 in., oblong, pinnæ often distant never finely cut, rarely deeply pinnatifid. *Bracts* 1–3 in., of an oblong entire white-margined sheath and divided often 2-pinnatifid limb; rays 1–5 in.; pedicels very many, short; umbellule capitate embraced by the bracteoles. *Fruit* ellipsoid or subquadrate; epicarp very lax, glistening, reticulate, ridges hollow, furrows 1-vittate. *Seed* distinctly grooved on the inner face.

2. **P. sikkimense**, *C. B. Clarke*; leaves pinnate rarely 2-pinnate pinnæ $\frac{1}{2}$ –2 in. toothed or pinnatifid, bracteoles obovate toothed or subpinnatifid at the apex, fruit $\frac{1}{2}$ in. equally 5-ridged hardly winged, epicarp not loose.

Sikkim, alt. 13,000–16,000 ft.; *J. D. H., C. B. Clarke.*

Stem 2–24 in., thick, hollow. *Leaves* 4–8 in., oblong; pinnæ often distant, never finely cut. *Bracts* 1–1½ in., usually pinnatifid at the apex; rays 1–5 in.; pedicels very many, short; umbellules capitate and embraced by the bracteoles. *Fruit* narrow-oblong, rather broader upwards; calyx-teeth small; disc depressed; epicarp dull brown, somewhat corky; furrows 1-vittate. *Seed* concave or slightly grooved on the inner face.

3. **P. Candollii**, *Benth. in Gen. Pl. i.* 884, 916; leaves pinnate pinnæ ½–1½ in. toothed or pinnatifid, bracteoles elliptic or oblong entire, fruit ½ in. lateral ridges broadest, furrows 3–2-vittate. *Ligusticum Candollii*, *Wall. Cat.* 544. *Hymenolæna Candollii*, *DC. Prodr. iv.* 245. *H. latifolia*, *Lindl. in Royle Ill.* 233. *H. pimpinellifolia*, *Osten-Sacken & Ruprecht Sert. Tianschan*, 50.

From KASHMIR to KUMAON, alt. 10,000–15,000 ft.; frequent.—**DISTRIB.** Tianschan Mts.

Stem 6–18 in., usually very thick. *Leaves* 4–8 in., oblong; pinnæ often distant, never finely cut. *Bracts* 0–3 in., often like reduced upper leaves, sometimes a mere sheath; rays many, 2–8 in., sometimes carrying scattered white elliptic veined bracts; bracteoles obtuse, sometimes mucronate, embracing and usually overtopping the umbel. *Fruit* ellipsoid; ridges narrowly winged. *Seed* grooved on the inner face.—This has numerous vittæ, but the bracteoles and broad commissure are of *Pleurospermum*.

4. **P. ? rotundatum**, *Benth. in Gen. Pl. i.* 915; leaves pinnate or 3-partite, leaflets of the lower 1–3 in. diam. with 3 rounded lobes, bracts 0 or 1 small, bracteoles 5–8 ¼ in. narrow-lanceolate caudate entire white-margined. *Ligusticum rotundatum*, *Wall. Cat.* 549. *Hymenolæna rotundata*, *DC. Prodr. iv.* 245.

NIPAL; Gossain Than, *Wallich.*

Stem 2 ft., not very thick. *Leaflets* 3–5, petioluled, distant, entire or crenate, scarcely serrate, more often with 3 rounded lobes. *Rays* 8–12, 1–1½ in.; pedicels 8–16, some as long as the bracteoles. *Calyx-teeth* 0. *Disc* and *styles* small. *Young fruit* subcylindric with incipient ridges.—*Wallich's* examples show no ripe fruit, so that the genus is doubtful. The elongate not thick stem, the subobsolete bracts, and the little-prominent bracteoles do not look like *Pleurospermum*.

5. **P. Benthami**, *C. B. Clarke*; leaves pinnate or sub-2-pinnate pinnæ 1–3 in. deeply lobed, bracteoles oblong toothed scarcely pinnatifid at the apex, fruiting pedicels ½–1½ in., fruit ½–¾ in., lateral ridges widest. *Ligusticum Benthami*, *Wall. Cat.* 542. *Hymenolæna Benthami*, *DC. Prodr. iv.* 246.

NIPAL; Gossain Than, *Wallich.*

Stem 2–3 ft. *Pinnæ* pinnatifid; lobes distant, large, coarsely serrate *Bracts* 4–6, 1–1½ in., oblong, coarsely lobed or pinnatifid at the apex; rays 4–12, 1–2½ in. *Fruit* ellipsoid, dorsally compressed; calyx-teeth obsolete, style-bases somewhat prominent; furrows 1-vittate. *Seed* broadly concave on the inner face, hardly grooved.

6. **P. angelicoides**, *Benth. in Gen. Pl. i.* 915; leaves 1–2-pinnate pinnæ 3–6 in. with oblong segments, bracteoles 5–8 ¾ in. narrow-lanceolate entire, fruit ½ in. narrowly oblong. *Ligusticum angelicoides*, *Wall. Cat.* 548. *Hymenolæna angelicoides*, *DC. Prodr. iv.* 245. *Pterocyclus angelicoides*, *Klotzsch in Reis. Pr. Waldem. Bot.* 150, t. 47.

KASHMIR; *Falconer.* **KUMAON**; Rutam River, alt. 11,500 ft., *Strachey & Winterbottom.* **NIPAL**; *Wallich.*

Stem 3–4 ft. *Leaves* 12–18 in.; segments of the secondary pinnæ often 1–3 in.,

serrated somewhat closely and regularly. *Bracts* 5-8, 1-1 $\frac{3}{4}$ in., narrowly-lanceolate, entire, white-margined; rays 10-20, 1-4 in.; pedicels in fruit $\frac{1}{2}$ - $\frac{3}{4}$ in., often exceeding the bracteoles. Ridges of the *carpels* thin, narrowly winged, lateral rather the broadest.—The fruit is dorsally compressed; Klotzsch's figure must have been taken from very immature fruit, and does not show correctly the shape of the *carpel* in horizontal section at any period.

7. ***P. dentatum***, *Benth. in Gen. Pl.* i. 915; leaves 2-pinnate *pinnæ* $\frac{1}{2}$ -2 in. ovate, bracteoles 5-8 $\frac{1}{2}$ in. lanceolate entire or minutely denticulate near the apex, fruit $\frac{1}{4}$ in. ellipsoid. *Ligusticum dentatum*, *Wall. Cat.* 547. *Hymenolæna dentata*, *DC. Prodr.* iv. 245.

From KUMAON to SIKKIM, alt. 9000-13,000 ft., *Wallich, &c.*

Stem 2-4 ft. Segments of the *pinnæ* $\frac{1}{2}$ in., oblong or ovate, serrate. *Bracts* 3-0, 1 in., lanceolate, white-margined; rays 5-15, 1-3 in.; bracteoles usually undulate on the margin, crenulate or denticulate, or quite entire; pedicels in fruit usually shorter than the bracteoles. *Carpels* elliptic, dorsally compressed; ridges thin, narrowly alate, lateral broadest; dorsal furrows 1-vittate, lateral 2-vittate; commissure plane, 4-vittate; calyx-teeth 0; style-bases not prominent. *Seed* very obscurely concave on the inner face, or plane.—*Cnidium cuneatum*, *Ledeb. Fl. Alt.* i. 331 (*Aulacospermum*, *Ic. Fl. Ross.* iv. 7, t. 312) appears the same, but the authentic example is in young flower only. It is said to differ by the upper branches and leaves being opposite and whorled: but this is occasionally seen in many species of *Pleurospermum*. *P. dentatum*, in the absence of fruit, is very difficult to distinguish from *P. angelicoides*; but the leaves and leaflets are generally smaller, the bracteoles lanceolate (rather than narrow-lanceolate) and slightly crenulate or serrulate. In defining the area of the species; all Sir J. D. Hooker's examples distributed as *P. angelicoides* have been referred to *P. dentatum*; though the leaflets are large, the fruit is small, and the bracteoles distinctly serrulate.

VAR. erosa, *DC. l.c.*; bracts 4-5, leaflets more irregularly incise-serrate.—Mixed with the type as *DC.* states. There appear two states of the bracts, and two very differently cut leaves; the latter may indicate a different species as *DC.* suggests, but the typical *P. dentatum* has sometimes many bracts.

8. ***P. pumilum***, *Benth. in Gen. Pl.* i. 915; leaves pinnate *pinnæ* $\frac{1}{2}$ -1 in. ovate lobed or subpinnatifid, bracts 1-2 small linear or 0, bracteoles 3-7 $\frac{1}{4}$ in. linear entire obscurely white-margined. *Ligusticum pumilum*, *Wall. Cat.* 550. *Hymenolæna pumila*, *DC. Prodr.* iv. 245.

NIPAL; *Wallich*. SIKKIM; Islumbo, alt. 11,000 ft., *C. B. Clarke*.

The specimens are without fruit. The species is very near *P. dentatum*, and differs only in the subobsolete bracts and very narrow bracteoles. The Sikkim example must have been at least 3 feet high, so that the name *pumilum* is not well applied to the species.

9. ***P. stylosum***, *C. B. Clarke*; leaves 2-pinnate *pinnæ* 1-3 in. often pinnatifid, bracteoles 6-10 lanceolate entire or incise-serrate at the apex, fruit $\frac{1}{8}$ in. subglobose transversely plicate-rugose.

KASHMIR; *Falconer*. LAHUL; alt. 11,000-12,000 ft., *Rev. H. Jaeschke*.

Stem 2-4 ft. Segments of the secondary *pinnæ* $\frac{1}{2}$ -1 in., pinnatifid or serrate. *Bracts* 4-6, 1-3 in., lobed or pinnatifid at the apex; rays 10-35, 1 $\frac{1}{2}$ -3 in.; bracteoles white-margined, entire, incised or lobed in the same umbel. *Fruit* slightly longer than broad; epicarp of very lax tissue (as in *P. Govanianum*) the transverse folds occupying the whole back except the ridges; style-bases prominent even on the ripe fruit; calyx-teeth obsolete; ridges subequal, hardly winged.

10. ***P. stellatum***, *Benth. in Gen. Pl.* i. 915; leaves 1-2-pinnate *pinnæ* $\frac{1}{4}$ in. serrate or pinnatifid with small narrowly lanceolate lobes, bracteoles 5-8

oblong white-margined obtuse lobed or very shortly pinnatifid at the apex, fruit $\frac{1}{8}$ in. ellipsoid somewhat longer than broad, epicarp of very lax tissue, seed grooved on the inner face. *Selinum stellatum*, *Don Prodr.* 185; *DC. Prodr.* iv. 165. *Hymenolæna stellata*, *Lindl. in Royle Ill.* 233.

North-west HIMALAYA; *Royle*. KUMAON; Milam Glacier, alt. 13,000 ft., *Strachey & Winterbottom*.

Stem 1-6 in. *Leaves* 2-4 in., oblong; pinnæ ovate, acutely serrate, or sublobately pinnatifid or nearly 2-pinnate with mucronate lobes. *Bracts* 1-4, $\frac{1}{2}$ -1 $\frac{1}{2}$ in., pinnatifid; rays 3-5, 1-6 in., glabrous; pedicels very short. *Fruit* dorsally compressed; style-bases globose, depressed; calyx-teeth obsolete; petals often persistent. *Carpels* plane on the inner face; lateral ridges hardly so wide as the intermediate and dorsal, all obtuse, hollow; epicarp rugose, but hardly plicate; furrows 1-vittate.

VAR. *Lindleyana*; bracteoles entire or slightly lobed, leaves often 2-pinnate ultimate segments oblong or obovate obtuse. *Hymenolæna Lindleyana*, *Klotzsch in Reis. Pr. Waldem. Bot.* 150, t. 49. *H. nana*, *Osten-Sacken & Ruprecht Sert. Tianshan.* 49. *Hymenolæna*, sp. No. 9, *Herb. Ind. Or. H. f. & T.* ? *Aulacospermum simplex*, *Ost. & Rup. l. c.*—West Himalaya, alt. 13,000-16,000 ft.; Kashmir, *Thomson*. LAHUL; *Rev. H. Jaeschke*.—Distrib. Karakorum (Northern slope); Tianshan Mts.—Except as to the obtuse (not mucronate) ultimate segments of the leaflets, there seems no difference between this and *P. stellatum* type. Of *Aulacospermum simplex*, the authentic example has the fruit not half-ripe, the bracteoles are rather smaller.

11. **P. apiolens**, *C. B. Clarke*; leaves pinnate pinnæ $\frac{1}{2}$ -1 $\frac{1}{2}$ in. ovate often pinnatifid with 3-5-7 lobes, bracteoles 6-10 obovate caudate often toothed near the apex, calyx-teeth obsolete, fruit $\frac{1}{8}$ - $\frac{1}{6}$ in. ellipsoid subquadrate.—*Hymenolæna* sp. 10, *Herb. Ind. Or., H. f. & T.*

Interior valleys of SIKKIM, alt. 11,000-14,000 ft.; *J. D. H.*; *Flwies*; *C. B. Clarke*.

Stem 3-18 in. *Leaves* 4-8 in., oblong, mucronate-serrate. *Bracts* 4-5, $\frac{3}{4}$ -1 $\frac{1}{4}$ in., obovate-lanceolate, toothed, sometimes slightly pinnatifid, rarely subentire; rays 8-16, 1-2 in.; pedicels many, scarcely $\frac{1}{4}$ in. in fruit, much shorter than the bracteoles. *Carpels* dorsally compressed; epicarp loose but not of open tissue; ridges narrowly winged, subequal; furrows 1-vittate. *Seed* twice as broad as thick, inner face exactly plane.—Smells of celery (*J. D. H.*).

12. **P. Hookeri**, *C. B. Clarke*; leaves 2-3-pinnate ultimate pinnæ $\frac{1}{4}$ - $\frac{1}{2}$ in. ovate or oblong toothed or pinnatifid, bracteoles 6-10 obovate-lanceolate subentire white-margined, calyx-teeth ovate.—*Hymenolæna* sp. 8, *Herb. Ind. Or., H. f. & T.* *Oreocome* sp. 1, *Herb. Ind. Or. H. f. & T.*

SIKKIM, alt. 10,000-16,000 ft.; *J. D. H.*

Stem 8-20 in. *Leaves* 6-12 in., ovate, mucronate-serrate. *Bracts* 4-7, 1-1 $\frac{1}{2}$ in. lanceolate, often toothed or pinnatifid at the apex; rays 4-8, 1-3 in.; pedicels very many, $\frac{1}{4}$ - $\frac{1}{3}$ in., shorter than the bracteoles. *Petals* persistent. *Fruit* not ripe, but will be nearly as in the var. *Thomsoni*.

VAR. *Thomsoni*; bracteoles narrowly lanceolate (not at all obovate) narrow and narrowly white-margined often not prominent. WEST TIBET, alt. 14,000-16,000 ft., *Thomson*; Shelshed River, alt. 15,500 ft., *Strachey & Winterbottom*.—*Fruit* $\frac{1}{4}$ in., ellipsoid; epicarp loose but not of open tissue; ridges thin, narrowly winged, lateral a little broadest. *Seed* plane on the inner face or nearly so.—United with *P. Hookeri* by *H. f. & T.* in *Herb.* and it agrees with it as to the ovate calyx-teeth, but differs in the much smaller bracteoles and the remote locality. It has been placed next *Selinum tenuifolium* by *H. f. & T.* (mss.) and its bracts and bracteoles are hardly more prominent than in that species: but *P. Hookeri* type must be placed in *Pleurospermum*, which here touches *Selinum*.

13. **P. densiflorum**, Benth. in Gen. Pl. i. 916; leaves 3-4-pinnate ultimate segments very narrowly lanceolate or linear, bracteoles 5-8 elliptic entire or somewhat pinnatifid at the apex, fruit $\frac{1}{2}$ - $\frac{1}{4}$ in. with 5 subequal somewhat broad ridges, seed distinctly grooved on the inner face. Hymenidium? densiflorum, Lindl. in Royle Ill. 233. ? H. suaveolens, Klotzsch in Reis. Pr. Walden. Bot. 148, t. 48.

North-west HIMALAYA; Royle. KASHMIR, alt. 11,000-14,000 ft., Levinge, C. B. Clarke. GURWHAL, Falconer.

Stem 6-15 in. Leaves 3-4 in., ovate. Bracts 5-6, 1-2 in., oblong, tips usually pinnatifid or pinnate; rays 5-12, 1-2 in.; bracteoles prominently white-margined, exceeding the umbellule, often entire obtuse with the green midrib subexcurrent. Calyx-teeth obsolete. Fruit ellipsoid subquadrate, nearly terete; epicarp thin, loose, not of lax tissue; dorsal furrows 1-vittate, lateral 2-vittate, commissure 4-vittate. Carpels plane on the inner face. Seed about twice as wide as thick.—Hardly distinguishable from *P. Brunonis* but by the larger more winged fruit: it is doubtful to which of these species *H. suaveolens* belongs, the drawing being made from immature fruit: the leaves of *P. Brunonis* are usually more finely cut than as in Klotzsch's figure.

14. **P. Brunonis**, Benth. in Gen. Pl. i. 916; leaves 3-4-pinnate ultimate segments setaceous, bracteoles 5-8 elliptic or obovate often pinnatifid at the apex, fruit $\frac{1}{2}$ - $\frac{1}{4}$ in., dorsal and intermediate ridges narrowest, seed exactly plane on the inner face. Ligusticum Brunonis, Wall. Cat. 545. Hymenolæna Brunonis, DC. Prodr. 245. Hymenidium Brunonis, Lindl. in Royle Ill. 233.

From KASHMIR to NIPAL, alt. 9000-14,000 ft., frequent.

Closely resembling *P. densiflorum* except as to the smaller fruit. Fruit ellipsoid subquadrate, much dorsally compressed; epicarp thin, loose, not of open tissue; furrows all 1-vittate, commissure 2-vittate; carpels plane on the inner face. Seed 4-5 times as wide as thick.—Bentham not having seen ripe fruit doubted the seed being plane on the inner face as described by Lindley and upon which character he founded the genus *Hymenidium*.

29. **ANGELICA**, Linn.

Herbs, usually tall. Leaves 1-2-3-pinnate, pinnæ toothed, usually large. Umbels compound, rays many; bracts few, narrow, or 0; bracteoles small. Calyx-teeth obsolete. Petals obovate, emarginate, white or lurid-purple. Fruit ovoid or ellipsoid, dorsally compressed, commissure broad; lateral ridges broadly winged, dorsal and intermediate not prominent; carpels complanate, broadly margined; furrows 1-2-vittate; carpophore 2-partite. Seed much dorsally compressed, inner face plane concave or almost grooved.—DISTRIB. Species 18 in the north-temperate and arctic regions, and New Zealand.

1. **A. glauca**, Edgw. in Trans. Linn. Soc. xx. 53; leaves twice or thrice 3-partite or 2-pinnate, leaflets few 1-3 in. ovate serrate glaucous beneath.

From KASHMIR to SIMLA, alt. 8000-10,000 ft., Falconer, &c.

Glabrous, 4-12 ft. Bracts several, 1 in., linear; bracteoles many, $\frac{1}{4}$ in. Rays often 20-30, 1-3 in., equal; pedicels hardly half as long as the fruit. Fruit $\frac{1}{2}$ by $\frac{1}{4}$ in., subquadrate; dorsal and intermediate ridges approximate, rounded, somewhat corky; furrows 1-vittate; commissure 2-4-vittate; carpels plane on the inner face. Seed less than $\frac{1}{16}$ in. wide, but about twice as wide as thick; almost grooved on the inner face.

30. **ARCHANGELICA**, Hoffm.

Tall perennial herbs. *Leaves* 2-3-pinnate, ultimate pinnæ toothed, usually large. *Umbels* compound, rays many; bracts few, small, or 0; bracteoles many, linear, or obsolete. *Calyx-teeth* obsolete (in India). *Petals* ovate, subentire, white. *Fruit* ellipsoid, subquadrate, or oblong; commissure broad; carpels dorsally compressed, lateral ridges winged or acute, dorsal and intermediate narrower, distinct; vittæ many; carpophore 2-partite. *Seed* dorsally much compressed, inner face plane.—**DISTRIB.** Species 5, in North Temperate regions.

1. **A. officinalis**, Hoff. *Pl. Umb. Gen.* i. 168; leaflets $1\frac{1}{2}$ -4 by $\frac{3}{4}$ -2 in., bracteoles as long as the flowering umbellule, fruit $\frac{1}{4}$ in. *DC. Prodr.* iv. 169. *A. decurrens*, Ledeb. *Ic. Fl. Ross.* ii. 21, t. 166. *Angelica Archangelica*, Linn.

VAR. *himalaica*; flowers twice as large, fruit $\frac{1}{2}$ by $\frac{1}{2}$ in.

KASHMIR; 8-13,000 ft., C. B. Clarke; Aitchieson. **JOGI**; alt. 11,000 ft., Thomson. **SIKKIM**; Lachen, alt. 10,000-11,000 ft., J. D. H.—**DISTRIB.** (of the type) North Europe, Asia, and America.

Stem 5-10 ft. *Leaves* 1-3 ft., ovate, ultimate pinnæ sessile, rarely decurrent, terminal often 3-lobed. *Bracts* small; rays 10-30, $1\frac{1}{2}$ -4 in.; *pedicels* very numerous, $\frac{1}{4}$ - $\frac{1}{2}$ in. Lateral ridges usually winged; pericarp somewhat corky, easily separating from the seed; vittæ numerous, small, on the inner surface of the pericarp.—The fruit of the Himalayan variety is much larger than that of any other *Archangelica* preserved at Kew. It closely resembles the flowering example of *A. decurrens*, but in Ledebour's figure of that species its fruit is no larger than in ordinary *A. officinalis*.

31. **FERULA**, Linn.

Perennial herbs. *Leaves* 2-4-pinnatifid or 2-4-pinnate. *Umbels* compound. *Flowers* yellow, often polygamous. *Calyx-teeth* obsolete. *Petals* ovate, obtuse, or emarginate. *Fruit* orbicular or ellipsoid, much compressed dorsally; lateral ridges winged, dorsal and intermediate filiform or obscure; vittæ many or few; carpophore 2-partite. *Seed* much dorsally compressed, inner face plane.—**DISTRIB.** Species 60, in Europe, N. Africa, Central Asia.

Ferula is difficult to separate from *Peucedanum*. The Indian species all belong to the section *Narthex*.

SECT. Narthex, Falconer (Gen.) Segments of the *leaves* 1-4 in., oblong, often pubescent. *Bracts* 0, or small, deciduous; bracteoles 0, or very small. Dorsal furrows 1-vittate (rarely a small vitta added); lateral 1-2-vittate; commissure 2-14-vittate.

1. **F. Narthex**, Boiss. *Fl. Orient.* ii. 994; secondary and tertiary pinnæ decurrent entire or very irregularly crenate-serrate, ovary glabrous, fruit $\frac{1}{2}$ by $\frac{1}{2}$ in., vittæ manifest broad 1 (rarely 1-2) in the dorsal furrows. *Flück. & Hanb. Pharm.* 280; *Bentl. & Trim. Med. Pl.* t. 126. *Narthex Asafetida*, Falc. in *Trans. Linn. Soc.* xx. 285; *Bot. Mag.* t. 5168; *Balf. in Trans. R. Soc. Edinb.* xx. 366, tt. 21, 22.

BALTISTHAN; Astor, Falconer.

Stem 5-8 ft. *Leaves* pubescent, at least when young; lower leaves 1-2 ft., ovate, cauline sheaths large, from which spring simple or scarcely compound umbels. Terminal umbel large, compound, leafless. *Vittæ* broad, usually occupying the whole furrow, and as long as the carpel; commissural usually 4, 2 slender sometimes added.

—This is certainly not *F. Asafetida*, Boiss. l. c., which is *Scorodosma fetidum*, Bunge in *Borcz. Ferul.* tt. 1, 2, with hairy ovary and many very minute (or 0) vittæ. Whether it is the *F. Asa-fetida* founded by Linnæus on the figure in *Kæmpf. Aman.* p. 536, is a disputed point. That figure does not represent the numerous lateral subsimple umbels arising from the sheaths of the cauline leaves which characterise this, but this character varies so in *F. Jaeschkeana* (No. 3) that it is impossible to rely upon it. The fragments of Kæmpfer's plant preserved in the British Museum do not suffice to determine the point. *T. Thomsoni* (No. 2) has the subsimple umbels of Falconer's plant (in cultivation), and has also a divaricate corymb very like that figured by Kæmpfer.

2. **F. Thomsoni**, C. B. Clarke: glabrous, tertiary pinnæ 2 by $\frac{1}{2}$ in. subentire mostly petioluled, inflorescence as in *F. Narthex*.—Dorema No. 5, *Herb. Ind. Or. H. f. & T.*

KASHMIR; Banahal, alt. 5000–6000 ft., Thomson.

Resembling *F. Narthex*, but with leaves cut into remote lanceolate subacute leaflets.—Thomson's examples are in flower, but a fruiting corymb of this, or an allied *Ferula*, from Kashmir at Nowgunge (alt. 8000 ft., C. B. Clarke), has umbels and flowers as in the terminal umbel of *F. Narthex*; pedicels $\frac{1}{2}$ – $\frac{1}{4}$ in., clavate at the apex; carpels $\frac{1}{2}$ by $\frac{1}{4}$ in., much compressed, elliptic narrowed at both ends, plane or almost convex on the inner face: dorsal and intermediate ridges filiform, lateral narrowly winged; vittæ 3–2 in the dorsal furrows, minute, as long as the carpel, and seeds very much compressed.

3. **F. Jaeschkeana**, Vathe Append. in *Sem. Hort. Berol.* 1876, 2; secondary and tertiary pinnæ decurrent regularly closely crenate, carpel $\frac{3}{8}$ by $\frac{3}{8}$ in., vittæ very large solitary in each furrow. *F. foetidissima*, Regel & Schmalh. in *Gartenfl.* 1878, 195–198, t. 944.—Dorema sp. 3 and 4, *Herb. Ind. Or. H. f. & T.*

KASHMIR; alt. 6000–12,000 ft., plentiful; Falconer, Thomson, &c.—DISTRIB. Turkestan.

Stem, leaves, and inflorescence as in *F. Narthex*, except that the leaves are closely crenate or doubly crenate or almost serrate. As in *F. Narthex*, the fruiting corymb often appears elongate subpaniculate, sometimes divaricate and corymbose; peduncles bearing nearly simple umbels also proceed from the large sheaths of the cauline leaves. *Fruit* much larger and thicker than in *F. Narthex*, vittæ much the largest of any Indian umbellifer: the commissural often 2 only near the medial line, sometimes 4 or 6.—Regel and Schmalh. think that this plant probably produces the *Asafetida* of commerce; this may be so, as it is an abundant species in Kashmir, and very largely supplied with oil: but it is not the *Asafetida* of Linnæus, because Kæmpfer's figure has entire not crenate leaflets.

32. PEUCEDANUM, Linn.

Perennial glabrous or pubescent herbs (the Indian species). *Leaves* 1–3-pinnate or twice or thrice 3-partite, ultimate leaflets lanceolate or ovate, rarely linear, toothed or entire. *Umbels* compound, rays usually numerous; bracts various, bracteoles many few or 0. *Flowers* often polygamous, white or yellow, rarely pink. *Calyx-teeth* obsolete or small. *Petals* obovate, emarginate or 2-fid. *Ovary* glabrous. *Fruit* much dorsally compressed, ellipsoid, oblong, or orbicular, carpels scarcely convex on the back, more or less acutely winged on the margin, dorsal and marginal ridges little elevated or obsolete, lateral winged; dorsal furrows 1-vittate, lateral 1- rarely 2-vittate. *Seed* much dorsally compressed, inner face plane.—DISTRIB. Species 100, throughout nearly the whole world, few tropical.

The species (formerly referred to *Pastinaca*) having the ovary and young fruit hairy have been transferred by Mr. Benthams to *Heracleum*, whether the vittæ are abbreviated or not.

* *Ultimate segments of the leaves* $\frac{1}{2}$ –1 in., linear.

1. **P. graveolens**, *Benth. in Gen. Pl.* i. 919; bracts and bracteoles 0, petals yellow, fruit $\frac{1}{8}$ by $\frac{1}{2}$ in. narrowly winged plano-convex 2–3 times as broad as thick. *P. Sowa, Kurz in Journ. As. Soc.* 1877, pt. ii. 116. *Anethum graveolens*, *Linn.*; *DC. Prodr.* iv. 186; *Wall. Cat.* 7210; *Boiss. Fl. Orient.* ii. 1026. *A. Sowa, Roxb. Hort. Beng.* 22, *Fl. Ind.* ii. 94; *Fleming Cat. Ind. Med. Pl.* 5; *Wall. Cat.* 595; *DC. Prodr.* iv. 186; *W. & A. Prodr.* 372; *Wight Ic.* t. 572.

Throughout tropical and subtropical INDIA; often cultivated.—DISTRIB. Cultivated in S. Europe and W. Asia.

Glabrous, 1–3 ft. *Leaves* 2–3-pinnate. *Pedicels* many, $\frac{1}{2}$ in. *Styles* small. Dorsal and intermediate ridges distinct, slender; vittæ large, solitary in each furrow, 2 on the commissure.—The fruits are as broad and as much winged in the Indian *P. Sowa* as in the ordinary *P. graveolens*: never subobsolete, as shown in *Wight Ic.* t. 572. In the European *P. graveolens* the carpels are plano-convex, and not so subpentagonal as depicted by Reichenbach, as Benthams has observed *l. c.*

** *Ultimate segments of the leaves* $\frac{1}{2}$ –2 in., linear-oblong or ovate, entire or remotely sparingly toothed; bracts 0 or very small.

2. **P. Dhana**, *Ham. in Wall. Cat.* 7216; leaves twice or thrice 3-partite or sub-2-pinnate leaflets 2 by $\frac{1}{4}$ in. sessile usually entire, carpels $\frac{1}{4}$ by $\frac{1}{2}$ in.

NORTH-WEST INDIA; Sub-sewaliks up to 4500 ft.; *Edgeworth*. KUMAON, in the subtropical region; *Strachey & Winterbottom*. NORTH BENGAL; Goruckpore, *Hamilton*; Dinajpur, *C. B. Clarke*.

Glabrous, 6–24 in., subnude upwards. *Bracts* 3–5, $\frac{1}{4}$ in., linear or linear-lanceolate; rays 5–10, 1–2 $\frac{1}{2}$ in.; bracteoles 4–8, $\frac{1}{8}$ in., linear; pedicels numerous $\frac{1}{4}$ in. *Flowers* small, yellow. *Calyx-teeth* obsolete. *Styles* somewhat long. *Carpels* greatly compressed, subquadrate, tip obtuse, often truncate or emarginate; dorsal and intermediate ridges filiform, subobscure, lateral with a wing as thick as the seed; dorsal furrows 1-vittate lateral 2-vittate; vittæ nearly as long as the carpel, commissural 6–4.

VAR. *Dalzellii*; leaflets shortly oblong or suborbicular. *Pastinaca glauca*, *Dalz. in Hook. Kew Journ.* iv. 293; *Dalz. & Gibs. Bomb. Fl.* 107.—Belgaum, *Dalzell*, *Ritchie*. Jubbulpore, *McLeod*. Chota Nagpore, *C. B. Clarke*.—Leaflets usually 1 by $\frac{1}{2}$ – $\frac{2}{3}$ in., very unlike those of *P. Dhana*, but the plants in every other point agree. There has been considerable confusion between *Pastinaca glauca*, *Dalz.* (*Peucedanum*, sp. *Benth.*) and *Peucedanum glaucum*, *Wall.*: two widely different plants.

*** *Ultimate segments of the leaves* linear- or ovate-lanceolate serrate; bracts 0 or very small.

3. **P. ramosissimum**, *Wall. Cat.* 578; segments of the lower leaves ovate-lanceolate of the upper narrow-lanceolate, pedicels in fruit $\frac{1}{8}$ – $\frac{1}{4}$ in., fruit $\frac{1}{4}$ by $\frac{1}{8}$ – $\frac{1}{6}$ in. winged commissure evittate. *Palimbia ramosissima*, *DC. Prodr.* iv. 176.

KHASIA Mts., alt. 4000–6000 ft., common.

Glabrous, 2–5 ft. *Leaves* 2–4-pinnate, much and acutely serrate. *Bracts* 0, or 1–3, $\frac{1}{4}$ in.; rays 4–8, $\frac{1}{2}$ –1 $\frac{1}{2}$ in., divaricate; bracteoles 0–5, $\frac{1}{8}$ in., linear; pedicels 5–10. *Calyx-teeth* minute. *Styles* very short. *Carpels* elliptic, narrowed at both ends, entire or subemarginate at the apex: dorsal and intermediate ridges obscure,

wings of lateral as thick as the seed; furrows 1-vittate; vittæ nearly or quite as long as the carpel.

4. **P. sikkimense**, *C. B. Clarke*; segments of the lower leaves ovate-lanceolate of the upper narrow-lanceolate, pedicels in fruit $\frac{1}{4}$ – $\frac{3}{4}$ in., fruit $\frac{1}{4}$ – $\frac{1}{2}$ by $\frac{1}{8}$ – $\frac{1}{4}$ in. broadly winged deeply emarginate at both ends, commissure evittate.

SIKKIM; alt. 3000–7000 ft., frequent; *J. D. H., C. B. Clarke*.

Resembling *P. ramosissimum* closely except as to the fruit, which has a broader wing; the seed is not larger than in that plant, but the pedicels are usually longer and more slender, and there are often no bracteoles.

5. **P. anamallayense**, *C. B. Clarke*; segments of the leaves very narrowly lanceolate, pedicels in fruit $\frac{1}{2}$ – $\frac{1}{3}$ in., fruit $\frac{1}{2}$ in. orbicular commissure 6–4 vittate.

ANAMALLAY MTS.; *Wight, Beddome*.

Resembling *P. ramosissimum*, but the segments of the leaves narrower, the fruit different. Umbel as in *P. ramosissimum*; bracts 0, or 1–4, $\frac{1}{2}$ – $\frac{1}{4}$ in., linear, sometimes narrowly oblong, sub-serrate. Calyx-teeth small, lanceolate. Styles long. Dorsal and intermediate ridges scarcely excurrent, lateral with a prominent wing as thick as the seed; dorsal furrows 1-vittate, lateral 2–1-vittate; vittæ large usually as long as the carpel, commissural prominent.

6. **P. ceylanicum**, *Gardn. MS.*; pedicels in fruit $\frac{1}{2}$ –1 in., fruit $\frac{1}{4}$ by $\frac{1}{8}$ in., commissure 6–4-vittate. Palimbia ramosissima, *Thwaites Enum.* 131, not of *DC.*

CEYLON; *Gardner*; Galagama, *Thwaites*.

Resembling *P. anamallayense*, and perhaps a variety of it, but the (unripe) fruits are elliptic and less winged, the pedicels very much longer, and the calyx-teeth much smaller. Styles long.

7. **P. glaucum**, *DC. Prodr.* iv. 179; segments of the middle cauline leaves narrow-lanceolate serrate of the upper linear entire, fruit $\frac{1}{2}$ by $\frac{1}{4}$ in. truncate commissure 2-vittate. *Selinum glaucum*, *Wall. Cat.* 580.

NIPAL; *Wallich*.

Glabrous 2–4 ft. Segments of the cauline leaves 2 by $\frac{1}{2}$ in., entire in most of Wallich's examples, serrate in the only fruiting one. Bracts 0; rays 12–16, $\frac{1}{2}$ – $1\frac{1}{4}$ in.; bracteoles 0, or minute; pedicels 8–16, $\frac{1}{2}$ – $\frac{1}{3}$ in. Calyx-teeth obsolete. Styles subprominent. Fruit subquadrate, somewhat emarginate at both ends; dorsal and intermediate ridges obscure, lateral subprominently winged, the wing as thick as the seed; vittæ solitary, nearly as long as the carpel.

VAR. ? *nagpurensis*; bracteoles 4–7 $\frac{1}{2}$ in. linear, fruit narrowed at the base, margin thicker than the seed, commissure evittate.—Chota Nagpore, alt. 1500–2000 ft.; Ramghur and Bagoda, *C. B. Clarke*; Behar, at Monghyr, *G. Lockwood*.—Lower leaves twice 3-partite, leaflets 3 by $1\frac{1}{2}$ in., strongly serrate: upper with linear segments. Fruit truncate emarginate at the narrowed base.—This may be a distinct species.

**** Ultimate segments of the leaves 1–2 in., serrate; bracts prominent.

8. **P. grande**, *C. B. Clarke*; leaves 2-pinnate leaflets with 3 large rounded lobes, fruit $\frac{1}{2}$ in. obovate obtuse. *Pastinaca grandis*, *Dalz. & Gibs. Bomb. Fl.* 107.

BOMBAY GHATS; *Dalzell*.

Glabrous, 3 ft. Leaves mostly radical, long-petioled, ovate, shining on both surfaces, leaflets 1–3 in. Bracts oblong or obovate, obtuse; rays 20, 2–3 in., stout;

bracteoles oblong, obtuse; pedicels 10-16, $\frac{1}{2}$ - $\frac{2}{3}$ in. *Petals* yellow. *Ovary* glabrous. *Fruit* narrowed to the base and not there emarginate, nearly as broad as long; dorsal and intermediate ridges triangular, small, obtuse, lateral narrowly winged; dorsal furrows 1-vittate, lateral 2-1-vittate; vittæ nearly as long as the fruit or the lateral abbreviated, commissural 4 abbreviated. *Seed* much broader than thick.—Perhaps a *Heracleum*, but the ovary is glabrous.

**** *Leaves* 3-4-pinnate, ultimate segments $\frac{1}{2}$ in. ovate or lanceolate.

9. **P. Thomsoni**, C. B. Clarke; quaternary pinnæ $\frac{1}{2}$ in. ovate deeply pinnatifid, bracts hardly any, styles long.—*Peucedanum* sp. 5, *Herb. Ind. Or. H. f. & T.*

KASHMIR; alt. 5000-9000 ft.; KISHTWAR and BANAHAL, *Thomson*.

Glabrous, or the leaves sometimes minutely hispidulous, 3-4 ft., stem subnude upwards. *Lower leaves* 6-8 in., broadly ovate, ultimate segments scarcely $\frac{1}{2}$ in. linear-oblong, subobtuse. *Umbels* large, irregular, and often twice or thrice divided; rays unequal; bracteoles hardly any; pedicels 8-12, $\frac{1}{2}$ in. *Calyx-teeth* 0. *Ovary* glabrous. *Fruit* only half-ripe; will be at least $\frac{1}{2}$ in.—The very compound leaves and irregular umbels easily distinguish this species. The genus is doubtful in the absence of ripe fruit, but Dr. Thomson marked it *Peucedanum*, and it has all the appearance of being so.

DOUBTFUL SPECIES.

P. ? **SKARDICUM**, C. B. Clarke; glabrous, leaves twice 3-partite secondary pinnæ ovate or elliptic denticulate, bracts 0, bracteoles 4-7 $\frac{1}{2}$ in. lanceolate-linear scarious, petals yellow.—Baltisthan, near Skardo, alt. 12,000 ft., C. B. Clarke.—*Stem* 3-4 ft., corymbose. *Pinnæ* $\frac{1}{2}$ -1 in. diam., shining, yellowish green; nerves prominent, flabellate and pinnate, hardly reticulate. *Peduncles* 5-8 in.; rays 10-12, $1\frac{1}{2}$ -2 in., subequal; pedicels 12-20, $\frac{1}{2}$ in. *Calyx-teeth* 0. *Petals* obovate, emarginate. *Disc* large; styles short. *Fruit* very immature, but about to be winged.

33. **HERACLEUM**, Linn.

Herbs, biennial or perennial, never quite glabrous. *Leaves* 1-2-3-pinnate, segments never minute nor filiform. *Umbels* compound; rays usually many; bracts few simple, or 0, rarely many foliaceous; bracteoles many, rarely divided. *Flowers* polygamous, often radiant, white or yellowish. *Calyx-teeth* obsolete, rarely small linear-lanceolate. *Petals* obovate, emarginate or 2-fid. *Ovary* hairy or pubescent. *Fruit* orbicular obovate or elliptic, much dorsally compressed; dorsal and intermediate ridges small or 0, lateral usually winged or rarely acute; vittæ usually solitary in each valley, as long as the carpel or abbreviated and dilated below; carpophore 2-partite. *Seed* much dorsally compressed, plano-convex.—DISTRIB. Species 50; in Temperate Europe and Asia; 1 in N. America, 1 in Abyssinia.

* Species of Northern and North-Eastern India.

† *Not large, drying green, pubescence grey or whitish; fruit when ripe greenish or whitish.* (Approaching *Pastinaca* in habit.)

1. **H. Thomsoni**, C. B. Clarke; lower leaves 2-pinnate, bracts small, fruit elliptic $\frac{1}{2}$ - $\frac{1}{4}$ by $\frac{1}{8}$ - $\frac{1}{6}$ in. winged minutely pubescent.—*Pastinaca* sp. i., *Herb. Ind. Or. H. f. & T.*

LADAK and PITI; alt. 11,000-15,000 ft., T. Thomson. LAHUL; alt. 10,000 ft., Jaeschke. KASHMIR; Tilail, alt. 9000 ft., C. B. Clarke.

Stems 12–20 in., grey puberulo-pubescent, naked upwards. *Leaves* 6–10 in., ovate-lanceolate, ultimate segments $\frac{1}{2}$ –1 in. pinnatifid. *Bracts* 4–5, $\frac{1}{8}$ – $\frac{1}{4}$ in.; rays 4–10, 1–2 in.; bracteoles 5–8, $\frac{1}{8}$ in., ovate-lanceolate, white-margined. *Ovary* hairy. *Petals* white. *Fruit* distinctly but not broadly winged, greenish-pubescent when ripe, dorsal ridges hardly excurrent; dorsal vittæ extending nearly to the base; commissural 2, near the medial line, half as long.—*H. tragoides*, *Benth. in Gen. Pl. i. 924* (*Zozimia tragoides*, *Boiss.*), is very near this, but in it the lower leaves are pinnate and lobed.

VAR. glabrior; leaves nearly glabrous more acutely serrate. *Pastinaca* sp. 2. *Herb. Ind. Or. H. f. & T.*—North-west Himalaya and Kashmir; alt. 9000–12,000 ft., *Jacquemont*, *Thomson*.

2. **H. pinnatum**, *C. B. Clarke*; leaves pinnate pinnæ ovate toothed or pinnatifid, bracts small or 0, fruit $\frac{1}{4}$ – $\frac{1}{5}$ in. obovate winged.—*Heracleum* sp. 14, *Herb. Ind. Or. H. f. & T.*

KASHMIR northwards to the KARAKORUM, alt. 10,000–16,000 ft.; *Thomson*, *C. B. Clarke*.

White-pubescent, 1–3 ft., sparingly corymbose, little leafy upwards. *Leaves* 6–10 in., oblong; pinnæ usually $\frac{1}{2}$ –1 in. sometimes 2–3 in., sessile, serrate. *Bracts* 0–4, $\frac{1}{8}$ – $\frac{1}{4}$ in., linear or oblong; rays 8–20, 1–3 in.; bracteoles 5–8, $\frac{1}{8}$ – $\frac{1}{4}$ in., linear or oblong; pedicels 10–30, $\frac{1}{8}$ in. *Petals* white. *Ovary* hairy. *Fruit* rather broadly winged, minutely pubescent, whitish; dorsal and intermediate ridges excurrent; vittæ broad extending $\frac{2}{3}$ the length of the carpel, a minute vitta added in the centre of the wing; commissural 2, near the medial line, often more than half as long as the mericarp.

3. **H. Jacquemontii**, *C. B. Clarke*; leaves pinnate or 3-partite, segments ovate, bracts 0, fruit orbicular $\frac{1}{8}$ in. winged.

NORTH-WEST HIMALAYA?, *Jacquemont*.

Villous with lax white hairs, 1 ft., nude upwards. *Leaves* ovate, segments $\frac{1}{2}$ – $\frac{3}{4}$ in., serrate. *Rays* 7, 1–2 in.; bracteoles 4–8, $\frac{1}{8}$ – $\frac{1}{4}$ in., linear; pedicels 10–12, $\frac{1}{8}$ in. *Fruit* minutely pubescent, dorsal and intermediate ridges not excurrent, lateral excurrent in a continuous circular narrow wing; vittæ nearly as long as the carpel, commissural 4.—Very distinct by the small fruits.

4. **H. cachemiricum**, *C. B. Clarke*; lower leaves 2-pinnate pinnæ narrowly oblong entire or remotely obtusely toothed, bracts small, fruit $\frac{1}{4}$ by $\frac{1}{5}$ in. elliptic winged.—*Peucedanum glaucum*, *Herb. Ind. Or. H. f. & T.*, not of *Wall*.

MURREE, *Falconer*; JAMU, alt. 5000–6000 ft., *Thomson*; KASHMIR; Nowgunge, alt. 8000 ft., *C. B. Clarke*.

Minutely pubescent, 2–3 ft., naked, sparingly corymbose upwards. *Leaves* 6–12 in., ovate, secondary pinnæ 1–3 by $\frac{1}{12}$ – $\frac{1}{8}$ in., sessile, subobtusely. *Bracts* 2–4, $\frac{1}{8}$ – $\frac{1}{4}$ in., lanceolate; rays 6–10, 1–2 in.; bracteoles 5–8, $\frac{1}{8}$ in., lanceolate; pedicels 8–20, $\frac{1}{8}$ – $\frac{1}{5}$ in. *Fruit* pubescent; dorsal and intermediate ridges hardly excurrent, lateral forming a continuous narrow wing; vittæ broad nearly as long as the carpel, commissural 2, near the medial line.

†† *Large, drying brown; fruit when ripe brown, often with a very thin wing.*

5. **H. Wallichii**, *DC. Prodr. iv. 195*; glabrescent upwards, upper leaves 3-partite or pinnate, bracts 1–2 small deciduous or 0, calyx-teeth linear prominent, fruit $\frac{3}{8}$ by $\frac{1}{4}$ in. obovate, commissure evittate. *H. diversifolium*, *Wall. Cat. 574*.

NIPAL; *Wallich*. SIKKIM: on Singaleleh, alt. 10,000 ft., *C. B. Clarke*.

Stem 3–4 ft., white-hirsute beneath the nodes. *Leaves* serrate, pilose above and

on the nerves beneath. *Bracts* 1, $\frac{1}{4}$ in., linear; rays 6-8, 1-2 $\frac{1}{2}$ in., glabrous; bracteoles 0-5, $\frac{3}{4}$ in., linear; pedicels 8-16, $\frac{1}{2}$ - $\frac{3}{4}$ in. *Fruit* glabrous, brown, dorsal and intermediate ridges not prominent, wing broad having a narrow median vitta; vittæ about half as long as the fruit subclavate below.

VAR. elatior; more hairy upwards, bracts 4-6, rays 20-30 hairy.—Nipal.—This may be a different species but contains only very immature fruit. The upper leaves are lobed, not divided, more hairy than in the type, and the bracteoles are much more prominent. Bentham (*Gen. Pl.* i. 922) referred *H. diversifolium* to *Peucedanum*: but is not now certain to which of the many plants mixed under the name *H. diversifolium* he referred. *H. Wallichii* is a typical *Heracleum*, with the vittæ hardly half as long as the mericarp.

6. *H. nubigenum*, C. B. Clarke; upper leaves 3-partite or pinnate glabrescent, bracts several deciduous, calyx obsolete, fruit $\frac{1}{4}$ in. orbicular emarginate at both ends, commissure subvittate.

SIKKIM, alt. 10,000-14,000 ft.; Chola Pass, *J. D. H.*; Yakla Pass, *C. B. Clarke*.

Stem 3-5 ft., pubescent. Tertiary pinnæ 1-3 in., ovate, serrate, often lobed, slightly pubescent. *Bracts* 4-12, $\frac{1}{2}$ in., linear; rays 30-50, 2-6 in., pubescent; bracteoles 4-10, $\frac{1}{4}$ in., linear; pedicels 15-30, $\frac{1}{4}$ - $\frac{3}{4}$ in. *Fruit* glabrous, brown; dorsal and intermediate ridges obtuse, little excurrent, much broader than the vittæ; wing broad interrupted at the apex and base; vittæ nearly as long as the fruit, commissural usually 0, or 1-2 very short near the apex, sometimes fragments of an interrupted vitta are seen.—The fruit of this plant is much like that of *Cortia Hookeri*.

7. *H. Brunonis*, Benth. in Gen. Pl. i. 921; upper leaves pinnate oblong, bracts 5-8 $\frac{1}{2}$ -1 in. lanceolate hirsute sometimes divided or foliaceous, fruit $\frac{1}{4}$ - $\frac{1}{3}$ by $\frac{1}{6}$ - $\frac{1}{4}$ in. elliptic. Tordylium ? *Brunonis*, *Wall. Cat.* 590. Tordyliopsis *Brunonis*, *DC. Prodr.* iv. 199.

From KUMAON; *Wallich*; to SIKKIM; alt. 10,000-13,500 ft.

Stem 1-3 ft., pubescent. Cauline leaves 6-8 by 2-3 in.; pinnæ subsessile, ovate, lobed or pinnatifid, serrate, sparingly pubescent. *Rays* 4-8, 1-1 $\frac{1}{4}$ in.; bracteoles 5-6, $\frac{1}{2}$ in., lanceolate; pedicels 8-16, much shorter than the bracteoles. *Flowers* greenish-white or purple (*J. D. H.*), outer often radiant, large. *Calyx-teeth* minute. *Styles* long. *Fruit* glabrous, brown; dorsal and intermediate ridges filiform, hardly excurrent; wing prominent with a minute marginal vitta; vittæ $\frac{2}{3}$ or $\frac{3}{4}$ the length of the fruit, commissural 0, or 2 and short.

8. *H. sublineare*, C. B. Clarke; pinnæ of the upper leaves linear or nearly linear, bracts small or 0, calyx-teeth linear, fruit $\frac{1}{5}$ - $\frac{1}{4}$ by $\frac{1}{6}$ - $\frac{1}{8}$ in. elliptic, commissure 2-vittate.—*Pastinaca* sp. 4, *Herb. Ind. Or. H. f. & T.*

SIKKIM, alt. 10,000-13,000 ft., *J. D. H.*, &c.

Stem 2-4 ft., pubescent. Lower leaves 6 in., ovate, 2-pinnate; pinnæ lanceolate, serrate, little pubescent, upper pinnate, pinnæ often 4 by $\frac{1}{4}$ in., or 2 by $\frac{1}{2}$ in. *Bracts* 1-3, $\frac{1}{4}$ in., linear, often 0; rays 4-8, 1-1 $\frac{1}{2}$ in., hairy; bracteoles 2-5, $\frac{1}{5}$ - $\frac{1}{4}$ in., linear; pedicels 6-16, $\frac{1}{4}$ in. *Flowers* white, outer often radiant, large. *Fruit* glabrous, brown, dorsal and intermediate ridges filiform hardly excurrent; wing broad, continuous, with a minute marginal vitta; dorsal vittæ more than half as long as the fruit, commissural 2, usually slender, close to the medial line, nearly as long as the mericarp, rarely shorter or interrupted.

9. *H. canescens*, Lindl. in Royle Ill. 232; stem and leaves softly hairy, upper leaves mostly pinnate, bracts small or 0, fruit $\frac{1}{2}$ by $\frac{1}{4}$ in. obovate, commissure 2-vittate. *H. hirsutum*, *Edgw. in Trans. Linn. Soc.* xx. 57. ? *H. cinereum*, *Lindl. in Royle Ill.* 232.

NORTH-WEST HIMALAYA, alt. 6000–8000 ft.; Kishtwar and Banahal, *Royle, Thomson*; Simla, *Lady Dalhousie*, &c.

Stem 1–4 ft., subnude upwards, hirsute with white lax hairs at the apex of the peduncles. *Leaves* 3–12 in., 1–2-pinnate, oblong or ovate; pinnæ $\frac{1}{2}$ –3 in., ovate or oblong, acute or obtuse, crenate-serrate or lobed, rhachis with lax white hair. *Bracts* 1–4, $\frac{1}{2}$ in., linear or lanceolate, or 0; rays 6–16, 1–3 in.; bracteoles 4–8, $\frac{1}{2}$ in., linear or linear-lanceolate; pedicels 8–16, 0– $\frac{2}{3}$ in. *Calyx-teeth* linear, small. Young *ovary* very hairy, rarely slightly pubescent. Dorsal and intermediate *ridges* filiform, distinctly elevated; wing broad; dorsal vittæ $\frac{2}{3}$ the length of the fruit, not clavate below, commissural distinct, near the medial line, more than half as long as the carpel.—Easily separated from *H. candicans* by the indumentum. The leaves are most variable. No example exists at Kew of *H. cinereum*, but there appears no reason why it should not belong here.

10. *H. candicans*, *Wall. Cat.* 573; leaves pinnatifid or pinnate, pinnæ obtusely lobed or pinnatifid tomentose or white-villous beneath, bracts small or 0, fruit $\frac{1}{2}$ by $\frac{1}{4}$ – $\frac{1}{2}$ in. obovate, commissure 2-vittate. *DC. Prodr.* iv. 192.

From KASHMIR to KUMAON, alt. 6000–12,000 ft., common.

Stem 2–6 ft., pubescent or closely villous. *Pinnæ* often 8 by 6 in., crenate-serrate, thickly white-tomentose, or only slightly grey-pubescent. *Bracts* 1–3, $\frac{1}{2}$ – $\frac{1}{2}$ in., linear, or 0; rays 10–40, 1–4 in.; bracteoles 4–8, $\frac{1}{2}$ in., linear; pedicels 8–16, $\frac{1}{2}$ – $\frac{1}{2}$ in. *Calyx-teeth* linear. Dorsal and intermediate *ridges* filiform slightly excurrent, wing broad with a small distinct median vitta; vittæ in Wallich's example $\frac{1}{2}$ the length of the fruit, in others (with less elongate-obovate fruits) $\frac{2}{3}$ the length; commissural in the type more than $\frac{1}{2}$ the length, or minute near the apex, or 0.

11. *H. obtusifolium*, *Wall. Cat.* 577; upper leaves 3-fid or 3-partite lower 3–5-partite, pinnæ round crenate white-tomentose beneath, bracts 2–5 $\frac{1}{2}$ –1 in. deciduous. *DC. Prodr.* iv. 192.

NIPAL; *Wallich*. SIKKIM; Lachen, alt. 12,000 ft., *J. D. H. Bhotan, Griffith*.

Stem 1–3 ft., pubescent or villous. *Pinnæ* 1–4 in. diam., sometimes 2–3-lobed, always rounded, scarcely serrate. *Rays* 10–16, 1–3 $\frac{1}{2}$ in.; bracteoles 4–8, $\frac{1}{2}$ – $\frac{1}{2}$ in.; pedicels 10–20 $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx-teeth* linear, small. Outer *flowers* of the umbel moderately or not at all radiant. *Fruit* (ex *DC.*) obovate, commissure 4-vittate, dorsal vittæ linear, extending $\frac{2}{3}$ its length in the unripe fruit.

12. *H. nepalense*, *Don Prodr.* 185; upper leaves acutely 3-lobed rarely divided sparingly pubescent, lower pinnate, bracts 0 or inconspicuous, fruit $\frac{1}{2}$ by $\frac{1}{4}$ in. obovate, commissure 4-vittate. *Wall. Cat.* 576; *DC. Prodr.* iv. 192.

From NIPAL to BHOTAN, alt. 5000–12,000 ft.; frequent.

Stem 2–5 ft., sparingly pubescent. *Pinnæ* often 6 by 4 in., deeply lobed or pinnatifid, serrate. *Bracts* 3–5, $\frac{1}{2}$ in., linear, sometimes 0; rays 8–20, 1 $\frac{1}{2}$ –3 in.; bracteoles 0–6, $\frac{1}{2}$ in., linear; pedicels 8–20, $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx-teeth* linear, small. Outer *flowers* of the umbel radiant or not. Dorsal and intermediate *ridges* hardly excurrent; wing broad, with a prominent small marginal vitta; dorsal vittæ $\frac{2}{3}$ the length of the fruit, commissural 4, $\frac{2}{3}$ the length in Wallich's examples, shorter in others.

VAR. bivittata; fruit $\frac{1}{2}$ in. elliptic or subobovate, commissure 2-vittate.—Sikkim and Bhotan, common.—Uppermost leaves sometimes 3-partite, and middle cauline leaves sub-2-pinnate. A very doubtful plant, some specimens of which have been referred to a variety of *H. diversifolium* with 2-vittate commissure, but the cutting of the leaves is that of *H. nepalense*.

13. *H. barmanicum*, *Kurz in Journ. As. Soc.* 1872, pt. ii. 309, and 1877, pt. ii. 116; lower leaves 1–2-pinnate hairy, bracts 5–8 $\frac{3}{4}$ in. lanceolate,

fruit $\frac{1}{2}$ by $\frac{1}{4}$ in. obovate, furrows between the lateral and intermediate ridges 2-vittate, commissure 2-vittate.—*Heracleum* sp. 5, *Herb. Ind. Or. H. f. & T.*

KHASIA Mts., alt. 4000–6000 ft., common. PEGU, alt. 2500–3000 ft., frequent, *Kurz.*

Stem 2–4 ft., villous. *Upper leaves* 3-fid or 3-partite, pinnæ 1–3 in., cordate or ovate-lanceolate, serrate. *Rays* 6–12, $1\frac{1}{2}$ in.; bracteoles 5–10, $\frac{1}{4}$ – $\frac{1}{2}$ in. *Calyx-teeth* linear, small. *Petals* white, of the outer flowers radiant or not. Dorsal and intermediate ridges elevated hardly excurrent, vittæ between them 1 rarely 2; wing broad with a narrow marginal vitta; vittæ in the furrows between the intermediate and lateral ridges usually 1–3, more than half the length of the mericarp, commissural 2, usually more than half as long, 2 fragmentary often added.

** Species of Southern India and Ceylon.

14. **H. Hookerianum**, *W. & A. Prodr.* 373; lower leaves undivided roundly 3-lobed villous often woolly beneath, upper much reduced often to mere sheaths, bracts not prominent, fruit $\frac{1}{4}$ – $\frac{1}{2}$ in. broadly elliptic scarcely obovate obtuse at both ends. *Pastinaca Hookeriana*, *Wight Ic.* t. 1010.

NILGHIRI Mts.; *Wight, Gardner, G. Thomson.*

Stem 12–18 in. villous or pubescent, subnude upwards. *Leaves* 2–4 in. diam., sometimes peltate, often 3-lobed, lobes 2–3-fid, lobes rounded, crenate, not serrate. *Bracts* 1–5, $\frac{1}{4}$ – $\frac{1}{2}$ in., lanceolate or 0; rays 4–10, 1–3 in., hairy, unequal, sometimes compound; bracteoles 0–8, 0– $\frac{1}{4}$ in., lanceolate or linear, very variable; pedicels 4–10, $\frac{1}{4}$ in. *Calyx-teeth* small, lanceolate. *Outer flowers* of the umbel radiant or not. *Fruit* obtuse, dorsal and intermediate ridges slender, hardly elevated; wing broad, with a narrow marginal vitta; vittæ solitary in the furrows, large, nearly as long as the carpel, commissural 4–2, the 2 longer extending nearly to its base.—Distinguished from *H. rigens*, of which it may be a form, by the undivided leaves: it appears uniformly smaller, more naked upwards, the fruits shining scarcely narrowed at the base.

15. **H. rigens**, *Wall. Cat.* 575; lower leaves pinnate, pinnæ 3–5 rarely 7 orbicular villous beneath upper much reduced, bracts not prominent, fruit $\frac{1}{2}$ by $\frac{1}{4}$ in. obovate-elliptic. *DC. Prodr.* iv. 191; *W. & A. Prodr.* 373. ? *H. spengelium*, *Dalz. & Gibs. Bomb. Fl.* 108. *Pastinaca rigens*, *Wight Ic.* t. 1009.

Mts. of the DECCAN PENINSULA; *Heyne; Rottler; Nilghiris* and near Courtallum, *Wight*. CEYLON, *Walker, Thwaites* (No. 145 partly).

Near *H. Hookerianum*, but usually larger (2–3 ft.) with larger umbels. *Lower leaves* 3–12 in.; pinnæ 1–3 in. diam., obtuse, crenate not serrate. *Fruit* nearly as in *H. Hookerianum* but dull reddish-brown, often more elongate at the base, in which case the vittæ extend only $\frac{2}{3}$ the length of the carpel; commissural vittæ 2–6, usually 4.

VAR. Candolleana; lower leaves 2-pinnate, pinnæ lobed crenate or crenate-serrate. *Pastinaca Candolleana*, *W. & A. Prodr.* 372. *P. ligusticifolia*, *Wight Ill.* t. 116; *W. & A. Prodr.* 372.—Mts. of the Deccan Peninsula; plentiful.

16. **H. aquilegifolium**, *C. B. Clarke*; glabrous, lower leaves 3-partite or pinnate, pinnæ large ovate 3-lobed, fruit $\frac{1}{4}$ – $\frac{1}{2}$ in. orbicular or subelliptic, vittæ in the lateral furrows usually 2–3. *Heracleum* sp. 11, *Herb. Ind. Or. H. f. & T.*

CONCAN; tropical region, *Law, Stocks.*

Stem 2–3 ft. Pinnæ of the lower leaves 2–4 in. diam., denticulate: upper leaves often undivided, uppermost reduced to sheaths. *Umbels* often in a nearly naked raceme. *Bracts* 3–5, $\frac{1}{4}$ – $\frac{1}{2}$ in., lanceolate; rays 6–10, $1\frac{1}{2}$ – $2\frac{1}{2}$ in.; bracteoles

3-5, $\frac{1}{4}$ in., lanceolate or linear, sometimes obtuse. Dorsal ridges distinct, shortly excurrent, wing broad with a minute marginal vitta; dorsal vittæ produced nearly to the base; commissural 6-8.—Very near *H. rigens* var. *ligusticifolium* which has the leaves sometimes nearly glabrous, but the leaves are less serrate, and the vittæ are usually 2-3 in the lateral furrows.

17. **H. ceylanicum**, *Gardn. ms.*; lower leaves pinnate pinnæ deeply pinnatifid, lobes oblong hairy above villous beneath, fruit as in *H. rigens*. *H. Sprengelianum*, *Thwaites Enum.* 131, not of *W. & A.*

CEYLON; *Walker, Gardner, Wight, Thwaites* (No. 145 partly).

Pinnæ of the lower leaves 1-2 by $\frac{1}{4}$ - $\frac{1}{2}$ in., sharply closely serrate or crenate. Outer flowers of the umbel somewhat radiant, with lanceolate acute calyx-teeth. Fruit $\frac{1}{3}$ - $\frac{1}{2}$ by $\frac{1}{4}$ in., obovate, totally unlike that of *H. Sprengelianum* *W. & A.*, but altogether that of *H. rigens* from which this differs only in the cutting of the leaves, which is uniform in the numerous examples.

18. **H. Sprengelianum**, *W. & A. Prodr.* 372; lower leaves 1-2 pinnate hairy, pinnæ large ovate pinnatifid or lobed, fruit $\frac{1}{5}$ - $\frac{1}{4}$ by $\frac{1}{6}$ - $\frac{1}{5}$ in. elliptic narrowly winged. *Pastinaca Sprengeliana*, *Wight Ic.* t. 1008.

NILGHIRI MTS., *Wight, Gardner.*

Stem 2-4 ft. Lower leaves 8-16 in., ovate; secondary pinnæ often 4 by 3 in., lobed, crenate-serrate. Bracts usually 0; rays 6-16, 1-2 $\frac{1}{2}$ in., nearly glabrous; bracteoles 3-5, $\frac{1}{4}$ in., lanceolate, caducous; pedicels 8-16, in fruit $\frac{1}{2}$ in. Calyx-teeth obscure, in the radiant flowers small, ovate, obtuse. Dorsal and intermediate ridges obsolete; wing less than $\frac{1}{10}$ in. wide; vittæ often $\frac{3}{4}$ the length of the carpel, or more; commissural 2-4.—Easily distinguished from the foregoing species by the small fruit.

19. **H. concanense**, *Dalz. in Hook. Kew Journ.* ii.; 260; lower leaves 2-3-pinnate pubescent, fruit $\frac{1}{5}$ - $\frac{1}{4}$ by $\frac{1}{6}$ - $\frac{1}{5}$ in. elliptic not winged, primary ridges obtuse equally prominent. *Dalz. & Gibs. Bomb. Fl.* 107. *H. grandiflorum*, *Dalz. & Gibs. l. c.* 108.

CONCAN HILLS; *Dalzell, &c.*

Stem 2-4 ft., more or less hispid. Tertiary pinnæ of the lower leaves often 1-2 in., ovate, deeply 3-lobed, serrate; upper leaves much reduced, uppermost often to sheaths. Bracts 3-5, $\frac{1}{8}$ - $\frac{1}{6}$ in., oblong, obtuse, or 0; rays 5-10, 1-2 in.; bracteoles very variable, 5-7, lanceolate and longer than the umbellule, or small, linear. Calyx-teeth obscure, or small, oblong. Outer flowers usually radiant, large. Fruit exceedingly hard, much less dorsally compressed than in other species, ridges prominent; vittæ as long as the carpel, those of the lateral furrows usually 2, commissural 2-4.

VAR. ? *Stocksii*; dorsal and intermediate ridges (in the unripe fruit) slender lateral ridges excurrent into a narrow very thin ring. *Heracleum* sp. 10, *Herb. Ind. Or. H. f. & T.*—*Concan*; *Stocks*. Fruit the same size as in *H. concanense* type, and vittæ the same. This may be a new species; for the wing of the unripe fruit will almost certainly dilate and will then be unlike that of *H. concanense*.

20. **H. pedatum**, *Wight. Ic.* t. 342; cauline leaves pedately 5-7-foliate, leaflets lanceolate serrate hairy sometimes again lobed deeply.

DECCAN; *Shevagherry Hills, Wight.* BELGAUM; *Law.*

Stem 12 in., or more, remotely hirsute. Petioles 2-6 in.; leaflets 1-2 by $\frac{1}{2}$ - $\frac{3}{4}$ in. Bracts usually 1, $\frac{1}{3}$ in., linear-lanceolate; rays 5-6, 1-1 $\frac{1}{2}$ in.; bracteoles 0-5, $\frac{1}{8}$ - $\frac{1}{6}$ in., lanceolate; pedicels 8-12, $\frac{1}{8}$ in., in young fruit. Outer flowers of the umbel radiant; calyx-teeth linear, prominent; style-bases large conical. Fruit very immature in our specimen and in *Wight's* drawing.—The large style-bases and pedate leaves are not like *Heracleum*; the fruit promises to be like that of *Schultzia*.

21. **H. Pinda**, Dalz. & Gibs. *Bomb. Fl.* 107; clothed with long weak white flat hairs, lower leaves bipinnate, pinnæ cuneate coarsely toothed, vittæ 2 in the lateral furrows, commissure 2-vittate.

BOMBAY; On Hursur and Hurry-chunder hill forts, *Dalzell*.

Stem 1-1½ ft., erect, branched. *Leaves* mostly radical, long-petioled. *Bracts* 1-3, broad-ovate, acute, foliaceous; rays 6-8, unequal; bracteoles 3, like the bracts. *Flowers* white, exterior radiant.—Not seen: the foregoing copied from Dalzell, l. c.

34. **ZOSIMIA**, Hoffm.

A perennial herb, pubescent or hirsute. *Leaves* 2-4-pinnate, segments small. *Umbels* compound, rays numerous; bracts and bracteoles usually many, small. *Calyx-teeth* linear, somewhat prominent. *Petals* obovate, emarginate, white or yellowish, often unequal sometimes radiant. *Fruit* elliptic or orbicular, dorsally compressed, complanate; dorsal and intermediate ridges filiform or obscure, lateral hyaline, with a thick corky obtuse wing; furrows with solitary large vittæ; carpophore 2-partite. *Seed* 4-6 times broader than thick.

1. **Z. absinthifolia**, DC. *Prodr.* iv. 195; Boiss. *Fl. Orient.* ii. 1037. *Z. orientalis*, Hoffm. *Gen. Umb.* 148, t. 4. *Z. radians*, Boiss. & Hohen. in Boiss. l. c. 1037. *Heracleum absinthifolium*, Vent. *Choix* t. 7. *H. tomentosum*, Smith, not of Dalz.

SCINDE; *Stocks*. PUNJAB; base of Suleiman Mts., Edgeworth.—DISTRIB. Beloochistan and Cabul to S.E. Europe.

Stem 1-3 ft., pubescent or hirsute. *Leaves* 4-8 in., oblong-lanceolate, pubescent, ultimate segments ¼-½ in. narrowly lanceolate or linear. *Bracts* and bracteoles variable, usually 5, ¼-½ in., lanceolate; rays 6-16, 1-3 in., often stout; pedicels 8-20, ⅓-½ in. *Fruit* ⅓ by ¼ in., elliptic or somewhat obovate, variable in size and shape, pubescent till fully ripe.

34.* **CORIANDRUM**, Linn.

A herb, annual, branched, glabrous. *Leaves* decompound. *Umbels* compound, rays few; bracts 0, or small linear; bracteoles few, filiform. *Calyx-teeth* small, acute, often unequal. *Petals* obovate, emarginate, white or purplish, of the outer flowers unequal, often radiant. *Fruit* subglobose; ridges not prominent, dorsal primary and adjacent secondary strongest, lateral primary and secondary obscure; vittæ obscure, solitary, under the secondary ridges; carpels slightly concave on the inner face, commissure distinctly 2-vittate; carpophore 2-partite. *Seed* convexo-concave, about thrice as broad as thick.

1. **C. sativum**, Linn.; DC. *Prodr.* iv. 250; ultimate segments of the lower leaves ovate or lanceolate of the upper linear. *Roxb. Hort. Beng.* 21, *Fl. Ind.* ii. 94; *Wight Ill.* t. 117, fig. 9, *Ic.* t. 516; Boiss. *Fl. Orient.* ii. 920. *Cuminum Cyminum*, Wall. *Cat.* 594.

Throughout INDIA; cultivated.—DISTRIB. Widely cultivated.

34.** **CUMINUM**, Linn.

A slender, annual herb, glabrous except the fruit. *Leaves* twice or thrice 3-partite, ultimate segments filiform. *Umbels* compound, rays few; bracts and bracteoles several, linear, rigid. *Calyx-teeth* small, subulate, unequal.

Petals oblong or obovate, emarginate, white, often unequal. *Fruit* cylindric, tip narrowed; primary ridges filiform, distinct; secondary usually hispidulous; vittæ large, solitary under each secondary ridge; carpophore 2-partite or 2-fid. *Seed* somewhat dorsally compressed, convexo-concave.

1. **C. Gyminum**, Linn.; *DC. Prodr.* iv. 201; *Roxb. Hort. Beng.* 21, *Fl. Ind.* ii. 92; *Wall. Cat.* 7213; *Wight Ill.* t. 117, *fig.* 6; *W. & A. Prodr.* 372; *Boiss. Fl. Orient.* ii. 1080.

PUNJAB PLAIN, DECCAN, &c., cultivated.—DISTRIB. Widely cultivated.

35. **DAUCUS**, Linn.

Annual or biennial herbs, usually hispid. *Leaves* 2–4-pinnate, ultimate segments narrow or small. *Umbels* compound, rays usually many; bracts generally very many, pinnate; bracteoles many, 3-fid entire or 0. *Calyx-teeth* small, or obsolete. *Petals* obovate, emarginate, white, outer often radiant. *Fruit* elliptic, terete or somewhat dorsally compressed; ridges all prominent, all or secondary only bristly, lateral primary little developed, lateral secondary usually the widest almost in the plane of the commissure; vittæ solitary, under the secondary ridges; carpophore undivided or 2-fid. *Seed* $\frac{1}{2}$ -terete, dorsally subcompressed, inner face plane.—DISTRIB. Species 20, mostly Mediterranean and temperate Asiatic; 2 N. American, 1 Australian.

1. **D. Carota**, Linn.; *DC. Prodr.* iv. 211; hispid, leaves 2–3-pinnate, pinnæ pinnatifid segments narrow-lanceolate, outer rays connivent in fruit, bristles of the secondary ridges as broad as the fruit, of primary shorter or 0. *Roxb. Hort. Beng.* 21, *Fl. Ind.* ii. 90; *Wall. Cat.* 7214; *W. & A. Prodr.* 374; *Wight Ill.* t. 117, *fig.* 7; *Boiss. Fl. Orient.* ii. 1076.

KASHMIR and the WESTERN HIMALAYA, alt. 5000–9000 ft.; cultivated elsewhere in India.—DISTRIB. Of the genus.

Stem 1–4 (in the Himalaya often 6) ft. *Bracteoles* many, 3-fid and simple. *Fruit* $\frac{1}{10}$ in.; bristles on the secondary ridges glistening white, connate at the base only, of the primary ridges small or sessile, subglochidiate; carpophore undivided.—The carrot.

36. **CAUCALIS**, Linn.

Annual herbs, scabrid or hispid. *Leaves* 2–4-pinnate. *Umbels* compound, rays few (in Indian species); bracts 0, or linear, inconspicuous; bracteoles usually several, linear or oblong, membranous. *Calyx-teeth* small, acute, or obsolete. *Petals* obovate, emarginate, white or purplish, outer often radiant. *Fruit* elliptic or oblong, terete, subcompressed laterally, constricted at the commissure; primary and secondary ridges prominent or not, with 1 or 3 rows of bristles or tubercles; vittæ solitary, under the secondary ridges; carpophore undivided or 2-fid. *Seed* $\frac{1}{2}$ -terete, deeply grooved on the inner face.—DISTRIB. Species 18, principally in the temperate Old World.

1. **C. Anthriscus**, Scop.; *Don Prodr.* 183; bracts 1–5 $\frac{1}{2}$ – $\frac{1}{3}$ in. linear, fruit $\frac{1}{2}$ in., primary and secondary ridges equally bristly not prominent. *C. elata*, *Wall. Cat.* 564; *Don Prodr.* 183. *Tordylium Anthriscus*, Linn. *Torilis Anthriscus*, Gmel.; *DC. Prodr.* iv. 218; *W. & A. Prodr.* 374; *Boiss. Fl. Orient.* ii. 1081. *T. japonica* and *elata*, *DC. Prodr.* iv. 219, 220.

HIMALAYA, alt. 3000-9000 ft.; from KASHMIR to SIKKIM, frequent.—**DISTRIB.** N. Asia, Europe, N. Africa.

Addressedly hispid; 1-2 (in the Himalaya 5) ft. Secondary *pinne* 1 in., pinnatifid half-way down into lanceolate acute lobes. *Umbels* long-peduncled, rays 5-12; bracteoles linear, not white-margined. *Petals* purplish or white, not radiant. Bristles scattered over the whole surface of the *fruit*, rough, curved or almost hooked, not glochidiate.

2. **C. leptophylla**, Linn.; *DC. Prodr.* iv. 216; bracts 0, fruit $\frac{1}{2}$ - $\frac{1}{4}$ in., secondary ridges prominent, primary filiform minutely hispid, bristles in 1-3 rows. *Boiss. Fl. Orient.* ii. 1084.

KASHMIR, alt. 4000-6000 ft., *Jacquemont, Thomson.* **PUNJAB**; *Falconer.*—**DISTRIB.** W. Asia, S. Europe, N. Africa.

Resembling *C. Anthriscus*, but the leaves rather more finely cut, ultimate segments narrower, sometimes almost linear; fruit larger, bristles longer, shining, scarcely scabrous, subglochidiate. *Umbels* often lateral, peduncle 1-2 in., stout; rays usually 2-5.

3. **C. latifolia**, Linn. *Syst. Nat.* ii. 205; bracts and bracteoles small oblong white-membranous, fruit $\frac{1}{2}$ in., primary and secondary ridges equally prominent and aculeate. *Tordylium latifolium*, Linn. *Sp. Pl.* 345. *Turgenia latifolia*, Hoffm.; *DC. Prodr.* iv. 218; *Boiss. Fl. Orient.* ii. 1087.

KASHMIR; *Falconer*; alt. 5000-8000 ft., frequent, C. B. Clarke.

Hispid, almost prickly, 4-24 in., rigid, erect or divaricate. *Leaves* 1-2-pinnate, *pinne* often 1-2 in., oblong, serrate or pinnatifid half-way to the midrib. *Rays* 3-4, 1-3 in.; pedicels hardly $\frac{1}{4}$ as long as the fruit. *Carpels* with 7 subequally aculeate ridges, the two lateral primary ridges within the commissure less prominent; bristles stout, rough, curved or nearly straight at the apex, hardly glochidiate.

37. **PSAMMOGETON**, Edgw.

A small annual, pubescent or glabrous. *Leaves* 1-2-pinnate, *pinne* laciniate. *Umbels* compound; bracts and bracteoles many, small, lanceolate or linear, scarious. *Calyx-teeth* obsolete. *Petals* obovate, emarginate, white or purplish, not or but slightly radiant in the outer flowers. *Fruit* small, ovoid or lanceolate commissure slightly constricted; primary and secondary ridges hairy, elevated, scarcely winged, secondary rather the more prominent; vittæ solitary, under the secondary ridges; carpophore 2-fid. *Seed* somewhat dorsally compressed, inner face plane or scarcely concave.

1. **P. biternatum**, Edgw. in *Trans. Linn. Soc.* xx. 57; segments of the lower leaves ovate pinnatifid into narrow lobes of the upper narrowly cuneate lacinate, hairs on the ridges white capitellate 1-seriate scattered longer than the carpel is broad. *P. crinitum*, *Boiss. Fl. Orient.* ii. 1078. *Pimpinella crinitum*, *Boiss. in Ann. Sc. Nat.* 3rd ser. i. 131.

PUNJAB PLAIN, ascending the Himalaya to 3000 ft.; frequent. **SCINDE**.—**DISTRIB.** Beloochistan, Cabul, Persia.

Stem 2-8 in., divaricately branched, pubescent or grey subtomentose, not villous. *Peduncles* 1-3 in., stout, lateral and terminal. *Bracts* 3-8, $\frac{1}{4}$ - $\frac{1}{2}$ in., narrowly lanceolate or linear; rays 5-10, $\frac{1}{2}$ -1 in.; bracteoles 4-8, $\frac{1}{4}$ in., lanceolate, sheathing the young umbellule; pedicels 6-16, $\frac{1}{4}$ in. *Fruit* scarcely $\frac{1}{4}$ in., lanceolate, thinly hairy in the Indian plants; styles very long.

VAR.? *villosa*; much taller with patent soft hairs, ridges of the fruit with several dense rows of often brown hairs.—Scinde, *Stocks*: a frequent form in Beloochistan

and Cabul.—Very unlike the type, but there are intermediate forms. Probably *P. brevisetum* and *setifolium*, Boiss. *Fl. Orient.* ii. 1079, are other varieties

DOUBTFUL UMBELLIFERÆ.

ATHAMANTHA TERES, *Don Prodr.* 185; *DC. Prodr.* iv. 156.

LIGUSTICUM ? NEPALENÆ, *Don Prodr.* 125; *DC. Prodr.* iv. 159. (An *Hymenolæna*? *DC. l. c.*)

ORDER LXXI. **ARALIACEÆ.** (By C. B. Clarke.)

Trees or shrubs, very rarely herbs, sometimes scandent or scandent when young and finally self-supporting, not rarely prickly. *Leaves* alternate, the uppermost rarely sub-opposite, long-petioled, large, simple or compound; stipules adnate to the petiole, sometimes inconspicuous or 0. *Flowers* regular, small, sometimes polygamous, in umbels racemes or paniced heads; bracts and bracteoles small or conspicuous; pedicels continuous with the base of the calyx or there jointed. *Calyx-tube* adnate to the ovary; limb truncate, obsolete or with small teeth. *Petals* 5 rarely 6-7 or many, valvate or sub-imbricate, expanding or deciduous in a cap. *Stamens* as many as and alternate with the petals (very many in *Tupidanthus*), inserted round an epigynous disc. *Ovary* inferior, 2-celled, or cells as many as the stamens (in *Arthrophyllum* 1-celled); styles as many as the cells, distinct or united; ovules solitary and pendulous in each cell. *Fruit* coriaceous or drupaceous usually small, one or more cells sometimes suppressed. *Seed* pendulous, albumen uniform or ruminated; embryo minute, radicle next the hilum.—DISTRIB. Species 340, chiefly tropical and subtropical, a few in the cool temperate zones.

SECT. I. **Araliæ.** *Petals* imbricated (but only lightly). *Pedicels* jointed.

Styles 2-5, free. Leaves compound	1. ARALIA,
Styles 5, combined	2. PENTAPANAX.
Styles 4-3, free. Leaves pinnatifid	3. ARALIDIUM.

SECT. II. **Panaceæ.** *Petals* valvate. *Albumen* uniform.

* *Ovary* 2-celled.

Pedicels jointed. Leaves decompose	3.*PANAX.
Pedicels continuous. Leaves digitate	4. ACANTHOPANAX.

** *Ovary* 4-10-celled.

† *Umbels sessile on the back of the leaf.*

Leaves simple	5. HELWINGIA.
-------------------------	---------------

†† *Pedicels jointed.*

Leaves once pinnate	6. POLYSCIAS.
-------------------------------	---------------

††† *Pedicels continuous. Leaves not pinnate.*

Fruit angular the size of a pea	7. HEPTAPLEURUM.
Fruit more than $\frac{1}{2}$ in. long	8. TREVESIA.
Flower sessile embraced by 4 bracteoles	9. BRASSAIA.
Leaves simple (except the lowermost)	10. DENDROPANAX.

SECT. III. **Hedereæ.** *Petals* valvate. *Albumen* ruminated.

* *Ovary* 1-celled.

Leaves pinnate or undivided 11. ARTHROPHYLLUM.

** *Ovary* 2-celled.

Pedicels continuous. Styles distinct 12. HETEROPANAX.

Pedicels continuous. Styles combined 13. BRASSAIOPSIS.

Pedicels jointed. Styles combined 14. MACROPANAX.

*** *Ovary* 5-4-celled; styles combined.

† *Leaves* simple lobed or pinnate.

Pedicels continuous 15. HEDERA.

Pedicels jointed 16. HEDEROPSIS.

†† *Leaves* digitate.

Tree. Leaflets ciliate 17. GAMBLEA.

SECT. IV. **Plerandreeæ.** *Petals* valvate. *Stamens* 20-50.

Petals united, falling off in a cap 18. TUPIDANTHUS.

1. **ARALIA**, Linn.

Herbs shrubs or small trees, glabrous hairy or prickly. *Leaves* alternate or whorled, digitate pinnate or compound-pinnate; leaflets serrate or nearly entire; stipules not prominent. *Umbels* solitary or in racemes or panicles rarely in compound umbels; pedicels jointed close under the flower or not. *Flowers* often polygamo-monoecious. *Calyx* margin truncate or 5-toothed. *Petals* 5, ovate, imbricate in bud. *Stamens* 5. *Ovary* 2-5-celled; styles 2-5, free or shortly connate at base (at least in the seed-producing flowers). *Fruit* 4-5-celled 4-5-angular, or subglobose 2-3-celled. *Albumen* uniform.—DISTRIB. Species 30; extending from India and Malaya to Japan and North America.

SECT. I. **Ginseng.** Herbs 1-2 feet with a whorl of digitate leaves. *Styles* 2-3. *Fruit* red or red and black, shining, globose, subdidymous.

1. **A. Pseudo-ginseng**, Benth. in *Gen. Pl.* i. 936; leaflets lanceolate with scattered bristles especially on the upper surface. *Panax Pseudo-ginseng*, Wall. *Pl. As. Rar.* t. 137, Cat. 3730; C. A. Mey. in *Gaug. Repert. Pharm. & Chem.* 1842, p. 525, with fig.; *Seem. Rev. Heder.* 99.

NIPAL, SIKKIM, and BHOTAN, alt. 6000-12,000 ft., frequent. KHASIA Mts., alt. 5000 ft.; *H. f. & T.*

Rootstock horizontal, tuberous or tuberiferous. *Stem* 6-15 in., erect, smooth, terminated by a whorl of leaves; the scale at its base deciduous or persistent. *Leaflets* 5 rarely 3, 2-6 by $\frac{1}{2}$ -1 $\frac{1}{4}$ in., acuminate often caudate, rounded or tapering at the base, closely serrate or deeply doubly serrate, glabrous except the scattered bristles; petiole 1-6 in., glabrous; petiolules 0-1 in. *Peduncles* shorter or longer than the leaves, glabrous or nearly so, solitary or 2-4, simple or with 2-5 umbellate heads; pedicels $\frac{1}{4}$ -1 in., pubescent or puberulous; bracteoles $\frac{1}{4}$ in., narrow lanceolate-linear. *Flowers* polygamo-monoecious; styles in the male flowers sometimes united nearly to their summit. *Fruit* red, or half-black half-red.

Doubtfully separable from the true Ginseng of Japan, *Panax Ginseng*, C. A. Mey. l. c. 524, which differs by having broader, more obovate, less bristly leaves, and not by the characters relied on by C. A. Meyer. The Indian examples show every

form of rootstock and tuber attributed specially to *P. Ginseng* and to *P. quinquefolius*, Linn.: the scale at the base of the stem is persistent even in some of Wallich's specimens.

2. **A. bipinnatifida**, C. B. Clarke; leaflets pinnatifid the lobes serrate or bipinnatifid pilose above. *Panax bipinnatifidum*, Seem. Rev. Heder. 100.

SIKKIM HIMALAYA, alt. 8500–11,500 ft.; J. D. H.; C. B. Clarke.

Generally resembles *A. Pseudo-ginseng*, and perhaps not distinct. Leaflets petioluled or sessile, lanceolate acuminate or caudate. Rootstock horizontal, quite like that of some examples of *A. Pseudo-ginseng*, and doubtless, like it, produces tubers not rarely.

SECT. II. Shrubs, erect or scandent, or small trees. Leaves digitate. Styles 5 (or 4). Fruit carpels 5–4, ridged on the back.

3. **A. cissifolia**, Griff.; Seem. Rev. Heder. 91; leaflets 5 rarely 3 lanceolate narrowed at each end, a tuft of fulvous hairs or spines often at the apex of the petiole, umbels simple.—*Araliad* sp. 4, Herb. Ind. Or., H. f. & T.

TEMPERATE HIMALAYA; Kumaon, Sikkim, and Bhotan.

A shrub 10 ft. or erect small tree, branches with short strong deflexed prickles which are sometimes clustered at the nodes. Petioles 5 in., glabrous or pubescent, often with scattered prickles; stipules large, ovate, often deciduous; leaflets 2–3 in., lanceolate, acuminate, pilose above; petiolule 0– $\frac{1}{2}$ in. Peduncles 2–5 in., solitary, pubescent upwards, carrying each one many-flowered umbel; bracteoles among the pedicels few, linear, small. Fruit glabrous.

VAR. 1. *normalis*; a small tree, branchlets and leaves prickly, leaflets fulvous-pubescent beneath doubly serrate, pedicels pubescent. Sikkim; alt. 9000–13,000 ft., Lachen, J. D. H. Bhotan; Griffith (Kew Distrib. No. 2669).

VAR. 2. *scandens*, Edgew. in Herb.; scandent (?) without spines, glabrous, leaflets simply serrate. Kumaon; alt. 9000 ft., Madhari Pass, Strachey & Winterbottom.

SECT. III. **Eu-Aralia**. Erect lax shrubs. Leaves 1–3-pinnate. Styles 5 (or 4). Fruit carpels 5–4, ridged on the back.

4. **A. cachemirica**, Dene. in Jacq. Voy. Bot. 72, t. 81; unarmed no leaflets at the points of division of the leaf-rachis, leaflets elliptic shortly acuminate base often rounded minutely fulvo-pubescent on the nerves above. Seem. Rev. Heder. 91; Brand. For. Fl. 248. *A. macrophylla*, Lindl. in Bot. Reg. 1844, Misc. 73. *Panax tripinnatum*, Wall. Cat. 4934; G. Don Gen. Syst. iii. 384. *P. decompositum*, Wall. Cat. 4935; DC. Prod. iv. 255.—*Araliad* sp. 43, Herb. Ind. Or., H. f. & T.

TEMPERATE HIMALAYA; from SIKKIM, alt. 7000–8000 ft., to KASHMIR, alt. 9000–12,000 ft.; frequent.

A lax shrub, 5–10 ft. Leaves 1–3-pinnate, ultimate pinna with 5–9 leaflets, petiolules 0– $\frac{1}{4}$ in.; leaflets 3 $\frac{1}{2}$ by 1 $\frac{1}{2}$ in., often cordate at base, usually simply regularly serrate, pilose above, glabrous or hispid on the nerves beneath. Umbels in elongate panicles a foot long, but many smaller panicles occur; bracts $\frac{1}{2}$ in., few, lanceolate, or sometimes leaf-like 1 $\frac{1}{2}$ in.; panicle-branches and pedicels pubescent.

5. **A. malabarica**, Bedd. Fl. Sylv. ii. 121, and Anal. Gen. t. 15; aculeate, panicle-branches and pedicels glabrous or sparingly bristly, bracts $\frac{1}{2}$ in. narrow lanceolate acute ciliate.

WESTERN GHATS, from MALABAR to TRAVANCORE: common on the Carcoor Ghat in Wynaad; Beddome.

A large shrub, nearly glabrous, with scattered weak prickles and bristles. Leaves

2-3 ft., 2-pinnate with a pair of leaflets at each division of the rachis; petiolules $0\frac{1}{2}$ in.; leaflets 3-5 $\frac{1}{2}$ by 1-1 $\frac{1}{4}$ in., 5-9 to each pinna, simply or doubly serrate, ciliate, acuminate, narrowed ovate or cordate (*Beddome*) at the base, when young weakly aculeate, when older nearly glabrous on both surfaces. *Umbels* in a compound spreading panicle, at least 8 in. *Fruit* slightly 10-ribbed (*Beddome*).

6. **A. Thomsonii**, *Seem. Rev. Heder.* 91; prickles short strong, stem upwards fulvous villous and woolly, pedicels $\frac{1}{2}$ - $\frac{3}{4}$ in.—*Araliad* sp. 42, *Herb. Ind. Or.*, *H. f. & T.*

ASSAM; in the plains, *Jenkins*. KHASIA Mts., alt. 2000-4000 ft.; *H. f. & T.*; *C. B. Clarke*.

A large prickly shrub, all parts softly villous. *Leaves* large, 2-3-pinnate, with a pair of leaflets at each division of the rachis, petiolules $0\frac{1}{2}$ in.; leaflets 3-4 by 1 $\frac{1}{2}$ in., 5-9 to each ultimate pinnule, elliptic, acuminate, base broad, sparingly often very obscurely serrate. *Panicles* 1 $\frac{1}{2}$ ft., compound; bracts $\frac{1}{2}$ in., narrow-lanceolate.—Resembles *A. chinensis*, Linn., and *A. montana*, Blume, but differs from both in its long-pedicelled flowers. It is much more hairy than the other Indian *Aralias*.

7. **A. foliolosa**, *Seem. Rev. Heder.* 91; very prickly, leaflets glabrous beneath or sparingly bristly on the nerves, bracts narrow-oblong somewhat obtuse persistent, pedicels glabrous or nearly so. *Panax* (?) *foliolosum*, *Wall. Cat.* 4928.—*Araliad* sp. 44, *Herb. Ind. Or.*, *H. f. & T.*

SIKKIM, alt. 5000 ft., *J. D. H.*; BHOTAN, *Griffith*. KHASIA Mts., *Griffith* (*Kew Distrib. No.* 2659); alt. 3000-4000 ft.; *H. f. & T.*

A large lax shrub, glabrous or nearly so; prickles short strong spreading. *Leaves* large, 2-3-pinnate, with a pair of leaflets at each division of the rachis; petiolules $0\frac{1}{2}$ in.; leaflets 2-3 by 1-1 $\frac{1}{4}$ in., 5-9 to each ultimate pinnule, elliptic, acuminate, usually rounded at the base, sparingly serrate, glabrous or minutely pilose above, pilose on the nerves beneath. *Panicle* 1 ft., compound; pedicels $\frac{1}{2}$ - $\frac{3}{4}$ in.

VAR. *sikkimensis*; leaflets more slender more serrate, at their base are often needle-like spines $\frac{1}{2}$ - $\frac{3}{4}$ in., panicle very large.—Sikkim, alt. 2000-6000 ft.; *J. D. H.*, *N. Gamble*, *C. B. Clarke*.

8. **A. armata**, *Seem. Rev. Heder.* 91; prickly, upper part of stem and petioles glabrous, leaflets pilose on both surfaces, upper part of panicle and pedicels pubescent, bracts 0 or caducous. *Kurz For. Fl.* i. 536. *Panax armatum*, *Wall. Cat.* 4933; *G. Don Gen. Syst.* iii. 386.—*Araliad* sp. 45, *Herb. Ind. Or.*, *H. f. & T.*

SIKKIM, alt. 2000-6000 ft., frequent. KHASIA Mts., alt. 2000-4000 ft.; *H. f. & T.* TENASSERIM; *Kurz*. TAVOY; *Wallich*.

A shrub. *Leaves* very large, usually 3-pinnate, with a pair of leaflets at each division of the leaf-rachis; petiolules $\frac{1}{2}$ in.; leaflets $4\frac{1}{2}$ by 2 in., 5-9 to each ultimate pinnule, acuminate, round or cordate at the base, distinctly serrate. *Panicle* often 1 $\frac{1}{2}$ ft., the lower part of the rachis glabrous; pedicels $\frac{1}{2}$ - $\frac{3}{4}$ in.—*Panax Finlaysonianum*, *Wall. Cat.* 4933, from Turong Bay, Cochin China, hardly differs from this except that the leaflets have soft brownish-red hairs on the lower surface instead of bristly hairs.

2. PENTAPANAX, *Seem.*

Trees or large scandent shrubs. *Leaves* simply pinnate with 5-9 leaflets, or digitate with 3-5 leaflets glabrous; leaflets entire crenate or serrate. *Flowers* hermaphrodite or polygamous, in compound racemes or umbelled, pedicels jointed close under the flowers. *Calyx*-teeth 5. *Petals* 5, imbricated in bud.

Stamens 5. *Ovary* 5- (or 4-) celled; styles 5-4, combined to the summit or free for more than half their length. *Fruit* 5-4-celled and angled. *Albumen* uniform.—*DISTRIB.* Species 5, confined to continental India.

* *Flowers in panicked racemes.*

1. ***P. racemosum***, *Seem. Rev. Heder.* 21; panicles unisexual elongate oblong with racemes diverging from the rachis divaricately to its summit, styles in the perfect flowers half- or more- free recurved.—*Araliad* sp. 41, *Herb. Ind. Or., H. f. & T.*

SIKKIM; alt. 6000-8000 ft.; *H. f. & T.*; *Gamble*; *C. B. Clarke*.

A tree 60 ft. (*ex H. f. & T.*), or a large climber (*ex Gamble*). *Leaflets* 4-9 by 2½-5½ in., usually 5-7, elliptic, acuminate, often rounded or cordate at the base, sinuate-denticulate; petiolules often ½-¾ in. *Panicles* glabrous or villous, often 1 ft. by 4-6 in., 3-9 clustered at the ends of the branchlets; branches 2-3½ in., racemed, flowering from their base; pedicels 0-½ in., with a minute linear bract at their bases. *Styles* in the male flowers combined nearly to their summit, in the perfect flowers 3-5, recurved free sometimes almost to the base. *Fruit* (not ripe) small, subglobose; probably less angular and elongate than that of *P. Leschenaultii*; disc not elongate-conical.

2. ***P. subcordatum***, *Seem. Rev. Heder.* 22; panicle ovate acuminate, racemes ascending, rachis unbranched upwards, styles combined nearly to their summits. *Hedera subcordata*, *Wall. Cat.* 4917; *G. Don Gen. Syst.* iii. 394.—*Araliad* sp. 41, *Herb. Ind. Or., H. f. & T. partly.*

• KHASIA MTS., alt. 4000-6000 ft.; *Wallich, Griffith, &c.*, not rare.

A small tree. *Leaflets* 3½-4½ by 2 in., usually 3-5, elliptic, acuminate, often rounded or cordate at the base, sinuate-crenate; petiolules often ¼-⅓ in. *Panicles* 8 in., with 3-8 racemed branches ascending from its lower half; panicle-branches 2-4 in., glabrous racemed flowering from their base; pedicels often ¼ in. (rarely 0-⅛ in.), with a minute linear bract at their bases. *Flowers* appear all perfect. *Fruit* (nearly ripe) small, subglobose, obscurely 5-angled, disc not elongate-conical.

** *Flowers umbelled, umbels simply panicked.*

3. ***P. parasiticum***, *Seem. Rev. Heder.* 22; leaflets 5 lanceolate entire glaucous beneath. *Brand. For. Fl.* 248. *Hedera parasitica*, *Don Prodr.* 188; *DC. Prodr.* iv. 265. *H. glauca*, *Wall. Cat.* 4921; *G. Don Gen. Syst.* iii. 394. *Aralia parasitica*. *Ham. MS.*

NIPAL; *Hamilton*. KUMAON; *Wallich, Royle*. Binsar, alt. 7,600 ft., *Strachey & Winterbottom*.

Scandent, glabrous. *Leaflets* 2¾ by 1¼ in. (or smaller), scarcely acuminate, base rounded or subacute; petiolules 0-⅛ in. *Panicles* 3-4 in., simple with 2-8 umbels; pedicels ½-¾ in., glabrous. *Styles* long, combined to near the top. *Fruit* (not ripe) small, subglobose, obscurely 5-angled; disc not elongate-conical.

VAR. 1. *khasiana*; pedicels and rachis of panicle pubescent.—Khasia Mts.; Myrung, alt. 5000 ft., *Griffith* (*Kew Distrib.* No. 2680), *Simons*.

4. ***P. Leschenaultii***, *Seem. Rev. Heder.* 22 partly; leaflets 3-5 elliptic-acuminate bristle-serrate, fruit ovoid not very angular, disc not elongate-conical. *Bedd. Fl. Sylv. Anal. Gen.* t. 15. *Panax Leschenaultii*, *DC. Prodr.* iv. 254. *P. micranthum*, *Wall. Cat.* 4938; *Excl. A.* *Hedera Leschenaultii* and *H. trifoliata*, *W. & A. Prodr.* 377; *Wight Ic.* t. 307.—*Araliad* sp. 39, *Herb. Ind. Or., H. f. & T.*

SIKKIM, alt. 6000-1000 ft.; *J. D. H.* SOUTH DECCAN and CEYLON in the mountains. BURMA, Taong-dong; *Wallich*.

A tree 30–50 ft., or scandent shrub. *Leaflets* $3\frac{1}{2}$ by $2\frac{1}{4}$ in., 3 (or 5 in Wight's No. 1204), base rounded or cordate; petiolules often $\frac{1}{4}$ – $\frac{3}{8}$ in. *Panicles* 3–6 in., with 3–6 heads; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in., glabrous or puberulo-pubescent. *Styles* combined nearly to their summits. *Fruit* $\frac{1}{2}$ in. long and broad subcampanulate; ribs not prominent.

The typical form of the fruit in the Nilgherries, accurately described and figured by Wight and Beddome, differs from the Himalayan, but the large series of examples bridges over the gap completely.

VAR. umbellatum, Seem. Rev. Heder. 22 (sp.); fruit oblong strongly-ribbed, disc often elongate-conical, pedicels glabrous or pubescent. *P. Leschenaultii*, Seem. Rev. Heder. 22, partly; *Brand. For. Fl.* 248. *Hedera fragrans*, *Don Prodr.* 187, not of Roxb. *Panax bijugum*, *Wall. Cat.* 4937; *C. Don Gen. Syst.* iii. 386, &c.—Temperate Himalaya from Kumaon to Bhotan, alt. 4000–10,000 ft.; common. Khasia Mts., alt. 3000–5000 ft.—Resembles the type except in the fruit: the pedicels are either glabrous, or more or less pubescent. Seemann has marked as *P. Leschenaultii* examples with pubescent pedicels.

3. **ARALIDIUM**, Miq.

Leaves large, simply pinnatifid, glabrous. *Panicles* male or hermaphrodite, males much larger and more compound; pedicels jointed close under the flowers; flowers small. *Calyx-teeth* 5, triangular. *Petals* 5, imbricate. *Stamens* 5. *Ovary* 4–3-celled; styles 4–3, separate, linear-cylindric, stigmatose on all sides. *Fruit* 1-seeded.—*DISTRIB.* Species 2, Malayan.

1. **A. pinnatifidum**, Miq. *Fl. Ind. Bat.* i. 763, t. 13; leaves 12–18 in. lobed nearly (sometimes quite) to the rachis, panicles upwards and flowers tawny-pubescent.

MALACCA: Griffith (Kew Distrib. No. 2702); Maingay No. 676.

Lobes of the *leaves* 4–6 by 1–2 in., oblong-lanceolate. *Male panicles* 15 by 12 in., compound, with innumerable minute pubescent flowers. *Petals* pubescent. *Young ovary* with 1 pendulous ovule in each cell. *Fruit* (unripe) $\frac{1}{4}$ in. long.—Maingay notes “Drupes 1-seeded, cotyledons crumpled leafy.” The albumen in the imperfectly ripe seeds seems much ruminated. The seeds of the closely allied *A. dentatum* are 1 in. long.

3.* **PANAX**, Linn.

Shrubs or trees. *Leaves* pinnate or digitate rarely undivided; leaflets entire or serrate. *Umbels* paniced (in Indian species), pedicels jointed close under the flowers. *Flowers* often polygamous. *Calyx-limb* 5-toothed or nearly entire. *Petals* 5, valvate. *Stamens* 5. *Ovary* 2- (rarely 3-) celled; styles 2 (rarely 3), distinct. *Fruit* subcompressed or globose, 2- (rarely 3-) seeded, carpels rounded on the back.—*DISTRIB.* Species 25, Polynesian, Australian, and Malayan, extending to Manchuria and Tropical Africa.

1. **P. fruticosum**, Linn.; *DC. Prodr.* iv. 254; leaves tripinnate, leaflets lanceolate bristle-serrate, fruit compressed laterally. *Blume Bijl.* 880; *Roxb. Hort. Beng.* 21, *Fl. Ind.* ii. 76; *Wall. Cat.* 4932; *W. & A. Prodr.* 376; *Wight Ic.* t. 573; *Kurz For. Fl.* i. 537. *Nothopanax fruticosum*, Miq. *Fl. Ind. Bat.* i. pt. i. 765; *Seem. Rev. Heder.* 70.—*Rumph. Amb.* iv. t. 33.

Throughout the warmer parts of INDIA, cultivated.—*DISTRIB.* Malaya and Polynesia, cultivated; wild state unknown.

A shrub, 3–6 ft. *Leaflets* 2–3 by $\frac{1}{4}$ – $\frac{1}{2}$ in., but varying greatly in size and often irregular in shape, usually much setose-serrate or incised, sometimes nearly entire. *Panicles* 3–6 in.; bracts minute, deciduous; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in. *Fruit* $\frac{1}{2}$ in. long and broad and $\frac{1}{16}$ in. thick; styles persistent recurved.

4. **ACANTHOPANAX**, Dcne. & Planch.

Shrubs or small trees, glabrous (or in non-Indian species tomentose). *Leaves* palmate or digitate (in Indian species). *Umbels* paniced or subsolitary; pedicels not jointed under the flower. *Flowers* polygamous or hermaphrodite. *Calyx-teeth* 5, small. *Petals* 5-4, valvate. *Stamens* 5-4. *Ovary* 2- (rarely 3-4) celled; styles 2 at the apex of a conical disc, distinct or combined at the base. *Fruit* laterally subcompressed or subglobose. *Albumen* uniform.—**DISTRIB.** Species 6; Japan to Malaya, and E. Bengal.

1. ***A. aculeatum***, Seem. *Rev. Heder.* 86; glabrous, prickly, leaves digitate, leaflets 3-5 elliptic attenuate at base toothed, umbels in small panicles or solitary, fruit compressed. *A. sepium*, Seem. *Rev. Heder.* 86. *Panax aculeatum*, Ait. *Hort. Kew*, v. 482; Jacq. *Ic. Rar.* t. 634; Wall. *Cat.* 4926; DC. *Prodr.* iv. 252. *P. Loureiranum*, DC. *l.c.* *Plectronia chinensis*, Lour. *Fl. Cochinch.* 162. *Xanthoxylon trifoliatum*, Linn. *Sp. Pl.* 1455.—*Araliad* sp. 5, *Herb. Ind. Or.*, *H. f. & T.*

MISHMEE; Griffith (Kew Distrib. No. 2665). KHASIA MTS., alt. 4000 ft., frequent.—**DISTRIB.** China, Japan.

A shrub or small tree; branches angular; spines short, broad-based, stout, often deflexed. *Leaves* of 3-5 leaflets; petiole 1-2 in., often bearing one or more prickles; leaflets 2 by $\frac{3}{4}$ -1 in., subacute, denticulate or serrate, sometimes with a few stiff bristles on the nerves beneath; petiolules usually distinct, $\frac{1}{4}$ - $\frac{1}{2}$ in. *Umbels* often solitary; pedicels numerous, $\frac{3}{4}$ -1 in. *Fruit* $\frac{1}{2}$ in. long and broad; styles persistent, recurved, united for half their length.—Seemann has marked some of the Kew examples *A. sepium*, others *A. aculeatum*, between which no difference can be discovered, and his diagnosis of *A. sepium* applies to the examples he has marked *A. aculeatum*. It is very doubtful whether *Panax spinosum*, Linn. f. (*Acanthopanax*, Miq.), specifically differs: the leaflets in this seem quite sessile and the prickles are less deflexed.

5. **HELWINGIA**, Willd.

Glabrous under-shrubs. *Leaves* petioled, simple, lanceolate or ovate-lanceolate, bristle-serrate; stipules a tuft of linear bristles seen only at the base of the young petioles. *Umbels* unisexual, simple, very small, sessile about the middle of the back of the leaf, or on phyllodes; females 1-4-flowered; males with more flowers; bracts 0, pedicels not jointed under the flower. *Calyx-margin* obsolete. *Petals* 3-5, valvate. *Stamens* 3-5. *Ovary* 3-4-celled; styles 3-4, combined at base, rising from a conical disc. *Fruit* ovoid or ellipsoid, usually 2-3-celled; carpels rounded on the back. *Seed* compressed; albumen uniform.—**DISTRIB.** Species 2, an Indian and a Japanese.

1. ***H. himalaica***, Hk. f. & T. ms.; leaves lanceolate, fruit $\frac{1}{4}$ in. ellipsoid.

SIKKIM, alt. 7000-9000 ft., frequent. EAST HIMALAYA; Griffith. KHASIA MTS., alt. 5000-6500 ft., *H. f. & T.*

Stem woody, branched. *Leaves* 3 by 1 in., tapering at both ends; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Phyllodes* when present spatulate-oblong, sessile, $1\frac{1}{2}$ in., entire below bristle-serrate near the apex, midrib strong, the wing membranous imperfectly herbaceous. *Flowers* $\frac{1}{20}$ in. diam., greenish. *Fruit* 1-3 on the leaf; pedicels hardly $\frac{1}{2}$ in. *Seeds* narrowly-oblong, compressed, more than twice as long as broad.—This hardly differs from *H. rusciflora*, Willd., which has elliptic (rather than lanceolate) leaves, the fruit shorter subglobose, the seeds less than twice the length of their breadth.

EXCLUDED SPECIES.

Helwingia populifolia, *Spreng. Pugillus* ii. 89, said to be from Bengal, does not belong to the genus.

6. **POLYSCIAS**, *Forst.*

Glabrous trees or large shrubs. *Leaves* pinnate, leaflets coriaceous entire. *Umbels* paniced (in Indian species); bracts $\frac{1}{2}$ in., lanceolate or 0; pedicels jointed under the flower. *Calyx-margin* truncate or toothed. *Petals* 5-4 (in Indian species), valvate. *Ovary* 5-4-celled (in Indian species), summit flat; styles 5-4, distinct. *Fruit* ellipsoid or globose, prominently ribbed. *Seed* compressed; albumen uniform.—**DISTRIB.** Species 8; E. African Islands, S. India, and Malaya.

1. **P. acuminata**, *Seem. Rev. Heder.* 56; leaflets 5-13 oblong much acuminate, panicle narrowly oblong simple, branches short ending in an imperfect umbel. *Bedd. Fl. Sylv.* t. 213, *excl. syn.* *Hedera acuminata*, *Wight Ic.* t. 1062; *Thwaites Enum.* 181, *excl. syn.* *Eupteron acuminatum*, *Miq. Fl. Ind. Bat.* i. pt. i. 762.

DECCAN MTS., alt. 5000 ft.; NILGHIRIS; *Wight.* ANAMALLAYS and TINNEVELLY GHATS; *Beddome.* CEYLON, Adams Peak, alt. 4000-5000 ft.; *Thwaites.*

A tree. *Leaflets* 5 by $1\frac{3}{4}$ in., attenuated at both ends, margin thickened, petiole $\frac{1}{4}$ in. *Panicle* 8-10 by 1-3 in., branches stout, umbel at the end of each subcapitate the pedicels not rising from the same point and being sometimes again divided so that the panicle may be called compound, but the umbels altogether are not above 1 in. diam.; bracts caducous. *Ovary* truncate, ellipsoid, soon becoming distinctly ribbed. *Ripe fruit* not seen. [The Andaman leaves distributed by Mr. Kurz as *Eupteron* sp. nov.? *Andaman Rep. Suppl.* B. 9 appear to be *Arthrophyllum diversifolium*, *Blume.*]

2. **P. pinnata**, *Forst. Char. Gen.* p. 64, t. 32; leaflets orbicular subentire or with small remote teeth base cordate. *DC. Prodr.* iv. 257; *Seem. Rev. Heder.* 56. *Panax*? *Heyneanum*, *Wall. Cat.* 4927; *G. Don Gen. Syst.* iii. 385. *Nothopanax tricochleatum*, *Miq. Fl. Ind. Bat. Suppl.* 340. *Aralia latifolia*, *W. & A. Prodr.* 376.

INDIA? *Wight* No. 1213.—**DISTRIB.** Malaya, Polynesia.

This plant is noticed here because taken up in *W. & A. Prodr.* and because Dr. Seeman supposed it might be a new genus. *Wight's* Herbarium specimen is without locality, there is therefore small probability that the plant is Indian.

7. **HEPTAPLEURUM**, *Gaertn.*

Large shrubs or trees, glabrous or tomentose, without prickles. *Leaves* digitate rarely compound-digitate or 1-foliolate; leaflets coriaceous, entire or remotely toothed or lobed, never closely serrate nor ciliate, those near the panicle usually entire; stipules often connate within the petiole and prominent. *Umbels* (rarely capitate) paniced or in compound racemes; bracts woolly, deciduous or persistent; pedicels not jointed under the flower; bracteoles few or 0, or rarely densely tufted. *Calyx-margin* toothed or truncate. *Petals* 5-8 or many, valvate. *Stamens* as many as the petals. *Ovary* cells as many as the petals, disc small or large; styles small, separate or combined in a short conical narrow cylindric column. *Fruit* subglobose, 5-6-angled. *Seeds* compressed; albumen uniform.—**DISTRIB.** Species 50, in the tropics of the old world.

SUBGEN. I. **Agalma**. *Stigmas* connate into a narrow cylindric style.

† *Umbels* perfect, *pedicels* not racemed.

1. **H. impressum**, C. B. Clarke; leaflets (from leaves near the panicle) lanceolate nearly entire nerves impressed above stellately woolly beneath, petals sparingly stellate-woolly. *Agalma tomentosum*, *Seem. Rev. Heder.* 25. *Hedera tomentosa*, *Ham. in Don Prodr.* 187; *Wall. Cat.* 4922; *DC. Prodr.* iv. 264. *Panax tomentosum*, *DC. Prodr.* iv. 254.—*Araliad* sp. 13, *Herb. Ind. Or. H. f. & T.*

Temperate Himalaya, alt. 6000–11,000 ft.; from KUMAON to BHOTAN, frequent.

A tree, 60 ft. *Leaflets* often 10 by $2\frac{1}{4}$ in., rugose above from the impressed nerves, lanceolate or oblanceolate, acuminate; petiolules rarely more than 1 in.; leaflets from young trees often distantly lobed or serrate. *Panicle* 12–15 in., stellate-tomentose; bracts very shortly ovate, somewhat persistent; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in.—Seeman has applied the name *H. tomentosum* to a different Malayan plant: hence the new name *H. impressum*.

2. **H. hypoleucum**, *Kurz For. Fl.* i. 539; leaflets with scattered lax stellate wool or glaucous beneath glabrous and not rugose above, petals covered with dense stellate wool.—*Araliad* sp. 15, *Herb. Ind. Or. H. f. & T.*

KHASIA Mts., alt. 4000–6000 ft. frequent; *Griffith, H. f. & T., C. B. Clarke, MARTABAN*, alt. 6000 ft.; *Kurz*.

A small branched tree. *Leaflets* 4–8 by $1\frac{1}{2}$ – $3\frac{1}{2}$ in., those even from leaves next the panicle polymorphous, oblong or ovate, acute, quite entire or serrulate or lobed or irregularly pinnatifid, the stellate wool beneath deciduous, leaving a glaucous surface; petiolules $\frac{1}{2}$ –3 in. *Panicle* often 12–15 in., lower branches often elongate with several umbels, stellately woolly; bracts shortly ovate, somewhat persistent; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in.—Closely allied to the preceding. From Mr. Kurz's description it would seem that the rarer Khasian form with perfectly glabrous glaucous leaves, is the only Burman one.

3. **H. elatum**, C. B. Clarke; leaflets near the panicle nearly entire oblong lanceolate glabrous not rugose above, petals glabrous or sparingly stellate woolly. *Hedera elata*, *Ham. in Don Prodr.* 187; *DC. Prodr.* iv. 264; *Wall. Cat.* 4914. *Agalma elatum*, *Seem. Rev. Heder.* 25.—*Araliad* sp. 6, *Herb. Ind. Or. f. & T.*

KUMAON to BHOTAN, alt. 5000–7000 ft., not uncommon; *Wallich, &c.*

A tree 30–40 ft. *Leaflets* 4–7 by 1 – $2\frac{1}{2}$ in., broadest below the middle, in young trees but sparingly toothed or lobed; petiolules often 1–2 in. *Panicle* 12–18 in., lower branches usually compound; bracts very short, ovate, auriculate; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in., glabrous pubescent or stellately woolly; buds usually glabrous.

VAR. *Griffithii*; pedicels very woolly, young petals more pubescent. *Heptapleurum glaucum*, *Kurz For. Fl.* i. 538. *Agalma Griffithii*, *Seem. Rev. Heder.* 25.—Bhotan; *Griffith* (Kew Distrib. No. 2698 and E. I. C. No. 2064). Burma; Martaban, alt. 5000–7000 ft.; *Kurz*; Moolee Mt., *Parish*.

4. **H. glaucum**, C. B. Clarke (not of Kurz); leaflets near the panicle nearly entire glabrous obovate-lanceolate with impressed nerves above, petals with minute white stellate tomentum. *Agalma glaucum*, *Seem. Rev. Heder.* 25.—*Araliad* sp. 14, *Herb. Ind. Or. H. f. & T.*

KHASIA Mts., alt. 4000–6000 ft.; *H. f. & T., C. B. Clarke.* EAST BENGAL; *Griffith* (Kew Distrib. No. 2660).

A small tree. *Leaflets* 6 by 2 in., broadest above the middle, the tertiary nerves impressed above but less deeply than in *H. impressum*, leaflets of young plants with

remote serratures or shallow lobes; petiolules 1 in. *Panicle* much as in *H. elatum*, nearly glabrous or more or less pubescent or stellately woolly.

5. **H. rostratum**, *Bedd. Fl. Sylv.* ii. p. 122; leaflets glabrous lanceolate or elliptic narrowed at both ends coriaceous, tertiary nerves obscure above, petals glabrous or nearly so. *Hedera rostrata*, *Wight Ic.* t. 1013. *Agalma rostratum*, *Seem. Rev. Heder.* 25.

NILGHIRIS; *Wight*; *Gardner*, alt. 7000 ft.; *C. B. Clarke*. (The Sikkim locality given by Seeman is an error.)

A small branched tree. *Leaflets* $4\frac{1}{2}$ by $1\frac{1}{4}$ –2 in., entire or denticulate; petiolules $\frac{3}{4}$ –1 in. *Panicle* 8 in., branches often bearing one umbel each only; bracts shortly ovate, persistent; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in., glabrous or stellately pubescent, springing from a dense tuft of permanent bracteoles.

VAR. *micrantha*; flowers and fruit smaller, pedicels and bracteoles glabrous.—Sisparah, Nilghiri Mts., *Wight*.

†† *Pedicels usually racemed.*

6. **H. racemosum**, *Bedd. Fl. Sylv.* t. 214; leaflets glabrous entire narrowed at both ends, pedicels glabrous or often rusty stellately woolly. *Hedera racemosa*, *Wight Ic.* t. 1015; *Thwaites Enum.* 132. *Agalma racemosum*, *Seem. Rev. Heder.* 24.

NILGHIRIS; *Gardner*; Cancor, alt. 6000 ft., *Wight*. ANAMALLAY Mts. alt. 3000–5000 ft.; *Beddome*. CEYLON, alt. 3000–5000 ft.; *Thwaites*.

A large tree. *Leaflets* 6 by $2\frac{1}{2}$ in., elliptic or lanceolate, subobtusate or cuspidate, coriaceous, tertiary nerves above, obscure; petiolules often 1– $1\frac{1}{2}$ in. *Panicle* 6–12 in., the ends of the branches bracts and pedicels rusty pubescent while young; bracts shortly ovate, persistent; pedicels $\frac{1}{2}$ in. *Flowers* at first often umbelled, the fruits usually distinctly racemed.—Closely allied to the preceding species: some of *Thwaites'* specimens are not racemed at all, even in fruit.

SUBGEN. II. **Eu-Heptapleurum**. *Styles* short, not connate into a narrow cylindric column.

* *Leaves* 1- (rarely 1-3-) foliolate.

7. **H. emarginatum**, *Seem. Rev. Heder.* 44; leaves cuneate-oblong emarginate, panicles 1-2 in., umbels 2-5-flowered. *Hedera emarginata*, *Moon Cat. Pl. Ceylon*; *Thwaites Enum.* 132.

CEYLON, up to 4000 ft.; *Walker*, *Thwaites*.

A climbing glabrous shrub. *Leaflets* $\frac{3}{4}$ – $1\frac{1}{2}$ by $\frac{3}{8}$ – $\frac{3}{4}$ in., narrowed at the base, sessile, broadest at the very summit and there distinctly emarginate or 2-lobed, nerves on both surfaces raised. *Pedicels* $\frac{1}{4}$ in., spreading; bracts 0 or early fugacious. *Flowers* very small, white tinged red (*Thwaites*).

** *Leaves* simply digitate; leaflets usually 5-7.

† *Reticulating nerves prominent on the upper surface of the leaflets.*

8. **H. venulosum**, *Seem. Rev. Heder.* 44; leaflets oblong or elliptic acute usually broadest below the middle. *Brand. For. Fl.* 249; *Kurz For. Fl.* i. 538. *H. ellipticum*, *Seem. Heder.* 43. *Paratropia venulosa*, *W. & A. Prodr.* 377; *Wight Ill.* t. 118. *P. elliptica* and *macrantha*, *Miq. Fl. Ind. Bat.* i. pt. i. 756. *Hedera venosa*, *Wall. Cat.* 4923. *H. terebinthacea*, *Wall. Cat.* 4920 partly. *Aralia digitata*, *Roxb. Hort. Beng.* 22, *Fl. Ind.* ii. 107. *Sciadophyllum ellipticum*, *Blume Bijdr.* 878; *DC. Prodr.* iv. 260.—*Rheede Hort. Mal.* vii. t. 28. *Araliad* sp. 18, *Herb. Ind. Or. H. f. & T.*

Throughout tropical and subtropical INDIA, from the NORTH-WEST HIMALAYA to the SOUTH DECCAN and SINGAPORE.—DISTRIB. Malaya and Tropical Australia.

A small glabrous tree or climbing shrub. *Leaflets* 4 by 2 in., glabrous, entire, acuminate, base subacute or rounded; petiolules 1 in. or larger. *Panicle* small or large; lateral branches sometimes 10 in., compound; bracts caducous, large, ovate, hairy in the young panicle; branchlets and pedicels glabrous or pubescent; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in. *Buds* varying in size, and the disc after flowering is very prominent or not.—The panicle branches become more delicate and the buds smaller in Burma, where the plant is exactly *Paratropia elliptica*, Miq.; while at Malacca the form collected by Dr. Maingay (No. 680) is *P. micrantha*, Miq.

VAR. *macrophylla*, Wall. Cat. 4918 (sp.); leaflets 6–8 in.—Amherst; Wallich.

9. **H. stellatum**, Gaertn. *Fruct.* ii. 472, t. 178; leaflets obovate obtuse. *Seem. Rev. Heder.* 45. *Hedera* obovata, *Wight Ic.* t. 1011. *H. Vahl.* *Thwaites Enum.* 132. *H. terebinthacea*, *Vahl Symb.* iii. 42; *DC. Prodr.* iv. 265; *Wall. Cat.* 4920 partly. *Paratropia terebinthacea*, Arn. *Pugill.* 20.

SOUTH DECCAN PENINSULA; near Coimbatore, *Wight*. NILGHIRI MTS., *Hohenacker* No. 1472. CEYLON, abundant up to 3000 ft. alt.; *Thwaites*.

Altogether resembles *H. venulosum* except as to the obtuse obovate leaflets, and may be merely a South Indian and Ceylon form of it.

10. **H. subulatum**, *Seem. Rev. Heder.* 42; leaflets often 4–3 more rarely 5 oblong or elliptic acuminate, panicles linear. *Paratropia subulata*, *Miq. in Ann. Mus. Lugd. Bat.* i. 22.

PINANG and MALACCA; *Griffith* (Kew Distrib. No. 2690); *Maingay*, No. 681.—DISTRIB. Sumatra.

Branchlets glabrous. *Leaflets* $5\frac{1}{2}$ by $2\frac{1}{2}$ in., narrowed at both ends, glabrous or rarely with scattered stellate woolly hairs beneath, entire or with a few teeth. *Panicle* in flower 10 by 1 in., in fruit nearly 3 in. broad, when young with scattered white stellate wool; bracts $\frac{1}{2}$ in., lanceolate, stellately white woolly, soon deciduous; branches usually very short, sometimes 1 in.; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in., always stellately tomentose when young. *Fruit* pentagonal, disc large, prominent.—May this be a state of *H. heterophyllum*?

†† *Leaves coriaceous, tertiary nerves not prominent above.*

11. **H. Wallichianum**, C. B. Clarke (not of Seemann); pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in. glabrous, buds $\frac{1}{2}$ in. broad. *H. exaltatum*, *Seem. Rev. Heder.* 44. *Paratropia Wallichiana*, W. & A. *Prodr.* 377. *Hedera exaltata*, *Thwaites Enum.* 44. *H. Wallichiana*, Dalz. & Gibs. *Bomb. Fl.* 108.—Araliad sp. 19, *Herb. Ind. Or. H. f. & T.*

SOUTH DECCAN PENINSULA; Kurg, *Wight*. NILGHIRIS, alt. 4000–6000 ft., near Canoor, C. B. Clarke. CEYLON, alt. 4000–6000 ft.; *Thwaites*.

A large glabrous tree. *Leaflets* 5–10 by $2\frac{1}{2}$ –4 in., oblong or elliptic, acute, rounded at the base, very leathery. *Panicle* oblong, about 12 by 3 in.; buds glabrous, unusually large. *Fruit* crowned by the much enlarged pentagonal disc.

12. **H. khasianum**, C. B. Clarke; pedicels $\frac{1}{2}$ in. stellately tomentose when young, buds $\frac{1}{2}$ in. broad. *H. Wallichianum*, *Seem. Rev. Heder.* 44.—Araliad sp. 20, *Herb. Ind. Or. H. f. & T.*

BHOTAN, Mishmee; *Griffith* (Kew Distrib. No. 2694). KHASIA MTS., alt. 3000–6000 ft.; *H. f. & T.*; C. B. Clarke.

Leaflets attain 11 by 3 in., usually much smaller, narrow-oblong or lanceolate, acuminate, glabrous, the base sometimes almost rounded, very coriaceous, entire; petiolules often $1\frac{1}{2}$ in. *Panicle* with white stellate tomentum on the branches pedicels and backs of the petals, often a foot long in fruit; lower branches elongate, ascend-

ing, compound; bracts $\frac{1}{4}$ in., oblong, acuminate, caducous; pedicels $\frac{1}{4}$ in. in fruit. *Fruit* globose, hardly pentagonal, disc depressed conical, not pentagonal.

13. **H. Cephalotes**, C. B. Clarke; panicle pubescent, flowers sessile, bracts deciduous. *H. capitatum*, Seem. *Heder.* 45 partly.

MALACCA; Griffith (No. 2700 Kew Distrib.).

Apparently a large tree. *Leaflets* 14 by $4\frac{1}{2}$ in., oblong-elliptic, acuminate, rounded or little narrowed at the base, coriaceous, entire, shining, glabrous above, with scattered loose woolly hairs that easily wear off beneath; petiolules 3-4 in., stout. *Panicle* 15 in. with stellate pubescence from the base. Heads of *fruit* globose, close packed without bracteoles. *Fruit* much longer than broad, 5-8-ribbed, stellately white-tomentose, crowned by the broad short cluster of styles; disc enlarged, somewhat corky.—Very unlike *Paratropia capitata* W. & A. (a *Brassia*), with which, regardless of geography, Dr. Seeman united it.

*** Leaves twice digitate or digitately decompound.

14. **H. heterophyllum**, Seem. *Rev. Heder.* 42; leaves twice digitate, panicle narrowly oblong or linear stellately white-pubescent. *Hedera heterophylla*, Wall. *Cat.* 4919; *G. Don. Gen. Syst.* iii. 394. *Paratropia heterophylla*, Presl *Epimel. Bot.* 250; *Miq. Fl. Ind. Bat. i.* pt. i. 761.

PINANG; Wallich.—DISTRIB. Java.

Branchlets glabrous. *Leaves* digitately 3-4-petioluled, each petiolule bearing 3-4 rarely 5 leaflets; leaflets 4-5 by 1-3 in., oblong or elliptic, acuminate, rounded or somewhat acute at the base, glabrous, entire, membranous; tertiary nerves prominent above, secondary petiolules much varying in length from $\frac{1}{2}$ - $1\frac{1}{2}$ in. at the same cluster. *Panicle* 8-12 by 1-3 in., branches slender, little compound; bracts $\frac{1}{4}$ in., ovate-oblong, stellately white tomentose, caducous or sometimes persistent. *Flowers* small. *Fruit* pentagonal.

15. **H. binternatum**, C. B. Clarke; leaves digitately decompound or twice pinnate with ternate leaflets at each node of the rhachis.

MALACCA; Maingay No. 684.

A small tree; trunk about 3 ft. (*Maingay*). *Leaflets* 5 by $\frac{3}{4}$ in., linear-oblong, acuminate, unequal subacute at the base, entire, the reticulating nerves prominent on both surfaces, with scattered stellate hairs (easily wearing off) beneath; petiolules $0\frac{1}{16}$ in. *Panicle* 8 by $1\frac{1}{2}$ in., branches hardly divided, with scattered stellate hairs; bracts deciduous; pedicels less than $\frac{1}{4}$ in. *Flowers* small, altogether of a *Eu-Heptapleurum*.—May prove a form of *H. heterophyllum*.

DOUBTFUL SPECIES.

HEDERA MOLLIS; Wall. *Cat.* 4924; the example consists of leaves only; it may be *Heptapleurum Cephalotes* above.

8. TREVESIA, Vis.

Shrubs or small trees, prickly or unarmed, glabrous or stellate-hairy. *Leaves* palmate or digitate; petioles often united by a wing at their base; stipules united within the petiole or obsolete. *Flowers* polygamous, large for the Order; umbels paniced; pedicels not jointed under the flower; bracts small or 0. *Calyx-margin* entire or toothed. *Petals* 8-12, valvate, somewhat thick, often cohering as a cap in the fertile flowers. *Stamens* as many as the petals. *Ovary* with as many cells as the petals; styles united into a small boss or short column. *Fruit* ovoid, large for the Order. *Seeds* compressed; albumen uniform.—DISTRIB. Species 8; inhabiting Eastern India, Malaya and Polynesia.

Hardly separable from *Heptapleurum* by the larger flower and fruit, and the usually more numerous carpels.

1. **T. palmata**, *Vis. in Mem. Acad. Torino*, ser. 2, iv. 262, with fig.; leaves large palmate or digitate nearly glabrous, lobes serrate or again lobed, petiolules connected at base by a serrate or lobed wing. *Seem. Rev. Heder.* 77; *Kurz For. Fl.* i. 539. *Gastonia palmata*, *Roxb. Hort. Beng.* 33, *Fl. Ind.* ii. 407; *Lindl. in Bot. Reg.* t. 894. *Gilibertia palmata*, *D.C. Prodr.* iv. 256. *Hedera ferruginea* and *palmata*, *Wall. Cat.* 4909 and 4910 partly. *Brassaiopsis confluens*, *Seem. Rev. Hed.* 18 (as to the leaves).—*Araliad* sp. 30 and 31, *Herb. Ind. Or. H. f. & T.*

From NIPAL and SIKKIM to PEGU, alt. 1000–5000 ft., frequent.

A small tree 10–15 ft., the shoots with reddish hair and many prickles. *Leaves* 1–2 ft., adult glabrous or with scattered stellate hairs on both surfaces deeply palmate, in young plants often digitate; petiole often prickly. *Panicles* 18 in., straggling, young with red-brown tomentum; bracts 1 in., oblong, usually deciduous; pedicels 1–1½ in. *Buds* exceeding ¼ in. diam. *Fruit* ⅝ by ½ in., ovoid, glabrate, ribs not prominent, crowned by the stout style.

VAR. 1. insignis, *Miq. in Ann. Mus. Lugd. Bat.* i. 220 (sp.); leaves very large, segments lobed or subpinnatifid. Khasia Mts.; *Griffith* No. 2664 (Kew Distrib.).

VAR. 2. cheirantha; leaves palmate nearly glabrous, lobes serrate, petiolules when present with entire wing. *Hedera* ? *Aralia*, *Jack* in *Wall. Cat.* 4925. Chittagong, alt. 0–1000 ft.; *H. f. & T.* Pinang and Malay Peninsula, *Porter, Sir W. Norris*; *Wall. Cat.* 4910 partly. Malacca, *Griffith* (No. 2661 Kew Distrib.).—Distrib. Philippines.—These are the examples (leaves only) referred in *Gen. Pl.* i. 943 to *T. sundauca*, *Regel* (*Gartenfl.* 1864, t. 438, not of Miquel). In *T. palmata* the young plants only, and only occasionally, produce digitate leaves; and such are often only imperfectly digitate, the central leaflets being frequently petioluled the lateral leaflets continuous. There may be more than one species of *Trevesia* here included, but no species can be founded on imperfectly digitate leaves. One sheet of *Wall. Cat.* 4910, marked *Hedera confluens*, consists of the fruit of *Brassaiopsis* (probably *B. Hainla*) mixed with leaves of *Trevesia* and constitutes the *Brassaiopsis confluens*, *Seem. Rev. Heder.* 18.

9. **BRASSAIA**, *Endl.*

Unarmed glabrous trees. *Leaves* digitate; leaflets large, leathery, entire; stipules united within the petiole. *Panicle* stout, long, branches mostly undivided; umbels contracted into heads; each flower surrounded by 4 ovate bracteoles, as long as the ovary and united below into a tube. *Calyx-margin* entire or nearly so. *Petals* 6–18, valvate, thick. *Stamens* as many as the petals. *Ovary* cells as many as the petals; styles very short, scarcely united as a short cone. *Fruit* obconic and ribbed below, hemispheric above. *Seed* compressed; albumen uniform.—**DISTRIB.** Species 2, extending from the Deccan Peninsula to Northern Australia.

Separated from *Heptapleurum* *Cephalotes* by the floral bracteoles.

1. **B. capitata**, *C. B. Clarke*; bracts at the base of the panicle-branches ovate short very persistent, petals and carpels 6–10. *Heptapleurum capitatum*, *Seem. Rev. Heder.* 45 partly. *Paratropia capitata*, *W. & A. Prodr.* 378.

NILGHERRY MTS., Kotagherry and Vellyengry Hill; *Wight*.

Leaflets 6–8, 6 by 2½ in., elliptic-oblong subacute, somewhat rounded at the base, very coriaceous, entire; petiolules 2 in., very stout. *Panicle* 16 by 3–4 in., branches very stout.—Doubtfully separable from *B. actinophylla*, *Endl.* (see *Benth. Fl. Austral.* iii. 385) by its persistent bracts, less numerous flower-parts. *Wight's* examples are very good, but the species seems rare, as *Col. Beddome* has never met with it.

10. **DENDROPANAX**, *Dene. & Planch.*

Trees or shrubs, glabrous, unarmed. *Leaves* simple, entire, on young shoots polymorphous, palmately 3-5-lobed; stipules small, scarcely united within the petiole. *Umbels* solitary or in small panicles; bracts small or 0; pedicels not jointed under the flower. *Calyx-margin* entire or 5-toothed. *Petals* 5, valvate, somewhat thick. *Stamens* 5. *Ovary* 5-celled; styles united into a column at the base, their summits (in the Indian species) spreading. *Fruit* globose or ellipsoid, distinctly or obscurely 5-ribbed. *Seeds* compressed; albumen uniform.—**DISTRIB.** Species 20, mostly tropical American; four species in China, Japan, and E. India.

1. **D. japonicum**, *Seem. Rev. Heder.* 27; leaves densely glandular, fruit ellipsoid much longer than broad distinctly ribbed. *Hedera japonica*, *Jungb. in Walp. Rep.* ii. 431 (*ex Seem.*).—*Araliad* sp. 34, *Herb. Ind. Or. H. f. & T.*

KHASIA Mts., alt. 4000-5000 ft.; *H. f. & T.*; *Griffith* (Kew Distrib. No. 2681, 2679).—**DISTRIB.** Japan.

Appears to be an erect shrub or very small tree. *Leaves* (those near the umbels) 4 by 2-3 in., oblong or elliptic, acute, entire, 1-3-5-nerved from the base; petiole $\frac{1}{2}$ -2 in.; polymorphous leaves on young shoots sometimes 8 in. diam., deeply 3-5-palmated; segments narrowly lanceolate, often remotely and minutely toothed; petiole 6-8 in. *Umbels* solitary or 2-3, panicked; pedicels $\frac{1}{2}$ in. *Fruit* $\frac{3}{8}$ by $\frac{1}{2}$ in., somewhat pentagonal.

2. **D. parviflorum**, *Benth. Fl. Hongk.* 137; leaves not densely glandular usually 3-nerved at the base oblong or elliptic acute, fruits subglobose obscurely ribbed. *Seem. Rev. Heder.* 27. *Hedera parviflora*, *Champ. in Hook. Kew Journ. Bot.* iv. 122.

Mount Ophir, MALACCA; *Griffith* (Kew Distrib. No. 2685); *Maingay*, No. 682.—**DISTRIB.** Hongkong.

Apparently an erect shrub. *Leaves* $3\frac{1}{2}$ by $2\frac{1}{4}$ in., entire or very obscurely toothed, glands not visible on the young leaves even; petiole $\frac{1}{4}$ - $1\frac{1}{2}$ in. *Umbels* mostly solitary; pedicels $\frac{1}{2}$ in. *Fruit* $\frac{1}{4}$ in. diam.—The branchlets from Mount Ophir have all entire leaves as they carry umbels; the Hongkong young shoots have polymorphous palmate leaves. *D. proteum*, *Benth. Fl. Hongk.* 136, has the upper leaves very narrowly lanceolar, mostly 1-nerved from the base, but is perhaps only a variety of the present species.

11. **ARTHROPHYLLUM**, *Blume.*

Shrubs or small trees, unarmed. *Leaves* glabrous or nearly so, lower usually alternate and compoundly pinnate, uppermost opposite and simple, intermediate 3-foliolate; leaflets easily separable from the rhachis; stipules united within the petiole. *Peduncles* mostly forming a terminal umbel, each ending in a simple (or slightly compound) umbel of flowers; bracts very small; pedicels not jointed under the flower. *Calyx-teeth* 5, small. *Petals* 5, valvate. *Stamens* 5. *Ovary* 1-celled 1-ovuled; style short, simple. *Fruit* (in the Indian species) ovoid, not angular. *Seed* subglobose; albumen ruminated.—**DISTRIB.** Species 3, Malayan.

1. **A. diversifolium**, *Blume Bijl.* 879; leaves near the umbels usually all simple, leaflets subobtuse or shortly acuminate. *DC. Prodr.* iv. 266;

Miq. Fl. Ind. Bat. i. pt. i. 767. *A. javanicum*, *Blume Bijdr.* 879; *DC. l. c.*; *Kurz For. Fl.* i. 540. *A. ellipticum*, *Blume and DC. ll. c.* *A. Blumeianum*, *Zoll. & Mor. Verz.* 41; *Miq. l. c. i.* 768. *A. ovalifolium*, *Jungh. & De Vriese in Miq. l. c. t.* 14. *Panax polycarpum*, *Wall. Cat.* 4930. *P. Jackianum*, *Wall. Cat.* 4931. *Hedera Jackiana*, *G. Don Gen. Syst.* iii. 394. *H. ? ovata*, *Wall. Cat.* 4911. *Eupteron* sp. nov. *Kurz Andam. Rep. Suppl.* B 9.

SOUTH ANDAMAN, *Kurz*. PINANG, *Phillips*. MALACCA, *Griffith*, &c.—DISTRIB. Throughout Malaya.

Lower leaves a yard across, decompose-pinnate, with pairs of opposite leaflets at the divisions of the main rhachis, upper smaller simply pinnate, uppermost 1-3-foliate; leaflets 3 by $1\frac{1}{2}$ in., oblong or elliptic, glabrous, entire, reticulations distinct; petiolule $0\frac{1}{2}$ in. *Peduncles* 2 in., stout, many in the umbel, with very small acute scattered bracts or naked; pedicels $\frac{1}{2}$ in., quite glabrous even when young, or with more or less rusty stellate wool. *Fruit* $\frac{1}{2}$ by $\frac{1}{2}$ in.

2. ***A. pinnatum***, *C. B. Clarke*; uppermost leaves usually 3-foliate or pinnate, leaflets much acuminate often obtusely. *Panax pinnatum*; *Lamk. Dict.* ii. 715; *DC. Prodr.* iv. 254; *Wall. Cat.* 9057. *P. secunda*, *Schultz Syst.* vi. 215. *Nothopanax ? pinnatum*, *Miq. Fl. Ind. Bat.* i. pt. i. 766.—*Rumph. Amb.* iv. t. 32.

PINANG; *Wallich, Maingay*, No. 679. MALAY PENINSULA, *Griffith, Maingay*, No. 677.—DISTRIB. Malay Islands.

Leaves pinnate and 2-pinnate, leaflets sometimes ternate; uppermost often pinnate with 5-17 leaflets, but sometimes with only 3-1 leaflets; leaflets varying greatly in size on the same branchlet, much narrowed to both ends, reticulations obscure, glabrous, entire; petiolule $0\frac{1}{2}$ in. *Peduncles* usually much fewer than in *A. diversifolium* and evidently only pseudo-terminal; pedicels glabrous or with rusty stellate wool. *Flowers* yellow (*Maingay*) and *fruits* nearly as in *A. diversifolium*.—The fruits are said by Miquel to be sometimes 2-seeded, but all the Kew examples are 1-seeded. Both Rumphius and Maingay note two forms of this plant, which are, however, connected by a series of intermediates:

VAR. latifolia, *Rumph l. c.*; leaflets few 4 by $1\frac{1}{2}$ in. *A. pinnatum*, *Maingay MS.*, No. 679.

VAR. angustifolia, *Rumph l. c.*; leaflets many $1\frac{1}{2}$ by $\frac{1}{2}$ in. *A. alternifolium*, *Maingay MS.*, No. 677.

12. **HETEROPANAX**, *Seem.*

A small unarmed tree. *Leaves* glabrous or nearly so, very large, pinnately decompose; stipules not prominent. *Panicles* large; umbels racemed, more or less stellate-hairy; bracts small, ovate, obtuse, persistent; pedicels not jointed under the flower. *Flowers* polygamous, the terminal umbel of each panicle-branch usually alone fruiting. *Calyx-margin* nearly entire. *Petals* 5, valvate. *Stamens* 5. *Ovary* 2-celled; styles 2, distinct from the base, spreading. *Fruit* much laterally compressed, 2-seeded. *Seeds* compressed; albumen ruminated.—DISTRIB. Species 1 or 2; Western Himalaya, Java, China.

1. ***H. fragrans***, *Seem. Rev. Heder.* 73; leaves often a yard across with pairs of opposite leaflets at the nodes of the rhachis. *Brand. For. Fl.* 249; *Kurz For. Fl.* i. 541. *Panax fragrans*, *Roxb. Hort. Beng.* 21, *Fl. Ind.* ii. 76; *Wall. Cat.* 4929; *DC. Prodr.* iv. 254, excl. syn. of *Don*.—*Araliad* sp. 47, *Herb. Ind. Or. H. f. & T.*

From the SEWALIK HILLS to BURMA, alt. 0-4000 ft.; common in BENGAL.—DISTRIB. Java, China.

Leaflets $3\frac{1}{2}$ by $1\frac{1}{4}$ in., elliptic, shortly acuminate, little narrowed at the base, glabrous, entire, nerves not very prominent; petiolules $0\frac{1}{4}$ in. *Panicle* often 12-16 in., branches 4-8 in.; umbels dense subcapitate in flower; pedicels in fruit elongating to $\frac{1}{2}$ in. and more. *Fruit* $\frac{1}{4}$ by $\frac{1}{2}$ in. and $\frac{1}{8}$ in. thick, ultimately glabrous and often glaucous.

VAR. 1. *typica*; leaflets elliptic shortly acuminate, base slightly narrowed.

VAR. 2. *subcordata*; leaflets ovate shortly acuminate, base rounded or even cordate.

VAR. 3. *attenuata*; leaflets $4\frac{1}{2}$ by $1\frac{1}{4}$ in., attenuate acuminate, much narrowed at base.—Bengal Plain. China.—This may be a distinct species.

13. **BRASSAIOPSIS**, Dcne. & Planch.

Large shrubs or trees, glabrous or tomentose, armed or not. *Leaves* digitate or palmate or angled; stipules connate within the petiole, not prominent. *Umbels* in large compound panicles, young parts at least stellately tomentose; bracts not large, often persistent; pedicels rising from a dense cluster of persistent bracteoles, not jointed under the flower; flowers often polygamous. *Calyx* 5-toothed. *Petals* 5, valvate. *Stamens* 5. *Ovary* 2-celled; styles 2, united, long or short. *Fruit* broadly globose or turbinate, 2- or by abortion 1-seeded. *Seed* not compressed; albumen ruminated.—DISTRIB. Species 10, from Nipal to Java.

* *Leaves undivided.*

1. **B. simplicifolia**, C. B. Clarke; upper leaves simple lanceolate serrate, adult glabrous.

MISHMEE; Griffith (Kew Distrib. No. 2699).

Branchlets prickly, glabrous or with a little hard close tomentum. *Leaves* near the panicle alone seen (the lower may be divided) 9 by $3\frac{1}{4}$ in., acute, subacute at the base, sharply serrated, membranous, nerves much elevated; petiole $1\frac{1}{4}$ in.; stipules not prominent. Young *panicle* 5 in., nearly glabrous, branches slightly compound; bracts $\frac{1}{2}$ in., lanceolate; pedicels $\frac{1}{2}$ in. with scattered stellate hairs, rising from a dense tuft of bracteoles.—Marked by Seemann as new genus, with a note that the petals are imbricate. They are, however, valvate, and it is clearly a *Brassaiopsis*.

2. **B. Hainla**, Seem. Rev. Heder. 18, partly; leaves divided less than half-way down into triangular cuspidate segments, fruit broadly orbicular. *Brassaiopsis* confluens, Seem. Rev. Hed. 18 (as to the fruit). *Hedera* Hainla, Ham. in Don Prodr. 187; DC. Prodr. iv. 253. *Panax curcifolia*, Griff. Itin. Notes, 145.—Araliad sp. 28, Herb. Ind. Or. H. f. & T.

TEMPERATE HIMALAYA, alt. 3000-6000 ft., from NIPAL to BHOTAN; Griffith (Kew Distrib. No. 2668); J. D. H.; C. B. Clarke.

A small tree, the ends of the branches prickly, young parts stellately tomentose. *Leaves* 4-9 in. diam., truncate or cordate at the base, subspinose-toothed, finally glabrous above and nearly so beneath the hispidulous or stellate hairs distantly scattered. *Bracts* to the panicle-branches ovate, short, densely stellate-tomentose, persistent. *Buds* densely stellate-tomentose. *Pedicels* $\frac{1}{2}$ - $\frac{3}{4}$ in., rising from a dense cluster of bracteoles $\frac{1}{3}$ in. oblong and very tomentose. *Fruit* $\frac{1}{4}$ by $\frac{1}{2}$ in., globose, subdidymous. *Style* $\frac{1}{2}$ in. on the fruit.

3. **B. palmata**, Kurz For. Fl. i. 537; leaves palmate divided about half-way down into oblong acute segments, fruit ellipsoid or urbinat, longer than broad. *Panax palmatum*, Roxb Hort. Beng. 21, Fl. Ind. ii. 74. *Araliopsis* andamanica, Kurz in Andaman Rep. App. B. 9. *Hedera polyacantha*, Wall. Pl. As. Rar. t. 190.—Araliad sp. 33, Herb. Ind. Or. H. f. & T.

NIPAL; *Wallich*. SIKKIM TERAI; *J. D. H.* Subtropical zone of EAST BENGAL and BURMA. CHITTAGONG; *Roxburgh, J. D. H.* BURMA; *Griffith* (Kew Distrib. No. 2663). SOUTH ANDAMAN; *Kurz*.

Closely resembles *B. Hainla*; sparingly prickly. *Pedicels* springing from a dense cluster of bracteoles $\frac{1}{2}$ in., oblong and very tomentose. *Fruit* often 1-seeded, when 2-seeded it is $\frac{1}{2}$ by $\frac{3}{8}$ in., turbinate-ellipsoid. *Style* on the fruit $\frac{1}{8}$ in. or rather more. —*Wallich's* plate belongs to this plant, as he mentions the fruit as turbinate (as also does *Roxburgh*). *Aralia palmata*, *Lour. Fl. Cochinch.* 187, doubtfully referred here by *Seeman*, is an *Acanthopanax*.

4. **B. alpina**, *C. B. Clarke*; leaves cordate-ovate acute or slightly 3-5-cuspidate densely stellate-tomentose, bracts to the panicle-branches lanceolate. —*Araliad* sp. 27, *Herb. Ind. Or. H. f. & T.*

ALPINE SIKKIM, alt. 10,000–11,000 ft.; Tonglo and Lachen, *J. D. H.*

An unarmed tree, 30 ft.; young branches densely villous and tomentose with yellow or brown stellate hair. *Leaves* 4–5 in. and nearly as wide, softly serrate, membranous, thickly tomentose on both surfaces when young, when older the scattered stellate hairs wear off, but much remains on both surfaces. *Panicle* (very young) densely tomentose; buds completely enclosed in thick stellate wool; bracts at the base of the panicle-branches $\frac{1}{4}$ in., very narrow. —Can this be a woolly alpine form of *B. Hainla*?

5. **B. hispida**, *Seem. Rev. Heder.* 18; stem panicle and petioles prickly, leaves deeply palmate spinosely serrate, reticulating nerves beneath much raised and ultimately nearly glabrous. —*Araliad* sp. 30, *Herb. Ind. Or. H. f. & T.* partly.

SIKKIM, alt. 6000–7000 ft.; *J. D. H.* MISHMEE; *Griffith* (Kew Distrib. No. 2696).

Yellowish when dried; prickles numerous and often whorled, lanceolate, compressed, deflexed. *Leaves* 1 ft. diam. and more, segments oblong-lanceolate narrower towards the base, coriaceous, lower surface glabrous or sparingly hispidulous; stipules united within the petiole with two free linear points. *Panicle* very large; bracts to the branches $\frac{3}{4}$ in., lanceolate, tomentose, persistent; pedicels very many, rising amid numerous bracteoles $\frac{1}{8}$ – $\frac{1}{2}$ in. lanceolate closely tomentose. Young *calyx-tube* closely densely stellate-tomentose. *Petals* glabrous, appear yellow. *Style* after the petals have fallen scarcely $\frac{1}{16}$ in. *Fruit* not seen.

6. **B. mitis**, *C. B. Clarke*; branches prickly, leaves deeply palmate softly serrate, the reticulating nerves scarcely raised beneath ultimately pubescent or hispidulous. —*Araliad* sp. 29, *Herb. Ind. Or. H. f. & T.*

SIKKIM, alt. 4000–8000 ft., not rare; *J. D. H.*, *C. B. Clarke*, *N. Gamble*.

An erect small tree, 20 ft., the panicle and petioles usually without prickles. *Leaves* 1 ft. diam. and more; segments oblong-lanceolate, narrowed towards the base, membranous, adult beneath softly hairy and not shining; stipules large, lanceolate-subulate, nearly distinct. *Panicle* very large, often with dense bundles of bristles on the rachis and at the top of the petiole; bracts on the branches $\frac{3}{4}$ in., lanceolate, caducous; pedicels very many, arising amid numerous lanceolate closely-tomentose bracteoles $\frac{1}{8}$ – $\frac{1}{2}$ in. Young *calyx-tube* more or less stellate-tomentose. *Petals* glabrous. *Style* after the petals have fallen $\frac{1}{8}$ in.; the disc large, subhemispheric. Ripe *fruit* not seen.

7. **B. Griffithii**, *C. B. Clarke*; leaves very large palmate divided half-way down or more serrate-denticulate, adult glabrous or the nerves beneath minutely hispidulous.

EAST BENGAL; Namroo (? Upper Assam), *Griffith* (Kew Distrib. No. 2697).

No prickles seen on the end of the branchlets nor elsewhere. *Leaves* 16 in. diam.; lobes oblong or elliptic, acuminate, tertiary nerves prominent on both surfaces.

Panicle very large and compound, much more glabrous than in the allied species; bracts to the branches short, ovate, persistent; pedicels $\frac{3}{4}$ in., very numerous, bracteoles at their base minute. Young *calyx-tube* sparingly stellate-tomentose, limb distinctly toothed. *Disc* of the young *fruit* much elevated; style scarcely $\frac{1}{20}$ in. *Fruit* $\frac{1}{2}$ in. diam., globose.

** *Leaves digitate.*

8. **B. speciosa**, *Dcne. & Planch. in Revue Hort.* 1854, 106; petiolules long, leaflets lanceolate or elliptic rounded or attenuate at the base entire crenulate or lightly subserrate, adult glabrous or nearly so beneath. *Seem. Rev. Heder.* 19. *B. floribunda*, *Seem. Rev. Heder.* 19. *Hedera floribunda*, *Wall. Cat.* 4912; *G. Don Gen. Syst.* iii. 394. *H. glomerulata*, *DC. Prodr.* iv. 265; *Hook. Bot. Mag.* t. 4804; *Regel in Gartenfl.* 1863, t. 411. *Aralia glomerulata*, *Blume Bijdr.* 872. *Macropanax glomerulatum*, *Miq. Fl. Ind. Bat.* i. pt. i. 764.—*Araliad* sp. 9, 10, and 11, *Herb. Ind. Or. H. f. & T.*

From NIPAL and ASSAM to CHITTAGONG; alt. 0–5000 ft., frequent.—DISTRIB. Java.

A small tree; upper part of the branches (and sometimes the panicle also) prickly; innovations stellately tomentose often rusty reddish brown. *Leaflets* 4–8 by 1–3 in., when young often with scattered stellate hairs above and some clustered stellate wool beneath, acuminate, herbaceous, reticulations moderately conspicuous; petiolules usually more than 1 in., summit of the petiole without dense clustered bristles. *Panicle* large, usually a foot long or more; bracts at the base of the branches oblong or lanceolate, persistent; pedicels $\frac{3}{4}$ in. rising from a dense cluster of rusty stellately hairy persistent bracteoles $\frac{1}{2}$ in. *Fruit* $\frac{1}{4}$ by $\frac{3}{4}$ in., didymo-globose, or 1-seeded and subglobose.—There are many forms of this plant, but these being large, it is not easy to establish species upon them. In the young fruit the disc is sometimes very elevated, and the style is long or short, as mentioned by *Dcne. & Planchon*: the calyx-tube of the young fruit is shortly hemispheric, or more often long and obconic. These differences appear to depend on the stage of ripening at which the fruit is gathered.

VAR. 1. *typica*; leaflets $6\frac{1}{2}$ by 2 in. oblong acuminate entire, base not rounded under surface of the adult glabrous. *Wall. Cat.* 4912.

VAR. 2. *subovata*; leaflets 7 by $4\frac{1}{2}$ in. ovate or elliptic shortly suddenly acuminate entire or very nearly so base rounded adult glabrous beneath.—Sikkim, *J. D. H.*

VAR. 3. *hirta*; leaflets 5 by $1\frac{1}{4}$ in. lanceolate narrowed to both ends entire midrib beneath when young with needle-like spreading hairs (unlike those of any other plant in the order).—The leaflets are detached from the panicle, but except as to the hairs they appear to belong to the species. *Cachar, R. L. Keenan.*

VAR. 4. *rufo-stellata*; leaflets oblong-lanceolate from a rounded base somewhat closely denticulate-serrate in nearly their whole extent with scattered rusty-stellate hairs above, when young rusty villose pubescent beneath, panicle densely rufous-stellate tomentose.—Chiefly from low levels in Cachar, Khasia, and Chittagong.

VAR. 5. *serrata*; leaflets 7 by $2\frac{1}{2}$ in. elliptic-lanceolate dentate-serrate base subacute, panicle very sparingly stellate-woolly. *Darjeeling, Griffith* (*Kew Distrib. No.* 2689).

9. **B. Hookeri**, *C. B. Clarke*; petiolules distinct or long, leaflets very large oblong narrowed at each end serrate, mature more or less stellate-woolly beneath.—*Araliad* sp. 12, *Herb. Ind. Or. H. f. & T.*

SIKKIM, alt. 2000–5000 ft.; Yoksun, *J. D. H.* KHASIA Mts., alt. 4000 ft.; Nunklow, *H. f. & T.*

A small prickly tree. *Leaflets* attaining 18 by 8 in., somewhat leathery, nerves above subimpressed; petiolules $\frac{1}{2}$ –2 in. *Panicle* 2 ft., the branches more than a foot with broad oblong persistent bracts at their base, the young parts densely white

stellate-woolly; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in., stout, rising from numerous persistent bracteoles $\frac{1}{2}$ in., less hairy than those of *B. floribunda*. Young fruit much as in *B. floribunda*; calyx-tube campanulate or obconic; disc prominently rayed, not greatly elevated; style $\frac{1}{2}$ in.—Possibly a large form of *B. floribunda*.

10. ***B. aculeata***, *Seem. Rev. Heder.* 19; leaflets serrate attenuate at base subsessile and often enveloped densely by bristles with stellate hairs on both surfaces when adult. *Hedera aculeata*, *Don Prodr.* 187; *DC. Prodr.* iv. 264. *H. æsculifolia*, *Wall. Cat.* 4913. *Agalma æsculifolium*, *Seem. Rev. Heder.* 25.

KUMAON; *T. Thomson*. NIPAL; *Wallich*. KHASIA Mts., alt. 4000 ft., *C. B. Clarke*.

A small prickly tree. *Leaflets* 9 by $2\frac{3}{4}$ in., narrowly lanceolate-obovate, acuminate, herbaceous, soft in texture, rusty stellate-tomentose, apex of the petiole very hispid; in one example of *Dr. Thomson*'s the digitate leaf is sometimes replaced by a single entire leaf cordate at base. *Panicle* large, compound, greatly resembling that of *B. floribunda*, young parts stellate rusty-woolly; bracts at the base of the branches ovate, short, persistent; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in., springing from a dense cluster of lanceolate hairy persistent bracteoles $\frac{1}{2}$ in. *Fruit* $\frac{1}{4}$ in. long and broad, globose, subdymous; disc on the ripe fruit flat; style $\frac{1}{2}$ – $\frac{3}{4}$ in.—*Wallich's Hedera æsculifolia*, in the Linnæan Society's herbarium, and those marked *Agalma æsculifolium* in the British Museum by *Seemann*, are all 2-ovuled, and identical with *Brassaiopsis aculeata*.

14. **MACROPANAX**, *Miq.*

Unarmed small trees. *Leaves* digitate, 3–5-foliolate, leaflets entire or serrate, in the Indian species glabrous; stipules shortly connate within the petiole or 0. *Panicles* large, branched; bracts small, deciduous; pedicels jointed under the flowers; flowers umbelled, polygamous. *Calyx-teeth* 5. *Petals* 5, valvate. *Stamens* 5. *Ovary* 2-celled; styles united. *Fruit* ovoid or subglobose or somewhat elongated upwards, striated or ribbed but hardly angular. *Seeds* dorsally compressed; albumen ruminated or very rugose.—DISTRIB. Species 2, Nipal to Java.

1. ***M. oreophilum***, *Miq. Fl. Ind. Bat.* i. pt. i. 764; leaflets usually denticulate serrate or crenulate, panicle-branches spreading stellately rusty-tomentose. *Seem. Rev. Heder.* 20; *Kurz For. Fl.* i. 541. *M. floribundum*, *Miq. Fl. Ind. Bat.* i. pt. i. 764. *Panax serratum*, *Wall. Cat.* 4915; *DC. Prodr.* iv. 253. *Aralia disperma*, *Blume Bijl.* 872. *Hedera disperma*, *DC. Prodr.* iv. 265.—*Araliad* sp. 8, *Herb. Ind. Or. H. f. & T.*

From NIPAL and ASSAM to TENASSERIM, alt. 500–7000 ft., frequent.—DISTRIB. Malaya.

Attains 30 ft. *Leaflets* 5 by $1\frac{1}{2}$ in., lanceolate, acuminate, sometimes longer and very narrow, sometimes almost elliptic, base narrowed or rounded; petiolules 1–3 in. *Panicle* 1 ft., compound; bracts usually deciduous, inconspicuous; pedicels $\frac{1}{2}$ in., stout, more or less stellate-hairy, the bracteoles few or deciduous. *Fruit* $\frac{1}{4}$ in., ovoid, sometimes elongated upwards; disc large, conical, often wider than the top of the fruit, crowned with the permanent style $\frac{1}{2}$ – $\frac{3}{4}$ in.

2. ***M. undulatum***, *Seem. Rev. Heder.* 20; leaflets entire or very nearly so, panicle-branches ascending glabrous. *Hedera undulata*, *Wall. Cat.* 4916; *G. Don Gen. Syst.* iii. 394.—*Araliad* sp. 5, *Herb. Ind. Or. H. f. & T.*

SIKKIM, BHOTAN, ASSAM and KHASIA, alt. 500–5000 ft., common. SILHET station. A small tree. *Leaflets* 3–4 by $1\frac{1}{4}$ in., lanceolate, acuminate, rarely elliptic-

lanceolate, entire rarely minutely denticulate, base narrowed often very acute; petiolules $\frac{1}{2}$ –2 in. *Panicle* 1 ft., compound; bracts $\frac{1}{2}$ in., triangular, caducous; pedicels $\frac{1}{2}$ in., angular, perfectly glabrous; bracteoles 0 or caducous. *Fruit* as in *M. oreophilum*.

15. **HEDERA**, Linn.

Shrubs, climbing extensively, or small trees. *Leaves* simple, lobed or pinnate, glabrous; stipules 0. *Flowers* polygamous; umbels panicled; bracts very small, pedicels not or very obscurely jointed under the flowers. *Calyx-margin* 5-toothed or sub-entire. *Petals* 5, valvate. *Stamens* 5. *Ovary* 5-celled; styles connate into a column. *Fruit* globose, almost berried. *Seeds* ovoid; albumen ruminated.—Species 2; one in all temperate regions of the Old World; the other Australian.

1. **H. Helix**. Linn.; *DC. Prodr.* iv. 261; leaves simple, panicle not elongated. *Don Prodr.* 187; *Wall. Cat.* 4908; *Roxb. Fl. Ind. ed. Carey & Wall.* ii. 515; *Brand. For. Fl.* 248.

Throughout the HIMALAYA alt. 6000–10,000 ft.; KHASIA Mts., alt. 4000–6000 ft.; not rare.—DISTRIB. From W. Europe to Japan.

Stem glabrous climbing adhesively by means of numerous extra-axillary rootlets. *Leaves* 3–4 in., varying from linear-lanceolate to cordate-ovate, entire or variously lobed palmate or subpinnatifid; petiole $\frac{1}{2}$ –2 in. *Panicle* often depressed, subcorymbose, or shortly ovate, never large compound; bracts scarcely $\frac{1}{4}$ in., triangular; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in., stellately hairy; bracteoles minute or 0. *Fruit* black, more rarely yellow or red.—There is no note of red fruit from India; yellow fruit is not uncommon there.

16. **HEDEROPSIS**, C. B. Clarke.

A glabrous unarmed tree. *Leaves* 1–3-foliolate; leaflets lanceolate, denticulate or nearly entire; base of petiole much dilated; stipules inconspicuous. *Umbels* panicled; bracts and bracteoles deciduous; pedicels jointed close under the flowers. *Calyx* margined, 5-toothed somewhat prominently. *Petals* 5, valvate. *Stamens* 5. *Ovary* 5-celled; styles connate. *Fruit* berried, large, subglobose, crowned by the stout persistent style. *Seeds* 5–4; albumen ruminated.

Differs technically from *Hedera* in the jointed pedicels: the serrate leaflets and large fruit give to it a widely different aspect.

1 **H. Maingayi**, C. B. Clarke.

MALACCA; *Maingay*, No. 683.

Leaflets of the compound leaves $3\frac{1}{2}$ by $1\frac{1}{2}$ in., simple leaves attain $8\frac{1}{2}$ by 4 in., membranous, opaque, base subacute, secondary nerves raised tertiary obscure; petiole 1–2 in. *Panicle* glabrous or obscurely pubescent; pedicels $\frac{1}{2}$ – $\frac{3}{4}$ in. Young *flowers* small, petals expanding, reflexed. *Fruit* (not quite ripe) more than $\frac{1}{2}$ in. exclusive of the conical disc and stout style.—Dr. Maingay's examples are in fragments; the size of the panicle is doubtful, and it is not improbable that some at least of the leaves may have more than 3 leaflets or may be pinnate.

17. **GAMBLEA**, C. B. Clarke.

A tree. *Leaves* digitate, 5–3–1-foliolate; stipules within the petiole. *Umbels* panicled, bracts 0, pedicels continuous. *Flowers* polygamous. *Calyx-margin* minute. *Petals* 5, valvate. *Stamens* 5. *Ovary* 3–5-celled: styles 3–5,

combined nearly half their length. *Fruit* globose, 3-5-celled. *Seed* not compressed; albumen lightly ruminated, nearly as in *Hedera*.

1. *G. ciliata*, C. B. Clarke; leaflets oblanceolate or if solitary cordate harshly pilose above margin bristle-ciliate.—Araliad sp. 3, *Herb. Ind. Or. H. f. & T.*

SIKKIM; Tonglo, alt. 10,000 ft., J. D. H., Gamble; Jongri, C. B. Clarke.

Unarmed, 30 ft. *Leaflets* $6\frac{1}{2}$ by $2\frac{1}{2}$ in., acuminate, hairs on both surfaces harsh in age, or nearly glabrous beneath; petiolules $0-\frac{1}{4}$ in., densely rusty villose. *Umbels* in small panicles; pedicels $\frac{1}{2}-\frac{3}{4}$ in., puberulo-pubescent. *Fruit* $\frac{1}{4}$ in. diam., ultimately glabrous.

18. TUPIDANTHUS, H. f. & T.

A glabrous small tree at first erect, afterwards a lofty climber. *Leaves* digitate; leaflets glabrous, leathery, entire; stipules connate within the petiole. *Umbels* in a compound umbel or small panicle; pedicels thick, not jointed under the flowers. *Calyx-margin* obsolete. *Petals* closely connate, falling off in a cap. *Stamens* very many, in two or several series. *Ovary* cells very numerous; stigmas very many (90), sessile, radiating, contiguous but not connate. *Fruit* globose, depressed (not seen ripe).

1. *T. calyptratus*, H. f. & T. in *Bot. Mag.* t. 4908; *Seem. Rev. Heder. G.*

KHASIA Mts., alt. 2000-3000 ft.; Borpani, H. f. & T. EAST BENGAL; Griffith (Kew Distrib. No. 2701).

Leaflets 7-9, 7 by $2\frac{1}{2}$ in., narrowly oblong, shortly acuminate, narrowed at the base; petiolule 2 in. Main *umbel* about 3-rayed, branches 3 in., very stout with large ovate sheathing leathery persistent bracts at their base; partial umbels 5-7-fid; pedicels $1-1\frac{1}{4}$ in., glabrous, stout. *Buds* $\frac{5}{8}$ in. diam., nearly globose; calyx-tube leathery, smooth. *Stamens* about 50-70, densely packed; filaments and anthers as in most of the order but larger. Unripe *fruit* more than $\frac{3}{4}$ by 1 in., will be berried. *Seeds* numerous, 20-30 at least.

ORDER LXXII. CORNACEÆ. (C. B. Clarke.)

Shrubs or trees. *Leaves* opposite or alternate, generally petioled, entire or occasionally angular lobed or serrate, frequently unequal at the base; stipules 0. *Flowers* usually small, regular, hermaphrodite or unisexual, in axillary or terminal cymes panicles or heads. *Calyx-tube* adnate to the ovary; limb truncate or 4-5-toothed, persistent. *Petals* 0 or 4-5 (occasionally indefinite), epigynous, imbricate or valvate. *Stamens* inserted with the petals and equal to them in number, rarely twice or thrice as many. *Ovary* inferior, 1-4-celled, crowned by a usually fleshy sometimes inconspicuous disc; style single, short or long, stigma capitate or branched; ovule solitary (very seldom 2-3), pendulous from the apex of the cell. *Fruit* generally succulent, 1-4-celled, less often with 2 pyrenes. *Seed* oblong, pendulous, albumen copious, fleshy; embryo minute or cotyledons flat leafy nearly as wide as the seed.—DISTRIB. Species 75, chiefly in the northern hemisphere.

* Flowers hermaphrodite.

† *Petals* narrow much elongate.

Stamens twice or thrice the petals. Cotyledons crumpled . . . 1. *ALANGIUM*.
 Stamens equalling the petals in number. Cotyledons flat . . . 2. *MARLEA*.

†† *Petals short or oblong.*

Ovary 2-celled . . . 3. *CORNUS*.
 Ovary 1-celled . . . 4. *MASTIXIA*.

** Flowers unisexual

† *Leaves opposite.*

Petals 4. Stamens 4 . . . 5. *AUCUBA*.

†† *Leaves alternate.*

Ovary 1-celled. Flowers in dense heads . . . 6. *NYSSA*.
 Ovary 4-celled. Flowers in large panicles . . . 7. *TORICELLIA*.

1. *ALANGIUM*, Lamk.

Shrubs or small trees, armed or not. *Leaves* alternate, petioled, oblong, entire, 3-nerved at the base, persistent. *Flowers* in axillary fascicles or condensed cymes, hermaphrodite, silky, white, jointed on the pedicel; bracts 0. *Calyx-tube* adnate to the ovary, limb 5-10-toothed or truncate. *Petals* 5-10, linear-oblong, valvate, then reflexed. *Stamens* twice as many as the petals or more, filaments hairy; anthers very long. *Ovary* inferior, 1-celled, surmounted by a disc; style very long, stigma large, capitate; ovule pendulous. *Fruit* a berry, crowned by the somewhat enlarged calyx-limb. *Seed* oblong, albumen ruminated; cotyledons leafy, crumpled; radicle elongate.—*DISTRIB.* Species 2; tropical and subtropical Asia and Africa.

The species with stamens equal in number to the petals in which the structure of the embryo is unknown are here for convenience placed under *Marlea*; Sir J. Hooker (*Gen. Pl.* i. 949) has placed them in *Alangium*, but till the embryo is known their position must be uncertain.

1. *A. Lamarckii*, *Thwaites Enum.* 133; calyx-tube in the bud not furrowed, fruit ellipsoid quite smooth with slight vertical ribs when dry. *Dalz. & Gibs. Bomb. Fl.* 109; *Brand. For. Fl.* 250. *A. decapetalum*, Lamk. *Dict.* i. 174; *DC. Prodr.* iii. 203; *Wall. Cat.* 6884; *W. & A. Prodr.* 325; *Wight Ic.* t. 194; *Miq. Fl. Ind. Bat.* i. pt. i. 774; *Kurz For. Fl.* i. 543. *A. hexapetalum*, Lamk. & *DC. Ilc.*; *Roxb. Hort. Beng.* 38, *Fl. Ind.* ii. 502; *Wall. Cat.* 6883; *W. & A. Prodr.* 326; *Wight Ill.* t. 96. *A. tomentosum*, Lamk. & *DC. Il. c.*; *Wall. Cat.* 6885. *A. sundanum*, *Kurz l. c.* *A. latifolium*, *Miq. in Pl. Hohe-nack.* No. 719.—*Rheede Hort. Mal.* iv. tt. 17, 26.

Throughout India from the N.W. HIMALAYA to CEYLON and TENASSERIM; very common.—*DISTRIB.* Malaya and South China to the Philippines. East Africa.

A small tree or rambling shrub, armed or not. *Leaves* 3-6 by 1-2 in., oblong (*A. decapetalum*), or elliptic (*A. hexapetalum*), acute or subobtus, the base unequal somewhat rounded, above nearly glabrous with pubescent nerves, beneath with more or less scattered hair and often with tufts of hairs or hollow glands in the axils of the primary nerves; petiole $\frac{1}{4}$ in., hairy, often villous or woolly. *Flowers* in small close fascicles; peduncles pedicels and calyx-tube usually woolly. *Calyx-limb* minutely toothed. *Petals* 5-10 usually 6-7, $\frac{1}{2}$ -1 $\frac{1}{4}$ in. woolly without. *Stamens* about 20-30. *Style* glabrous, uniformly cylindric, stigma large subglobose. *Fruit* $\frac{5}{8}$ by $\frac{3}{8}$ in., black, closely pubescent or finally glabrous; endocarp bony.—The examples of *A. sundanum*

communicated by Miquel to the British Museum agree with Mr. Kurz's, which have the calyx-tube not furrowed, and do not materially differ from *A. Lamarckii*, but the examples of *A. sundanum* at Kew have the calyx-tube (even in the bud) deeply grooved and appear a distinct species.

VAR. *glandulosum*, Thwaites Enum. 133 (sp.); young parts ruddy-furfuraceous, leaves ovate or oblong rostrate-acuminate, beneath with most minute shining glands and with glandular pores at the axils of the primary nerves, flowers glandular sparingly hairy, pedicels and calyces furfuraceous with red glands.—Ceylon, Central Province, alt. 2000–4000 ft.; *Thwaites*.—According to Mr. Thwaites a closely allied but distinct species. The peduncles, calyx-tube, and petals are much less woolly than in *A. Lamarckii*; these and the tender surfaces of the leaves are not (in Thwaites' No. 381) glandular, but covered with most minute glistening hairs, giving under a common lens a glandular appearance. *A. glandulosum* thus has much shorter hairs than the ordinary forms of *A. Lamarckii*, while some examples of *A. Lamarckii* have the under surface of the leaves glabrous or very nearly so.

2. **MARLEA**, Roxb.

Trees or shrubs. *Leaves* alternate, petioled, orbicular or oblong from an oblique base. *Flowers* in axillary contracted cymes, white, jointed on the pedicel, hermaphrodite. *Calyx-tube* adnate to the ovary, limb toothed or truncate. *Petals* 4–8, linear, free or slightly cohering at the base, valvate. *Stamens* 4–8, filaments attached to the petals slightly at the base and there usually hairy; anthers linear. *Ovary* 1–3-celled or 1-celled at the apex 2–3-celled at the base, crowned by a disc; style long, often thicker upwards and pubescent, stigma simple or lobes 4 linear or sub-clavate; ovule solitary in each complete or incomplete cell. *Berry* 1–2-celled, 1–2-seeded. *Seed* (in *M. begoniæ-folia* and *ebenacea*) oblong, compressed; cotyledons orbicular, thin, leafy; radicle short.—**DISTRIB.** Species 8; India, to Japan, Malaya, Australia, and Polynesia.

SECT. I. *Pseudalangium*, F. Muell. *Ovule* 1. *Embryo* of *Marlea*. (**RHYTIDANDREA**, *A. Gray.*)

1. ***M. Griffithii***, *C. B. Clarke*; leaves oblong acuminate, cymes repeatedly divided, flowers numerous and close, style glabrous, stigma simple sub-globose.

MALACCA; *Griffith* (No. 3387 Kew Distrib.); *Maingay* No. 708.

A tree (*Maingay*); branchlets minutely rusty-pubescent. *Leaves* $5\frac{1}{4}$ by $1\frac{3}{4}$ in., very unequal auricled at the base, nearly glabrous or minutely pubescent on the nerves above, beneath with spreading fulvous hairs on the main nerves and the surface minutely dotted and with more or less scattered villous hairs; petiole $\frac{1}{2}$ in., fulvous, villous. *Cyme* with minute close fulvous pubescence rather longer and softer on the calyx-tube; bracteoles most minute, linear, deciduous. *Calyx-tube* not furrowed, limb almost truncate. *Petals* 5, $\frac{1}{3}$ in., nearly glabrous. *Stamens* 5, filaments short with much wool at their summit. *Ovule* 1.

2. ***M. ebenacea***, *C. B. Clarke*; leaves oblong acuminate, cymes few-flowered, style hairy, stigma lanceolate grooved. *Alangium ebenaceum*, *Griff. in Herb.*

MALACCA; *Griffith* (No. 3383 Kew Distrib.); *Maingay* No. 706.

Branches stout, glabrous or nearly so. *Leaves* 10 by $3\frac{1}{4}$ in., glabrous, entire, thick and somewhat coriaceous, base subacute slightly unequal; petiole $\frac{3}{8}$ – $\frac{1}{2}$ in. thick. *Cyme* short, 4–8-flowered, minutely fulvous-pubescent. *Calyx-tube* more softly pubescent, not grooved, limb much dilated, truncate. *Petals* $\frac{3}{4}$ –1 in., 6 (sometimes 5),

with minute close tomentum. *Stamens* 6 or 5, filaments short, woolly. *Style* shortly hairy, stigma an elongate quadrangular pyramid; ovule 1. *Fruit* $\frac{7}{8}$ by $\frac{1}{2}$ – $\frac{3}{8}$ in., nearly glabrous and without ribs, crowned by the short cylindric truncate little-enlarged limb of the calyx. *Seed* much compressed, albumen fleshy; cotyledons orbicular, thin, flat.

3. **M. nobilis**, C. B. Clarke; leaves elliptic or orbicular, cymes few-flowered, calyx-tube in the bud deeply grooved.

MALACCA; Griffith (Kew Distrib. Nos. 3384, 3385); Maingay No. 707. SINGAPORE, Maingay No. 705.

Branchlets petioles cymes and leaves beneath densely fulvous-villous. *Leaves* often 8 by $5\frac{1}{2}$ in. (sometimes only half these dimensions), not acuminate, from cordate to subacute at the base, firm, at length glabrous above; petiole often $\frac{3}{4}$ in. *Cyme* short, 4–8-flowered. *Calyx-tube* deeply grooved, teeth prominent rising from the angles. *Petals* 6–5, $\frac{3}{4}$ in., much dilated at the base, very villous. *Stamens* 6–5; filaments short woolly. *Style* cylindric densely villous, the very apex narrowed, stigma as in *M. ebenacea*; ovule 1. *Fruit* 1 by $\frac{5}{8}$ in., ellipsoid, compressed, very woolly, with 10 or 12 light vertical ridges, crowned by the incurved calyx-teeth.

4. **M. barbata**, R. Br. in Wall. Cat. 7129; shaggy with much soft spreading hair, leaves elliptic or ovate acuminate, cymes many-flowered, style glabrous apex almost divided into two subclavate stigmas.

BHOTAN and ASSAM; Griffith (Kew Distrib. No. 3388). KHASIA Mts.; Wallich.

Leaves 4 by $2\frac{1}{2}$ in., entire, rounded or subcordate at the base, with scattered golden or brownish hairs on both surfaces especially beneath; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., densely hairy. *Cyme* 12–30-flowered with spreading golden hairs. *Calyx-tube* shaggy, not grooved, teeth lanceolate. *Petals* 6–5, $\frac{3}{8}$ – $\frac{1}{2}$ in., hairy on the back. *Filaments* short, hairy. *Ovule* 1. *Fruit* $\frac{1}{2}$ by $\frac{1}{2}$ in., ovoid, finally glabrous, slightly striated longitudinally, crowned by the erect calyx-teeth.

SECT. II. **Eu-Marlea**. *Ovules* 2, rarely 1 or 3. *Fruit* normally 2-seeded.

5. **M. begoniæfolia**, Roxb. Cor. Pl. t. 283, Hort. Beng. 28, Fl. Ind. ii. 261; young leaves and innovations villous, mature leaves more glabrous broad angular lobed or entire, connective hairy or nearly glabrous, style glabrous or with scattered hairs. DC. Prodr. iv. 267; Bot. Reg. 1838, t. 61; Wall. Cat. 3719; Miq. Fl. Ind. Bat. i. pt. i. 744; Brand. For. Fl. 251; Kurz For. Fl. i. 544. *M. affinis*, Dene. in Jacq. Voy. Bot. t. 83. *M. tomentosa*, Endl. ex Hassk. in Flora 1844, p. 605; Miq. l. c. 775; Kurz l. c. 545. *Diaccarpium tomentosum*, Blume Bijl. 657; Hassk. in Bonpland. vii. 173. *D. rotundifolium*, Hassk. l. c. 172. *Stylidium chinense*, Lour. Fl. Cochinch. 221. *Strax javanicum*, Blume Bijl. 671 (ex Kurz).

Throughout Northern India, alt. 1000–6000 ft., common from the PUNJAB to BENGAL and BURMA.—DISTRIB. China, Japan.

A tree, often small, but attains 60 ft.; branches horizontal. *Leaves* $4\frac{1}{2}$ by $3\frac{1}{2}$ in., sometimes very large, from orbicular to broad oblong, acuminate, base rounded or subcordate unequal, not serrate nor denticulate, above glabrous when mature or villous on the nerves rarely with scattered fulvous hairs on the surface also, mature usually glabrous beneath with or without tufts of hairs in the axils of the main nerves, which are puberulous, or closely hairy on the nerves; petiole 1– $1\frac{1}{4}$ in., fulvous-hairy or glabrous. *Cymes* 1–3 in., dichotomous, 8–12-flowered, more or less fulvous-hairy; bracts inconspicuous. *Calyx-tube* not grooved; limb shortly toothed. *Petals* usually 6–8, slightly hairy. *Filaments* short, hairy. *Style* usually glabrous, stigma capitate, sub-2–4-lobed. *Fruit* $\frac{1}{2}$ by $\frac{1}{4}$ in., ovoid, glabrous, obscurely ribbed, crowned with the very

narrow calyx-limb.—The Japan *M. macrophylla* and *M. heterophylla* hardly differ from this.

VAR. *alpina*; leaves not angular, hairy all over beneath and no tufts in the nerve-axils.—Sikkim, alt. 6000–9000 ft.; *H. f.* & *T.* *Marlea* sp. 2.

3. **CORNUS**, Linn.

Trees and shrubs, glabrous or hairy, hairs often centrally attached. *Leaves* opposite or alternate, petioled, entire. *Flowers* small, hermaphrodite, white or yellow, in branched cymes or in involucrate heads. *Calyx-tube* campanulate or urn-shaped; limb with 4 short or long teeth. *Petals* 4, oblong, valvate. *Stamens* 4, anthers oblong. *Ovary* 2- (very rarely 3-) celled; style filiform or cylindrical, stigma capitate sub-2-lobed; ovule solitary pendulous in each cell. *Drupe* ovoid, 2-celled, 2-seeded; endocarp bony. *Seeds* oblong, compressed, albumen fleshy; cotyledons leafy.—**DISTRIB.** Species 15, in N. temperate regions, and 2 in Burma and Hongkong.

SECT. I. *Thelycrania*, Endl. *Flowers* cymose, without bracts.

1. **C. *sanguinea***, Linn.; Boiss. *Fl. Orient.* ii. 1092; a shrub, leaves opposite rarely exceeding 3 in. shortly or not at all acuminate not very glaucous beneath. *DC. Prodr.* iv. 272; *Brand. For. Fl.* 253. *C. australis*, *C. A. Mey.*; Boiss. *l. c.*

KASHMIR; alt. 7000 ft.; Gulmurg, *Stewart*.—**DISTRIB.** W. and N. Asia, Europe.

An erect shrub, branchlets leaves beneath and cymes with minute white hairs. *Leaves* (in Kashmir examples) $1\frac{1}{2}$ by $1\frac{1}{4}$ in., ovate from a rounded base, obtuse, beneath paler and with appressed hairs, nerves 4 on each side with spreading crisped hairs beneath; petiole nearly $\frac{1}{4}$ in. *Fruit* $\frac{1}{5}$ in. diam., subglobose, minutely hairy.

2. **C. *macrophylla***, Wall. in *Roxb. Fl. Ind. ed. Carey & Wall.* i. 433; a tree, leaves opposite or alternate usually exceeding 3 in. distinctly acuminate glaucous beneath. *Don Prodr.* 141; *Wall. Cat.* 469; *DC. Prodr.* iv. 272; *Brand. For. Fl.* 252, t. 32. *C. brachypoda*, *C. A. Mey.*; *Walp. Ann.* ii. 725.

Throughout the HIMALAYA, alt. 4000–8000 ft., frequent.—**DISTRIB.** China, Japan.

An erect tree 40 ft., branches horizontal. *Leaves* 6 by $3\frac{1}{4}$ in. (often much larger), ovate; base rounded or subacute; secondary nerves 6 on each side, ultimately glabrous above, beneath with scattered minute appressed hairs; petiole 1 in. *Panicles* terminal, erect, often 4–5 in. diam., branches opposite or alternate. *Calyx-tube* urn-shaped, whitish from the numerous appressed hairs. *Fruit* $\frac{1}{2}$ – $\frac{1}{3}$ in. diam., globose.—*C. alternifolia*, Linn. f., a N. American species differs very little, if at all, from this.

VAR. *Stracheyi*; panicle densely clothed with spreading fulvous hairs, young leaves silky hairy.—Kumaon, alt. 7000 ft., Kathi; *Strachey & Winterbottom*.

3. **C. *oblonga***, Wall. in *Roxb. Fl. Ind. ed. Carey & Wall.* i. 432; leaves narrowly oblong narrowed at both ends adult glabrous or minutely hairy beneath. *Don Prodr.* 140; *Wall. Cat.* 468; *DC. Prodr.* v. 272; *Brand. For. Fl.* 253; *Kurz For. Fl.* i. 545.

From the JHELMUM to NIPAL, alt. 4000–7000 ft.; frequent. BHOTAN *Griffith*. KHASIA Mts., alt. 4500 ft.; *C. B. Clarke*. MARTABAN HILLS; alt. 4000–7000 ft. *Kurz*.

A tree 20–30 ft. *Leaves* 5 by $1\frac{1}{4}$ in., somewhat coriaceous, nerves much elevate beneath; petiole $\frac{1}{4}$ in. *Pedicels* and cyme-branches minutely pubescent; bracteoles small. *Calyx-tube* campanulate, hardly urn-shaped. *Petals* almost glabrous. *Fruit* $\frac{1}{2}$ by $\frac{1}{3}$ in., ellipsoid, glabrous or nearly so.

VAR. *Griffithii*; leaves beneath with spreading hairs.—Bhotan; *Griffith*, No. 2091.

SECT. II. **Benthamia**, Lindl. (gen.) *Flowers* connate in dense heads subtended by 4 large white bracts.

4. **C. capitata**, Wall. in Roxb. *Fl. Ind. ed. Carey & Wall.* i. 434; leaves oblong or elliptic adult closely covered above with minute hairs, calyx-teeth distinct reflexed. *Don Prodr.* 141; *Wall. Cat.* 467, *Pl. As. Rar.* t. 214; *Brand. For. Fl.* 253. *Benthamia fragifera*, Lindl. in *Bot. Reg.* t. 1579; *Wight Ill.* t. 122.

From KULU and KUMAON to BHOTAN, alt. 4000–7000 ft., not rare.

A small tree, the tender parts densely clothed with minute bicuspidate hairs. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., narrowed at both ends, hardly acuminate. *Heads* hemispherical, $\frac{3}{8}$ – $\frac{1}{2}$ in. wide; bracts 1 by $\frac{1}{2}$ in. *Fruiting* heads depressed, globose, 1 in. wide, succulent, of numerous coalesced pericarps; endocarp about $\frac{1}{4}$ in., bony, ellipsoid or obovoid, compressed; calyces spreading on all sides from the young fruit heads, ultimately deciduous.

VAR. *khassiana*; adult leaves glabrous or very nearly so.—Khasia, alt. 5000–6000 ft., Kalapani; *H. f. & T.* This variety approaches *C. japonica*, *Thunb.* which is closely allied but has the calyx-limb subtruncate.

4. **MASTIXIA**, Blume.

Trees, young parts more or less pubescent. *Leaves* alternate or opposite, petioled, entire. *Flowers* hermaphrodite, 2-bracteolate, small, in terminal many-flowered panicles; bracts small or lengthened, pedicels short or 0, jointed under the flower. *Calyx-tube* campanulate, pubescent or silky; limb 5–4-toothed. *Petals* 5–4, ovate, leathery, valvate, silky. *Stamens* 5–4; anthers cordate-oblong. *Ovary* 1-celled; disc fleshy; style cylindric, simple; ovule 1, pendulous from one side of the cell very near its summit. *Drupe* ellipsoid or ovoid, crowned by the calyx-teeth or a scar; putamen grooved down one face; endocarp protruded inwards down one side. *Seed* ellipsoid; albumen fleshy; embryo small, radicle elongate, cotyledons thin, elliptic.—DISTRIB. Species 8; S. India and Malaya.

* Leaves all alternate.

† Bracts about $\frac{1}{2}$ in., acute.

1. **M. tetrandra**, C. B. Clarke; bracts caducous, calyx-teeth in the bud shortly triangular, stamens usually 4. *Bursinopetalum tetrandrum*, *Wight ms.*; *Thwaites Enum.* 42.

CEYLON; *Thwaites*.

A large tree, foliage heavy green. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., elliptic or obovate-oblong, suddenly obtusely acuminate, narrowed at the base, glabrous, drying green; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., minutely pubescent when young. *Panicle* 2–3 in. diam., branches and calyx-tube with close fulvous pubescence. *Calyx-teeth* rarely 5. *Style* $\frac{1}{16}$ in. *Fruit* 1 by $\frac{3}{8}$ in., almost cylindric, or $\frac{3}{4}$ by $\frac{1}{2}$ in. ellipsoid.

VAR. *Thwaitesii*; leaves $1\frac{3}{4}$ by $\frac{1}{2}$ – $\frac{3}{4}$ in. obtuse turning black in drying, panicle and petals glabrous.—Ceylon; *Thwaites*. Very different in general appearance from *M. tetrandra*, but Mr. Thwaites regards it as a variety.

2. **M. arborea**, C. B. Clarke; bracts acute persistent till after the petals drop, calyx-teeth in the bud triangular-lanceolate, stamens 5. *Bursino-*

petalum arboreum, *Wight Ic.* t. 956; *Thwaites Enum.* 42; *Bedd. Fl. Sylv.* t. 216.

CACHAR; Calacherra, *R. L. Keenan*. NILGHIRI Mts.; near Sisparah, *Wight*. CEYLON; alt. 4000-7000 ft., *Gardner, Thwaites*.

A large tree, foliage dark green. *Leaves* 3 by 2 in., elliptic or obovate-oblong, suddenly shortly acuminate, narrowed at the base, glabrous, drying black; petiole $\frac{1}{2}$ -1 in., minutely pubescent when young. *Panicle* 2-3 in. diam., branches and calyx-tube with close fulvous pubescence. *Style* less than $\frac{1}{16}$ in. *Fruit* $1\frac{1}{2}$ by $\frac{1}{2}$ - $\frac{5}{8}$ in., ellipsoid.—Closely allied to the preceding. Possibly not distinct from *M. pentandra*, *Blume Mus. Bot.* i. 256, of which there is no authentic example at Kew; the description agrees except that the leaves are much larger, 4-8 in.

†† *Some of the bracts* $\frac{1}{2}$ - $\frac{3}{4}$ in., linear-oblong, obtuse.

3. *M. pentandra*, *Blume Mus. Bot.* i. 256; leaves 4-7 in., bracteoles and calyx-tube very hairy, calyx-teeth 5 ovate subacute. *M. cuspidata*, *Blume l. c.*, *ex Miq. Fl. Ind. Bat.* i. pt. i. 1095.

MALABAR; CANERA, Dharwar and Bellary; *Law*; Concan; *Stocks*.

A tree. *Leaves* 4-7 by $1\frac{1}{4}$ - $2\frac{1}{4}$ in., oblong or elliptic, narrowed to each end, puberulous on both surfaces at least when young, drying green, whiter beneath; petiole $\frac{3}{4}$ -1 $\frac{1}{2}$ in., pubescent when young. *Panicle* 3-6 in. diam., very pubescent towards the extremities. Some of the lower bracts $1\frac{1}{4}$ in., leaflike though narrow, many of the upper exceeding $\frac{1}{4}$ in. *Buds* silky. *Style* less than $\frac{1}{16}$ in. *Fruit* $1\frac{1}{4}$ by $\frac{2}{5}$ in., elongate-ellipsoid.—Identified from description only: *Blume* does not mention the large bracts, so that this is possibly a new species.

4. *M. bracteata*, *C. B. Clarke*; leaves 2 in., bracteoles and calyx-tube minutely silky or almost glabrous, calyx-teeth 5 short triangular.

MALACCA; *Maingay*, No. 710.

Branchlets glabrous. *Leaves* 2-3 by 1-1 $\frac{1}{2}$ in., elliptic, suddenly and obtusely acuminate, narrowed at the base, glabrous, drying an olive green; petiole $\frac{1}{4}$ in. *Panicle* 2 in. diam., nearly glabrous. Some of the lower bracts nearly 1 in., leaflike though narrow, many of the upper nearly $\frac{1}{4}$ in. and obtuse. *Buds* silky. *Style* less than $\frac{1}{16}$ in. *Fruit* not seen.

** Leaves subopposite and opposite.

5. *M. Junghuhniana*, *Miq. Fl. Ind. Bat.* i. pt. i. 772; leaves glabrous beneath or shortly hairy on the main nerves, calyx-teeth 4 roundish minutely pubescent.

MALACCA; *Maingay* No. 709.

A tree of moderate size; tips of branchlets pubescent. *Leaves* $4\frac{1}{2}$ by 2 in., oblong, narrowed to both ends, drying a shining green above, much whiter beneath; petiole $\frac{1}{2}$ in., pubescent when young. *Panicle* 2-3 in. diam., trichotomous; bracteoles $\frac{1}{8}$ - $\frac{1}{2}$ in., pubescent. Young petals most minutely silky. *Fruit* not seen.—Identified with *M. Junghuhniana* by the description, which closely agrees. It has been named *M. trichotoma*, *Blume*, in the Kew Herbarium, of which species it is very possibly a variety.

6. *M. Maingayi*, *C. B. Clarke*; under surface of the leaves and panicle densely softly woolly.

SINGAPORE; *Maingay* No. 711.

Branchlets densely woolly. *Leaves* 5 by 2 $\frac{1}{4}$ in., elliptic, acute not acuminate, narrowed at the base, shining green above, with much spreading soft hair and rugose beneath; petiole 1 in. *Panicle* 4 in. diam.; branches thick; bracts $\frac{1}{2}$ in., ovate, obtuse, thick. Young flowers densely woolly. *Fruit* $1\frac{1}{4}$ by $\frac{5}{8}$ in., ovoid, much narrower upwards.—A very fine and distinct species.

5. **AUCUBA**, *Thunb.*

Glabrous branching shrubs. *Leaves* opposite, petioled, ovate or lanceolate, obtusely serrate, leathery, shining, turning black in drying. *Flowers* small, dioecious, in pseudo-axillary panicles, lurid purple; bracts inconspicuous; pedicels jointed and 2-bracteolate. **MALE**: calyx small, 4-toothed; petals ovate or lanceolate, valvate; stamens 4; disc quadrangular, fleshy; no rudiment of an ovary. **FEMALE**: calyx-tube ovoid, limb 4-toothed; petals as in the male; no rudiments of stamens; ovary 1-celled, disc fleshy; style short, thick, stigma capitate; ovule solitary, pendulous. *Berry* ellipsoid, crowned by the calyx-teeth and style. *Seed* oblong, albumen copious; embryo minute, radicle superior near the summit of the seed.—**DISTRIB.** Species 3 or 1, Sikkim, Hongkong, Japan.

1. **A. himalaica**, *Hook. f. Ill. Him. Pl. t. 12*. leaves lanceolate or narrowly lanceolate acuminate, branches of the panicle very pilose.

SIKKIM and BHOTAN, alt. 6000–9000 ft., *Griffith, &c.*—**DISTRIB.** Japan.

A stout shrub, 6–12 ft., branching dichotomously. *Leaves* 8 by 1½ in., narrowed at the base, denticulate or serrate; petiole ¾–1 in. *Panicles* ¾ in. diam., terminal on very short lateral branches. *Fruit* ½ by ¼ in., smooth, shining, variable in colour, orange yellow or scarlet.—Yokohama specimens, named *A. longifolia* in *Herb. Hook.*, are identical with the Indian. *A. japonica* differs by having rather broader less acuminate leaves and less hairy panicles. The increase of material renders more probable the suggestion made by Sir J. Hooker l. c. that there is but one and that a very variable species of *Aucuba*.

6. **NYSSA**, *Linn.*

Trees (or shrubs), innovations silky. *Leaves* alternate, petioled, entire. *Flowers* capitate, on axillary peduncles, polygamo-dioecious, 1 or few females and many males in a head, each 3–4-bracteolate, or the males irregularly coalescing. **MALE**: calyx short, cup-shaped, 5–7-toothed; petals 5–7, imbricate, hairy; stamens usually 10 (in the Indian species) around a large circular disc; rudiment of the ovary 0 or small. **FEMALE**: calyx-tube campanulate; limb 5-toothed; petals 0 or minute; no rudiments of stamens; ovary 1-celled; style cylindric, simple or shortly 2-fid; ovule solitary, pendulous. *Berry* oblong or ovoid. *Albumen* copious; cotyledons flat, leafy, nearly as broad as the seed.—**DISTRIB.** Species 5–6, in N. America, and from Sikkim to Java.

1. **N. sessiliflora**, *Hook f. in Gen. Pl. i. 952*; leaves oblong acuminate, flowers sessile. *Daphniphyllopsis capitata*, *Kurz For. Fl. i. 240*; and in *Journ. As. Soc. 1875*, part ii. 201, *with fig.* *Ilex daphnephylloides*, *Kurz in Journ. As. Soc. 1870*, pt. ii. 72. *Agathisanthes javanica*, *Blume Bijl. 645*; *Miq. Fl. Ind. Bat. i. pt. i. 839*. *Ceratostachys arborea*, *Blume Bijl. 644*; *Miq. l. c.*

SIKKIM, alt. 5000–8000 ft.; *J. D. H., Kurz. KHASIA MTS.: H. f. & T. Cachar*; *R. L. Keenan. MARTABAN*, alt. 5000–7000 ft.; *Kurz.*—**DISTRIB.** Java.

A tree, 60 ft. *Leaves* 6 by 2 in., serrate at the base, punctate on both surfaces, adult glabrous beneath, rarely pubescent and chiefly on the nerves; petiole 1 in. *Peduncles* 1–1½ in., more or less pubescent. *Calyx-teeth* rounded, pubescent and ciliate. Ripe *fruit* ½ by ⅓ in., ovoid, narrowed upwards to a point, glabrous.

7. **TORICELLIA**, DC.

A small tree, branches thick. *Leaves* alternate, long-petioled, deciduous, broadly cordate, acute, sharply serrate; petiole sheathing at base. *Flowers* small, white, diœcious, numerous in pendulous panicles; pedicels short, bracteolate, in the female jointed under the flower, in the male not. MALE: calyx-tube short, lobes generally 5; petals 5, oblong, acuminate, induplicate-valvate; stamens usually 5; disc flat; rudiment of ovary 0 or of 1-3 small bristles. FEMALE; calyx-tube ovoid; limb minute, 3-5-toothed; petals and stamens 0; ovary 3-5-celled, disc inconspicuous; style very short, stigmas 3-5, cylindric; ovule solitary pendulous in each cell. *Drupe* small, purple, obliquely ovoid, crowned by the stigmas, 4-celled, 1-seeded. *Seed* linear, curved; albumen fleshy; embryo minute.

1. **T. tiliæfolia**, DC. *Prodr.* iv. 257; *Seem. Journ. Bot.* iii. 361, t. 41. *Sambucus tiliæfolia*, Wall. *Cat.* 483.

NIPAL; Wallich. SIKKIM, alt. 6000 ft., J. D. H. BHOTAN; Griffith.

Leaves 6 in. diam., adult glabrous or slightly pubescent on the nerves beneath, membranous, palmately nerved from the base; petiole often 3-4 in. Male *panicle* 1 ft., very compound, minutely pubescent or glabrous, with a few scattered linear bracts $\frac{1}{2}$ in.: fem. sometimes nearly as long as the male, but much less dense and with far fewer more scattered flowers. *Fruit* $\frac{2}{3}$ in., ovoid, glabrous.

INDEX OF GENERA, SPECIES AND SYNONYMS.

The Synonyms and Species incidentally mentioned are printed in Italics.

FLORA OF BRITISH INDIA.

ORDER LXXIV. **CAPRIFOLIACEÆ.** (By C. B. Clarke.)

Shrubs, erect or scandent, or small trees (*Adoxa*, a herb), branches round. *Leaves* opposite, rarely 3-nate; stipulate or not. *Flowers* hermaphrodite, cymose or paniced, capitate in *Adoxa*, regular or irregular. *Calyx-tube* adnate to the ovary; limb 3-5-toothed or -lobed. *Corolla* gamopetalous; limb often 2-lipped, 5-lobed, lobes imbricate in bud. *Stamens* 5 (in *Adoxa* 8-12), on the corolla alternate with its lobes. *Ovary* inferior (in *Adoxa* $\frac{1}{2}$ -inferior), 2-8-rarely 1-celled; style long, with capitate stigma, or short, 2-5-lobed; ovules solitary, pendulous, or several on axile placentas. *Fruit* a drupe (in *Abelia* dry), with 1-8 cartilaginous pyrenes, or a many-seeded berry. *Seeds* 1 or many in each cell, albumen copious fleshy; embryo usually minute.—Species 200; mostly Northern, with a few Australian and S. American.

Distinguished from *Rubiaceæ* chiefly by habit and the frequently irregular flowers and rarity of stipules.

TRIBE I. Sambuceæ. *Corolla-limb* regular. *Style* short, 2-5-lobed. *Ovary-cells* 1-ovuled.

Leaves 2-ternatisect. Flowers capitate. Stamens 8-12	1. ADOXA.
Leaves pinnate; leaflets 5-9, serrate	2. SAMBUCUS.
Leaves undivided	3. VIBURNUM.

TRIBE II. Lonicereæ. *Corolla-limb* regular or irregular. *Style* long; stigma capitate.

Leaves sessile, connate, obovate. Ovary-cells 3, 1-ovuled	4. TRIOSTEUM.
Calyx-lobes elongate. Fruit elongate, coriaceous, 1-seeded	5. ABELIA.
Leaves entire. Flowers paired. Berry 2-3-celled	6. LONICERA.
Leaves exstipulate. Branches fistular. Ovary 5-8-celled	7. LEYCESTERIA.
Leaves stipulate. Branches solid. Ovary 5-celled	8. PENTAPYXIS.

1. **ADOXA**, Linn.

A small glabrous succulent herb. *Radical* leaves long-petioled, 3-ternatisect; cauline 3-fid. *Flowers* small, green, in a peduncled head. *Calyx-tube* hemispheric; limb $\frac{1}{2}$ -superior, 2-4-lobed. *Corolla* rotate, 4-6-lobed. *Stamens* 8-12, in pairs alternating with the corolla lobes; anther-cells 2, confluent above. *Ovary* 3-5-celled; styles 3-5; ovules 1 in each cell. *Drupe* subglobose; pyrenes 4-5, compressed. *Seeds* obovate, flattened.

D. H. HILL LIBRARY
North Carolina State College

A genus differing much from the order in habit. Perhaps nearer *Chrysosplenium*.

1. **A. Moschatellina**, Linn.; Boiss. *Fl. Orient.* iii. 2.

VAR. *inodora*, Falc. mss.; inodorous, cauline leaf often solitary, flowers 5-6-merous.

KASHMIR, Falconer; Pir Pinjal, alt. 11,500 ft., C. B. C.—DISTRIB. N. Europe, Asia, and America.

Rootstock short, creeping. Stem simple, 3-6 in., terminating in a solitary peduncle. Radical leaves $\frac{1}{2}$ -2 in. diam., with a long 2-6 in. petiole; cauline 2 in European, often 1 in Kashmir specimens, smaller, petiole short or 0; segments obtuse or mucronate. Heads $\frac{1}{2}$ in. diam., green, in European specimens with a terminal 4-merous and 4 lateral 5-merous flowers; in Kashmir with a terminal 5-merous and 4 or more lateral 6-merous ones. Drupe $\frac{1}{8}$ in. diam.; endocarp and seeds flattened.—Odour of the European plants musky, of Kashmir 0, on which account and the 5-6-merous flowers Falconer regarded the latter as a distinct species (*A. inodora*, Falc.), but its habit and all other characters are identical with the European.

2. **SAMBUCUS**, Linn.

Shrubs or small trees. Leaves unequally pinnate, large, often stipulate; leaflets serrate or laciniate. Corymbs large, very compound, bracteate; flowers small, jointed with the pedicel, very rarely bracteolate. Calyx-limb 3-5-toothed. Corolla rotate or campanulate, 3-5-partite. Stamens 5, attached to the base of the corolla. Ovary 3-5-celled; style short, 3-5-partite, or stigmas 3-5-sessile; ovules 1 in each cell, pendulous. Drupe crowned by the calyx-teeth, 3-5-celled. Seeds compressed; embryo long.—DISTRIB. Species 10-12, in all temperate regions (except S. Africa).

1. **S. Ebulus**, Linn.; herbaceous, leaflets free, stipules often foliaceous serrate, drupes black. *H. f. & T. in Journ. Linn. Soc.* ii. 179; *Brundis For.* Fl. 260; Boiss. *Fl. Orient.* iii. 2.

KASHMIR; alt. 6000-10,000 ft., plentiful; *T. Thomson*, &c.—DISTRIB. Europe, N. Africa, and to the Elburz Mts.

Gregarious; stems mostly simple, 3-6 ft. high. Leaves 9 in.; leaflets 5-9, oblong-lanceolate, 3-6 in., puberulous or nearly glabrous. Corymb peduncled or leafy at the base, compact and 3-rayed in English, usually larger and many-rayed in Kashmir specimens; bracteoles minute, linear. Corolla $\frac{1}{2}$ in. diam., broadly campanulate, white pink or dark purple. Drupe $\frac{1}{2}$ in. diam., globose.—Flowers with a strong peculiar odour, both in Kashmir and Europe, uppermost usually barren.

2. **S. javanica**, Blume *Bijd.* 657; a straggling shrub, leaflets free, stipules usually small or 0, drupes black. *DC. Prodr.* iv. 322, *Miq. Fl. Ind. Bat.* ii. 124; *H. f. & T. in Journ. Linn. Soc.* ii. 180. *S. Wightianus*, Wall. *Cat.* 6303; *W. & A. Prodr.* 388. *S. rubra*, Ham.; Wall. *Cat.* 482. *S. chinensis*, Lindl. in *Trans. Hort. Soc. Lond.* vi. 297; *DC. l.c.* *S. Thunbergiana*, *Miq. in Ann. Mus. Lugd. Bat.* ii. 265; *Kurz For. Fl.* ii. 3. *Sambucus* sp., *Griff. Notul.* iv. 259.

ASSAM and EAST BENGAL PLAIN; ascending in KHASIA to 5000 ft. alt., in SIKKIM to 6000.—DISTRIB. Java, China, Japan.

Leaves 18 in., of 5-9 oblong-lanceolate leaflets 3-8 in., puberulous or nearly glabrous. Corymb usually leafy at the base, often 1 ft. diam., puberulous or almost villous; bracteoles minute, ovate. Corolla $\frac{1}{2}$ in. diam., broadly campanulate, white or pink. Berry $\frac{1}{8}$ - $\frac{1}{4}$ in. diam., globose.—Uppermost flowers usually barren; female

apetalous in the cultivated *S. chinensis* (Lindley), but not usually so in the wild plant. The Khasia examples have the fruits mostly sessile, agreeing thus more closely with *S. chinensis* than with *S. javanica*, in which the fruits are usually shortly pedicelled.

3. ***S. adnata*, Wall. Cat. 482**; a spreading shrub, leaflets often decurrent, stipules usually small or 0, drupes red. *DC. Prodr.* iv. 322; *H. f. & T. in Journ. Linn. Soc.* ii. 180.

NIPAL, *Wallich*; Tambur Valley, alt. 5000–10,000 ft., *J. D. H. Sikkim*; Singalalah, alt. 10,000 ft., *Gamble, C. B. C.*

A shrub, 4–8 ft. *Leaves* 12 in.; leaflets 5–9, 3–5 in., oblong-lanceolate, puberulous or nearly glabrous. *Corymb* usually leafy at the base, often 9 in. diam., puberulous, bracteoles minute or 0. *Corolla* $\frac{1}{2}$ in. diam., broad-campanulate. *Drupe* $\frac{1}{8}$ in. diam., globose.

3. **VIBURNUM**, *Linn.*

Shrubs or small trees. *Leaves* opposite, rarely 3-nate; stipules inconspicuous (in the Indian species). *Flowers* in terminal or subterminal corymbose or panicked cymes, all fertile in Indian (outer radiant and neuter in some European, &c., species). *Calyx-tube* turbinate or subcylindric; limb short, 5-toothed, persistent. *Corolla* campanulate rotate or tubular; lobes 5, equal. *Stamens* 5, inserted on the corolla-tube. *Ovary* 1–3-celled; style short, stigma sub-3-lobed; ovules 1 in each cell, pendulous. *Drupe* 1- or sub-2–3-celled, 1-seeded. *Seed* oblong, compressed, concave on the ventral face or with the margins greatly incurved; albumen fleshy, uniform or ruminated; embryo minute.—**DISTRIB.** Species 80, in N. temperate regions and in the Andes; a few in the West Indies and Madagascar.

SECT. I. *Eu-Viburnum* (Oersted). *Cymes* corymbose. *Drupe* 1-celled, compressed; endocarp not intruded. *Albumen* uniform, margins little incurved.

* *Corolla rotate or shortly campanulate, lobes spreading* (in *V. corylifolium* unknown).

1. ***V. cotinifolium*, Don Prodr. 141**; leaves ovate or elliptic base obtuse usually woolly beneath, corymb-branches stellately tomentose, calyx glabrous limb very short, corolla shortly campanulate lobes about as long as the tube. *DC. Prodr.* iv. 327; *Wight Ill. t.* 121, A fig. 1–5; *Bot. Reg. t.* 1650; *H. f. & T. in Journ. Linn. Soc.* ii. 174; *Brandis For. Fl.* 258. *V. polycarpum*, *Wall. Cat.* 455; *DC. l.c.* 328.

KASHMIR; alt. 6000–11,000 ft., to KUMAON, frequent. EAST BHOTAN; *Griffith* (Kew Distrib. No. 3399).

A spreading shrub, 5–10 ft. high. *Leaves* 3 by 2 in., obtuse or subacute, subentire rarely coarsely crenate, stellately-woolly at least when young, in age often glabrous except on the nerves beneath; petiole $\frac{1}{4}$ in. *Corymbs* 2–3 in. diam., generally terminal, dense, branches stout; bracteoles linear, equalling the calyx-tube. *Corolla-tube* $\frac{1}{2}$ by $\frac{1}{10}$ in., glabrous, lobes round. *Anthers* large, subexsert. *Style* very short, conical. *Drupe* $\frac{1}{4}$ by $\frac{1}{2}$ in., compressed, broad-oblong, red. *Seed* dorsally 2-grooved, ventrally sub-concave 3-grooved.—*Leaves* usually thick, reticulately rugose and entire, but sometimes thin, glabrous, and somewhat strongly crenate. *V. Lantana*, *Linn.*, differs but slightly by the denticulate leaves and shorter corolla-tube.

2. ***V. corylifolium*, H. f. & T. in Journ. Linn. Soc.** ii. 174; branchlets and large fruiting corymb rufous-hirsute, leaves ovate or elliptic base subcordate, softly hairy beneath.

KHASIA Mts., alt. 5-6000 ft.; Moleem, *Griffith* (Kew Distrib. No. 3402); Kala-Pani, *H. f. & T.*: Moflong, *C. B. C.*

Leaves $2\frac{1}{2}$ by $1\frac{1}{2}$ in., acute, dentate, parallel-nerved. *Corymbs* often on short lateral branches. *Flowers* not seen. *Drupe* $\frac{1}{4}$ by $\frac{1}{5}$ in., compressed ovate-oblong, bright red; seed dorsally convex shallowly 2-grooved, ventrally concave and 2-grooved close to the medial line.

3. *V. stellulatum*, *Wall. Pl. As. Rar.* ii. 54, t. 169; *Cat.* 463; leaves shortly petioled elliptic-lanceolate acuminate toothed stellately pubescent rarely glabrate beneath, corolla small rotate. *DC. Prodr.* iv. 327; *H. f. & T. in Journ. Linn. Soc.* ii. 174; *Brandis For. Fl.* 258. *V. Mullaha*, *Ham.*; *Don Prodr.* 141; *DC. l. c.*

TEMPERATE HIMALAYA, alt. 6000-11,000 ft.; from KASHMIR to SIKKIM, common.

A large shrub: branches puberulous. *Leaves* 3 by $1\frac{1}{2}$ in., base obtuse or cuneate, parallel-veined; petiole $\frac{1}{2}$ in. *Corymbs* terminal, in fruit divaricate, 3-5 in. diam., subglobose; bracts $\frac{1}{2}$ in., linear, membranous, caducous. *Calyx-tube* stellately hairy; lobes minute, ovate. *Corolla-lobes* $\frac{1}{10}$ in., round, pubescent in bud. *Style* short, stigma capitate. *Drupe* $\frac{1}{2}$ by $\frac{1}{5}$ in., compressed, broadly oblong, yellow-red; seed 2-grooved on both faces, hardly concave ventrally.

VAR. 1. involucratum, *Wall. Cat.* 458 (sp.); branchlets and leaves rufous-villous, corymbs densely villous, bracts lanceolate herbaceous persistent.—*Nipal, Wallich*; *Kumaon, Edgeworth*.—*V. forma monstrosa*, *H. f. & T. l. c.* 175.

VAR. 2. glabrescens; corymbs with a few scattered hairs, leaves glabrescent except on the nerves beneath, bracts caducous?—*V. involucratum*, *H. f. & T. l. c.*

4. *V. Griffithianum*, *C. B. Clarke*; leaves short-petioled elliptic or subobovate acute toothed villous beneath, corymbs densely villous umbellately 4-7-rayed, calyx-tube glabrous, corolla very small rotate. *V. foetidum*, var. *Griffithianum*, *Kurz in Journ. As. Soc.* 1877, pt. ii. 121. *V. foetidum*, var. *grandifolium*, *Kurz For. Fl.* ii. 2. *Viburnum* sp., *Griff. Notul.* iv. 259; *l. c. Pl. Asiat.* t. 480, fig. 1.

EAST ASSAM; banks of the Kamyoon in the Naga country, *Griffith* (Kew Distrib. 3403).

Branchlets stout, fuscous villous. *Leaves* $4\frac{1}{2}$ by 2 in., often unequal-sided, base obtusely cuneate, nerves parallel, the lowest not uniting nor quite reaching the base of the leaf; petiole $\frac{1}{2}$ in. *Corymbs* terminal, peduncled, 1-3 in. diam., dense even in young fruit; bracts 0, or few, lanceolate, $\frac{1}{2}$ in. *Calyx-tube* glabrous, viscid and black in the young fruit; teeth broad-oblong. *Corolla-lobes* $\frac{1}{16}$ in., round.—More nearly allied to *V. stellulatum* than to *V. foetidum*.

5. *V. foetidum*, *Wall. Pl. As. Rar.* i. 49, t. 61; *Cat.* 466; leaves oblong-rhomboid 3-nerved at the base remotely toothed nerves beneath stellately pubescent, corymbs subumbellate stellate-pubescent, calyx-tube glabrous. *DC. Prodr.* iv. 325; *H. f. & T. in Journ. Linn. Soc.* ii. 175; *Kurz For. Fl.* ii. 2.

KHASIA Mts. and ASSAM, alt. 3000-5000 ft., common.—*DISTRIB.* North Birma.

An erect shrub, 6-10 ft.; branchlets stellate-hairy. *Leaves* $2\frac{1}{2}$ by $1\frac{1}{4}$ in., scarcely acuminate, base cuneate or rounded, axils of the primary nerves with tufts of hair. secondary transverse conspicuous beneath; petiole $\frac{1}{2}$ in. *Corymbs* terminal, 2-4 in. diam., 4-8-rayed, peduncled; bracts and bracteoles from linear-oblong to spatulate-oblong, hairy. *Calyx-teeth* minute, triangular. *Corolla-lobes* $\frac{1}{16}$ in. diam., round, white. *Drupe* $\frac{1}{5}$ by $\frac{1}{6}$ in., compressed, subacute, red. *Seed* dorsally 2-grooved, ventrally 3-grooved and hardly concave.—Specimens of this in *Herb. Griffith.* are ticketed as from Darjeeling, whither he sent a collector; but the collections from thence were so mixed with others that no confidence is to be placed in their habitats.

VAR. premnacea, *Wall. Cat.* 461 (sp.); bracts at the base of the umbel large leaf-

like sometimes $1\frac{1}{2}$ in. long. *DC. Prodr.* iv. 325.—Khasia Mts. and Birma.—Hardly distinguishable as a variety, the bracts varying from 1 to 8, and from $\frac{1}{2}$ to $1\frac{1}{2}$ in.

6. **V. Colebrookianum**, *Wall. Cat.* 460; leaves large oblong crenate-serrate nearly glabrous, corymbs large on very short axillary branches stellate-hairy, corolla rotate, drupe ellipsoid, seed hardly grooved. *V. lutescens*, *H. f. & T. in Journ. Linn. Soc.* ii. 176, not of *Blume*; *Kurz For. Fl.* ii. 2 (as to *Var. 2 only*).

Subtropical HIMALAYA, alt. 1–5000 ft.; SIKKIM and BHOTAN, common. ASSAM and KHASIA Mts., alt. 0–4000 ft., frequent.

A large spreading shrub, 6–15 ft.; flowering branches usually pendent with large terminal leaves, corymbs from axils below them. *Leaves* $5\frac{1}{2}$ by 2 in., shortly acuminate, cuneate at the base, young and petiole ($\frac{1}{4}$ – $\frac{1}{2}$ in.), stellately pubescent. *Corymbs* umbelliform, dense on a portion of the branch bare of leaves; bracts minute, bracteoles 0. *Calyx-tube* glabrous, teeth minute. *Corolla*-lobes $\frac{1}{10}$ in., round, white. *Drupe* $\frac{1}{5}$ by $\frac{1}{6}$ in., hardly compressed, red: seed obscurely convex dorsally, concave ventrally.—*V. lutescens*, *Blume*, united with this by *H. f. & T.* has berries $\frac{1}{2}$ in. long, narrowly obovoid-oblong, with deeply grooved seed, and terminal inflorescence.

7. **V. punctatum**, *Ham. in Don Prodr.* 142; leaves elliptic-lanceolate coriaceous subentire glabrous punctate beneath, corymb branches angular and calyx-tube minutely scaly, corolla rotate. *Wall. Cat.* 456; *DC. Prodr.* iv. 324; *H. f. & T. in Journ. Linn. Soc.* ii. 176; *Brandis For. Fl.* 260.

NIPAL, *Wallich*. KUMAON; Sarju Valley, alt. 4000 ft., *Strach. & Winterb.*

A stout spreading shrub. *Leaves* $3\frac{1}{2}$ by $1\frac{1}{2}$ in., acute at both ends, often with peltate scales on the midrib beneath; petiole $\frac{1}{2}$ in. *Corymbs* terminal, sessile, in flower 2–6 in. diam., branches umbellate or corymbose, cinnamonaceous when dried; bracts $\frac{1}{2}$ in., lanceolate, deciduous; bracteoles scarcely $\frac{1}{10}$ in., ovate. *Calyx-teeth* minute, obtuse. *Corolla*-lobes $\frac{1}{12}$ in., round, white. *Anthers* large, much exerted. *Drupe* $\frac{1}{4}$ by $\frac{1}{5}$ in., ellipsoid, succulent. *Seed* 2-grooved dorsally, concave 3-grooved ventrally.

Var. acuminata, *Wall. Cat.* 465 (sp.); leaves acuminate, bracts persistent, berry $\frac{1}{2}$ by $\frac{1}{5}$ in., squamulose, seed much compressed obscurely grooved. *V. acuminatum*, *DC. Prodr.* iv. 324; *W. & A. Prodr.* 388; *Wight Ic.* t. 1021; *Bedd. Fl. Sylv.* t. 217. *V. Wightianum*, *Herb. Hohen.* No. 1381, not of *Wall.*—Deccan Mts. alt. 4000–7000 ft., common.—The berry looks so different that it may indicate a distinct species.

8. **V. sambucinum**, *Reinw.; Blume Bijl.* 656; leaves elliptic-lanceolate entire nearly glabrous, corymb-branches and calyx-tube pubescent, corolla rotate. *DC. Prodr.* iv. 325; *Miq. Fl. Ind. Bat.* ii. 120; *Oersted in Vidensk. Meddel.* 1860, t. 7, fig. 11–13. *V. integrerrimum*, *Wall. Cat.* 457; *DC. Prodr.* iv. 324; *H. f. & T. in Journ. Linn. Soc.* ii. 176.

PINANG and SINGAPORE; *Wallich, Walker*. MALACCA; Maingay *Kew Distrib.* 712/2.—DISTRIB. Malaya.

A stout shrub, or small tree, 20 ft. *Leaves* 5 by $2\frac{1}{2}$ in., shortly acuminate, base broad-cuneate, impunctate, minutely pilose on the midrib beneath (or in Java examples often more hairy); petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., pilose. *Corymb* terminal, peduncled, umbellate, 2–4 in. diam.; bracts 0, or rarely caducous; bracteoles minute, linear-oblong. *Corolla*-lobes $\frac{1}{12}$ in., round, yellow-white. *Drupe* $\frac{1}{4}$ by $\frac{1}{5}$ in., compressed, ovate, suddenly acute; endocarp thickened, subosseous. *Seed* dorsally 2-grooved, ventrally 3-grooved little concave.—Leaves in some Japan specimens are hairy beneath, in others as in *Wallich's V. integrerrimum*.

** *Corolla tubular, lobes very short erect or scarcely spreading.*

9. **V. coriaceum**, *Blume Bijl.* 656; leaves oblong-lanceolate acuminate coriaceous glabrous with tufts of hairs on the axils of the nerves beneath,

corymbs pubescent upwards, bracteoles 0 or caducous, corolla-tube glabrous. *DC. Prodr.* iv. 329; *H. f. & T. in Journ. Linn. Soc.* ii. 179; *Miq. Fl. Ind. Bat.* ii. 120; *Brandis For. Fl.* 259; *V. cylindricum*, *Ham. in Don Prodr.* 142; *DC. l. c.* 329.

TEMPERATE HIMALAYA, alt. 4–8000 ft.; from KUMAON to BHOTAN and KHASIA Mts., alt. 3–5000 ft., frequent.—DISTRIB. North Birma; Java.

A large shrub, or small tree, 15–20 ft. Leaves 4–9 by 2–2½ in., base cuneate or obtuse, quite entire in some Himalayan, often toothed in Javanese and Sikkim specimens, often punctate beneath; petiole ½–1 in., glabrous or subpilose. *Corymb* terminal, peduncled or sessile, umbellate or corymbose; bracts ¼ in., linear, caducous; bracteoles minute, ovate. *Calyx-tube* glabrous or puberulous; limb 0. *Corolla-tube* ½ in., white. *Anthers* oblong, exserted. *Drupe* ½ by ¼ in., moderately compressed, elliptic, shortly acute, black. *Seed* 2-grooved dorsally; endocarp subosseous, 3-grooved ventrally little concave.

VAR. capitellata, *Wight Ic.* t. 1022 (sp.); leaves entire or subsinuate, corolla glabrous (pilose in *Wight's Ic.*), drupe ½ by ¼ in., much compressed. *V. hebanthum*, *Thw. Enum.* 136 partly, not of *W. & A.*—Deccan Mts. alt. 4–7500 ft. Ceylon on Adam's Peak (C. P. n. 39).

VAR. zeylanica, *Gardner ms.* (sp.); berry ¼ by ½ in. broad ovoid very little compressed. *Oersted in Vidensk. Meddel.* 1860, t. vii. fig. 24, 25. *V. hebanthum*, *Thw. Enum.* 136 partly. *V. coriaceum*, var. β , *H. f. & T. in Journ. Linn. Soc.* ii. 179.—Ceylon, alt. 6000 ft., *Gardner, Thwaites*.

10. ***V. hebanthum***, *W. & A. Prodr.* 388; leaves oblong acuminate coriaceous sinuate or sinuate-dentate glabrous with tufts of hairs in the axils of the nerves beneath, corymbs minutely pilose upwards, bracteoles ½ in. linear, corolla-tube densely pubescent. *Wight Ic.* t. 1023; *H. f. & T. in Journ. Linn. Soc.* ii. 179, excl. syn. *V. pubigera*; not of *Thwaites*.

NILGHERY Mts., alt. 4–7500 ft., frequent; Mayaburam, *Sir F. Adam*.

A large shrub, doubtfully distinct from *V. coriaceum* by the densely pubescent yellowish corolla. The fruit resembles that of *V. coriaceum*, var. *capitellata*, but the leaves are rarely entire as in var. *capitellata*, and are less acuminate.

SECT. II. **Pseudo-Tinus**. *Cymes* corymbose or umbellately divided. *Drupe* succulent, 1-celled, compressed; endocarp slightly intruded. *Albumen* ruminated, margins incurved.

11. ***V. cordifolium***, *Wall. Cat.* 462; leaves elliptic cordate acuminate sharply serrate, stellately pubescent on the nerves beneath, corymbs not radiant terminal sessile stellately hairy, corolla rotate. *DC. Prodr.* iv. 327; *H. f. & T. in Journ. Linn. Soc.* ii. 175.

TEMPERATE HIMALAYA, alt. 9–12,000 ft., from KUMAON to BHOTAN, frequent.

A large shrub, flowering before leafing. Leaves 4½ by 2½ in., nearly glabrous above, parallel-veined; petiole ½–1 in. *Corymb* in flower small dense, in fruit 3–5 in. diam.; bracts ½ in., linear-oblong, woolly, caducous. *Calyx-tube* soon glabrous, lobes lanceolate, stellately woolly. *Anthers* small, shortly exserted. *Berry* ¼ by ½ in., little compressed. *Seed* dorsally with one shallow furrow, ventrally with much inflexed edges; testa full of red glands following the ruminations of the albumen.—*V. lantanoides*, *Michx.*, of N. America, has broader less serrate leaves, the corymbs usually radiant and the normal flowers much smaller; *V. furcatum*, *Blume*, of Japan, is almost identical with *V. lantanoides*. The three are closely allied and united by *Miquel in Ann. Mus. Lugd. Bat.* ii. 265.

SECT. III. **Tinus**, *Oerst.* (genus). *Cymes* umbellate. *Drupe* dry, hard, blue. *Albumen* ruminated.

12. **V. atro-cyanea**, C. B. Clarke; glabrous, leaves oblong narrowed at both ends not acuminate entire or obscurely sinuate-dentate, berry ellipsoid very smooth. *Viburnum* sp., *Griff. Itin. Notes*, 118.

MISHMI Mts., Thumathu summit, *Griffith* (Kew Distrib. No. 3406).

A shrub, resembling *V. Tinus*, L. Leaves 3 by $1\frac{1}{4}$ in., axils of the nerves beneath naked. *Cymes* terminal, subsessile; branches angular, red, slightly thickened; bracts small, caducous. *Flowers* not seen. *Berry* $\frac{1}{2}$ by $\frac{1}{4}$ in.; endocarp slightly intruded. *Albumen* strongly ruminated; testa with many red glands.—The European *V. Tinus* has a much larger, ovoid, somewhat ribbed drupe, and hairy nerve-axils beneath.

SECT. IV. **Microtinus**, Oerst. (genus). *Cymes* panicled. *Corolla* rotate. *Drupe* succulent, sub-2-celled, 1-seeded. *Albumen* uniform, margins incurved so as nearly to include the barren cell.

13. **V. odoratissimum**, Ker in *Bot. Reg.* t. 456; leaves elliptic acute coriaceous subentire glabrous, panicle glabrous, bracts and bracteoles lanceolate stellately-hairy caducous. *H. f. & T. in Journ. Linn. Soc.* ii. 177; *Benth. Fl. Hongk.* 143; *Oersted in Vidensk. Meddel.* 1860, 294, t. 6, fig. 7-10 (*Microtinus*).

KHASIA Mts., alt. 4000 ft., Mrs. Mack, &c.—DISTRIB. N. Birma, China.

A shrub, 6-10 ft. Leaves $5\frac{1}{2}$ by $2\frac{1}{4}$ in.; base cuneate, entire or sparingly sinuate-dentate, primary nerves remote pinnate glandular, sometimes slightly hairy in the axils beneath; petiole $\frac{1}{2}$ -1 in., stout. *Corymb* 2-4 in. high, mostly peduncled; bracts $\frac{1}{2}$ in., lanceolate, woolly in the Indian examples, minutely pubescent in the Chinese. *Calyx-limb* very wide, with shallow triangular teeth. *Corolla-lobes* $\frac{1}{2}$ in., elliptic, white. *Berry* nearly $\frac{1}{3}$ by $\frac{1}{5}$ in., ovoid-oblong, hardly compressed.

14. **V. Simonsii**, H. f. & T. in *Journ. Linn. Soc.* ii. 177; leaves elliptic-lanceolate coriaceous denticulate or subentire glabrous, panicle pubescent, bracts and bracteoles lanceolate pubescent persistent.

KHASIA Mts., alt. 4-6000 ft.; not rare; *Simons*, &c.

A shrub, 6-15 ft. Leaves 4 by 2 in.; base rhomboid or obtuse, nerves parallel, much closer than in *V. odoratissimum*, with large tufts of hairs in the axils beneath; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Corymb* flowers and fruit nearly as in *V. odoratissimum*, but both corolla and berry somewhat smaller.

SECT. V. **Solenotinus**, Oersted (genus). *Cymes* panicled, or thyriform. *Corolla* tubular. *Drupe* succulent, sub-3-celled, 1-seeded. *Albumen* uniform, margins incurved forming a T-shaped ventral groove.

15. **V. erubescens**, Wall. *Pl. As. Rar.* ii. 29, t. 134; *Cat.* 459; leaves oblong acute serrulate pilose on the nerves beneath otherwise glabrous, panicles peduncled terminal and many on shortened lateral branches. *DC. Prodr.* iv. 329; *H. f. & T. in Journ. Linn. Soc.* ii. 177; *Thwaites Enum.* 136; *Brandis For. Fl.* 258. *V. Wightianum*, Wall. *Pl. As. Rar.* ii. 29; *Cat.* 3729; *W. & A. Prodr.* 388; *Wight Ic. t.* 1024. *V. pubigerum*, W. & A. *Prodr.* 389. *Viburnum* sp., Wall. *Cat.* 7474.

HIMALAYA, alt. 3-10,000 ft.; from KUMAON to BHOTAN, common. DECCAN Mts., alt. 5-8000 ft., common. CEYLON.

A large shrub, or small tree. Leaves never large, $2\frac{1}{2}$ -3 by $1\frac{1}{4}$ in., from ovate to narrow-oblong, base obtuse, axils of nerves beneath very hairy in Deccan examples nearly glabrous in the others; petiole $\frac{1}{4}$ in. *Corymb* usually pendulous, small in the Deccan examples, sometimes 3-5 in. in the Himalayan, pubescent, nearly glabrous or sometimes stellately tomentose; bracts linear, $\frac{3}{4}$ in., glabrous, sometimes $\frac{1}{2}$ in. and pubescent. *Calyx-teeth* small, oblong, glabrous or pubescent. *Corolla-tube* $\frac{1}{2}$ in.; lobes $\frac{1}{2}$ in., round, spreading, white. *Stamens* inserted at the same height near the

summit of the tube. *Drupe* $\frac{1}{4}$ by $\frac{1}{2}$ in., ellipsoid, scarcely compressed, red, crowned by the thick short style.—Deccan specimens have more slender panicles, smaller flowers and rather narrower berries than Himalayan, but some Ceylon specimens appear altogether undistinguishable from the Himalayan.

16. **V. nervosum**, *Don Prodr.* 141, not of *Hk. & Arn.*; leaves elliptic-oblong acute crenate-serrate parallel-nerved hairy on the nerves beneath, cymes subcapitate silky, bracts oblong obtuse silky deciduous. *DC. Prodr.* iv. 327; *H. f. & T. in Journ. Linn. Soc.* ii. 178; *Brandis For. Fl.* 259. *V. grandiflorum*, *Wall. Cat.* 464; *DC. l. c.* 329; *Oersted in Vidensk. Meddel.* 1860, 295, t. 6, fig. 1-4 (*Solenotinus*).

HIMALAYA, alt. 10-13,000 ft., from KASHMIR to SIKKIM, not common; *Wallich, &c.*

A large shrub, or gnarled small tree; branchlets pilose. *Leaves* $2\frac{1}{2}$ -3 by $1\frac{1}{4}$ in., scarcely acuminate, base cuneate, adult glabrous above; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Cymes* appear before the leaves; branches very short; outer bracts ovate, $\frac{3}{4}$ in. diam., obtuse; inner $\frac{3}{4}$ by $\frac{1}{4}$ in., oblong. *Calyx-tube* glabrous, teeth small, irregular, often ciliate. *Corolla-tube* $\frac{1}{4}$ - $\frac{1}{2}$ in.; lobes $\frac{1}{6}$ in., elliptic, spreading, rose. *Stamens* inserted 2 near the top of the corolla-tube, 3 somewhat lower down. *Drupe* nearly $\frac{1}{2}$ by $\frac{1}{4}$ in., ellipsoid, hardly compressed.

17. **V. foetens**, *DCne. in Jacq. Voy. Bot.* 75, t. 84; leaves elliptic or oblong crenate-serrate glabrous, cymes thyrsiform branches glabrous or sparingly pilose ultimately lax. *Hk. f. & T. in Journ. Linn. Soc.* ii. 178; *Brandis For. Fl.* 259.

KASHMIR, alt. 6-10,000 ft., from MURREE to CHUMBA; *Jacquemont, &c.*, not rare.

A large shrub; branchlets glabrous, or laxly pubescent. *Leaves* 3 by $1-1\frac{1}{2}$ in., shortly acute, base cuneate or obtuse, parallel-nerved, adult glabrous except tufts of hairs in the axils of the nerves beneath. *Inflorescence* nearly as in *V. nervosum*, *Don*, but soon more lax and corolla larger; outer bracts ovate or oblong, deciduous; bracteoles linear, scarious, pubescent. *Stamens* inserted 2 near the top of the corolla-tube, 3 lower down. *Drupe* $\frac{1}{2}$ - $\frac{1}{2}$ by $\frac{1}{4}$ in., ellipsoid, little compressed, red edible.

4. **TRIOSTEUM**, *Linn.*

Herbs; stems from a perennial stock, simple, erect. *Leaves* opposite, sessile, connate, obovate, entire or sinuate. *Flowers* whorled in short terminal spikes (axillary in the non-Indian species), lurid, 2-bracteolate. *Calyx-tube* ovoid; lobes 5, short or long and foliaceous, persistent. *Corolla* narrow funnel-shaped, gibbous at the base; lobes 5, unequal, obtuse, imbricate. *Stamens* 5, inserted on the corolla-tube; anthers linear, included. *Ovary* 3-5-celled; style filiform, included, stigma capitate 3-5-lobed; ovules solitary in each cell, pendulous. *Berry* 2-3- (rarely 4-5-) celled, 2-3-seeded. *Seeds* oblong, angular; testa bony; albumen fleshy; embryo minute.—Species 3; 2 N. American, 1 Himalayan.

1. **T. hirsutum**, *Wall. in Roxb. Fl. Ind. ed. Carey & Wall.* ii. 180; hairy, spike short terminal, calyx-lobes minute, drupe 3-seeded. *DC. Prodr.* iv. 330. *T. himalayanum*, *Wall. Cat.* 484; *DC. Prodr. l. c.*; *H. f. & T. in Journ. Linn. Soc.* ii. 173.

NIPAL; Gossain Than, *Wallich*. SIKKIM; alt. 10-12,000 ft., *J. D. H.* KUMAON; alt. 10,500 ft., *Strach. & Winterb.*

Patently hairy. *Stems* 18 in. *Leaves* broadly elliptic-obovate obtuse, hairy on

both surfaces. *Spike* hardly 1 in.; peduncle scarce $\frac{1}{2}$ in. *Calyx-teeth* $\frac{1}{20}$ in. *Corolla-tube* $\frac{1}{2}$ in. long, green without purple within. *Drupe* $\frac{1}{2}$ in., ovoid or ellipsoid trigonous, hairy towards the apex.—H. f. & T. have been misled by DC. into supposing that Wallich described *T. hirsutum* from Chittagong as a different species from *T. himalayana*. The origin of the error appears to have been that DC. read Wallich's ms. locality "Gossain Than" as the Sanskrit spelling of Chittagong. DC. further misprints the fruit as 5-seeded, whereas Wallich states (rightly) 3-seeded.

5. ABELIA, Br.

Shrubs, branchlets slender. *Leaves* opposite, sometimes ternate, petioled, entire or toothed; stipules 0. *Flowers* axillary and terminal, in small trichotomous cymes or solitary, 2-4-bracteolate, white or rose. *Calyx-tube* narrow, striate; teeth 5, long, narrow, persistent. *Corolla* tubular or funnel-shaped, nearly regular; lobes 5, short, round. *Stamens* 4, inserted on the corolla-tube, subdidynamous. *Ovary* 3-celled; style filiform, stigma capitate subexserted; ovules in 2 cells several, in the 3rd solitary. *Fruit* coriaceous, narrowly oblong, surmounted by the long calyx-teeth, cells 3, 2 empty, the 3rd 1-seeded. *Seed* subcylindric, testa membranous, albumen fleshy; embryo short, cylindric.—DISTRIB. Species 5, from Kashmir to China and Japan; and 1 Mexican (perhaps a distinct genus).

1. **A. triflora**, Br. in Wall. Pl. As. Rar 14, t. 15; leaves lanceolate entire, cymes 3-8-flowered, bracts lanceolate shining glabrous reticulate. Wall. Cat. 815; DC. Prodr. iv. 339; Wight Ill. ii. 72, t. 121 C.; H. f. & T. in Journ. Linn. Soc. ii. 174; Lindl. & Paxt. Fl. Gard. t. 91; Brandis For. Fl. 257.

Temperate Himalaya from KASHMIR to KUMAON, alt. 5-10,000 ft., frequent.

An erect shrub, 3-6 ft. *Leaves* $2\frac{1}{2}$ by $\frac{3}{4}$ -1 in., acute, broadest near the cuneate or subobtus base, reticulate-nerved beneath, pilose especially on the margin or glabrous; petiole $\frac{1}{2}$ - $\frac{3}{8}$ in. *Cymes* sessile, i.e. bracts at their base 1 in. leaflike, but intermediate between the leaves and bracts. *Calyx-teeth* $\frac{1}{4}$ - $\frac{1}{2}$ in., linear, striate, ciliate. *Corolla-tube* $\frac{1}{4}$ - $\frac{1}{2}$ in., glabrous or pilose without; lobes $\frac{1}{5}$ - $\frac{1}{4}$ in., spreading. *Fruit* $\frac{1}{2}$ - $\frac{1}{4}$ in., linear, narrowed upwards, glabrous or pilose.

VAR. *parvifolia*; leaves much smaller $\frac{3}{4}$ in. sometimes lobed or subpinnatifid, corolla smaller pubescent within and without.—Jhelum Valley and Wuzaristan, Stewart.

6. LONICERA, Linn.

Shrubs, erect or scandent; buds scaly. *Leaves* opposite, petioled, sessile or connate, entire or in *L. heterophylla* sinuately-lobed. *Flowers* (in the Indian species) in peduncled pairs, often connate by their ovaries, bracteate and usually 2-bracteolate; peduncles axillary, solitary, or in subterminal panicles heads or clusters subtended by floral leaves. *Calyx-tube* ovoid; limb short, 5-toothed, deciduous or persistent. *Corolla* tubular, funnel-shaped or campanulate, tube short or long, gibbous or equal at the base, limb subequally 5-lobed or 2-lipped; lobes short or long. *Stamens* 5, inserted on the corolla-tube. *Ovary* 2-3-celled; style slender, stigma capitate; ovules several in each cell in double rows on axile placentas. *Berry* 2-3-celled or sub-1-celled. *Seeds* few in each cell, ovoid or oblong, albumen fleshy; embryo terete.—DISTRIB. Species 80, in temperate and subalpine regions of the Northern Hemisphere.

SUBGEN I. **Caprifolium**, DC. Scandent. Pairs of *flowers*, or some of

them, capitate or paniced. *Bracts* linear or small. *Corolla* 2-lipped. *Berry* crowned with the calyx-teeth.

In the simple lateral peduncles the bracts are undistinguishable from floral leaves; in the paniculate inflorescence of *L. japonica* the bracts are small linear.

1. ***L. Leschenaultii***, Wall. in Roxb. *Fl. Ind. ed. Carey & Wall.* ii. 178; *Cat.* 471; leaves ovate or oblong, beneath and calyx grey tomentose, corolla long closely pubescent. *DC. Prodr.* iv. 334; *Wight Ill.* ii. t. 120 and 121 B.; *W. & A. Prodr.* 389; *H. f. & T. in Journ. Linn. Soc.* ii. 173, not of *Miq.* *L. mollis*, *Wight Ill.* ii. 71; *Wall. Cat.* 6301.

DECCAN MTS., alt. 5-8000 ft.; *Wight, &c.*

Branchlets tomentose. *Leaves* $1\frac{1}{2}$ - $2\frac{1}{2}$ by $1-1\frac{3}{4}$ in., acute or rounded, base cordate or obtuse, above glabrous or puberulous on the impressed nerves; petiole $\frac{1}{8}$ in. *Flowers* in shortened panicles; floral leaves $\frac{1}{2}$ -1 in., petioled, ovate; bracts linear, $\frac{1}{2}$ - $\frac{3}{4}$ in.; bracteoles ovate, minute. *Calyx-teeth* $\frac{1}{12}$ in., linear. *Corolla-tube* $1-1\frac{1}{2}$ in., hairy within. *Style* glabrous or nearly so.—Rarely the pairs of flowers are solitary, when the elongate floral leaves which are close beneath the flower have been described as bracts.

2. ***L. glabrata***, Wall. in Roxb. *Fl. Ind. ed. Carey & Wall.* ii. 175; *Cat.* 474; leaves cordate-oblong acute coriaceous glabrous or nearly so rarely villous beneath, bracts $\frac{1}{2}$ - $\frac{3}{4}$ in. lanceolate, calyx glabrous or nearly so, corolla glabrous. *DC. Prodr.* iv. 334; *H. f. & T. in Journ. Linn. Soc.* ii. 172, excl. syn. *L. ovata*, Ham.

Temperate Himalaya, alt. 4-8000 ft.; from NIPAL to BHOTAN; Wallich, &c.

Branchlets glabrous, or closely pubescent. *Leaves* 3 by $1\frac{1}{2}$ in.; nerves glabrous or pilose or villous beneath; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in. *Flower-spikes* short, often paniced; floral leaves gradually reduced, sometimes minutely pilose above, the uppermost lanceolate, sessile; bracteoles ovate, minute. *Calyx-tube* somewhat glaucous, rarely slightly hairy; teeth $\frac{1}{16}$ in, lanceolate. *Corolla-tube* $\frac{1}{2}$ in., rarely with a few scattered hairs without, hairy within. *Style* glabrous, or with scattered hairs.—Griffith's specimens from East Bhotan have the leaves very villous beneath.

3. ***L. macrantha***, DC. *Prodr.* iv. 333; leaves cordate-oblong acute coriaceous villous beneath, floral usually greatly reduced, calyx-teeth hairy in fruit, corolla-lobes hirsute in bud white fading to yellow. *Benth. Fl. Hongk.* 144; *Miq. in Ann. Mus. Lugd. Bat.* ii. 269; *Maxim. in Bull. Acad. Petersb. Mel. Biol.* x. 58. *L. japonica*, Wall. *Cat.* 473, and in Roxb. *Fl. Ind. ed. Carey & Wall.* ii. 174; *H. f. & T. in Journ. Linn. Soc.* ii. 171, not of Linn. *Caprifolium macranthum* and *japonicum*, Don *Prodr.* 140.

Temperate Himalaya from NIPAL to BHOTAN, alt. 6-10,000 ft., frequent. KHASIA Mts., alt. 4-6000 ft.

Leaves $2\frac{1}{2}$ by 1 in., glabrescent or pilose on the surface above. *Peduncles* in sub-terminal panicles; upper floral leaves usually linear-lanceolate. *Bracts* $\frac{1}{2}$ - $\frac{3}{4}$ in., linear; bracteoles very small. *Calyx-tube* glaucous, glabrous. *Corolla-tube* $\frac{3}{4}$ -1 $\frac{1}{4}$ in.—*L. japonica*, L., which is very closely allied, differs in the less coriaceous leaves, usually petioled ovate or spatulate floral leaves, more or less hairy calyx-tube, and less hirsute unexpanded pink or reddish corolla.

4. ***L. acuminata***, Wall. in Roxb. *Fl. Ind. ed. Carey & Wall.* ii. 472; leaves oblong cordate acute, bracts $\frac{1}{2}$ - $\frac{3}{4}$ in. linear, calyx-tube glabrous, corolla-tube hairy lobes pubescent or glabrous, style densely fulvous hairy. *Wall. Cat.* 472; *DC. Prodr.* iv. 334. *L. Loureirii*, *H. f. & T. in Journ. Linn. Soc.* ii. 172, not of DC.

Temperate Himalaya from NIPAL, Wallich, to SIKKIM, alt. 7-11,000 ft.; *J. D. H.* &c.

Branchlets hairy. *Leaves* 4 by $1\frac{1}{2}$ - $1\frac{3}{4}$ in., with scattered hairs on both surfaces, or glabrescent; petiole $\frac{1}{8}$ in., hairy. *Inflorescence* in terminal many-flowered heads, and also often axillary 2-flowered peduncles; floral leaves gradually reduced, the uppermost linear-lanceolate, bracteiform; bracteoles $\frac{1}{16}$ in., subquadrate, ciliate. *Calyx-teeth* glabrate or ciliate in fruit. *Corolla-tube* $\frac{1}{2}$ in., funnel-shaped.—*L. Loureirii*, from Java? differs in the glabrous corolla-tube and style.

5. ***L. ovata***, *Ham. in Wall. Cat.* 6300; leaves ovate or ovate-oblong obtuse membranous nearly glabrous, bracts $\frac{1}{16}$ - $\frac{1}{12}$ in. ovate-lanceolate, calyx-tube glabrous, corolla-tube $\frac{1}{4}$ in. very slender glabrous, style hairy. *Lonicera* sp., *Griff. Journ.* 90.

ASSAM; *Hamilton, Masters.*—DISTRIB. Birma.

A slenderer plant, with much smaller flowers than in *L. glabrata*. *Branchlets* pubescent. *Leaves* $1\frac{1}{2}$ by $\frac{3}{4}$ -1 in., base rounded or subcordate, minutely pilose on both surfaces or glabrescent; petiole $\frac{1}{2}$ - $\frac{1}{4}$ in. *Upper peduncles* in terminal panicle; bracteoles minute, ovate. *Flowers* white, fading to yellow. *Calyx-teeth* glabrous or ciliate.

SUBGEN. II. ***Xylosteum***, DC. Erect. *Peduncles* not paniced. *Calyx-limb* deciduous (in *L. asperifolia*; *L. rupicola* and others, subsistent).

* *Bracts* large, ovate; *bracteoles* 0 or minute.

6. ***L. hispida***, *Pall.; DC. Prodr.* iii. 338; glabrous or hairy, leaves elliptic-oblong, peduncles $\frac{1}{2}$ -1 in., bracts obovate-elliptic boat-shaped hardly connate. *Ledeb. Fl. Ross.* ii. 389, *Ic. t.* 212; *H. f. & T. in Journ. Linn. Soc.* ii. 165. *L. bracteata*, *Royle Ill.* 237, t. 53.

Temperate and alpine HIMALAYA, alt. 9-13,000 ft.; from KASHMIR to KUMAON, frequent. SIKKIM, alt. 13-15,000 ft., *J. D. H.*—DISTRIB. Central Asia, Siberia.

Branchlets hispid-pilose or glabrescent. *Leaves* $1\frac{1}{2}$ by $\frac{3}{4}$ in., subobtusely, base rounded, hairy on both surfaces or glabrescent; petiole $\frac{3}{8}$ in. *Bracts* $\frac{1}{2}$ - $\frac{2}{3}$ in., hispid ciliate or glabrescent. *Corolla-tube* $\frac{1}{2}$ by $\frac{1}{2}$ in., often hairy; lobes $\frac{1}{4}$ - $\frac{1}{2}$ in., rounded, pink. *Style* glabrous or with scattered hairs. *Drupe*s more than $\frac{1}{4}$ by $\frac{1}{2}$ in., ellipsoid, confluent or entirely separate. Cf. *Maxim. in Bull. Acad. Petersb. Mel. Biol.* x. 73.—Exceedingly variable as to hairiness; the branchlets, leaves and bracts are sometimes absolutely glabrous, and the leaves subscabrid beneath.

7. ***L. glauca***, *H. f. & T. in Journ. Linn. Soc.* ii. 166, not of *Meerb.*; leaves small oblong obtuse glabrous hispidly ciliate, peduncle hardly any, bracts $\frac{1}{4}$ - $\frac{1}{2}$ in. ovate flat, calyx-limb deciduous.

Temperate N.W. HIMALAYA and WESTERN TIBET, 12-16,000 ft.; Nubra, Zaskar and Piti, *Thomson*; Tilail in Kashmir, *C. B. C.*; Gurwhal and Kumaon, *Strach. & Winterb.*

A glaucous, densely-branched wiry undershrub, glabrous except as to the margins of the leaves. *Leaves* $\frac{3}{4}$ by $\frac{1}{4}$ in., obtuse, base hardly rounded; petiole $\frac{1}{12}$ in. *Bracts* glaucous, hispidly ciliate on the margins, usually free, or when the fruits coalesce sometimes much connate. *Calyx* glabrous, or nearly so. *Corolla-tube* $\frac{1}{4}$ - $\frac{1}{2}$ by $\frac{1}{2}$ in., glabrous; lobes $\frac{1}{2}$ in., elliptic, yellow. *Style* glabrous. *Berry* $\frac{1}{4}$ by $\frac{1}{2}$ in., ellipsoid, pairs sometimes confluent into a spherical fruit. (Both confluent and non-confluent berries occur on one branch.)

8. ***L. asperifolia***, *H. f. & T. in Journ. Linn. Soc.* ii. 166; leaves ovate-oblong subcordate, margin crisped and hispid, peduncle 0- $\frac{1}{2}$ in., bracts ovate

flat, berry crowned by the funnel-shaped calyx-limb. *Xylosteum asperrium*, *Dcne. in Jacq. Voy. Bot.* 77, t. 85.

WESTERN TIBET, *Falconer*; ZANSKAR, alt. 13,000 ft., *Thomson*. KASHMIR to the KARAKORUM, alt. 12,000 ft., *C. B. C. Rimkim* (Tibet), alt. 13,500 ft., *Strach. & Winterb.*

A shrub, 2-4 ft.; branchlets sparsely hispid. *Leaves* $1\frac{1}{4}$ by $\frac{3}{4}$ in., subacute or obtuse, shining and glabrous above; petiole $\frac{1}{5}$ - $\frac{1}{4}$ in. *Bracts* $\frac{1}{2}$ in., and ovaries free. *Calyx-tube* glabrous; limb ciliate or glabrous. *Corolla-tube* $\frac{1}{2}$ by $\frac{1}{2}$ in., glabrous or slightly hairy; lobes $\frac{1}{4}$ in. or more. *Style* glabrous. *Drupe* $\frac{1}{2}$ by $\frac{1}{4}$ in., or more, oblong.

** *Bracts* linear or narrow-oblong (broad in *L. parvifolia*); *bracteoles* often connate or prominent.

† *Corolla* not distinctly two-lipped, often gibbous at the base, and limb unequal.

9. ***L. ligustrina***, *Wall. in Roxb. Fl. Ind. ed. Carey & Wall.* ii. 179; *Cat.* 479; branchlets pubescent, leaves lanceolate obtusely acuminate margin and midrib beneath ciliate or glabrescent, peduncle hardly any, bracteoles connate. *DC. Prodr.* iv. 334; *W. & A. Prodr.* 389; *Wight Ic.* t. 1025; *H. f. & T. in Journ. Linn. Soc.* ii. 166; *Bedd. Fl. Sylv. Anal. Gen.* t. 15, fig. 5. *L. Wightiana*, *Wall. Cat.* under 1520, in *Herb. Linn. Soc.*

? NIPAL; *Wallich*. KHASIA Mts., alt. 4000-6000 ft., *H. f. & T. Mts. of the South DECCAN*, alt. 6-7000 ft., frequent.

A shrub, 5-15 ft. *Leaves* $1\frac{3}{4}$ by $\frac{1}{2}$ in., base narrowed or scarcely rounded, firm, shining; petiole $\frac{1}{10}$ in. *Bracts* $\frac{1}{10}$ in., glabrous; bracteoles at first small, in fruit sometimes $\frac{1}{2}$ by $\frac{1}{4}$ in., forming a boat-shaped involucre half-enclosing the fruit. *Calyx-limb* tubular; margin irregular. *Corolla-tube* $\frac{1}{4}$ by $\frac{1}{12}$ - $\frac{1}{16}$ in., narrowly funnel-shaped, base very gibbous, slightly pubescent; lobes $\frac{1}{8}$ in., obtuse, yellowish-white (*Wallich*). *Style* patent hairy. *Drupe*s usually confluent into a single small spherical fruit, ovaries free or half-coalescent in bud.—*Wallich's* Nipal habitat must be considered doubtful till confirmed, owing to the mixture of specimens on one sheet.

10. ***L. tomentella***, *H. f. & T. in Journ. Linn. Soc.* ii. 167; branchlets pubescent, leaves oblong villous or pubescent beneath, peduncles $0\frac{1}{4}$ in., bracteoles short connate.

Temperate HIMALAYA; SIKKIM, Lachen and Lachoong, alt. 8-12,000 ft., *J. D. H.*

A shrub, 10-12 ft. *Leaves* $1\frac{1}{4}$ by $\frac{1}{2}$ - $\frac{2}{3}$ in., obtuse at both ends; petiole $\frac{1}{2}$ in., tomentose. *Bracts* $\frac{1}{4}$ - $\frac{1}{2}$ in., narrowly oblong, foliaceous; bracteoles $\frac{1}{20}$ - $\frac{1}{16}$ in. long in fruit. *Calyx* glabrous. *Corolla-tube* $\frac{1}{4}$ by $\frac{1}{2}$ in., subequal, pilose without and within; lobes hardly $\frac{1}{8}$ in., little spreading, white. *Style* glabrous. *Berry* $\frac{1}{4}$ by $\frac{1}{2}$ in., black, often coalescent in pairs into one spherical fruit. *Seeds* numerous, small.

11. ***L. purpurascens***, *H. f. & T. in Journ. Linn. Soc.* ii. 169; leaves oblong or obovate-oblong hairy at least beneath, peduncles $\frac{1}{2}$ -1 in., bracteoles small quadrate subobsolete in the fruit, calyx-limb patelliform truncate glabrous. *L. sericea*, *Royle Ill.* 236; *H. f. & T. in Journ. Linn. Soc.* ii. 167. *Xylosteum purpurascens*, *Dcne. in Jacq. Voy. Bot.* 79, t. 87.

Subalpine Himalaya; KASHMIR, alt. 9-12,000 ft.; Pir Pinjal, *Jacquemont*, *C. B. C.* Goolmurg, *Stewart*. KUNAWUR; alt. 12-13,000 ft., *Munro*. SIKKIM, Yeumtong, alt. 11,000 ft., *J. D. H.*

A shrub, 8 ft.; branchlets pilose, ultimately glabrous. *Leaves* 1 by $\frac{1}{2}$ in., obtuse, base narrowed or obtuse, above softly pilose or glabrescent, beneath villous or hairy on the nerves only; petiole $\frac{1}{2}$ in. *Bracts* $\frac{1}{6}$ - $\frac{1}{4}$ in., linear or lanceolate-linear; bracteoles distinct or connate. *Corolla-tube* $\frac{1}{4}$ by $\frac{1}{16}$ in., base gibbous, hairy within and

without; lobes short, purple. *Style* sparsely pilose. *Fruit* usually of two confluent drupes, $\frac{1}{4}$ in. diam., globose, black. *Seeds* many or few.—*Royle's* specimens have the leaves and flowers more hairy: the number of seeds varies on the same branch.

12. ***L. angustifolia***, Wall. Cat. 480; leaves lanceolate white beneath, peduncles $\frac{1}{2}$ –1 in., bracts $\frac{1}{8}$ – $\frac{1}{2}$ in. linear or linear-lanceolate, bracteoles connate often half as long as the fruit, calyx-limb distinctly 5-toothed. DC. Prodr. iv. 337; Journ. Hort. Soc. Lond. iii. 238, with a fig.; H. f. & T. in Journ. Linn. Soc. ii. 167; Brandis For. Fl. 255.

Temperate Himalaya; from KASHMIR and KUMAON, alt. 6–12,000 ft., frequent, to SIKKIM; Lachen, alt. 10–12,000 ft., J. D. H.

A shrub, 6–12 ft.; branchlets glabrescent. *Leaves* $1\frac{1}{4}$ by $\frac{1}{4}$ in. (nearly $\frac{1}{2}$ in. broad in Sikkim sp.), narrowed at both ends, beneath pubescent or glabrous; petiole $\frac{1}{8}$ in. *Bracts* linear or foliaceous. *Corolla-tube* $\frac{1}{4}$ by $\frac{1}{10}$ in., glabrous or pubescent, subequal; lobes hardly $\frac{1}{8}$ in., white or rose. *Style* short, glabrous. *Fruit* usually of two confluent drupes, $\frac{1}{4}$ in. diam., globose; calyx-limb often subpersistent. *Seeds* few.

13. ***L. rupicola***, H. f. & T. in Journ. Linn. Soc. ii. 168; leaves oblong tomentose beneath, peduncles hardly any, bracteoles small quadrate distinct obsolete in the fruit, calyx-teeth $\frac{1}{8}$ in. narrow-lanceolate pubescent.

EASTERN TIBET (North of Sikkim), alt. 16–17,000 ft., J. D. H. Rimkim, WESTERN TIBET (North of Kumaon), alt. 13,500 ft., Strach. & Winterb.

A rigid shrub, 2–4 ft.; branchlets pubescent, becoming leafless and subspinescent. *Leaves* $\frac{1}{2}$ by $\frac{1}{8}$ in., subobtuse at both ends, nearly glabrous above; petiole $\frac{1}{16}$ in. *Bracts* $\frac{1}{4}$ in., linear-obovate, often subfoliaceous, tomentose beneath. *Corolla-tube* $\frac{1}{4}$ by $\frac{1}{8}$ in., pubescent; lobes $\frac{1}{2}$ in. broad-oblong, spreading. *Style* short, glabrous. *Berries* $\frac{1}{8}$ – $\frac{1}{4}$ in., ellipsoid, not confluent in pairs, crowned by the long calyx-teeth.

14. ***L. spinosa***, Jacquem. ms.; H. f. & T. in Journ. Linn. Soc. ii. 168; glabrous, leaves small narrow-oblong, peduncles hardly any, bracteoles quadrate connate inconspicuous in fruit, calyx-teeth $\frac{1}{12}$ in. narrow-oblong obtuse. *Xylosteum spinosum*, Dene. in Jacq. Voy. Bot. 78, t. 86.

ALPINE HIMALAYA, alt. 11–16,000 ft.; from KASHMIR to Tibet north of SIKKIM. —DISTRIB. Kashgar.

A rigid shrub, 2–4 ft.; branchlets glaucous, often leafless and spinescent. *Leaves* $\frac{1}{2}$ by $\frac{1}{8}$ – $\frac{1}{6}$ in., obtuse, margins recurved, base narrowed; petiole hardly any. *Flowers* subfasciculate; bracts $\frac{1}{8}$ – $\frac{1}{2}$ in., linear-oblong. *Corolla-tube* $\frac{1}{4}$ – $\frac{1}{2}$ by $\frac{1}{12}$ – $\frac{1}{8}$ in., glabrous, subequal; lobes $\frac{1}{8}$ in., elliptic. *Style* glabrous, exserted. *Berries* $\frac{1}{8}$ by $\frac{1}{6}$ in., ellipsoid, not confluent in pairs, crowned by the subpersistent calyx-limb.

15. ***L. parvifolia***, Edgw. in Wall. Cat. 9058, and in Trans. Linn. Soc. xx. 60; leaves small oblong or obovate glabrous, peduncles $\frac{1}{2}$ – $\frac{1}{3}$ in., bracts $\frac{1}{8}$ – $\frac{1}{3}$ in. oblong or ovate foliaceous, corolla-tube not widened upwards, style included. H. f. & T. in Journ. Linn. Soc. ii. 168. *L. depressa*, Royle Ill. 226.

Alpine Himalaya; KUMAON; Blinkworth; Pindari, alt. 12,000 ft., Strachey & Winterbottom. SIKKIM; alt. 12–14,000 ft., Lachen and Lama Kangra, J. D. H.

A small, rigid, nearly glabrous, shrub; branches often prostrate. *Leaves* $\frac{1}{2}$ by $\frac{1}{8}$ – $\frac{1}{6}$ in., obtuse, base cuneate rarely obtuse; petiole $\frac{1}{16}$ in. *Bracteoles* connate, often nearly as long as the ovary, inconspicuous in fruit. *Calyx* glabrous; teeth minute, triangular. *Corolla-tube* $\frac{1}{4}$ by $\frac{1}{8}$ in., exactly cylindric, equal, glabrous without, hairy within; teeth $\frac{1}{10}$ in., round, pink-purple. *Style* short, glabrous. *Berries* $\frac{1}{4}$ by $\frac{1}{8}$ in., ellipsoid, not confluent in pairs; seeds few.

VAR. *Myrtillus*, H. f. & T. in Journ. Linn. Soc. ii. 168 (sp.); bracts linear-oblong or sublinear. Brandis For. Fl. 255.—Kashmir to Kumaon, alt. 8–12,000 ft. Sikkim; alt. 11–14,000 ft., Lachen, J. D. H.

16. **L. obovata**, *Royle mss.*; *H. f. & T. in Journ. Linn. Soc.* ii. 169; glabrous, leaves small obovate-oblong, peduncle $\frac{1}{2}$ – $\frac{1}{4}$ in., bracts $\frac{1}{2}$ – $\frac{1}{4}$ in. linear ovate or oblong rarely foliaceous, corolla tube widened upwards, style exserted glabrous.

Temperate Himalaya, from KASHMIR to KUMAON, alt. 8–13,000 ft., frequent. SIKKIM, Lachen, alt. 12–14,000 ft., *J. D. H.*

A shrub, 6 ft. *Leaves* $\frac{1}{2}$ by $\frac{1}{4}$ – $\frac{1}{3}$ in., subsessile, obtuse, base narrowed. *Bracteoles* small or 0, distinct or connate, obsolete or cupshaped in fruit. *Calyx-limb* very short, undulate, hardly toothed. *Corolla-tube* $\frac{1}{4}$ by $\frac{1}{2}$ in., tubular-funnel-shaped, base narrowed prominently gibbous or campanulate and subequal, glabrous without, hairy within; teeth $\frac{1}{2}$ in., round, suberect, yellowish-white. *Berries* spherical, $\frac{1}{5}$ in. diam., with 2. calyx-scars, calyx-tubes more or less coalescent even in the bud.

†† *Corolla* prominently 2-lipped.

a. *Bracteoles* connate into a cup.

17. **L. quinquelocularis**, *Hardwick in As. Res.* vi. 351; leaves ovate or broad-lanceolate hairy beneath, peduncles hardly any, bracts $\frac{1}{2}$ – $\frac{1}{3}$ in. linear, calyx-limb short funnel-shaped teeth triangular ciliate. *Wall. in Roxb. Fl. Ind. ed. Carey & Wall.* ii. 174; *H. f. & T. in Journ. Linn. Soc.* ii. 169; *Brandis For. Fl.* 255. *L. diversifolia*, *Wall. l. c.* 178, *Cat.* 477; *Hook. Ic. Pl.* t. 807; *Lindl. in Bot. Reg.* 30, t. 33. *L. Royleana*, *Wall. Cat.* 478.

TEMPERATE HIMALAYA from Kashmir to Kumaon; alt. 4–12,000 ft., common. BHOTAN; *Griffith.*

A shrub 5–10 ft.; branchlets pubescent. *Leaves* $1\frac{1}{2}$ –2 by $\frac{3}{4}$ – $1\frac{1}{2}$ in., acute or obtuse at either end, nearly glabrous above, pubescent pilose or villous beneath; petiole $\frac{1}{2}$ in. *Flowers* clustered, axillary; bracteoles pubescent, usually scarcely $\frac{1}{2}$ the length of the fruit. *Corolla* hairy without and within, yellow; tube $\frac{1}{2}$ by $\frac{1}{2}$ in. *Style* hairy, exsert. *Berries* $\frac{1}{4}$ by $\frac{1}{2}$ in., ovoid, not connate; crowned, till ripe often, by the calyx-limb.

18. **L. hypoleuca**, *DCne. in Jacq. Voy. Bot.* 81, t. 89; leaves ovate obtuse pubescent white beneath, peduncle $\frac{1}{2}$ – $\frac{1}{4}$ in., bracts $\frac{1}{2}$ in. lanceolate foliaceous, bracteoles hairy as long as the glandular-pubescent calyx-tube. *H. f. & T. in Journ. Linn. Soc.* ii. 170; *Brandis For. Fl.* 256. *L. elliptica*, *Royle II.* 236.

NORTH-WEST HIMALAYA, alt. 8–10,000 ft., *Royle, Edgeworth.* KUNAWAR, *Thomson, Lance.* Gurwhal, *Strach. & Winterb.*

A low shrub; branchlets pilose. *Leaves* $\frac{3}{4}$ by $\frac{1}{2}$ in., subsessile, obtuse at both ends, upper narrower, passing into the bracts. *Calyx-teeth* minute, lanceolate. *Corolla-tube* $\frac{1}{4}$ by $\frac{1}{2}$ in., base gibbous; lobes $\frac{1}{4}$ in. and more, linear-oblong, orange-red; style hairy below. *Berries* $\frac{1}{2}$ by $\frac{1}{2}$ in., ellipsoid, hairy, distinct or nearly so, nearly included by the bracteoles.—*H. f. & T.* say the ovaries are usually connate, but they appear rarely and imperfectly so.

19. **L. decipiens**, *H. f. & T. in Journ. Linn. Soc.* ii. 170; leaves oblong-lanceolate acuminate minutely hairy, peduncles $\frac{1}{2}$ – $\frac{1}{4}$ in. pubescent, bracts $\frac{1}{2}$ in. linear, bracteoles ovate nearly glabrous as long as the glabrate calyx-tube. *L. lanceolata*, *Wall. Cat.* 475. *Symphoricarpos* sp., *Griff. Itin. Notes*, 191.

Central and Eastern Himalaya; Nipal; *Wallich.* SIKKIM, Lachen, alt. 10–12,000 ft., *J. D. H., Elwes* BHOTAN; Timboo River, alt. 6500 ft., *Griffith.*

A small shrub; branchlets pubescent. *Leaves* 2 by $\frac{3}{4}$ in., subsessile, base obtuse, more or less pubescent on the midrib and nerves above, beneath glandular-pubescent with the midrib hairy; petiole $\frac{1}{12}$ in. *Calyx-teeth* minute, ovate acute ciliate.

Corolla-tube $\frac{1}{2}$ by $\frac{1}{2}$ in., base gibbous, glabrous without, hairy within; lobes $\frac{1}{2}$ in., red-purple. *Style* shortly exsert, hairy to the summit. *Drupe*s distinct or completely confluent.

β . *Bracteoles* small or 0, except 21. *L. orientalis*.

20. ***L. microphylla***, Willd.; Roem. & Schult. Syst. v. 258; leaves small oblong or obovate pubescent beneath, peduncles $\frac{1}{2}$ –1 in., bracts $\frac{1}{2}$ – $\frac{1}{2}$ in. linear, bracteoles 0, calyx-limb truncate. DC. Prodr. iv. 336; H. f. & T. in Journ. Linn. Soc. ii. 171. *L. Sieversiana*, Bunge Verz. Altai-Geb. 18.

WESTERN TIBET; Kashmir to the Karakorum, alt. 11–14,000 ft., frequent.—DISTRIB. Northward to the Altai Mts.

A small, erect, shrub; branchlets glabrous or nearly so. *Leaves* subsessile, $\frac{1}{2}$ – $\frac{3}{4}$ by $\frac{1}{2}$ – $\frac{1}{2}$ in., obtuse, base narrowed. *Peduncle* minutely pubescent, slender. *Corolla-tube* $\frac{1}{2}$ by $\frac{1}{2}$ in., base gibbous, glabrous without sparsely pilose within; teeth $\frac{1}{2}$ in., suberect. *Style* subexsert, very hairy below. *Berries* $\frac{1}{2}$ in., ellipsoid; usually connate half-way.

21. ***L. orientalis***, Lamk. Dict. i. 731; leaves ovate-lanceolate acute finely nerved above more or less pubescent beneath, peduncles $\frac{1}{2}$ –1 in. pubescent, calyx-teeth linear-lanceolate, corolla glabrous without or nearly so, tube short. DC. Prodr. iv. 337; Jaub. & Spach. Ill. t. 71; H. f. & T. in Journ. Linn. Soc. ii. 170; Boiss. Fl. Or. i. 8; Brandis For. Fl. 256. *L. Govaniana*, Wall. Cat. 481; DC. l. c. 337.

TEMPERATE HIMALAYA, alt. 7–11,000 ft.; from Kashmir common, rarer eastward, to Kumaon.—DISTRIB. Western Asia.

A large shrub or tree, 25 ft., branches horizontal, flattened. *Leaves* $2\frac{1}{2}$ by $1\frac{1}{2}$ in., acute, mucronate hardly acuminate, base narrowed or scarcely obtuse, midrib above pubescent, nerves fine and elevated when dried, beneath dotted and more or less pubescent; petiole $\frac{1}{2}$ – $\frac{1}{2}$ in. *Peduncle* stout, or slightly flattened, thickened upwards. *Bracts* $\frac{1}{2}$ in., linear-lanceolate; bracteoles 0 or small, but in the Kashmir arboreous form larger, well-marked even in fruit. *Corolla-tube* $\frac{1}{2}$ in., base gibbous; limb $\frac{1}{2}$ in., pink. *Style* hairy, usually to the summit. *Berries* generally confluent.

VAR. *discolor*, Lindl. in Bot. Reg. xxxiii. 1847, t. 44 (sp.); leaves glaucous beneath. H. f. & T. in Journ. Linn. Soc. ii. 171.—Kashmir, alt. 9–11,000 ft., Thomson.—Lindley's figure shows the corolla glabrous without, the calyx-teeth not shorter than occurs in *L. orientalis*. This agrees perfectly with Thomson's examples. But with these occur (as *L. discolor*) plants with pubescent leaves and corollas, which we refer to *L. alpigena*.

22. ***L. heterophylla***, Dene. in Jacq. Voy. Bot. 80, t. 89; glabrous or nearly so, leaves narrow oblong reticulate-nerved beneath, peduncle $\frac{1}{2}$ – $1\frac{1}{2}$ in., calyx-teeth short-triangular, corolla sparsely pilose, tube short. H. f. & T. in Journ. Linn. Soc. ii. 170.

WESTERN ALPINE HIMALAYA and W. TIBET; KASHMIR; Choupienne, Jacquemont; Burjila and Karakorum, alt. 12,000 ft., C. B. Clarke.

An erect shrub, 3 ft., branches glabrous, rigid, ascending. *Leaves* $2\frac{1}{2}$ by $\frac{1}{2}$ –1 in., upper narrow-oblong, narrowed at both ends, margin irregularly sinuate or sublobate, above glabrous, even on the midrib; petiole $\frac{1}{2}$ in. *Peduncles* rigid, compressed, thickened upwards, scarcely pubescent. *Bracts* $\frac{1}{2}$ in., linear. *Corolla* nearly of *L. orientalis*. *Style* hairy to the summit. *Drupe*s $\frac{1}{2}$ by $\frac{1}{2}$ in., never connate.—Appears distinct from every form of *L. orientalis*; but when Hk. f. & T. suggested it might be a variety thereof, they had seen no specimens.

23. ***L. alpigena***, Linn.; DC. Prodr. iv. 336; leaves elliptic or oblong acute or acuminate pilose beneath, peduncles 1–2 in., calyx-tube pubescent limb

short, corolla glandular-hairy, tube very short. *Reich. Ic. Fl. Germ.* t. 1173; *H. f. & T. in Journ. Linn. Soc.* ii. 171; *Boiss. Fl. Orient.* iii. 8; *Brandis For. Fl.* 256. *L. Webbiana*, *Wall. Cat.* 476; *DC. l. c.* 336. *L. oxyphylla*, *Edgw. in Trans. Linn. Soc.* xx. 60.

KASHMIR to KUMAON, alt. 9–12,000 ft.; *Blinkworth*, &c.—DISTRIB. European Alps.

A large shrub; branchlets pubescent. *Leaves* 4 by 1–2 in., base rounded or cuneate, hairy or glabrate above, with pubescent nerves; nervation not prominent on either surface; petiole $\frac{1}{5}$ in. *Peduncle* stout, flattened, slightly thickened upwards, nearly glabrous. *Bracts* $\frac{1}{3}$ in., lanceolate or linear; bracteoles very small. *Corolla* nearly as in *L. orientalis*. *Drupe*s free in the Indian specimens.—Not a Bhotan plant (as stated by Hook. f. and Thomson).

DOUBTFUL SPECIES.

LONICERA FINLAYSONIANA, *Wall. Cat.* 6302, was perhaps collected in Cochin-China: the specimen is poor, and may be *L. confusa*, *DC.*

L. CHINENSIS, *CONFUSA* and *LONGIFOLIA*, mentioned by *Royle* (*Ill.* 236) as common to the Himalaya, China, and Japan, are probably referable to *L. macrantha*, *DC.*

7. *LEYCESTERIA*, *Wall.*

Under-shrubs, with fistular stems and branches. *Leaves* opposite, distichous, caudate-acuminate, membranous, glaucous beneath, exstipulate or with very small stipules, entire or toothed. *Flowers* whorled, in terminal or axillary erect or drooping spikes subtended by small or large foliaceous bracts, 2-bracteolate. *Calyx-tube* ovoid, limb unequally 5-lobed, persistent. *Corolla* funnel-shaped, gibbously swollen at the base and limb subequally 5-lobed. *Stamens* 5, inserted on the throat of the corolla. *Ovary* 5–8-celled; style slender, stigma capitate; ovules many, 2-seriate in each cell. *Berry* oblong or subglobose, 5–8-celled, many-seeded. *Seeds* minute, testa crustaceous shining.

1. *L. formosa*, *Wall. in Roxb. Fl. Ind. ed. Wall. & Carey*, ii. 181; *Pl. As. Rar.* ii. 20, t. 120; *Cat.* 470; branches stout, leaves ovate-toothed, bracts large leafy, ovary 5-celled. *Bot. Mag.* t. 3099; *Wight Ill.* ii. t. 121 D. *Brandis For. Fl.* 256.

TEMPERATE HIMALAYA, alt. 5–10,000 ft., from Kumaon to Bhotan. KHASIA Mts., alt. 5–6000 ft., *H. f. & T.*

Branching from the base, branches 6 ft. *Leaves* 2–5 by 1–3 in., broadly ovate or ovate-lanceolate long acuminate, entire or irregularly toothed, white and more or less puberulous beneath, base rounded subacute or cordate; petiole $\frac{1}{8}$ –1 in. *Spikes* 2 in., pubescent; bracts cordate laxly leafy, often purplish; bracteoles variable. *Flowers* glandular, puberulous. *Corolla* $\frac{1}{2}$ –1 in., purplish-pink. *Style* glabrous. *Berry* subglobose, red.—*Flowers* rarely 3–4-merous.

2. *L. glaucophylla*, *Hook. f.*; branches slender, leaves lanceolate sinuate-toothed, bracts much shorter than the flowers, berry 7–8-celled. *Lonicera glaucophylla*, *H. f. & T. in Journ. Linn. Soc.* ii. 165; *Gard. Chron.* 1858, 700, with fig. *L. gracilis*, *Kurz in Journ. As. Soc.* 1870, pt. ii. 77. *Pentaptyxis* sp., *Hook. f. in Gen. Pl.* ii. 6.

SIKKIM HIMALAYA, alt. 5–6000 ft.; *Yoksun*, *J. D. H.*; *Simonbong*, *Kurz.*

A much more slender plant than *L. formosa*, with narrower shorter-petioled leaves, and small axillary few-flowered spikes of puberulous flowers, the bracts of which.

are shorter than the ovary and ovate-subulate. The stipules are entirely absent or more or less developed into a small semicircular coriaceous lamina. In the "Genera Plantarum," this species, of which the flower and fruit were then unknown, was supposed to be a *Pentaptyxis* on account of the presence of stipules.

8. **PENTAPTYXIS**, Hook. f.

A woolly erect shrub with solid stems and branches. *Leaves* opposite, distichous, coriaceous, ovate-lanceolate, caudate-acuminate, sinuate-toothed; stipules very large leafy, orbicular margins recurved. *Flowers* in axillary peduncled or sessile rarely terminal woollen spikes, with short bracts and bracteoles. *Calyx* funnel-shaped, subequally 5-cleft, persistent. *Corolla* funnel-shaped, gibbously swollen at the base; limb subequally 5-lobed. *Stamens* 5, inserted on the throat of the corolla. *Ovary* 5-celled; style slender, stigma capitate; ovules many, 2-seriate in each cell. *Berry* ellipsoid, 5-celled, many-seeded. *Seeds* minute; testa crustaceous, shining.

Closely allied to *Leycesteria*, but differing in the solid branches, calyx, and habit.

1. **P. stipulata**, Hook. f. *Lonicera stipulata*, Hk. f. & T. in *Journ. Linn. Soc.* ii. 165; *Gard. Chron.* 1858, 700, with fig.

SIKKIM HIMALAYA; at Darjeeling, alt. 6-10,000 ft., J. D. H.

A shrub, 6-8 ft., densely clothed except the leaves above with soft, white wool. *Leaves* 4-8 by 2-3 in., base rounded, subentire or sinuate-toothed, puberulous above or glabrate with deeply impressed nerves. *Stipule* $\frac{1}{4}$ - $\frac{2}{3}$ in. diam., erect or reflexed. *Heads* dense, rarely subsopicate; peduncle very stout; bracts about equalling the calyx, ovate. *Flowers* $\frac{2}{3}$ in. long, woolly, white. *Berry* hairy, $\frac{3}{4}$ in., pulp thin. *Seeds* ellipsoid.—Flowers sometimes 4-merous.

ORDER LXXV. **RUBIACEÆ**. (J. D. Hooker.)

Trees, shrubs or herbs, rarely annual, erect or twining, unarmed or spiny, rarely truly prickly. *Leaves* simple, opposite or whorled, quite entire, stipulate (except in *Galiceæ*). *Inflorescence* various. *Calyx-tube* adnate to the ovary; limb various. *Corolla* regular, usually 4-5-lobed, lobes valvate, imbricate or contorted (to the left as seen from outside). *Stamens* as many as the lobes, inserted on the mouth or tube of the corolla, filaments short or long; anthers 2-celled, usually dorsifixed and dehiscing laterally or in front. *Disk* epigynous, usually annular or cushion-shaped. *Ovary* wholly inferior, 2-10-celled; style simple or cleft, stigmas various; ovules 1 or more in each cell. *Fruit* berried, capsular, drupaceous or of dehiscent or indehiscent cocci, 2-10-celled. *Seeds* various, albumen fleshy or horny. *Embryo* straight or curved; cotyledons flat or semiterete, radicle superior or inferior.—DISTRIB. Genera about 340 and species 4000, chiefly tropical and subtropical.

SERIES A. Ovules numerous in each cell (rarely solitary in *Cephalanthus* and a few *Hedyotidæ*).

TRIBE I. **Naucleææ**. *Flowers* collected into dense globose heads. *Corolla* funnel-shaped; stigma simple.

* *Ovaries confluent; fruits forming a globose fleshy mass; corolla-lobes imbricate in bud.*

Ovary 2-celled, ovules numerous	1. SARCOCEPHALUS.
Ovary 4-celled above, 2-celled below, ovules many	2. ANTHOCEPHALUS.
Ovary 2-celled, ovules solitary in each cell	3. CEPHALANTHUS.

** *Ovaries free or nearly so; fruits free, capsular.*

- | | |
|---|----------------|
| Flowers bracteolate, calyx-limb 5-lobed, corolla-lobes valvate | 4. ADINA. |
| Flowers bracteolate, calyx-limb entire, corolla-lobes valvate | 5. STEPHEGYNE. |
| Flowers ebracteolate, corolla-lobes imbricate | 6. NAUCLEA. |
| Flowers ebracteolate, corolla-lobes valvate, climbers with hooked peduncles | 7. UNCARIA. |

TRIBE II. **Cinchonæ.** *Corolla-lobes valvate, imbricate, or twisted in bud. Fruit capsular, 2-celled. Seeds winged.*

- | | |
|--|--------------------|
| Corolla-lobes valvate, style 2-fid, bracts leafy | 8. HYMENOPOGON. |
| Corolla-lobes twisted, style entire, flowers paniced, bracts simple | 9. COPTOSAPelta. |
| Corolla-lobes valvate, style entire, flowers in paniced spikes, bracts leafy | 10. HYMENODICTYON. |
| Corolla-lobes imbricate, style 2-fid | 11. LUCULIA. |

TRIBE III. **Bondeletieæ.** *Corolla-lobes (in the Asiatic genera) twisted in bud. Fruit capsular, 2-celled. Seeds angled, not winged. Shrubs or trees.*

- | | |
|--|-----------------|
| Flowers simply paniced | 12. WENDLANDIA. |
| Flowers in subscorpoid cymes | 13. GREENIA. |

TRIBE IV. **Hedyotideæ.** *Corolla-lobes valvate in bud. Fruit a loculicidal or septicidal 2- rarely 4-celled capsule, or of 2 or 4 dehiscent or indehiscent cocci, rarely altogether indehiscent. Seeds small or minute, rarely winged. —Herbs. rarely shrubs, never trees.*

A. Leaves quite entire, stamens 4 or 5.

* *Fruit 2-celled, usually indehiscent, stipules entire.*

- | | |
|---|-----------------|
| Corolla funnel-shaped, lobes 4-5-toothed | 14. DENTELLA. |
| Corolla rotate, anthers large, stigma capitellate | 15. ARGOSTEMMA. |
| Corolla funnel-shaped, stigma minute | 16. CLARKELLA. |
| Corolla rotate, anthers connate, stigmas 2 | 17. NEUROCALYX. |

** *Fruit 4-celled, indehiscent, cells with 1 erect ovule.*

- | | |
|--|------------------|
| Fruit with 4 bony indehiscent pyrenes; stigmas 4 | 18. ALLÆOPHANIA. |
| Fruit membranous, indehiscent, stigmas 2 | 19. FERGUSONIA. |

*** *Fruit oblong subglobose or orbicular, 2- rarely 4-celled, usually dehiscent, cells many- rarely 1-seeded.*

- | | |
|---|------------------|
| Capsule loculi- or septicidal, rarely indehiscent, with contiguous calyx-teeth, seeds usually angular | 20. HEDYOTIS. |
| Capsule loculicidal above the remote calyx-teeth, rarely indehiscent, seeds minute, angular | 21. OLDENLANDIA. |
| Capsule loculicidal above the remote calyx-teeth, rarely indehiscent, seeds plano-convex, or globose with a ventral cavity | 22. ANOTIS. |
| Capsule subglobose loculicidal, strongly ribbed, seeds minute angular, flowers in secund cymes | 23. SPIRADICLIS. |
| Capsule globose septicidal, seeds minute angular, flowers crowded in the short recurved distant branches of an erect peduncle | 24. POLYURA. |

**** *Fruit broadly didymously obcordate, of 2 compressed spreading lobes, loculicidal above the calyx.*

- Flowers crowded on the upper side of the branches of a peduncled cyme 25. *OPHIORRHIZA*.
 Flowers scattered on the branches of a peduncled cyme 26. *PARAOPHIORRHIZA*.

B. Leaves crenate-serrate or undulate, stamens 2.

- Capsule dry, 2-valved 27. *CARLEMANNIA*.
 Capsule fleshy, 5-valved 28. *SILVIANTHUS*.

TRIBE V. **Mussaendæ**. *Corolla-lobes* valvate in bud. *Fruit* fleshy or drupaceous, indehiscent (rarely dehiscent). *Seeds* minute.

a. *Inflorescence terminal*. (See also 35. *Adenosacme*, and 41. *Keenania*.)

- Flowers paniced or corymbose, calyx with one lobe usually forming a coloured leaf 29. *MUSSÆNDA*.
 Calyx-lobes 5 slender, *ovary* 1-celled 30. *ACRANTHERA*.
 Flowers capitate, calyx quite entire, stamens 4 31. *LUCINÆA*.
 Calyx irregularly fissured, stamens 5 32. *LEUCOCODON*.
 Calyx 5-lobed, stamens 5 33. *POLYSOLENIA*.
 Flowers umbelled 34. *TRISCIADIA*.

β. *Inflorescence usually axillary, flowers not involucrate*.

- Calyx 4-5-lobed, corolla reduplicate-valvate, berry 2-5-celled, cymes loose 35. *ADENOSACME*.
 Calyx-lobes 5 rigid, drupe with 2 pyrenes, flowers capitate 36. *MYRIONEURON*.
 Calyx-limb 8-16-sinuate, corolla 8-16-partite, stamens 8-16, cymes axillary 37. *AULACODISCUS*.
 Calyx 4-7-toothed, corolla 4-7-lobed, cymes axillary 38. *UROPHYLLUM*.
 Calyx-lobes 5 unequal leafy 39. *SCHIZOSTIGMA*.

γ. *Flowers capitate, involucrate*.

- Climbing shrub, heads axillary 40. *LECANANTHUS*.
 Erect or prostrate shrub, head terminal 41. *KEENANIA*.

TRIBE VI. **Gardeniæ**. *Corolla-lobes* twisted in bud. *Fruit* berried, fleshy or dry. *Seeds* usually large; cotyledons often foliaceous.

* *Seeds many in each cell, or few in 41, 45 and 46.*

- Inflorescence terminal, flowers 2-sexual, stigma fusiform 42. *WEBERA*.
 Inflorescence terminal, flowers diœcious, stigma fusiform 43. *BYRSOPHYLLUM*.
 Inflorescence leaf-opposed, flowers diœcious, style-arms 2 44. *BRACHYTOME*.
 Inflorescence lateral, corymbose, style-arms 2 45. *ANOMANTHODIA*.
 Inflorescence usually axillary, stigma fusiform, ovary 2-celled 46. *RANDIA*.
 Inflorescence usually axillary, stigma fusiform, ovary 1-celled 47. *GARDENIA*.

** *Style-arms 2, free (rarely combined), ovary 2-celled, seeds usually few in each cell, inflorescence always axillary.*

- Calyx-limb cupular 4-lobed, flowers in small cymes, testa coriaceous 48. *HYPOBATHRUM*.
 Calyx-limb minutely 5-toothed, flowers in spikes, testa grooved 49. *PETUNGA*.
 Calyx-limb cupular or 4-toothed, flowers diœcious capitate 50. *MORINDOPSIS*.
 Calyx-lobes 4-5 oblong, corolla rotate, testa plicate 51. *HYPTIANATHERA*.
 Calyx-teeth 4-5 very short, albumen ruminant 52. *NARGEDIA*.

Calyx-limb elongate 4-lobed, flowers in spikes, testa grooved 53. *SCYPHOSTACHYS*.
 Calyx calyculate, limb truncate or 4-5-lobed, flowers fasciated,
 rarely cymose 54. *DIPLOSPORA*.

SERIES B. Ovules 2 in each cell (ovary 2-celled). See also 53. *Diplospora*.
 (Genera of uncertain affinity.)

Corolla-lobes twisted, ovules inserted together half-way up
 the cell, 1 pendulous, 1 erect 55. *SCYPHIPHORA*.
 Corolla-lobes valvate, ovules erect on the top of an erect
 basilar placenta 56. *JACKIA*.

SERIES C. Ovules solitary in each cell. (See also 3. *Cephalanthus*, 18
Alæophania, 19. *Fergusonia*, 20. *Hedyotis*, 21. *Oldenlandia* and 41. *Webera*.)

SUBSERIES a. Radicle superior.

TRIBE VII. **Guettardæ**. *Corolla-lobes* imbricate or valvate in bud.
Stamens inserted on the mouth of the corolla. *Fruit* drupaceous with 2-many
 free or cohering pyrenes. *Seeds* cylindric; albumen scanty or 0.

Corolla imbricate, calyx-limb deciduous 57. *GUETTARDA*.
 Corolla imbricate, calyx-limb persistent 58. *ANTIRRHŒA*.
 Corolla valvate, calyx-limb cupular, ovary 4-12-celled 59. *TIMONIUS*.
 Corolla valvate, calyx 5-toothed, corolla curved 2-lipped,
 ovary 2-celled 60. *DICHLANTHE*.

TRIBE VIII. **Knoxieæ**. *Corolla-lobes* valvate in bud. *Stamens* inserted
 on the mouth of the corolla. *Fruit* of 2-cocci. *Seeds* dorsally compressed.

Albumen copious, herbs, fruit very small 61. *KNOXIA*.

TRIBE IX. **Albertææ**. *Corolla-lobes* twisted in bud. *Stamens* inserted
 in the mouth of the corolla. *Ovary* 1-celled with 1-2 pendulous ovules, or
 2-∞-celled with 1 ovule in each cell.

Corolla campanulate, style 8-grooved, ovary 1-celled,
 1-2-ovuled 62. *OCTOTROPIS*.

TRIBE X. **Vangueriææ**. *Corolla-lobes* valvate in bud. *Stamens* inserted
 in the mouth of the corolla. *Drupe* with 2-many free or cohering pyrenes. *Seeds*
 various; albumen copious.

Ovary 2-celled, stipules equal 63. *CANTHIUM*.
 Ovary 3-5-celled, stipules equal 64. *VANGUERIA*.
 Ovary 2-celled, one stipule very large 65. *MESOPTERA*.

SUBSERIES β. Radicle inferior.

TRIBE XI. **Ixoreæ**. *Corolla-lobes* twisted in bud. *Ovary* 2-4-celled;
 ovules usually inserted about the middle of the cell, rarely basilar. *Fruit* a
 2-4-celled berry or drupe with 2-4 free or united pyrenes. *Seeds* usually
 plano-convex.

Flowers paniced or corymbose, bracts coriaceous not
 sheathing 66. *IXORA*.
 Flowers paniced or corymbose, bracts membranous lower
 sheathing 67. *PAVETTA*.
 Flowers axillary fasciated or solitary 68. *COFFEA*.

TRIBE XII. **Morindeæ**. *Corolla-lobes* valvate in bud. *Stamens* inserted
 in the mouth or throat of the corolla. *Ovules* usually inserted below the middle

of the cell, and amphitropous. *Fruit* a 2-4-celled berry, or a drupe with 2-4 pyrenes.

* *Calyx-tubes cohering in a head.*

Heads many-fld. solitary or umbelled 69. *MORINDA*.
Heads few-fld. somewhat spiked 70. *RENNELLIA*.

** *Flowers free.*

Calyx-limb 4-5-fld, corolla-throat villous, drupe with 1-4 pyrenes, flowers axillary. 71. *DAMNACANTHUS*.
Calyx-limb truncate, corolla-throat glabrous, berry 1-2-seeded, flowers terminal and axillary 72. *PRISMATOMERIS*.
Calyx-limb truncate, drupe with 4 pyrenes, flowers umbellate 73. *CELOSPERMUM*.
Calyx-limb annular, corolla-throat woolly, flowers in axillary heads 74. *GYNOCHTHODES*.

TRIBE XIII. **Psychotriæ.** *Corolla-lobes* valvate in bud. *Stamens* inserted near the mouth of the corolla. *Ovules* basilar, cuneate, anatropous. *Drupe* with 2 or more pyrenes. (See also 18. *Alleophania*, and 19. *Fergusonia*.)

* *Flowers in terminal rarely axillary corymbose or paniced rarely capitate cymes.*

Calyx-limb short 4-5-toothed, corolla usually short straight 75. *PSYCHOTRIA*.
Calyx-limb short 5-toothed, corolla-tube usually long curved 76. *CHASALIA*.

** *Flowers capitate or fascicled, axillary or terminal (or solitary in Geophila).*

Calyx with 4-7 rather long lobes, creeping herbs, leaves cordate 77. *GEOPHILA*.
Calyx with 4-5 short teeth, style arms 2, heads involucred . 78. *CEPHEALIS*.
Calyx-limb 3-6-fld, style-arms 3-9, leaves distichous . . . 79. *LASIANTHUS*.

*** *Flowers axillary and terminal, solitary or few, anthers 4 subsessile.*

Calyx-limb dilated unequally 4-lobed, drupe with 2 pyrenes, fetid shrubs 80. *SAPROSMA*.
Calyx-limb truncate, drupe with 2 pyrenes, stem tuberous, epiphytes 81. *HYDNOPHYTUM*.
Calyx-limb truncate, drupe with 3 pyrenes, stem tuberous, epiphytes 82. *MYRMECODIA*.

TRIBE XIV. **Pæderiæ.** *Corolla-lobes* valvate in bud. *Stamens* inserted on the throat or base of the corolla. *Style-arms* 2-5, papillose all over. *Ovules* basilar, erect. *Fruit* capsular, 5-valved, or with 2 dorsally compressed pyrenes often pendulous from a columella; albumen copious or scanty.—Usually fetid climbing or erect shrubs.

Styles 2 capillary twisted, pyrenes 2, twining shrubs . . . 83. *PÆDERIA*.
Style 5-fld, capsule 5-valved at the top, testa reticulated, erect shrubs 84. *HAMILTONIA*.
Style-arms 5, capsule 5-valved at the base, enclosing 5 pyrenes with reticulated coats, erect shrubs 85. *LEPTODERMIS*.

TRIBE XV. **Spermacocææ.** *Corolla-lobes* valvate in bud. *Ovary* 2- rarely 3-4-celled; style entire, stigma capitate or 2-fld, rarely style-arms elongate; ovules attached to the septum of the ovary, amphitropous. *Fruit* small, dry, capsular or of 2 cocci, or circumsciss at the base. *Seeds* usually oblong, deeply grooved on the ventral face.—Herbs, rarely undershrubs, leaves opposite, stipules usually setaceous.

- Fruit of 2 indehiscent at length separating cocci 86. HYDROPHYLAX.
 Fruit of 2 separable cocci, both or one only dehiscing
 ventrally 87. SPERMACOCE.
 Fruit of 2 connate cocci, calyx-limb greatly enlarged . . . 88. GAILLONIA.

TRIBE XVI. **Galiceæ**. *Corolla-lobes* valvate in bud. *Ovary* 2-celled: style-arms 2; ovules attached to the base of the septum. *Fruit* of 2 small coriaceous or fleshy indehiscent lobes. *Seeds* peltate, usually hollowed ventrally. —Herbs; leaves usually whorled, without stipules.

- Corolla rotate or shortly campanulate 5-merous 89. RUBIA.
 Corolla rotate 4-merous 90. GALIUM.
 Corolla funnel-shaped 91. ASPERULA.

TRIBE I. NAUCLEÆÆ.

1. SARCOCEPHALUS, Afzel.

Shrubs or trees, sometimes climbing. *Leaves* petioled; stipules large or small. *Flowers* in axillary or terminal peduncled globose heads, without bracteoles, united by their confluent calyx-tubes; bracts 2, stipular. *Calyx* 4-6-toothed with deciduous appendages. *Corolla-tube* long, funnel-shaped, throat glabrous; lobes 5-6, orbicular, imbricate. *Stamens* 5-6, on the corolla mouth; anthers sessile, acute. *Ovary* 2-celled; style filiform, exerted, stigma capitate, oblong or spindle-shaped; ovules very many, imbricating upwards on pendulous placentas. *Fruits* combined in a fleshy globose mass of 2-celled pyrenes with very thin septa. *Seeds* few in each cell, minute, testa crustaceous, albumen fleshy; embryo rather large, radicle inferior.—DISTRIB. Species 8, tropical Asiatic, African, and Australian.

1. **S. cordatus**, *Miq. Fl. Ind. Bat.* ii. 133; leaves elliptic ovate or cordate obtuse, peduncles solitary stout 1-headed, heads of fruit smooth. *Bedd. Fl. Sylv.* t. 318; *Kurz For. Fl.* ii. 63. S. Horsfieldii, *Miq. l. c.* 134. *Nuclea cordata*, *Roxb. Hort. Beng.* 14; *Fl. Ind.* i. 509. N. coadunata, *Roxb. in Rees Cyclop.* N. Roxburghii, *G. Don Gen. Syst.* iii. 467, excl. synonym. N. Wallichiana, *Br. in Wall. Cat.* 6098. N. parvifolia, *Wall. Cat.* 6093 B. *Platanocarpum cordatum*, *Korth. Naocl. Ind.* 16.

MALAY PENINSULA, from Pegu and Mergui to Malacca, Wallich, &c. CEYLON, Walker, &c.—DISTRIB. Malay and Philippine Islands, N. Australia.

A small tree. *Leaves* 5-12 by 4-8 in.; petiole $\frac{3}{4}$ -1 in.; stipules oblong, elliptic or obovate. *Heads* $\frac{1}{2}$ -1 in. diam., drooping; peduncle 1-1 $\frac{1}{2}$ in.; stipular bracts broad, almost basal. *Flowers* yellow, fragrant; calyx-lobes clavate.—A form with leaves pubescent beneath, from the Malay Islands, is N. undulata, *Wall. Cat.* 6094 (not of *Roxb.*). The true N. undulata, *Roxb.*, is not Indian, it is Wallich's N. purpurea, 6090 D. (N. stipulacea, *Herb. Roxb.*, not N. Roxburghii, *G. Don Gen. Syst.* iii. 467, which from the description is S. cordatus itself).

2. **S. subditus**, *Miq. Fl. Ind. Bat.* ii. 134; leaves lanceolate obtusely acuminate, peduncles solitary 1-headed, heads of fruit rough. *Platanocarpum subditum*, *Korth. Verh. Nat. Gesch. Bot.* 133, t. 32.

MALACCA, Griffith.—DISTRIB. Sumatra, Java.

Much more slender than S. cordatus. *Leaves* glabrous, 3-5 by 1 $\frac{1}{2}$ -2 in., narrowed into the slender petiole, black when dry. *Peduncles* slender, pubescent, bracteate

about the middle. *Heads* $\frac{1}{2}$ in. diam., fruiting with concave summits to the carpels and raised edges.

3. **S. Junghuhnii**, *Miq. Fl. Ind. Bat.* ii. 134; leaves elliptic abruptly obtusely pointed, peduncles 1-3-nate 1-3-headed, heads nearly smooth.

MALACCA; Mt. Ophir, *Griffith* (Kew Distrib. 2772), *Maingay* (Kew Distrib. 822, 822').—DISTRIB. Sumatra.

Branchlets and peduncles puberulous. *Leaves* 4-5 by 2-2 $\frac{1}{2}$ in., rather coriaceous, nerves with minute tufts of hair in the axils; petiole $\frac{1}{4}$ - $\frac{1}{2}$ in.; stipules oblong. *Peduncles* $\frac{1}{2}$ -1 $\frac{1}{2}$ in., with a small 4-lobed cup of bracts below the middle, of which 2 opposite are larger than the others. *Heads* $\frac{1}{4}$ - $\frac{1}{3}$ in. diam., in fruit $\frac{2}{3}$ in. diam.—I have seen no authentic specimen of *Junghuhnii*, but find the name attached by *Maingay* to his specimens. *Miquel's* description is most meagre.

2. **ANTHOCEPHALUS**, *A. Rich.*

A glabrous tree. *Leaves* petioled; stipules lanceolate, caducous. *Flowers* in terminal globose peduncled solitary heads, without bracteoles, united by their confluent calyx-tubes; peduncles with basal stipular bracts. *Calyx-limb* tubular, 5-lobed, persistent or deciduous. *Corolla-tube* long, funnel-shaped, throat glabrous; lobes 5, imbricate. *Stamens* on the throat of the corolla, filaments short. *Ovary* 4-celled above, 2-celled below; style exserted, stigma spindle-shaped; ovules very many, horizontal on 2 bifid placentas, which ascend from the septa below its middle, and send an arm into each of the 4 upper cells. *Fruits* confluent into a fleshy globose mass of many few-seeded coriaceous pyrenes. *Seeds* minute, testa rather thin; embryo clavate in fleshy albumen.

1. **A. Cadamba**, *Miq. Fl. Ind. Bat.* ii. 135; leaves elliptic-oblong ovate or ovate-cordate acute. *Bedd. Fl. Sylv.* 127, t. 35; *Brand. For. Fl.* 261. *A. morindæfolia*, *Korth. Verh. Nat. Gesch. Bot.* 154, t. 48. *Nauclea Cadamba*, *Roxb. Hort. Beng.* 14; *Fl. Ind.* i. 512. *Sarcocephalus Cadamba*, *Kurz For. Fl.* ii. 63; *Wall. Cat.* 6088, excl. C.

FROM THE HIMALAYA TO CEYLON AND MALACCA, wild or cultivated; Forests of PEGU, *Kurz*.—DISTRIB. Sumatra, Borneo.

A large tree; branches spreading. *Leaves* coriaceous, 5-9 in., shining above, pubescent beneath. *Heads* 1-2 in. diam., peduncles stout. *Flowers* orange-coloured with white stigmas, scented at night. *Fruit* as large as a small orange.—*Wallich's* 6088 C. a cultivated plant from Ava, is very different, having membranous leaves and very oblique nerves.

3. **CEPHALANTHUS**, *Linn.*

Shrubs or small trees. *Leaves* opposite or whorled, stipules short. *Flowers* densely crowded in terminal or axillary solitary simple or paniced globose heads mixed with setaceous or paleaceous bracteoles; peduncles with stipular caducous bracts about the middle. *Calyx-tube* obpyramidal; limb cup-shaped, 4-5-toothed or -lobed. *Corolla-tube* long, funnel-shaped; throat glabrous or hairy; lobes 4, imbricate. *Stamens* on the mouth of the corolla, filaments short; anthers 2-cuspidate at the base. *Ovary* 2-celled; style filiform, stigma capitate or clubbed; ovules 1 pendulous in each cell. *Fruit* of numerous obpyramidal indehiscent 1-seeded cocci. *Seeds* pendulous, with a fungoid aril, testa membranous sometimes winged; embryo in horny albumen, cotyledons flat.—DISTRIB. Species 6, tropical Asia, Africa, and America.

1. **C. naucleoides**, DC. *Prodr.* iv. 539; glabrous pubescent or tomentose, leaves ovate or ovate-lanceolate acuminate. *Kurz For. Fl.* ii. 68. *C. aralioides*, Zoll. & Mor. *Syst. Verh.* 61. *Nauclea tetrandra*, Roxb. *Hort. Beng.* 14; *Fl. Ind.* i. 576; *Wall. Cat.* 6101.

SIKKIM HIMALAYA, alt. 2000 ft., J. D. H. ASSAM, CACHAR, and SILHET.—DISTRIB. N. Birma, Java, China.

A small tree. *Leaves* opposite or 3-4-nate, 3-5 by 1-2 in.; petiole short; stipules acuminate, often gland-tipped. *Peduncles* often whorled, slender; bracteoles linear-clavate, hairy. *Heads* $\frac{3}{4}$ in. diam., yellowish-white. *Calyx-lobes* short, with interposed black glands.—Very closely allied to the N. American *C. occidentalis*, Linn., and perhaps a form of it.

4. **ADINA**, Salisb.

Trees or shrubs. *Leaves* petioled; stipules large, caducous. *Flowers* bracteate or not, densely crowded in solitary or paniced globose heads; receptacle hairy. *Calyx-tube* angled, lobes 5. *Corolla* funnel-shaped, tube long, throat glabrous; lobes 5, valvate. *Stamens* 5, on the mouth of the corolla, filaments short. *Ovary* 2-celled; style filiform, stigma capitate or clubbed; ovules numerous, imbricated on a pendulous placenta in each cell. *Capsule* of 2 dehiscent cocci, many-seeded. *Seeds* oblong, testa winged; embryo in abundant fleshy albumen, radicle superior.—DISTRIB. Species 6, tropical Asiatic and American.

1. **A. cordifolia**, Hook. f. in *Gen. Pl.* ii. 30; leaves petioled orbicular cordate abruptly acuminate pubescent beneath, peduncles 1-3-axillary 1-headed. *Brand. For. Fl.* 263, t. 33. *Nauclea cordifolia*, Willd.; Roxb. *Hort. Beng.* 14; *Cor. Pl.* 1, t. 53; *Fl. Ind.* i. 514; *Wall. Cat.* 6092; *W. & A. Prodr.* 391; *Kurz For. Fl.* ii. 66; *Dalz. & Gibs. Bomb. Fl.* 118.

Dry forests, alt. 1-3000 ft., from KUMAON to SIKKIM, PEGU and TENASSERIM, and throughout the hilly parts of India to CEYLON.

A large or small tree, wood hard. *Leaves* deciduous, coriaceous, 4-12 in. diam.; petiole 2-3 in., stout; stipules orbicular or oblong. *Heads* $\frac{3}{4}$ -1 in. diam.; peduncle stout, 1-2 in.; bracts small towards the apex. *Flowers* yellow; corolla downy; stigma clavate. *Capsule* $\frac{1}{2}$ in., cuncate, downy; cells about 6-seeded.

2. **A. sessilifolia**, Hook. f. in *Gen. Plant.* ii. 30; leaves sessile oblong glabrous base cordate tip rounded, peduncles 1-3 terminal solitary 1-headed, corolla shaggy. *Nauclea sessilifolia*, Roxb. *Fl. Ind.* i. 515; *Kurz For. Flor.* ii. 65. *N. sericea*, Wall. *Cat.* 6095; *G. Don Gen. Syst.* iii. 467.

CHITTAGONG, Roxburgh, &c. CACHAR, Keenan. PEGU, Wallich, &c.

A small tree. *Leaves* rather coriaceous, 6-10 by 3-6 in., glossy above; petiole very short and stout, stipules broadly oblong. *Heads* $1\frac{1}{2}$ in. diam., silkily villous; peduncle very stout, 1-2 in.; flowers shaggily silky; stigma clavate. *Capsules* $\frac{1}{2}$ in., cuncate.

3. **A. Griffithii**, Hook. f.; leaves shortly petioled elliptic oblong or obovate shortly obtusely acuminate glabrous, peduncles 1-2 terminal 1-headed, corolla glabrous.

KHASIA Mts.; Mahadeb, alt. 3000 ft., Griffith, J. D. H., and T. T. ? NICOBAR Islands, Kurz.

A small quite glabrous tree. *Leaves* persistent, coriaceous, 4-7 by $1\frac{1}{2}$ - $3\frac{1}{2}$ in., narrowed into the short stout petiole; nerves 6-7 pair, prominent beneath, transverse ones slender; stipules not seen. *Peduncles* 1-2 in., very stout, smooth. *Heads* $1\frac{1}{4}$ in. diam.; bracteoles of short stiff conical-subulate spines shorter than the silky calyces and apparently persistent; corolla quite glabrous.—The Nicobar specimen has rather

more flaccid and broader leaves than the Khasian, with 8-9 pairs of nerves, and a longer peduncle; its corollas have fallen away.

4. **A. polycephala**, *Benth. Fl. Hongkong*, 146; leaves shortly petioled lanceolate caudate-acuminate glabrous, heads in trichotomously branched panicles, corolla glabrous. *Nauclea polycephala*, *Wall. Cat.* 6100; *G. Don Gen. Syst.* iii. 467; *Kurz For. Fl.* ii. 65.

SILHET and KHASIA Mts., *De Silva, Griffith, &c. CHITTAGONG, J. D. H. & T. T. TENASSERIM, Kurz.* Moulmein on Thounggyun, alt. 4000 ft., *T. Lobb.*

A small evergreen tree. *Leaves* 3-5 by 1-1½ in., rather thin, glossy above; nerves 5-9 pair, caudate apex obtuse and variable in form and length, sometimes strap-shaped; petiole ½-¾ in.; stipules long. *Heads* ½ in. diam.; peduncles and pedicels slender, glabrous or puberulous. *Capsule* obovoid.

VAR. macrophylla; leaves broader 6-9 by 2½-4 in. oblanceolate with more numerous nerves (10-12 pairs) and much shorter tips.—*N. microcephala*, *Wall. in Herb. Hook.* *Cephalanthus aralioides*, *Zoll. & Morr. Syst. Verz.* 61; *Miq. Fl. Ind. Bat.* ii. 152, 344. *Nauclea trichotoma*, *Zoll. & Morr. l.c.* *N. aralioides*, *Miq. l.c. Suppl.* 538.—*Silhet, Wallich*; *Mergui, Griffith.*—Sumatra and Java: probably the Silhet habitat is erroneous, the authority being a garden specimen.

5. STEPHEGYNE, Korth.

Shrubs or trees. *Leaves* petioled; stipules large, caducous. *Flowers* crowded in globose axillary and terminal solitary panicked or subumbelled heads united by their confluent calyx-tubes, each peduncle with 2 deformed leaves at the top, within which are 2 caducous bracts; bracteoles paleaceous. *Calyx-tube* short; limb cupular or tubular, truncate or 5-toothed. *Corolla* funnel-shaped, tube long, throat hairy or glabrous; lobes 5, short, valvate. *Stamens* 5, on the throat of the corolla, filaments short. *Ovary* 2-celled; style filiform, stigma capitate or mitriform; ovules imbricated upwards on pendulous placentas. *Fruit* of 2 dehiscent cocci, many-seeded. *Seeds* small, testa winged, albumen fleshy.—*DISTRIB.* Species 10, tropical African and Asiatic.

1. **S. parvifolia**, *Korth. in Verh. Gesch. Nat. Bot.* 161; leaves orbicular oblong ovate or cordate, tip rounded acute or acuminate, calyx-limb very short, corolla-tube much exceeding the lobes. *Brand. For. Fl.* 262. *Nauclea parvifolia*, *Willd.*; *Roxb. Hort. Beng.* 14; *Cor. Pl.* i. 40, t. 52; *Fl. Ind.* i. 513; *Wall. Cat.* 6093, *excl. B. partly*; *W. & A. Prodr.* 391; *Wt. Ill.* t. 123; *Bedd. Fl. Sylv.* t. 34. *N. parviflora*, *Pers.*; *Dalz. & Gibs. Bomb. Fl.* 118. *Cephalanthus pilulifer*, *Lamk.*

Dry forests of the TROPICAL HIMALAYA, from the Chenab to Birma, ascending to 4000 ft., and throughout the drier parts of India to CEYLON.

A small or large tree, glabrous or pubescent. *Leaves* extremely variable in size and shape, deciduous, 2-6 in., with 6-8 pair of oblique nerves; petiole short; stipules obovate. *Heads* about 1 in. diam., with 2 linear-oblong leaves at the base; bracts caducous; peduncles ½-3 in. *Corolla* glabrous within, stamens inserted in the tube. *Capsules* ½ in.

2. **S. tubulosa**, *Hook. f. in Gen. Pl.* ii. 31; leaves elliptic-oblong or ovate-cordate shortly acuminate, calyx-limb tubular truncate, corolla-tube much exceeding the lobes. *Bedd. Fl. Sylv., Anal. Gen.* 128, t. xxix. f. 1 (*excl. name parvifolia*). *Nauclea tubulosa*, *Arn. in Thwaites Enum.* 137; *Bedd. Ic. Pl. Ind. Or.* t. 18.

WESTERN PENINSULA; *Cochin, Johnson.* CEYLON, *Macrae, &c.*

A small glabrous tree. *Leaves* 2-6 in., rather membranous, sometimes pubescent beneath, variable in shape, rarely acute at both ends, sometimes cordate; nerves

10-12 pair; petiole $\frac{1}{4}$ -1 in.; stipules large, obovate, membranous. *Peduncles* terminal, usually 3-nate with the middle ones very short or 0, the lateral 1-3 in.; bracted leaves petioled; bracts very caducous. *Heads* $1\frac{1}{2}$ in. diam.; flowers glabrous; stigmas cylindric, truncate at both ends. *Capsules* $\frac{1}{2}$ in. including the calyx ribbed, nearly glabrous.

3. ***S. diversifolia***, *Hook. f.*; leaves orbicular-cordate oblong or elliptic, tip rounded, calyx-limb 0, corolla-tube equalling the bearded lobes. *N. diversifolia*, *Wall. Cat.* 6096; *G. Don Gen. Syst.* iii. 467. *N. paryifolia*, *var. 2*, *Kurz For. Fl.* ii. 67. *N. rotundifolia*, *Roxb. Fl. Ind.* i. 516; *Kurz l. c.* *N. Brunonis*, *Wall. Cat.* 6097; *G. Don l. c.* 467.

CHITTAGONG, *Roxburgh*, &c. TENASSERIM and BIRMA, *Wallich*, &c.—DISTRIB. Philippines.

A small tree. *Leaves* deciduous, glabrous or pubescent beneath; the lower orbicular-cordate, 10 in. diam., coriaceous, the upper 4-6 by 2-3 in. and membranous, nerves oblique; petiole $\frac{3}{4}$ -1 $\frac{1}{2}$ in.; stipules obovate-oblong. *Heads* white, in spreading 3-chotomous panicles, nearly 1 in. diam.; foliar bracts long-petioled; corolla glabrous except the lobes within; stigma elongate, mitriform. *Capsules* $\frac{1}{2}$ in. long, smooth, ribbed.—I have preferred Wallich's and Don's name of *diversifolia* to Roxburgh's of *rotundifolia*, as expressing the very remarkable difference between what I take to be the upper and lower leaves of the branches.

6. **NAUCLEA**, *Linn.*

Trees or shrubs. *Leaves* usually large, sessile or petioled; stipules large, caducous or subsistent. *Flowers* crowded in globose peduncled bracteate solitary or subpanicled heads. *Calyx-tube* turbinate or obconic; lobes 5, usually tipped with valvate processes. *Corolla* elongate-funnel-shaped, throat glabrous; lobes short, imbricate. *Stamens* 5, on the throat of the corolla, filaments 0 or short or long. *Ovary* 2-celled; style filiform, stigma capitate cylindric or submitriform; ovules many, pendulous on adnate ascending placentas. *Fruit* of 2 dehiscent many-seeded cocci. *Seeds* imbricate, testa winged; embryo clavate in fleshy albumen.—DISTRIB. Species about 30, tropical Asiatic, and Polynesian.

* *Stigma capitate, stipules flat caducous.*

1. ***N. purpurea***, *Roxb. Cor. Pl.* i. 41, t. 54; *Fl. Ind.* i. 515; leaves elliptic or elliptic-lanceolate subacute, heads 1-3 long peduncled, corolla glabrous. *Wall. Cat.* 6090, excl. D.; *W. & A. Prodr.* 391, partly; *Bedd. Fl. Sylv.* 129; *l.c. Pl. Ind. Or.* t. 19. *N. lanceolata*, *Blume Bijl.* 1009. *Anthocephalus indicus*, *Richd. in Mem. Soc. Hist. Nat. Paris*, v. 237. *A. chinensis*, *Hassk. in Flora*, 1845, 231. *Cephalanthus chinensis*, *Lamk. Dict.* i. 678, excl. *syn. Rumph.*—*Rheede Hort. Malab.* iii. t. 33.

WESTERN PENINSULA; from the Concan to the Circars, and southwards, not common.

A small tree, quite glabrous. *Leaves* 4-8 by $1\frac{1}{2}$ -5 in., membranous, shining on both surfaces; petiole $\frac{1}{2}$ -1 $\frac{1}{4}$ in. *Heads* $1\frac{1}{2}$ in. diam., palæ of conical bristles; peduncles about 2-3 in., bracteate about the middle. *Calyx* silky.

2. ***N. zeylanica***, *Hook. f.*; leaves elliptic or oblanceolate obtuse, peduncles 1-3 slender, corolla silky. *N. peduncularis*, *Thwaites Enum.* 137, not of *Wallich*; *Bedd. Fl. Sylv.* 129; *l.c. Pl. Ind. Or.* t. 235.

CEYLON; Saffragam and contiguous districts, ascending to 1000 ft. not uncommon; central province rare, *Gardner, Thwaites*.

A middle-sized tree. *Leaves* 4-5 by 1-2 in., opaque when dry, nerves 6-8 pair;

petiole $\frac{1}{2}$ – $\frac{1}{2}$ in.; stipules linear-oblong. *Heads* $2\frac{1}{2}$ in. diam.; peduncles slender, 1–2 in., with 4 bracts below or above the middle. *Flowers* ochreous-purple; style rather short.

3. **N. peduncularis**, Wall. Cat. 609; leaves large elliptic or elliptic-oblong coriaceous obtusely acuminate, peduncles 3-nate very stout, corolla silky. *G. Don Gen. Syst.* iii. 469.

PENANG, Porter.—DISTRIB. Sumatra.

Branches very robust. *Leaves* 6–12 by 3–5 in., shining above, cordate or tapering into a very stout petiole $\frac{1}{2}$ –1 in.; nerves strong beneath. *Peduncles* 1– $2\frac{1}{2}$ in., lateral spreading, central short or long. *Heads* $1\frac{1}{2}$ in. diam.; calyx-lobes long, slender, clavate, acuminate, very silky, longer than the tube of the glabrous corolla.

** *Stigma elongate acute, stipules concave sub-persistent.*

4. **N. missionis**, Wall. Cat. 6099; leaves elliptic-lanceolate acute or obtuse membranous glabrous, peduncles short stout solitary, calyx and corolla tomentose. *W. & A. Prodr.* 392; *Arn. Pugill. Pl. Ind. Or.* 20. *N. oblongata*, *Miq. in Herb. Hohenack.* 717. *N. orientalis*, *Herb. Madr.* *N. elliptica*, *Dalz. & Gibs. Bomb. Fl.* 118.

TRAVANCOR, Rottler, Wight. MALABAR, Hohenacker. CONCAN, Stocks.

Very similar to *N. purpurea*, but distinguished by the sessile leaves of which the petioles are usually winged to the base, and the elongate stigma, and the remarkable stipules. *Leaves* 4–7 by $1\frac{1}{2}$ – $2\frac{1}{2}$ in., shining above; petiole rarely $\frac{1}{2}$ in.; nerves 10–12 pair, slender; stipules forming an appressed cylindric coriaceous sheath, more or less connate, sometimes half-way up, glabrous, obtuse, very persistent. *Peduncles* usually inclined, $\frac{2}{3}$ –1 in., with stipular sheathing bracts at the base, and 4 small bracts united below into a cup above the base, of which 2 are shorter than the others. *Heads* $1\frac{1}{4}$ in. diam.; calyx-lobes and corolla-lobes tomentose.—Of Dalzell's *N. elliptica* there are authentic specimens, but in bud only. He describes the stigma as 'round,' but his specimens accord so entirely with Wight's, Rottler's, &c., in all other respects, that I suspect some mistake. His plant should be searched for 'near Sura, and the village of Hoolun, not far from Chorla Ghaut.'

5. **N. Maingayi**, Hook. f.; leaves broadly elliptic or elliptic-obovate coriaceous obtusely acuminate, nerves beneath pubescent, peduncles solitary very short, calyx and corolla-lobes tomentose.

MALACCA; *Maingay* (Kew Distrib. 823).

Branches stout, glabrous. *Leaves* 4–6 by 2–3 in., shining above, contracted into a short petiole which is almost winged to the base; nerves 12–14 pair, strong, spreading; stipules $\frac{2}{3}$ in. long, forming an appressed cylindric sheath, obtuse, coriaceous. *Peduncle* $\frac{1}{2}$ in., curved, with basal sheathing stipular bracts, and broad subsistent ones under the head. *Head* $1\frac{1}{2}$ in. diam.—Very near to *N. missionis*, with similar remarkable stipules, but the leaves are much broader, very coriaceous, with more numerous more spreading strong nerves, which are pubescent beneath; the bracts under the head appear to be very large and orbicular, but they are much withered, and I have seen only 2 specimens.—A Bornean species (Beccari, n. 681) is probably the same as this, but the heads are larger.

DOUBTFUL SPECIES.

N. ovalifolia, Roxb. *Hort. Beng.* 14; *Fl. Ind.* i. 576; *Ed. Carey & Wall.* ii. 124; 'leaves sessile oval and elliptic, flowers terminal solitary.'—'Forests of Silhet': called Shāl by the natives.—Possibly *Adina sessilifolia*. Don refers it to *Uncaria elliptica*, which is not a Khasian plant.

N. excelsa, Blume; *Kurz For. Fl.* ii. 65, from Pegu. This is certainly not Blume's plant, if Kurz is correct in describing it as having no bracteoles, and the

peduncles only 2-3 lines, for Blume's *N. excelsa* is a true *Adiantum* with slender cuneate bracteoles amongst the flowers, and peduncles sometimes 2 in.

N. ORIENTALIS, Lamk. *Ill. t.* 153, f. 1; *Blume Bijl.* 1066; *Ham. in Trans. Linn. Soc.* xv. 94, is altogether doubtful.

7. *UNCARIA*, Schreb.

Climbing shrubs. *Leaves* shortly petioled; stipules entire or 2-fid. *Flowers* in globose axillary peduncled solitary or paniced heads; peduncles often headless converted into hooked tendrils. *Calyx-tube* spindle-shaped; limb 5-lobed or -parted. *Corolla-tube* long, funnel-shaped; limb 5-lobed, valvate; throat glabrous. *Stamens* 5, on the throat of the corolla, filaments short; anthers with 2 basal bristles. *Ovary* 2-celled; style slender, stigma capitate; ovules many, ascending on projecting placentas. *Capsule* elongate, septicidally 2-valved, many-seeded. *Seeds* imbricating upwards, testa winged above and below; embryo clavate, in fleshy albumen.—*DISTRIB.* About 30 species, tropical Asiatic, except 1 African and 1 American.—The Gambier of commerce is the produce of *U. Gambier*.

* *Calyx-limb long funnel- or bell-shaped, teeth lanceolate, corolla hirsute or villous.*

1. *U. sclerophylla*, *Roxb. Fl. Ind.* i. 520; branches robust obtusely 4-angled pubescent or villous, leaves short-petioled large ovate suborbicular or oblong rigid pubescent beneath shining and reticulate above, peduncles all axillary bracteate above the middle, heads very large, flowers pedicelled, corollas villous. *U. sclerophylla*, insignis, ferruginea, and pedicellata, *DC. Prodr.* iv. 347, 348. *U. speciosa*, *Wall. Cat.* 6106. *U. ferruginea*, *Kurz For. Fl.* ii. 69. *Nauclea sclerophylla*, *Hunter in Trans. Linn. Soc.* ix. 223. *U. pedicellata*, *Bl. Bijl.* 1012.

PENANG, *Hunter*, &c. MALAY PENINSULA, common from Pegu and Mergui to Malacca, *Wallich*, &c.—*DISTRIB.* Java, Borneo, Philippines.

Very large and stout. *Leaves* 5-6 by $3\frac{1}{2}$ -4 in., base rounded or cordate, rusty-pubescent beneath with strong transverse nerves between the 8 pairs of stout principal ones; petiole $\frac{1}{4}$ -1 in.; stipules hairy, rounded, 2-fid. *Peduncle* very stout, 2-4 in.; bracts 6 in a whorl, $\frac{1}{2}$ in. long. *Heads* 4 in. diam.; calyx tomentose, limb campanulate, lobes triangular acute; corolla 1 in., silky or densely villous all over. *Capsules* 1-1 $\frac{1}{2}$ in., longer than their pedicels, very variable.—Stems shaggy with long hairs in a specimen from Penang (Maingay), with capsules shorter and more turgid, and leaves ovate very hairy beneath. The corollas vary from densely shaggy with spreading fulvous hairs, to silkily shaggy with appressed hairs.

2. *U. pedicellata*, *Roxb. Fl. Ind.* i. 520; *Ed. Wall. & Carey*, ii. 128; branches robust 4-angled, leaves short-petioled oblong ovate-oblong or elliptic shining above puberulous beneath rigid, peduncles axillary and in terminal panicles bracteate about the middle, flowers pedicelled, corolla $\frac{1}{2}$ - $\frac{3}{4}$ in. with long silky hairs. *U. sclerophylla*, *Wall. Cat.* 6105. *U. ferruginea*, *DC. Prodr.* iv. 348. *U. Hallii*, *Korth. Verh. Nat. Gesch. Bot.* 165, t. 33. *Nauclea ferruginea*, *Bl. Bijl.* 1013.

PENANG and SINGAPORE, *Wallich*, &c. MALACCA, *Griffith* (*Kew Distrib.* n. 2755), *Maingay* (*Kew Distrib.* n. 326).—*DISTRIB.* Java, Borneo.

Closely allied to *U. sclerophylla*, but smaller in all its parts, with more oblong leaves not so reticulate above and only minutely pubescent beneath; heads nearly as large, but flowers smaller and capsules much shorter and more turgid (as in one specimen of *sclerophylla*).

** *Calyx-limb small, funnel-shaped, limb with short teeth, corolla glabrous or pubescent (not shaggy).*

3. *U. attenuata*, Korth. in *Verh. Nat. Gesch. Bot.* 170, t. 34; branches 4-angled puberulous, leaves elliptic obtusely acuminate shining above puberulous beneath, flowers shortly pedicelled, calyx-teeth very short obtuse, corolla $\frac{1}{2}$ in. silky, tube very slender. *U. sclerophylla*, Deless. *Ic. Select.* iii. t. 81, not of Roxburgh. *U. Gambier*, Wall. Cat. 6103 C. in part.

PENANG, Phillips. SINGAPORE, Wallich. TENASSERIM, Helfer.—DISTRIB. Sumatra. Branches nearly glabrous. Leaves 4-6 by 2-3 $\frac{1}{2}$ in., firm, base rounded; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in.; nerves about 8 pair, very obliquely ascending, strong, with transverse veins, axils with tufts of hair. Peduncles 1-2 in. Heads 1 $\frac{1}{2}$ in. diam.; pedicels very short, elongating to $\frac{1}{2}$ in. in fruit and calyx rufous-tomentose. Capsules (unripe) $\frac{2}{4}$ in.

4. *U. ovata*, Br. in Wall. Cat. 6112, in part; 6103 D. (*U. Gambier*) and 6107 in part (*U. macrophylla*); branches glabrous, leaves petioled oblong obtusely acuminate glabrous and ashy beneath, peduncles long stout straight axillary and in terminal panicles bracteate above the middle, flowers sessile, calyx-lobes ovate acute, corolla silky.

SINGAPORE, SILHET, and 'HB. FINLAYSON,' Wallich.

Foliage identical with that of *U. canescens*, Korth., but nerves usually 8 pair, always without tufts of hairs in the axils; and the peduncles long and stout, 1 $\frac{1}{2}$ -2 in., with the bract-scar $\frac{1}{2}$ in. below the head, and the silky calyx-lobes ovate and acute; the heads also are larger, and the corollas more silky. It differs from a Philippine Island plant of Cuming (n. 1470, 1503) in the calyx-lobes very short and ovate, not linear or subclavate. Of Wallich's Herbarium specimens (the only ones I have seen) one is from Singapore, on sheet 3112, with *U. Gambier*; another is on a sheet by itself, marked '6103 D. *U. Gambier*, Herb. Finlayson' (probably from Siam, where Finlayson collected); the third, also on a sheet by itself, is marked '6107. *U. sessilifolia*, Roxb. *Ic. pict.* Sylhet.' The latter is probably an erroneous habitat. There is a very similar plant in Maingay's herbarium from Penang (*U. sclerophylla*, Kew Distrib. 828), with the leaves slightly scabrid beneath.

5. *U. canescens*, Korth. *Verh. Nat. Gesch. Bot.* 172; branches glabrous or puberulous, leaves petioled oblong obtusely caudate-acuminate glabrous ashy beneath, peduncles very short bracteate near the base, calyx densely tomentose lobes rounded, corolla pubescent.

MALACCA or PENANG, Maingay (Kew Distrib. 1768, in part).

I have very imperfect specimens of this mixed with *U. ovata*, Br.; they precisely accord with others from Sumatra, collected by Korthals. These differ from all described species by the glabrous foliage, glaucous beneath, together with the very short curved peduncles, bracteate towards the base. Leaves 4-6 by 1 $\frac{1}{2}$ -2 $\frac{3}{4}$ in., rather membranous; nerves slender, 7 pair; petiole $\frac{1}{2}$ - $\frac{3}{4}$ in. Peduncle $\frac{1}{2}$ in., decurved; bracts ovate, acute, pubescent. Heads 1 $\frac{1}{2}$ in. diam.; flowers at first sessile, pedicelled later.—Identical in foliage with *ovata*, Br., and a Philippine Island species (Cuming, 1470, 1503), differing in the peduncle and calyx from both.

6. *U. pteropoda*, Miq. *Fl. Ind. Bot.* ii. 343; branches 4-angled glabrous, leaves large very coriaceous very broadly elliptic or ovate obtuse narrowed into the short winged petiole quite glabrous, peduncles short stout all axillary bracteate above the middle, heads large, flowers sessile, calyx-teeth obtuse.

PENANG, Phillips. MALACCA, Maingay (Kew Distrib. n. 829).—DISTRIB. Sumatra, Borneo.

A very distinct species (the Indian specimens are in fruit only) of a pale colour. Branches rather slender. Leaves 6-8 by 4-5 in., not shining above or beneath, point suddenly contracted but obtuse; nerves 6 or 7 pair, very strong beneath, arched,

veins very slender. *Peduncles* $\frac{1}{2}$ –1 in. *Fruiting heads* 3–4 in. diam. *Capsules* $\frac{3}{4}$ –1 in., on pedicels as long or longer, crowned with a very small almost cupular calyx-limb.—Bornean specimens have silky corollas.

7. *U. sessilifructus*, *Roxb. Fl. Ind. i.* 520; branches slender 4-angled glabrous, leaves elliptic obtuse or obtusely acuminate shining above glabrous and rather glaucous beneath, nerves 5 pair, peduncles axillary and in terminal panicles bracteate in the middle, corolla-tubes glabrous lobes silky or glabrous, capsules sessile. *Wall. Cat.* 6109; *Kurz For. Fl. ii.* 71. *Nauclea scandens*, *Roxb. mss. Ic. pict.* No. 1218.

Eastern Bengal, from SIKKIM and the KHASIA Mts. to CHITTAGONG, PEGU, and TENASSERIM.

Branches rather acutely angled. *Leaves* very uniform, pale-coloured, 4–4½ by 2–2½ in., coriaceous, smooth on both surfaces, tip sometimes produced; nerves often with tufts of hairs in the axils, very oblique, veins obscure; petiole $\frac{1}{4}$ in.; stipules 2-partite. *Peduncles* 1–1½ in. slender, often forming terminal panicles, puberulous; bracts 4, subulate, subequal. *Heads* 1 in. diam.; fruiting not much larger. *Calyx-lobes* small, rounded; corolla-tube slender, lobes glabrous in Griffith's Khasian specimens, silky in Wallich's. *Capsules* turgid, $\frac{1}{2}$ in. long, pubescent.—I follow Wallich in accepting this as *Roxburgh's U. sessilifructus*, though the leaves are not as described in the *Flora Indica*, 'soft underneath.' The stipules appear 2-partite, but are not perfect.

8. *U. lavigata*, *Wall. Cat.* 6111; branches 4-angled glabrous, leaves elliptic-lanceolate glabrous on both surfaces shining above not glaucous beneath, nerves 5–6 pair slender, stipules 2-fid, peduncles axillary and in terminal panicles bracteate about the middle, bracts short obtuse, calyx obscurely toothed, corolla glabrous, capsules sessile.

TENASSERIM and PEGU, *Wallich, Falconer, Kurz*; KHASIA Mts., *Griffith* (Kew Distrib. 2769).

Very near *U. sessilifructus*, but the leaves are not at all glaucous beneath, the bracts broad and obtuse, and the corolla perfectly glabrous.

9. *U. homomalla*, *Miq. Fl. Ind. Bat. ii.* 343; branches tomentose or puberulous, leaves ovate-lanceolate long acuminate opaque and puberulous above especially on the nerves, shortly hairy beneath, nerves 6–8 pair, veins remote, stipules 2-partite, peduncles all axillary bracteate above the middle, flowers sessile, calyx-limb very short obscurely toothed, ovary minute cuneate silky, corolla pubescent. *U. pilosa*, *Wall. Cat.* 6108 C., not of *Roxburgh*.

EASTERN BENGAL; Jyntea hills, *Wallich*.—DISTRIB. Sumatra.

Branches lower acutely 4-angled, upper nearly terete, closely finely pubescent. *Leaves* 2½–3½ by 1–1½, gradually tapering to the long points, base rounded; petiole slender, $\frac{1}{2}$ in.; stipules each divided into 2 subulate-lanceolate recurved subsistent segments. *Peduncles* stout, 1 in., tapering from the base; bracts obtuse. *Heads* $\frac{3}{4}$ in. diam.; receptacle small; corolla $\frac{1}{2}$ in. long. *Capsules* probably sessile.—Differs entirely from *Roxburgh's U. pilosa* in the fine pubescence, smaller size, petioled leaves, and calyx-teeth.

10. *U. ovalifolia*, *Roxb. in Wall. Cat. under* 6103 B. C. (*U. Gambier*); branches slender glabrous, leaves broadly elliptic-ovate or orbicular obtusely acuminate membranous opaque concolorous and quite glabrous on both surfaces, wrinkled when dry, stipules 2-fid, peduncles short slender all axillary bracteate near the base, flowers pedicelled, calyx-lobes small round, corollas small uniformly pubescent, capsules very slender. ? *U. ovalifolia*, *Roxb. Fl. Ind. i.* 128.

PENANG. *Porter*. SINGAPORE, *Wallich, T. Anderson*. MALACCA, *Griffith* (Kew Distrib. 2758, 2759, an abnormal state), *Cuming* (n. 2292).

Branches slender. *Leaves* 2-3 by $1\frac{1}{2}$ - $2\frac{1}{2}$ in., red-brown and quite opaque when dry; nerves about 5 pair, very slender; petiole slender, base rounded, rarely subcordate. *Peduncles* $\frac{1}{2}$ -1 in., slender, pubescent; bracts orbicular. *Heads* $\frac{3}{4}$ in. diam.; calyx villous, lobes very distinct and almost orbicular; corolla $\frac{1}{2}$ in., very slender. *Capsules* $\frac{1}{2}$ - $\frac{3}{4}$ in., twice as long as the filiform pedicels, rusty-puberulous.—A very distinct species, easily recognised by the broad thin quite glabrous wrinkled (when dry) leaves with faint nerves, the 2-fid stipules, small flowers, calyx, and very slender capsules. It is one of the 6 species included under Wallich's *U. Gambier* (n. 6103), and under letter B. is called '*U. Gambier* et *U. ovalifolia*, Roxb. Hb. 1824.' I do not find the peduncles to be 'axillary and terminal, compound,' as described by Roxburgh.

11. **U. dasyoneura**, Korth. *Verh. Nat. Gesch. Bot.* 169; branches 4-angled glabrous, leaves elliptic obtusely acuminate narrowed into the rather long petiole shining above, nerves 4-5 pair strong with scattered hairs beneath, stipules entire, peduncles short all axillary bracteate about the middle, flowers subsessile, calyx shortly 5-toothed, corolla puberulous. *Miq. Fl. Ind. Bat.* ii. 143. *U. elliptica*, Br. in Wall. *Cat.* 6104, A. in part, B.

PENANG, Porter, Phillips. MALACCA, Griffith (Kew Distrib. 2756, *U. brevispina* ?), Maingay (Kew Distrib. 827/2, *U. acida*). SINGAPORE, Lobb (No. 331).

Leaves very uniform, 3- $3\frac{1}{2}$ by 2- $2\frac{1}{2}$ in., coriaceous, dark brown, veins very faint beneath; petiole $\frac{3}{4}$ in. *Peduncles* generally shorter than the petioles; bracts ovate-lanceolate, glabrous. *Heads* 1 in. diam.; calyx shortly tomentose, limb a small very shortly toothed cup; corollas slender. *Capsules* slender, 1 in., on filiform pedicels.—There are three plants under Wallich's 6104 A., of which this is the principal; No. 6104 B., from Herb. Finlayson (probably from Siam), has rather more obovate leaves.

VAR. *Thwaitesii*; leaves sometimes almost glabrous beneath, flowers and fruit more tomentose and ferruginous. *U. Gambier*, *Thwaites Enum.* 138, not of Roxburgh.—Ceylon; at Colombo, &c., in the central provinces, alt. 3000 ft.

*** *Calyx-tube very short, lobes oblong or linear or filiform, corolla glabrous or pubescent.*

12. **U. Gambier**, Roxb. *Fl. Ind.* i. 517: leaves ovate or ovate-lanceolate obtusely subcaudate or acuminate glabrous on both surfaces, base rounded or acute not glaucous beneath, nerves 5 pair, peduncles all axillary bracteate in the middle flowers pedicelled, calyx-lobes oblong, corolla-tube puberulous lobes white silky externally and with a white beard within. Korth. *Verh. Nat. Gesch. Bot.* t. 34; Wall. *Cat.* 6103, A. E. C. in part, and 6107 (*U. macrophylla*) in part; Hayne *Arzn. Gesch.* x. t. 3. ? *Nauclea Gambier*, Hunter in *Trans. Linn. Soc.* ix. 218, t. 22; Fleming in *Asiat. Researches*, xi. 187.

HAB. MALACCA, PENANG, and SINGAPORE (wild or cultivated).—DISTRIB. Java, Sumatra.

It is impossible to pronounce, from the descriptions of Rumph and Hunter, what they intended by their 'Gambier.' I have assumed that Roxburgh's is the right plant, both from his accuracy, and because I find that Maingay's specimens marked as 'the cultivated plant of commerce' agree both with Roxburgh's description and with the specimen in Wallich's Herbarium (6103 A.), which bears Roxburgh's ticket of *Gambier*. Its characters are, in addition to those given above, leaves coriaceous, 4-5 by 2- $2\frac{1}{2}$ in., always glabrous beneath except small tufts of hairs in the nerve-axils, hardly shining above; stipules entire; peduncles rarely more than an inch long; heads $1\frac{1}{2}$ in. diam.; calyces tomentose; corollas $\frac{1}{2}$ in. long with the orbicular white silky lobes contrasting strongly when dry with the dark tube, the lobes inside bearded towards the base with white hairs (rarely absent): and glabrous fusiform capsules $\frac{3}{4}$ in. long on short pedicels. The tuft of white hairs on the corolla-lobes is not represented in Roxburgh's *Icones*, though described by him.

13. **U. jasminiflora**, Wall. Cat. 6103 C. F.; branches glabrous or puberulous, leaves elliptic obtusely acuminate glabrous base acute coriaceous, nerves 4-5 pair very slender, peduncles all axillary bracteate about the middle, flowers shortly pedicelled, calyx tomentose, lobes linear-oblong longer than the tube, corolla pubescent, capsules pedicelled almost glabrous.

MALACCA, Griffith (Kew Distrib. 2766), Maingay (Kew Distrib. 832). SINGAPORE, T. Anderson; Hb. Finlayson, Wallich.

A very distinct species, well-marked by the elliptic perfectly glabrous leaves narrowed into the petiole, and the linear-oblong calyx-lobes. I have seen neither stipules nor bracts.—Leaves 2-3 by $1\frac{1}{2}$ -2 in., somewhat shining above, opaque beneath veins very inconspicuous; petiole slender, $\frac{3}{4}$ in. Heads $1\frac{1}{2}$ in. diam. Capsules turgid, $\frac{1}{2}$ in., on very slender pedicels.—Maingay's specimens are very pale coloured.

14. **U. pilosa**, Roxb. Fl. Ind. i. 520; branches peduncles and leaves beneath tomentose with short hairs, leaves short-petioled oblong-ovate abruptly caudate-acuminate, above pilose or scaberulous and pubescent on the 8-10 pair of nerves, stipules 2-partite, peduncles all axillary very stout bracteate above the middle, calyx-lobes linear obtuse, corolla hairy, capsules obtuse sessile. Wall. Cat. 6108 A. B. Nauclea scandens, Smith in Rees. Cyclop.

TROPICAL HIMALAYA, alt. 1-2500 ft. from GARHWAL to SIKKIM. KHASIA MTS., J. D. H. & T. T. CHITTAGONG, Roxburgh, J. D. H. & T. T. BIRMA, Griffith (Kew Distrib. 2760); PEGU and TENASSERIM, Kurz.

A stout hairy species. Leaves 4-6 by 2-2 $\frac{1}{2}$ in., rather membranous, greenish when dry, base rounded; nerves rather delicate, veins distinct; petiole $\frac{1}{2}$ in.; stipule-segments lanceolate recurved. Peduncles stout, 1-3 in., tapering from the base; bracts on the upper $\frac{2}{3}$, about 6 in a whorl, linear-lanceolate. Heads $1\frac{1}{2}$ in. diam.; calyx-lobes equalling the tube, sometimes clavate, corolla-tube very slender. Capsules $\frac{1}{2}$ in., quite sessile, clavate, tipped by the long calyx-lobes, nearly glabrous.

15 **U. Roxburghiana**, Korth. in Verh. Nat. Gesch. Bot. 172; branches terete, peduncles and leaves on both surfaces strigose scabrid or hispid, leaves short-petioled ovate finely acuminate rigid, stipules 2-partite glabrous, peduncles short stout all axillary bracteate at the top, calyx-lobes linear-subulate, corolla glabrous, capsules sessile small.

MALACCA, Maingay (Kew Distrib. 831). SINGAPORE, T. Anderson.—DISTRIB. Sumatra.

A stiff scabrid species. Leaves 2 $\frac{1}{2}$ -3 by 1-1 $\frac{3}{4}$ in., rigid, paler beneath; nerves 5 pair, very stout, spreading; petiole $\frac{1}{2}$ in.; stipules large, broad, coriaceous, concave, subpersistent. Peduncles $\frac{1}{2}$ -1 in., tapering from the base; bracts close to the head, oblong, obtuse. Capsules $\frac{1}{4}$ in., quite sessile, strigose.

16. **U. macrophylla**, Wall. in Roxb. Fl. Ind. ed. Carey & Wall. ii. 132; Cat. 6107, in part; branches stout, leaves beneath and stout peduncles finely rusty-tomentose, leaves short-petioled broadly elliptic or elliptic-obovate or oblong acuminate above glabrous except on the 6 pair of nerves, stipules 2-partite, peduncles axillary and terminal bracteate near the top, calyx-teeth linear, corolla pubescent, capsules pedicelled. U. sessilifolia, Roxb. mss. in Wall. Cat.

BHOTAN and ASSAM, Griffith (Kew Distrib. 2763). KHASIA MTS., alt. 0-4000 ft. common. CACHAR, Keenan

A large stout species. Leaves 5-7 by 2 $\frac{1}{2}$ -4 in., rather coriaceous, opaque above, base cordate or rounded; nerves rather stout, oblique, not strongly curved; petiole $\frac{1}{2}$ in., stout; stipules small, segments ovate-lanceolate, pubescent. Peduncles 1 $\frac{1}{2}$ -2 $\frac{1}{2}$ in.; bracts near the head, 6 in a whorl, lanceolate, densely tomentose. Heads $1\frac{1}{2}$ in. diam., fruiting 3 $\frac{1}{2}$ in. diam.; flowers subsessile, tomentose; calyx-lobes equalling the

tube, narrow; corolla-lobes whiter than the tube. *Capsules* very numerous, $3\frac{1}{4}$ in., fusiform, beaked, shorter than the slender pedicels, nearly glabrous.—One sheet of Wallich's 6107 is *U. Gambier*, Roxb.; another is *U. ovata*.

17. **U. lanosa**, Wall. in Roxb. *Fl. Ind.*, ed. Carey & Wall. ii. 131; *Cat.* 6110; branches subterete hairy, leaves very short-petioled ovate-lanceolate finely acuminate slightly hairy above softly so beneath, stipules 2-partite, peduncles all axillary short bracteate in the middle, calyx-lobes long linear, capsules long-pedicelled glabrous. *Nauclea lanosa*, Poir. *Dict. Suppl.* iv. 64. *N. setigera*, Blume *Byd.* 1013.

PENANG, Wallich, Phillips.—DISTRIB. Sumatra, Malay Islands.

Slender. *Leaves* 3-4 by $1\frac{1}{2}$ -2 in., membranous, yellow-brown, opaque above when dry with scattered hairs or glabrate, paler beneath with soft appressed hairs, base acute or rounded; nerves 6 pair, very distinct, obliquely arching, transverse nerves very slender; petiole $\frac{1}{8}$ in.; stipular segments ovate-oblong, recurved, quite glabrous. *Peduncles* $\frac{1}{2}$ $\frac{3}{4}$ in., narrowed from the base; bracts 4, slender, recurved. *Heads* $\frac{2}{3}$ in. diam., in fruit 2 in.; receptacle very small and pedicels slightly hairy; calyx-lobes longer than the tube. *Capsules* fusiform, $\frac{1}{8}$ in., glabrous, on filiform pedicels twice their length, acute, hardly beaked.—I have seen no corollas. Wallich describes the tube as capillary, smooth, and the lobes as a little hairy.

18. **U. Lobbii**, Hook. f.; branches subterete glabrous, leaves short-petioled elliptic-ovate abruptly obtusely acuminate glabrous membranous, nerves 7 pair, stipules 2-fid, peduncles all axillary bracteate above the middle, calyx villous, lobes linear longer than the tube, corolla-tube glabrous, lobes pubescent.

SINGAPORE, Lobb (n. 332).

Slender, very glabrous. *Leaves* 3-3 $\frac{1}{2}$ by $1\frac{1}{2}$ -1 $\frac{3}{4}$ in., green when dry, shining above, almost so beneath; nerves slender, arching upwards, with minute axillary tufts and a few scattered hairs; petiole slender, $\frac{1}{8}$ in.; stipules membranous, reflexed. *Peduncles* narrowed from the base, shining; bracts 6, large, ovate, acuminate, membranous, reflexed. *Heads* 1 in.; flowers sessile.

19. **U. ferrea**, DC. *Prodr.* iv. 348; branches subterete, peduncles and petioles and leaves beneath densely tomentose or villous, leaves short-petioled ovate or elliptic-ovate obtusely acuminate with scattered hairs and tomentose on the 8-9 pair of nerves above, stipules 2-fid and large bracts tomentose, peduncles all axillary bracteate above the middle, calyx hirsute, lobes very long filiform, corolla glabrous, capsules slender long-pedicelled. *Nauclea ferrea*, Blume *Byd.* 1014.

MALAY PENINSULA, from Mergui, Griffith (Kew Distrib. 2762), Helfer (Kew Distrib. 2761), to MALACCA, Maingay (Kew Distrib. 830).—DISTRIB. Sumatra, Java, Borneo.

Rather robust and very hairy. *Leaves* 3-4 $\frac{1}{2}$ by 2-2 $\frac{1}{2}$ in., rather coriaceous, rusty-brown above when dry, paler beneath, base rounded, nerves strong spreading, transverse ones distinct; petiole $\frac{1}{8}$ in.; stipules broad, recurved. *Peduncles* 1-1 $\frac{1}{4}$ in., narrowed upwards; bracts 4-6, nearly $\frac{1}{2}$ in., ovate, acuminate. *Heads* 2 in. diam., fruiting not much larger; flowers subsessile; calyx-tube much shorter than the lobes. *Capsules* $\frac{1}{8}$ in., fusiform, shorter than the pedicels, acuminate, hairy.—*U. Horsfieldiana*, Miq., is a variety with leaves less hairy beneath. Cuming's 1128, from the Philippines, is a closely allied species with much smaller bracts and stipules.

DOUBTFUL SPECIES.

U. ACIDA, Roxb. *Fl. Ind.* i. 520. *Nauclea acida*, Hunter in *Trans. Linn. Soc.* ix. 223. It is impossible from Hunter's or Roxburgh's descriptions to say to what

species this name applies; it is a native of Penang, and stated to have acid foliage. Wallich does not include it in his Catalogue. Miquel (*Fl. Ind. Bat.* ii. 145) records it as a native of Sumatra, Java, Borneo, and the Moluccas, and from his allusion to its often monstrous state from Borneo he probably refers to it the *U. ovalifolia*.

U. CIRRHIFLORA, Roxb. *Fl. Ind.* i. 520, doubtfully referred in *Fl. Ind.*, ed. Carey & Wall. ii. 129 to *U. pedicellata*, is not determinable.

TRIBE II. CINCHONEÆ.

8. HYMENOPOGON, Wall.

An epiphytic undershrub. *Leaves* petioled, deciduous; stipules large, persistent, with fleshy axillary bristles. *Flowers* rather large, corymbose, white; corymbs with large white leafy reticulated bracts. *Calyx-lobes* elongate, persistent. *Corolla-tube* long, limb salver-shaped, throat with reflexed hairs; lobes 5, valvate in bud. *Stamens* 5, inserted below the throat, filaments short; anthers linear, included. *Ovary* 2-celled; style filiform, 2-grooved, stigmas 2 linear; ovules many, subulate, imbricate on peltate placentas. *Capsule* crowned with the calyx, septicidally 2-valved, many-seeded. *Seeds* imbricate, linear, with long tails at each end, hilum lateral; embryo minute in copious albumen. —DISTRIB. 2 Indian species.

1. *H. parasiticus*, Wall. in Roxb. *Fl. Ind.*, ed. Carey & Wall. ii. 157; *Pl. As. Rar.* iii. t. 227; *Cat.* 6113; leaves elliptic-lanceolate or oblanceolate acuminate, corymbs shorter than the leaves, flowers pedicelled, corolla-lobes villous. *Kurz For. Fl.* ii. 73. *Mussaenda cuneifolia*, Don *Prodr.* 139.

TEMPERATE HIMALAYA, from Kumaon to Bhotan, alt. 6–8000 ft., Wallich. &c. KHASIA Mts., alt. 4–6000 ft. PEGU, alt. 3000 ft., Kurz.

A small straggling often epiphytic shrub. *Stem* curved, rooting, shoots villous. *Leaves* at the ends of the branches, 3–12 by 2–4 in., membranous, narrowed into the short petiole, midrib broad, nerves about 20 pair; stipules ovate, acute. *Corymbs* 3-chotomous; peduncle 2–3 in.; bracts at the axils stipule-like, those at the pedicels foliaceous, long-petioled, 3–4 in. long, narrow oblong, obtuse or acute, finely reticulated. *Calyx-lobes* linear. *Corolla* $1\frac{1}{2}$ in. *Capsule* membranous, turbinate.

2. *H. assamicus*, Hook. f.; leaves elliptic-lanceolate finely acuminate, corymbs longer than the leaves, flowers subsessile, corolla-lobes glabrous.

ASSAM, Masters (*Herb. Hort. Bot. Calc.*).

Stem as in *H. parasiticus*. *Leaves* 5–10 by 2–2½ in., subfalcate, narrowed into the shorter pubescent petiole, glabrous, midrib slender, nerves 30–40 pair; stipules ovate, acuminate. *Peduncle* slender, 5 in., with the rachis 8 in.; branches long, slender; bracts at the axils whorled, ovate, acute, at the pedicels petioled foliaceous lanceolate acute. *Calyx-lobes* broadly ovate. *Corolla* $\frac{3}{4}$ in.

9. COPTOSAPelta, Korth.

Climbing tomentose shrubs. *Leaves* coriaceous; stipules small, triangular, deciduous. *Flowers* in terminal pendulous panicles, buds angular. *Calyx-tube* turbinate or subglobose; teeth 5, short, persistent. *Corolla* coriaceous, tube very short; lobes 5, linear, twisted in bud. *Stamens* 5, on the throat of the corolla; filaments short, subulate; anthers elongate, 2-fid at the base, back hairy. *Ovary* 2–3-celled; style short; stigma long fusiform, with 4 pubescent angles; ovules many, ascending, placentas on the septum. *Capsule* 2–3-celled,

loculicidally 2-3-valved. *Seeds* many, peltate, imbricate, winged; embryo straight in fleshy albumen.—**DISTRIB.** Species 4, all Malayan.

1. ***C. flavescens***, *Korth. in Ned. Kruidk. Arch.* ii. 113; branches inflorescence and leaves beneath softly tomentose or glabrate, leaves elliptic acuminate, calyx-limb short small, corolla tube silky lobes glabrous. *Stylodyne macrophylla*, *Wall. Cat.* 8405, *excl. syn.* *Webera macrophylla*, *Roxb.*

MALAYAN PENINSULA, from Tenasserim to Singapore and Penang, *Porter, Griffith* (Kew Distrib. 2708), *Maingay* (Kew Distrib. 908).—**DISTRIB.** Sumatra, Java, Borneo.

A shrub, branches terete. *Leaves* coriaceous, 3-4 by 2 in., shining above, green when dry, nerves 3 or 4 pair prominent beneath; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Flowers* 1 in. diam., fragrant. *Calyx-limb* short, lobes oblong. *Corolla-tube* $\frac{1}{4}$ in.; lobes twice as long, linear, obtuse. *Capsule* $\frac{1}{2}$ in. diam.

2. ***C. Griffithii***, *Hook. f. Ic. Pl.* t. 1089; branches inflorescence and leaves beneath softly tomentose or glabrate, leaves elliptic or orbicular acuminate, calyx-limb cupular, corolla-tube and lobes silky.

MALACCA and SINGAPORE, *Griffith* (Kew Distrib. 2789), *Maingay* (Kew Distrib. 907).

Very similar to *C. flavescens* in foliage, but more tomentose, calyx-limb larger almost inflated, corolla-tube shorter and much broader, and together with the lobes very silky; fruit and seeds all larger.

10. **HYMENODICTYON**, *Wall.*

Trees or shrubs with thick branches and bitter bark. *Leaves* petioled, deciduous; stipules deciduous. *Flowers* small, spicate; spikes in axillary and terminal nodding panicles with 1 or 2 large leafy reticulate persistent bracts. *Calyx-tube* short; lobes 5-6, ovate or subulate, deciduous. *Corolla* funnel- or bell-shaped, glabrous within; lobes 5, short, valvate in bud with everted margins. *Stamens* 5, inserted below the throat, filaments short dilated upwards; anthers linear. *Ovary* 2-celled; style filiform, stigma spindle-shaped; ovules numerous, on cylindric placentas adnate to the septum. *Capsule* loculicidally 2-valved, many-seeded; placentas at length free. *Seeds* imbricating upwards, testa broadly winged; embryo small, in fleshy albumen.—**DISTRIB.** Species 4-5 tropical Asiatic and African.

1. ***H. excelsum***, *Wall. in Roxb. Fl. Ind., ed. Carey & Wall.* ii. 149; leaves ovate elliptic or almost orbicular abruptly acuminate finely pubescent on both surfaces, stipules subentire, panicles large spreading compound. *W. & A. Prodr.* 392; *Wt. Ic.* t. 79; *Dalz. & Gibs. Bomb. Fl.* 117; *Brand. For. Fl.* 267. *H. thyrsoflorum*, *Wall. l. c.* 151; *Cat.* 6114 and 6115 D. (*flaccidum*); *Kurz For. Fl.* ii. 72. *H. utile*, *Wight Ic.* t. 1159 (*letterpress*); *Bedd. Fl. Sylv.* 130, t. 219, *A. only.* *H. obovatum*, *Wt. Ic.* t. 80 (*copied from Roxburgh*). *H. Horsfieldianum*, *Miq. Fl. Ind. Bat.* ii. 154. *Cinchona excelsa*, *Roxb. Cor. Pl.* t. 106; *Fl. Ind.* i. 529. *C. thyrsoflora*, *Roxb. Hort. Beng.* 15; *Fl. Ind.* i. 530.

Dry hills, base of the WESTERN HIMALAYA from Garwhal to Nepal, ascending to 2500 ft., throughout the DECCAN and Central India to the Annamallays; and in TENASSERIM and CHITTAGONG.—**DISTRIB.** JAVA.

A deciduous tree, 30-40 ft., with smooth bark. *Leaves* 4-10 by 3-5 in.; mem-

branous, narrowed into a petiole 1-3 in., nerves 7-10 pair; stipules broad, recurved, usually glandular-serrate. *Panicles* large, pubescent often drooping; floral leaves long-petioled, 3-5 in., strongly nerved. *Flowers* small, white, pedicelled, clustered. *Calyx* $\frac{1}{2}$ in. *Corolla* $\frac{1}{2}$ in. *Capsules* on thick decurved pedicels, $\frac{2}{3}$ in. long, ellipsoid.

2. **H. flaccidum**, Wall. in Roxb. *Fl. Ind.*, ed. Carey & Wall. ii. 152; (at. 6115 A. C.; *Tent. Fl. Nap.* t. 22; *Pl. As. Rar.* ii. 81, t. 188; leaves elliptic abruptly acuminate glabrous or puberulous only on the nerves beneath, racemes spiciform nearly simple, capsules deflexed. *Brand. For. Fl.* 268.

TEMPERATE HIMALAYA, alt. 3-6000 ft., from Garwhal to Bhotan frequent. KHASIA Mts., alt. 4-5000 ft.

A deciduous tree, with ashy bark, young often epiphytic. *Leaves* 5-8 by 3-6 in., narrowed into the petiole of 1-4 in., nerves 7-8 pair; stipules broadly obovate oblanceolate or ovate, glandular-serrate. *Racemes* 4-10 in., pubescent, curved, dense-flowered; peduncle 1-3 in.; floral bracts as in *H. excelsum*, white, convex. *Flowers*: subsessile, white. *Calyx* $\frac{1}{2}$ in. *Corolla* about twice as long. *Capsules* $\frac{1}{2}$ in. long, ellipsoid.

3. **H. obovatum**, Wall. in Roxb. *Fl. Ind.*, ed. Carey & Wall. ii. 153; *Cat.* 6116; leaves elliptic or broadly obovate abruptly acuminate glabrous or pubescent beneath, racemes spiciform, capsules erect. *W. & A. Prodr.* 392; *Wt. Ic.* t. 1159; *Dalz. & Gibs. Bomb. Fl.* 117; *Bedd. Fl. Sylv.* t. 219; *Brand. For. Fl.* 268.

WESTERN PENINSULA, from Bombay to Travancore, on the Ghauts, frequent.

In its extreme form, with broadly obovate leaves, from the southern part of the Peninsula, this looks very different from *H. flaccidum*; but specimens from the Concan almost unite them; but both specimens from the Bababoodan hills, with elliptic leaves, and Wight's figured from Coimbatore, with broadly obovate ones, have erect capsules, which I have not observed in any specimen of *H. flaccidum*. The differences in the length, &c., of the anthers and filaments are probably sexual.

11. LUCULIA, Sweet.

Shrubs. *Leaves* petioled; stipules cuspidate, deciduous. *Flowers* rosy or white, in terminal many-fld. corymbs, odorous; bracteoles deciduous. *Calyx-lobes* 5, elongate, unequal, linear-oblong, deciduous. *Corolla* salver-shaped, tube long; lobes 5, simple or with 2 calli at the base, imbricate in bud. *Stamens* 5, in the tube of the corolla, filaments very short; anthers linear. *Ovary* 2-celled; style slender, stigmas 2 linear included; ovules many, on 2 revolute longitudinal placentas in each cell. *Capsule* almost woody, septicidally 2-valved, many-seeded. *Seeds* minute, imbricate upwards, testa rough winged toothed; embryo minute in fleshy albumen.—DISTRIB. 2 Indian species.

1. **L. gratissima**, Sweet *Brit. Fl. Gard.* t. 145; leaves oblanceolate lanceolate or elliptic-lanceolate acuminate, nerves usually spreading, inflorescence pubescent, corolla-lobes without interposed tubercles. *Kurz For. Fl.* ii. 71; *Hook. Bot. Mag.* 3946. *Cinchona gratissima*, Wall. in Roxb. *Fl. Ind.*, ed. Carey & Wall. ii. 154; *Tent. Fl. Nap.* t. 21; *Cat.* 6117 A. *Mussaenda Luculia*, Ham. in *Don Prodr.* 139.

TEMPERATE HIMALAYA, from Nipal to Bhotan, not frequent, alt. 4-6000 ft. *Wallich*, &c.—DISTRIB. Ava (*Kurz*).

A spreading shrub, 10-16 ft.; branches lenticellate. *Leaves* membranous or coriaceous, 6-9 by 2-4 in., very variable in breadth, sometimes pubescent beneath, acuminate, narrowed into the petiole; nerves 9-12 pair. *Corymbs* sometimes 8 in. diam, very many flowered; flowers 3-nate, pink, shortly pedicelled. *Calyx-tube* $\frac{1}{4}$ in.,

limb twice as long, glabrous or pubescent. *Corolla-tube* 1-1½ in., lobes 1½ in. across. *Capsule* ½-⅔ in., obovoid, apparently very variable; in Nipal specimens obovoid ½ by ⅓ in., in Bhotan ones ¾ by ¼ in.

2. **L. Pinceana**, Hook. Bot. Mag. t. 4132; leaves elliptic-lanceolate acuminate, nerves suberect, inflorescence glabrous, corolla-lobes with interposed pairs of tubercles at their bases. *L. gratissima*, Wall. Cat. 6117 B.

KHASIA MTS., Mrs. Mack, &c., alt. 3-5000 ft. MISHMI HILLS, Griffith.

A bush 4-5 ft., very similar to *L. gratissima*, but with leaves smaller, narrower, more coriaceous with more numerous (12-14 pair of) nerves which are more straight and ascending. The inflorescence is quite glabrous, calyx-lobes larger, corolla-tube 1½-2 in., and lobes nearly 2 in. across, with a pair of raised tubercles one on each side of the sinus. *Capsule* ⅓-½ in. and broadly obovoid in Khasian specimens, very much larger, nearly 1 in. long with strongly ribbed valves in Mishmi ones.

TRIBE III. RONDELETIÆ.

12. WENDLANDIA, Burtl.

Shrubs or small trees. *Leaves* opposite or ternately whorled; stipules entire or 2-fid. *Flowers* small, rosy or white, in terminal dense thyrsoid or paniced cymes, 2-3-bracteolate. *Calyx-lobes* 4-5, subequal, small, persistent. *Corolla* tubular- salver- or funnel-shaped, throat glabrous or hairy; lobes 4-5, imbricate in bud. *Stamens* 4-5, between the corolla-lobes, filaments 0 or elongate; anthers versatile, exserted. *Ovary* 2- (rarely 3-) celled; style filiform, stigma entire 2-fid or 2-partite: ovules numerous, on small globose placentas adnate to the septum. *Capsule* small, globose, loculicidally, rarely septicidally 2-valved, many-seeded. *Seeds* very minute, horizontal, compressed, testa membranous obscurely winged; embryo short, cylindric, in fleshy albumen.—**DISTRIB.** Species about 16, tropical Asiatic.

A. Leaves opposite.

* *Corolla-tube* short, not twice the length of the oblong lobes; anthers large, much exserted. *Stipules* persistent or caducous.

1. **W. exserta**, DC. Prodr. iv. 411; softly tomentose or pubescent all over, leaves opposite ovate-lanceolate glabrate above finely acuminate, stipules persistent recurved, calyx hairy lobes ovate or subulate, corolla-tube shorter than the lobes, stigma 2-partite. *W. & A. Prodr.* 402; *Wall. Cat.* 6267 A. C. D. E. F. in part; *Bedd. Fl. Sylv.* 130; *Brand. For. Fl.* 268. *W. cinerea*, Wall. Cat. 6268; DC. Prodr. iv. 412. *Rondeletia exserta*, Roxb. Hort. Beng. 14; *Fl. Ind.* i. 523. *R. cinerea*, Wall. in Roxb. Fl. Ind., ed. Carey & Wall. ii. 141. *R. thyrseiflora* and *orissensis*, Roth Nov. Gen. & Sp. 142. *R. Heynei*, Roem. & Sch. Syst. v. 234.

Dry forests of the TROPICAL HIMALAYA, from the Chenab eastward to Nipal and Sikkim, ascending to 4000 ft. ORISSA, CENTRAL INDIA, N. DECCAN, and CONCAN.

A small crooked tree; branches terete. *Leaves* coriaceous, 4-9 by 1-3½ in.; nerves 10-18 pair, arched; stipules ovate, acute, recurved. *Panicles* sessile, pyramidal, 6-10 in. broad and long. *Flowers* ½ in. diam., white, fragrant, sessile. *Stamens* nearly as large as the corolla-lobes. *Capsule* ⅓ in. diam., white, tomentose.

2. **W. puberula**, DC. Prodr. iv. 412; leaves opposite elliptic-lanceolate acuminate glabrous except the nerves above slightly hairy chiefly on the nerves beneath, stipules persistent erect, panicle pubescent, calyx hairy, lobes triangular

or subulate, corolla-lobes shorter than the tube. *Wall. Cat.* 6270. *W. scabra*, *Kurz in Journ. As. Soc. Beng.* 1877, ii. 310. *W. appendiculata*, *Wall. mss.*

Dry forests of the TROPICAL HIMALAYA from Gurwhal to Nipal, alt. 0–4000 ft., *Wallich, &c.* *AVA, Kurz.*

Habit of *W. exserta*, but with smaller (4–6 by 2–3 in.) nearly glabrous elliptic leaves, which are more membranous, with fewer (10–12 pair) of nerves, and longer calyx-tubes often smaller panicles and nearly glabrous capsules; stipules very variable.

3. **W. Wallichii**, *W. & A. Prodr.* 402, in note; branches glabrous or puberulous, leaves opposite elliptic or elliptic-lanceolate acuminate at both ends glabrous or puberulous on the nerves beneath, stipules very caducous broad rounded, panicle pubescent, calyx glabrous teeth short triangular, corolla-tube a little longer than the lobes. *Wall. Cat.* 6269 B., in part (*tinctoria*).

SIKKIM HIMALAYA, alt. 2000 ft., *J. D. H.* KHASIA Mts., alt. 4000 ft.; *De Silva, &c.*, *Griffith* (Kew Distrib. 2834).

An erect nearly glabrous shrub; branches swollen at the nodes when dry. *Leaves* 3–7 by $1\frac{1}{2}$ – $2\frac{1}{2}$ in., rather coriaceous; nerves 10–12 pair, prominent beneath; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in.; stipules so deciduous that I found only one in ten specimens, it is imperfect, broad, and apparently acute. *Panicle* moderate. *Flowers* like those of *W. puberula*.

** *Corolla-lobes rounded or shortly oblong, much shorter than the usually slender tube; anthers included or exserted. Stipules more or less persistent.*

† *Calyx-teeth shorter than the tube.*

4. **W. tinctoria**, *DC. Prodr.* iv. 411; leaves opposite elliptic ovate or obovate acuminate glabrous or pubescent beneath, stipules erect large with a subulate point or a laterally flattened rigid appendage, calyx-teeth ovate. *Brand. For. Fl.* 269; *Kurz For. Fl.* ii. 74; *Bedd. Fl. Sylv.* t. 130. *Rondeletia tinctoria*, *Roxb. Hort. Beng.* 15; *Fl. Ind.* i. 522.

TROPICAL HIMALAYA, from GARWHAL and from BENGAL and OUDH, to the KHASIA Mts., ASSAM, CHITTAGONG, PEGU, and TENASSERIM.—DISTRIB. JAVA? *AVA.*

A small tree. *Leaves* 4–8 by 2–4 in., always narrowed into the petiole, glabrous and often shining above, paler rarely glabrous beneath, oftener pubescent on the nerves, sometimes tomentose all over; nerves 10–12 pair; petiole $\frac{1}{2}$ – $\frac{3}{4}$ in. *Stipules* variable in length, always with erect points. *Panicles* large, spreading, pubescent pilose or tomentose; flowers sessile, fascicled, white, $\frac{1}{4}$ in. long; corolla-tube usually slender, the lobes forming a capitate not ovoid head; anthers shortly exserted. *Stigmas* oblong.—There are two principal forms.

VAR. 1. normalis; leaves 3–5 by 2– $2\frac{1}{2}$ in. elliptic more or less pubescent beneath, petiole $\frac{1}{4}$ in., panicle tomentose. *Wall. Cat.* 6267; (*exserta*) *F.* in part, 6269 D., 6269 D. 3. *W. proxima*, *DC. Prodr.* iv. 411. *Rondeletia proxima*, *Don Prodr.* 139.

VAR. 2. grandis; leaves 5–7 by 2– $3\frac{1}{2}$ in. elliptic perfectly glabrous, petiole $\frac{1}{2}$ – $\frac{3}{4}$ in., panicle tomentose. *Wall. Cat.* 6266 B. A. (*paniculata*), the lower specimen only, 6269 A. *W. budleoides*, *Wall. mss. in W. & A. Prodr.* i. 402.—Khasia and Jyntea hills, *Wallich, &c.*; Naga hills, *Griffith*; Sikkim, *Herb. Griffith*; Assam, *Jenkins*.

5. **W. nitens**, *Wall. Cat.* 6271; robust, leaves opposite elliptic-oblong obtuse coriaceous shining above glabrous or puberulous on the nerves beneath, stipules erect very short triangular or broadly reniform apiculate, panicle pubescent, flowers in glomerules, calyx hairy, teeth short triangular.

TENASSERIM, Attran river. *Wallich, Helfer* (Kew Distrib. 2380).

Branches robust, glabrous. *Leaves* 4–5 by $1\frac{1}{2}$ –2 in., rarely obovate or subacute, nerves 6–8 in *Helfer's* specimen, 8–12 in *Wallich's*. *Panicle* robust. *Corolla* slender, lobes very small.—This may be a form of *W. tinctoria*, with which it is perhaps

united by a plant of Griffith's (Kew Distrib. 2835) from Menkroom, in Birma, with elliptic-lanceolate acuminate leaves, and much more pubescent panicles.

6. **W. glabrata**, DC. *Prodr.* iv. 411; glabrous or with the branches, leaves beneath and panicle minutely pubescent, leaves opposite petioled elliptic-lanceolate subacute obtuse or obtusely acuminate shining above, stipules erect small triangular cuspidate or acuminate, calyx glabrous, teeth minute triangular. *Kurz For. Fl.* ii. 74. *W. Heyneana*, Wall. in *W. & A. Prodr.* 403; *Cat.* 6274. *W. sumatrana* and *W. lævigata*, Miq. *Fl. Ind. Bat.* ii. 159, 346. *Rondeletia tinctoria*, Blume *Bijd.* 974.

MAISOR, Heyne; TENASSERIM, Griffith (Kew Distrib. 2836), Helfer (Kew Distrib. 2831 and 2832).—DISTRIB. Yunan, Malay Islands, Formosa.

A shrub or small tree. Leaves of the form, &c., of *W. tinctoria*, always glabrous except sometimes the midrib beneath, panicle glabrous or minutely puberulous (more so in *W. lævigata*, Miq.), flowers as in *W. tinctoria*, but calyx always glabrous with very short teeth. No one has sent this plant from Western India but Rottler, whose specimens (in Herb. Kew) are marked "Nundry dr, Mars 17, 1806." A single specimen from Parish has 3-nately whorled leaves.

W. tenuiflora, Miquel mss., appears a form with the slender branches of the panicle covered with empty bracteoles.

7. **W. coriacea**, DC. *Prodr.* iv. 412; everywhere quite glabrous, leaves opposite coriaceous petioled narrowly lanceolate finely acuminate shining above, stipules erect very short and broad with an erect laterally compressed appendage, panicles very many and dense-fld., calyx glabrous, teeth short. *Wall. Cat.* 6279. *Rondeletia coriacea*, Wall. in *Roxb. Fl. Ind.*, ed. Carey & Wall. ii. 142.

TROPICAL HIMALAYA; Nipal, Wallich; Sikkim, alt. 2-4000 ft., J. D. H.

A small tree or large shrub. Leaves 5-6 by $1\frac{1}{2}$ -2 in., coriaceous, pale when dry, narrowed into a petiole $\frac{1}{2}$ in.; nerves about 10 pair, very delicate. Panicles 4-5 in. high and broad, branches flowering all over. Flowers sessile, $\frac{1}{2}$ in. long. Calyx-teeth triangular or ovate-lanceolate. Corolla-tube slender, lobes broadly oblong. Anthers shortly exserted, stigmas short.—This differs from *glabrata* in the longer narrower coriaceous leaves with faint nerves and finely acuminate points and the larger flowers.

8. **W. paniculata**, DC. *Prodr.* iv. 411; leaves opposite elliptic or elliptic-lanceolate acuminate more or less pubescent beneath, stipules recurved broad orbicular or oblong with tips rounded, panicle spreading villous, calyx-teeth rounded. *Wall. Cat.* 6266 A. (*upper specimen only*); 6269 (*tinctoria*), B. in part; 6267 (*exserta*), B. in part. *W. luzoniensis*, DC. l. c., 412. *Rondeletia paniculata*, Roxb. *Hort. Beng.* 15; *Fl. Ind.* i. 521. *Gardenia Burha*, Ham. in *Wall. Cat.* 8298.

ASSAM, SILHET, and KHASIA Mts., alt. 0-4000 ft. BIRMA, Griffith (Kew Distrib. 2837).—DISTRIB. Java, Moluccas.

A tree. Leaves usually large, 5-8 by 2-4 in., membranous, usually tapering to both ends, rarely narrowly obovate, nerves 8-10 pair, petiole usually $\frac{1}{2}$ - $\frac{3}{4}$ in.; stipules coriaceous, pubescent. Panicle ample. Flowers as in *W. tinctoria*.

†† Calyx-teeth longer than the tube.

9. **W. ligustrina**, Wall. *Cat.* 6272; branches slender glabrous, leaves opposite elliptic or elliptic-ovate acute glabrous or puberulous on the nerves beneath, petiole rather long, stipules broadly triangular cuspidate, panicle lax pubescent, calyx glabrous, teeth filiform longer than the tube.

AVA; Taong-dong Mts., Wallich.

Much branched, leafy. Leaves 4-5 by 1-2 in., acute not acuminate, rather coriaceous, nerves 6-8 pair, petiole $\frac{1}{2}$ - $\frac{3}{4}$ in.; stipules appressed. Panicle-branches slender. Corolla-lobes oblong, half as long as the tube; stamens and styles much exserted.—

Wallich's specimen alone seen; well distinguished by the simply acute leaves and glabrous calyx with long teeth.

10. **W. glomerulata**, *Kurz in Journ. As. Soc.* 1872, ii. 310; 1877, ii. 129; *For. Fl.* ii. 77; branches slender glabrous, leaves opposite narrow-lanceolate long-acuminate glabrous membranous, stipules large orbicular recurved, panicle small pubescent, calyx hirsute, teeth much longer than the tube.

TENASSERIM; at Mergui, *Griffith, Helfer* (Kew Distrib. 2838), *Kurz*.

An evergreen small tree or shrub. *Leaves* 6-7 by $\frac{3}{4}$ - $1\frac{1}{4}$ in., much attenuate at both ends; nerves 12-15 pair; petiole $\frac{1}{4}$ -1 in.; stipules leafy, sometimes 2-fid, very persistent. *Panicle* with slender branches. *Corolla-tube* funnel-shaped, twice as long as the calyx-teeth. *Stamens* much exserted. *Capsule* hispid.—The narrow leaves, stipules, and hispid calyx with long teeth, well distinguish this species.

B. Leaves usually 3-nately whorled (see also 6. *W. glabrata*).

11. **W. Notoniana**, *Wall. in W. & A. Prodr.* 403; *Cat.* 6273, 6267 G. (*W. exserta*); robust tomentose except the leaves above, leaves usually 3-nately whorled rarely opposite short petioled elliptic or elliptic-lanceolate acuminate, stipules recurved with rounded or 2-fid. tips rarely straight and acute, panicle pyramidal hirsute dense-fid., calyx hirsute, teeth ovate-lanceolate. *Wt. Ic.* t. 1033; *Dalz. & Gibs. Bomb. Fl.* 117; *Bedd. Fl. Sylv.* t. 224. *Webera thyrsoides*, *Roth Nov. sp.* 149. *Canthium thyrsoides*, *Roem. Sch. Syst.* v. 207. *Ixora montana*, *Miq. in Herb. Hohen.* n. 336.

Hills of the DECCAN PENINSULA, alt. 2-6000 ft., common. CEYLON, hills of the central province, ascending to 7000 ft.

A shrub or small tree. *Leaves* 3-5 $\frac{1}{2}$ by 2 $\frac{1}{2}$ in., coriaceous, rarely obovate, nerves 8-10 pair, strong beneath, not shining above, pale when dry, petiole $\frac{1}{8}$ - $\frac{1}{4}$ in.; stipules variable, usually smaller than in *W. tinctoria*. *Flowers* reddish-white (Wight), odorous. *Calyx* hairy, teeth variable in length.—This is the southern representative of *W. tinctoria*.

VAR. 1. *bicuspidata*; leaves nearly glabrous longer petioled, stipules entire or 2-fid or divided into 2, calyx glabrous or hairy, teeth short obtuse. *W. bicuspida*, *W. & A. Prodr.* 403.—Mts. of Travancore and Ceylon.

VAR. 2. *zeylanica*; leaves nearly glabrous lanceolate narrowed into a slender petiole, panicle pubescent very large and lax with long filiform spreading and drooping branches, flowers scattered sessile and on slender pedicels, calyx quite glabrous, teeth very minute.—Ceylon, *Thwaites*.

12. **W. Lawii**, *Hook. f.*; branches and inflorescence tomentose, leaves ternately whorled lanceolate obtuse pubescent on the nerves beneath, stipules broadly triangular acute, panicles very large, branches 3-nate very slender erect, flowers often long pedicelled, calyx hairy lobes filiform longer than the tube.

MAISOR; on the Bababoodan hills, *Law*.

Branches slender. *Leaves* (upper alone seen) 3-4 by 1 in., quite glabrous above, paler and almost shining beneath, nerves 8-9 pair, strong; petiole $\frac{1}{4}$ in.; stipules short, broad. *Panicle* a foot long, softly downy with white hairs. *Branches* very long and slender, forming a rather flat-topped corymb. *Flowers* laxly scattered, mixed with subulate or linear bracteoles, most of which are not floriferous. *Calyx-teeth* variable, sometimes short. *Corolla-tube* $\frac{1}{8}$ in., very slender.—Closely allied to *W. Notoniana*, differing in the form of the panicle and calyx-teeth.

13. **W. angustifolia**, *Wight mss.*; everywhere glabrous, leaves ternately whorled narrowly linear-lanceolate acute, stipules triangular-ovate acute, panicle slender pyramidal, calyx-teeth short subulate.

TINNEVELLI; at Coetallum, *Wight*.

Branches rather slender. *Leaves* 3-4 by $\frac{1}{3}$ - $\frac{2}{3}$ in., narrowed into the short petiole, coriaceous, not shining, midrib strong, nerves about 8 pair very slender; stipules persistent. *Panicle* leafy below. *Flowers* rather crowded, often pedicelled. *Corolla-tube* slender, $\frac{1}{8}$ in.; lobes almost orbicular, small. *Anthers* shortly exserted. *Stigma* shortly clavate, entire or 2-fid.—A very distinct species.

14. **W. pendula**, DC. *Prodr.* iv. 412; branches and inflorescence pubescent, leaves 3-nately whorled sessile ovate or ovate-lanceolate obtusely acuminate puberulous on the nerves beneath, stipules small very shortly triangular, panicle small, calyx glabrous, teeth lanceolate about equalling the tube. *Wall. Cat.* 6275.

NIPAL, *Wallich*; Pemmi river, alt. 4000 ft., *J. D. H.*

A shrub, branches slender. *Leaves* 3-4 by $1\frac{1}{4}$ - $1\frac{3}{4}$ in., thin, shining and reticulated above, base rounded or subacute, nerves 6-7 pair, petiole hardly any; stipules very inconspicuous. *Panicle* 4-6 in. long, branches stout. *Flowers* rathered clustered, often pedicelled. *Corolla-tube* $\frac{1}{8}$ in., slender, lobes oblong. *Stamens* shortly exserted; stigma clavate.—A most distinct species.

13. **GREENEA**, W. & A.

Shrubs. *Leaves* opposite or whorled in threes; stipules various. *Flowers* small, white, sessile in terminal paniced scorpioid cymes, bracteoles slender or 0. *Calyx-tube* globose; lobes 4-5, subulate or ovate, persistent, one longer than the others. *Corolla* funnel-shaped, tube long, glabrous within; lobes 4-5, twisted in bud. *Stamens* 4-5 in the corolla-throat, filaments short; anthers linear, 2-fid at both ends. *Ovary* 2- rarely 3-celled; style filiform, stigmas 2 linear revolute; ovules numerous on peltate placentas adnate to the septum. *Capsule* small, globose, 2-celled, septicidally 2-valved, valves with separable endocarp, placentas at length free many-seeded. *Seeds* falcate, or subcubical, or angled, testa narrowly winged; embryo club-shaped in fleshy albumen.—DISTRIB. Species 5 or 6, Burmese and Malayan.

1. **G. Jackii**, W. & A. *Prodr.* 404; inflorescence and leaves beneath softly tomentose or villous, leaves oblanceolate obtusely acuminate, stipules large, flowers close-set. *Rondeletia corymbosa*, *Jack in Mal. Misc.* i. 4. *R. spicata*, *Wall. in Roxb. Fl. Ind., ed. Carey & Wall.* ii. 139. *Wendlandia?* *corymbosa*, *Wall. Cat.* 6276; *DC. Prodr.* iv. 413; *Kurz For. Fl.* ii. 75. *W.?* *spicata*, *DC. l. c.* 412.

MALAYAN PENINSULA, from Tenasserim to Singapore, *Jack*, &c.

An evergreen shrub. *Leaves* membranous, 8-20 by $1\frac{1}{2}$ -6 in., puberulous or glabrate above, narrowed into the very short petiole; nerves 20-30 pair, slender; stipules very variable in length and breadth, $\frac{1}{2}$ -1 in., acute. *Panicle* subsessile, primary branches 3-chotomous, ultimate 2-chotomous; bracteoles filiform. *Corolla-tube* $\frac{1}{4}$ in., hairy, twice as long as the 4 ovate lobes. *Capsule* $\frac{1}{8}$ in. diam., pubescent.

2. **G. Wightiana**, W. & A. *Prodr.* 404; inflorescence puberulous, leaves elliptic-lanceolate or oblanceolate acuminate glabrous except sometimes the midrib beneath, stipules with long subulate points, flowers separate. *Wt. Ic.* t. 1151. *Wendlandia?* *Wightiana*, *Wall. Cat.* 6277; *G. Don Gen. Syst.* iii. 520. *W. secunda*, *Griff. Notul.* 266; *Kurz For. Fl.* ii. 75. *Guettarda*, sp. *Wall. Cat.* 8400.

TENASSERIM, *Gomez*, &c. **BIRMA**, *Griffith*.

A shrub or small tree. *Leaves* much like those of *G. Jackii*, but glabrous with longer petioles and fewer nerves; stipules usually suddenly contracted to a long point. *Panicles* sessile or long- or short-peduncled, branches very slender. *Corolla-tube* $\frac{1}{2}$ in., puberulous, thrice as long as the 4-5 ovate lobes. *Capsules* puberulous.

TRIBE IV. **HEDYOTIDÆ.**14. **DENTELLA**, *Forst.*

A small weak prostrate annual or perennial-rooted herb. *Leaves* small; stipules connate, scarious. *Flowers* minute, solitary, axillary and in the forks, sessile or pedicelled, white. *Calyx-tube* globose; limb tubular, persistent. *Corolla* funnel-shaped, hairy within; lobes 5, 2-3-toothed, induplicate-valvate. *Stamens* 5, in the middle of the corolla-tube, filaments short; anthers linear. *Ovary* 2-celled; style short, stigmas filiform; ovules numerous on hemispheric placentas. *Fruit* small, dry, globose, 2-celled, indehiscent, many-seeded. *Seeds* minute, angled, testa dotted.

1. **D. repens**, *Forst. Char. Gen.* 26, t. 13; *Roxb. Fl. Ind.* i. 532; *Wall. Cat.* 6206; *W. & A. Prodr.* 405; *Dalz. & Gibs. Bomb. Fl.* 115. *Oldenlandia repens*, *Linn. Mant.* 40. *Hedyotis repens*, *Lam. Ill.* 1424, not of *Don*. *Lippaya telephioides*, *Endl. Atakt.* t. 13.

In moist places throughout Bengal and eastward to Birma, and in both Peninsulas to Ceylon and Singapore.—**DISTRIB.** Malayan Islands, N. Australia, Polynesia.

A straggling weed, stems rooting at the joints. *Leaves* $\frac{1}{4}$ in., obovate spatulate or elliptic, ciliate or glabrous. *Flowers* $\frac{1}{12}$ in. *Style* cleft nearly to the base. *Capsule* $\frac{1}{10}$ in. diam., hispid or glabrous.

15. **ARGOSTEMMA**, *Wall.*

Small delicate herbs. *Leaves* usually membranous, opposite, pairs very unequal, or falsely whorled; stipules entire, persistent or obsolete. *Flowers* white, in peduncled cymes or umbels. *Calyx-tube* short; lobes 5, rarely 3-7. *Corolla* rotate, 4-5-partite, valvate. *Stamens* 4-5, filaments short; anthers large, free, conniving or cohering, erect or declinate, dehiscing by 1-2 terminal pores, rarely longitudinally. *Ovary* 2-celled; style filiform, stigma capitate; ovules very many on projecting placentas. *Capsule* coriaceous or membranous, 2-celled, dehiscing at the apex or by an operculum. *Seeds* minute, angled or compressed, testa granulate or reticulate; embryo most minute, in dense fleshy albumen.—**DISTRIB.** Species about 40, all from subtropical Asiatic and Malayan Mts., except one African (which is also Indian).

* *Leaves* opposite or whorled.

† *Flowers* 4-merous.

1. **A. sarmentosum**, *Wall. in Roxb. Fl. Ind., ed. Carey & Wall.* ii. 324; *Cat.* 8396; leaves sessile or petioled opposite or in whorls of 4 orbicular elliptic or broadly obovate obtuse sparingly pubescent, umbels terminal, calyx pubescent, teeth ovate obtuse, anthers 4 free slender opening by pores. *Benn. Pl. Rar. Jav.* 95. *Sonerila angustifolia*, *Wall. Cat.* 4090.

SUBTROPICAL HIMALAYAS, from Garwhal to Bhotan, alt. 2-5000 ft. **KHASIA Mts.**, alt. 2-4000 ft., *J. D. H. & T. T.*

Stems 2 in. to a span, often with filiform very long simple or branched runners from buds below the leaves. *Leaves* 1-4 in., 4 in a whorl, or in 2 rarely more pairs, equal or more or less unequal or dissimilar. *Umbels* simple, 1- many-fld.; bracts ovate; pedicels $\frac{1}{4}$ - $\frac{1}{2}$ in., very stout. *Flowers* white, with a green eye, $\frac{3}{4}$ in. diam. *Calyx-lobes* ovate. *Corolla* segments acuminate.

2. **A. courtallense**, *Arn. in Ann. Nat. Hist.* iii. 22; sparsely pubescent, leaves subsessile in whorls of 4 ovate or orbicular-ovate subacute or obtuse base contracted rounded or cordate, umbel terminal simple, calyx-teeth

acute, anthers 4 free oblong-lanceolate curved opening by pores. *Wt. Ic. t.* 1160. *A. connatum*, *Dalz. in Hook. Kew Journ.* iii. 345; *Dalz. & Gibs. Bomb. Fl.* 118 (*by error cuneatum*).

Mountains of the WESTERN PENINSULA, from Canara to Travancore, *Rottler, Heyne, &c.*

Three inches to a span high. *Leaves* never more than 4, very variable in size and shape, rarely acute or shortly petioled. *Umbels* 3- many-fld. *Flowers* about $\frac{2}{3}$ in. diam., white. *Corolla-lobes* acute.

3. **A. tavoyanum**, *Wall. in Benn. Pl. Jav. Rar.* 95; *Cat.* 8393; leaves subsessile opposite or in whorls of 4 ovate acute base contracted or cordate, umbels terminal, calyx pubescent teeth ovate, anthers 4 free oblong-lanceolate with terminal pores.

TENASSERIM; Tavoy, *Wallich*. MARTABAN, at Moulmein, *Parish*.

Sparsely pilose; stem 2-4 in. *Leaves* sometimes only one pair, usually 4 in a whorl, rarely with a smaller pair added, equal or more or less unequal. *Umbels* simple, many-fld. *Flowers* $\frac{1}{4}$ in. diam. *Corolla* $\frac{1}{2}$ in. diam., and segments acute short.—This may prove to be a variety of *A. courtallense*, but the leaves are more acute and the calyx-lobes more obtuse, and the corolla smaller with shorter lobes, as far as I can make out by moistening the dried specimens.

4. **A. khasianum**, *C. B. Clarke*; leaves sessile or petioled opposite or in whorls of 4, elliptic ovate acute or subacute glabrous, umbels terminal and axillary and their peduncles pubescent, calyx-teeth broad acute, anthers 4 free linear-oblong straight opening by pores. *A. verticillatum*, *Wall. Cat.* 8394, *in part*.

KHASIA Mts., alt. 2-4000 ft., *De Silva, &c.*

Closely allied to *A. courtallense*, differing in the much narrower glabrous leaves, often 2-3 umbels, which are more closely pubescent; the anthers, too, are more strictly oblong. There are sometimes as many as 8 leaves of very various size in irregularly superposed pairs, and the midrib and nerves are sometimes white.

†† *Flowers* 5-merous.

5. **A. pictum**, *Wall. in Roxb. Fl. Ind., ed. Carey & Wall.* ii. 327; *Cat.* 8392; leaves sessile or shortly petioled, usually in a whorl of 4 of which 2 are very small and 2 very large, broadly ovate or almost orbicular obtuse or subacute glabrous or with a few short scattered hairs, umbels 1-3 terminal simple glabrous, anthers 5 coherent linear-oblong straight opening by pores. *Benn. Pl. Jav. Rar.* 94.

PENANG; *Wallich, &c.*

3-4 in. high. *Leaves* usually large, sometimes 4 by 3 in., often variegated along the midrib and nerves. *Peduncle* slender. *Calyx-teeth* broad, acute.

6. **A. verticillatum**, *Wall. in Roxb. Fl. Ind., ed. Carey & Wall.* ii. 325; *Pl. As. Rar.* ii. 80, t. 185; *Cat.* 8394, *in part*; leaves sessile 4 in a whorl lanceolate or ovate-lanceolate finely acuminate glabrous unequal, umbels 1 or more terminal sometimes branched, anthers 5 free linear-oblong straight apiculate opening by pores. *Benn. Pl. Jav. Rar.* 94. *A. glaberrimum*, *Dalz. in Hook. Kew Journ.* iii. 345; *Dalz. & Gibs. Bomb. Fl.* 118. *A. acutum*, *Wall. mss.*

TEMPERATE HIMALAYA, from Kumaon to Sikkim, alt. 2-6000 ft. KHASIA Mts., alt. 4000 ft. CANARA; in the WAREE country, on trees, *Dalzell*. MARTABAN, at Moulmein, *Parish*. PENANG, *Wallich*.

Leaves 1-5 in., broader more ovate and distinctly petioled only in Moulmein specimens, very rarely with an additional pair of leaves below the whorl. *Umbels* 1-3, sometimes compound, all terminal. *Flowers* about $\frac{1}{2}$ in. diam. *Calyx-teeth* acute.

7. **A. Parishii**, *Hook. f.*; quite glabrous, leaves sessile in whorls of 5 or 6 or oftener in several superimposed pairs elliptic-lanceolate acuminate, umbels branched terminal, calyx-teeth very short, anthers 5 free linear-lanceolate straight obtuse opening by pores.

MARTABAN; hills behind Moulmein, *Parish*.

Similar in many respects to *A. verticillatum*, and, like it, quite glabrous; but the leaves are far more numerous, usually in approximate pairs, the corolla lobes longer and very acute, the anthers much longer and obtuse.

8. **A. pumilum**, *Benn. Pl. Jav. Rar.* 95; glabrous, leaves sessile about 10 almost whorled lanceolate tip rounded lowest obovate, umbels very shortly peduncled irregularly few-flowered, calyx-teeth broad obtuse, corolla-lobes long subacute, anthers 5 free oblong opening by slits throughout their length. *A. verticillatum*, *Wall. Cat.* 8394 B., chiefly; *Hiern in Fl. Trop. Africa*, iii. 44.

KHASIA MTS., alt. 0-2000 ft., *De Silva, &c.*—DISTRIB. W. trop. Africa.

A very small rather rigid species, 1-1½ in. high; stem stiff. *Leaves* 1-1½ in., more coriaceous than usual in the genus. *Umbels* smaller than the leaves, few-fl. *Flowers* ¼ in. diam.—The West African specimen from Mt. Sierra del Crystal (on the upper Gaboon river) differs only in the anthers opening towards the summit.

9. **A. Lobbii**, *Hook. f.*; very slender, quite glabrous, leaves in numerous superposed whorls of 4-6, of which 1 is much the longest linear-lanceolate subacute, umbels axillary and terminal, pedicels slender divaricate, calyx-teeth short, corolla-lobes long, anthers 5 free linear-lanceolate curved with minute pores.

MARTABAN; at Moulmein on limestone rocks, *Lobb, Parish*.

Stem succulent, 4-6 in. *Leaves* in about 5-8 equidistant whorls, the long ones 1-1½ in., curved upwards, the short ones ¼-½ in. *Umbels* branched from the base, or peduncles forked. *Flowers* ⅕ in. diam. *Calyx* very small. *Anthers* not conniving. *Stigma* minute.

10. **A. rostratum**, *Wall. in Roxb. Fl. Ind., ed. Carey & Wall.* ii. 326; *Cat.* 8395; quite glabrous, leaves whorled or in superimposed pairs linear or elliptic-lanceolate acuminate with often bulbiferous axils, umbels small solitary simple or compound, corolla-lobes caudate-acuminate, anthers 5 coherent oblong with long slender beaks opening by pores. *Benn. Pl. Jav. Rar.* 95.

KHASIA MTS., alt. 3-5000 ft., *De Silva, &c.*

Very variable indeed in stature and foliage. *Stem* 3-10 in., slender or robust. *Leaves*, the larger on each plant 1½-8 in., membranous, sessile or shortly petioled. *Umbels* very various, few-fl. *Peduncles* 1-3 in. *Flowers* ½ in. diam. *Calyx* small, lobes short broad. *Anthers* very large for the size of the flowers, erect; straight beaks as long as the cells.—The beaked anthers distinguish this from all allied species. The bulbiferous specimens have smaller leaves and long capillary runners; they often somewhat resemble *A. Lobbii*.

** Stem with a terminal pair of leaves, one very large, the other very small, and sometimes one or more pairs of very small leaves lower down.

11. **A. humile**, *Wall. in Benn. Pl. Jav. Rar.* 94; *Cat.* 8391; leaves glabrous, uppermost pair of a very large ovate-lanceolate acuminate and a very small ovate one, lower pairs few or solitary very small ovate subequal, umbels solitary puberulous, bracts large, corolla-lobes lanceolate, anthers 4 linear-subulate straight free obtuse opening by pores.

KHASIA MTS.; Mahadeb, *Griffith*; Churra, *J. D. H. & T. T. PENANG, Jack.*

Very variable in size. *Stem* 1-2 in., very short in comparison with the large leaf, which is 2-5 in. long, sessile, membranous, the smaller leaf is ovate, ¼-½ in. long. *Umbels* 3-many-fl.; bracts ovate or orbicular. *Anthers* more than half the length of the corolla-lobes. *Stigma* minutely capitate.

12. **A. unifolium**, Benn. *Pl. Jav. Rar.* 94; quite glabrous, leaves 2 only larger long-petioled ovate caudate-acuminate smaller (stipule?) sessile ovate-cordate, umbels compound, pedicels slender, anthers 5 coherent elongate-subulate opening by pores.

PENANG, Porter. MALACCA? Maingay.

Stem slender, a span high. Larger leaf membranous, 5-8 by 2-4½ in., base rounded or cordate, petiole 1-1½ in.; smaller, ¼-1 in., recurved. Flowers numerous, ½ in. diam. Calyx-lobes small, broad, obtuse. Corolla-lobes lanceolate, equalling the anthers. Stigma minute, capitate.—The largest-leaved species of the genus.

13. **A. Kurzii**, C. B. Clarke; quite glabrous, leaves 2 only, larger sessile broadly ovate obtuse or obtusely-acuminate, smaller (stipule?) ovate, umbels simple, bracts 4, anthers 5 free broadly oblong-obtuse dehiscing by their whole length. *A. unifolium*, Kurz in *Journ. As. Soc.* 1877, ii. 131, not of Blume.

MARTABAN; at Moulmein, Parish; Attran, Scott.

Stem simple, 3 in., forked, in one specimen stout, succulent. Leaves membranous, large, 3½-5 by 2½-3 in., base rounded, smaller, ½ in., obtuse. Umbel 4-8-fld; bracts almost orbicular, equal. Flowers ½ in. diam. Calyx-teeth very short, broad acute. Corolla-lobes lanceolate, much longer than the anthers.—Only three specimens seen.

*** Stem prostrate with many subequal pairs of thick distichous leaves, one of each pair very large, the other very small.—Habit of *Elatostemma*, anthers with long beaks.

14. **A. Elatostemma**, Hook. f.; stem umbel and leaves beneath furfuraceously tomentose, large leaf of each pair shortly petioled obovate-oblong obtuse base contracted cordate, smaller sessile ovate-cordate, umbels few-fld simple or compound, corolla-lobes lanceolate, anthers 5 coherent subulate produced into a long straight beak opening by pores.

PENANG, Griffith. SINGAPORE, Lobb.

Stem 6-8 in., prostrate, very robust, simple or branched, sometimes rooting at the nodes. Leaves 6-8 pairs, larger 2-2½ in., coriaceous; nerves about 10 pair, united by very stout reticulating nerves. Peduncle softly tomentose. Flowers ¾ in. diam. Calyx small, lobes triangular, acute. Stamens as long as the puberulous corolla-lobes.—This species singularly resembles an *Elatostemma* in habit.

15. **A. parvifolium**, Benn. *Pl. Jav. Rar.* 96; stem hispid, large leaf of each pair petioled elliptic-ovate acute with few scattered cellular hairs above, glabrous beneath except the midrib, smaller sessile ovate, umbels few-fld., simple pubescent, corolla-lobes lanceolate, anthers 5 coherent subulate produced into a long straight beak. *Miq. Fl. Ind. Bat.* ii. 165, t. 31 D.

SINGAPORE, Lobb.—DISTRIB. Java.

Stem 4-8 in. slender, prostrate, simple or branched, rooting at the nodes. Leaves thick and succulent, in 4-8 distant or approximate pairs; larger ½-1¼ in., base rounded or cordate and equally or unequally auricled; smaller ½ in.; nerves indistinct. Flowers similar to those of *A. Elatostemma*, but beak of anthers shorter.

16. **A. ophirense**, Maingay mss.; stem robust sparsely hairy, leaves coriaceous glabrous, larger of each pair subsessile oblanceolate or obovate obtuse or acuminate obliquely auricled at the base, smaller obliquely ovate-cordate sessile, umbels few-fld.

MALACCA; on Mt. Ophir, Maingay.

Stem 8-10 in., ascending, nodose, copiously rooting at the base, succulent. Leaves thick and succulent, in many pairs, larger 2-3½ by ¾-1½ in., smaller ¾-¼ in. Calyx-lobes very broad, acute. Corolla and stamens not seen.

17. **A. spinulosum**, C. B. Clarke; stem stout hispid with curled hairs, large leaf of each pair petioled oblanceolate acute, glabrous above with minute spinulose hairs on and near the margin, hairy on the nerves beneath, smaller ovate-lanceolate acuminate, umbels forked compound many-fld., anthers 5 coherent subulate produced into a short beak.

SINGAPORE, Lobb.

Only one specimen seen. *Stem* 4 in., very stout, flexuous and rooting below: *Leaves* rather thick and succulent in 4 pairs, the larger 4-5 by $1\frac{1}{4}$ in., base contracted obliquely, auricled, nerves spreading raised beneath, petiole $\frac{1}{2}$ in.; smaller $\frac{1}{2}$ in., more membranous. *Umbel* and *peduncle* quite glabrous. *Flowers* $\frac{1}{2}$ in. diam. *Calyx-lobes* triangular-ovate, acuminate. *Corolla-lobes* lanceolate.

DOUBTFUL SPECIES.

A. INÆQUILATERUM, Benn. *Pl. Jav. Rar.* 95; "leaves usually 4 in a whorl more or less unequal, lanceolate or ovate-lanceolate unequal-sided acuminate glabrous; umbel subsimple few-fld; flowers 5-merous."—Perhaps *A. verticillatum*.

A. SONERILOIDES, Kurz in *Journ. As. Soc.* 1872, ii. 310; calyx-lobes 3-4; corolla subcampanulate, 3-4-lobed; leaves whorled; anthers oblong obtuse.—Andaman Islands, Kurz.—Very imperfect specimens from Dr. King do not enable me to refer this satisfactorily to any described species: it resembles *tavoyanum*.

A. OLIGANTHA, Kurz in *Journ. As. Soc.* 1877, ii. 131.—An Andaman species and another of Kurz, from Boronga Island, on the Arracan coast, are not recognisable.

16. **CLARKELLA**, Hook. f.

A very small erect glabrous puberulous herb. *Leaves* opposite, petioled, ovate, one of the lower pair usually suppressed, the other very large; stipules minute, broadly ovate, or obsolete. *Flowers* 1-6 in., in peduncled terminal bracteate cymes, white. *Calyx-tube* obconic, produced above the ovary; limb dilated, 5-7-toothed. *Corolla-tube* long, slender, funnel-shaped above, throat glabrous; lobes 5, lanceolate, valvate. *Stamens* 5, near the bottom of the tube, filaments short slender; anthers linear-oblong. *Ovary* 2-celled; style short, arms 2 slender hairy; ovules many, on ascending placentas attached to the septum below its middle. *Capsule* obconic, 5-7-ribbed, crowned with the dilated calyx-limb, membranous, indehiscent, many-seeded. *Seeds* very minute, irregularly ellipsoid, testa black papillose.

1. **C. nana**, Hook. f. *Ophiorhiza nana*, Edgw. in *Trans. Linn. Soc.* xx. 60.

TEMPERATE HIMALAYA, alt. 4-8000 ft. Kumaon, Edgworth, &c.; Garwhal, Falconer.

A very singular little plant, requiring examination in a living state as to its mode of growth. *Stem* 1-3 in., slender, simple, curved upwards, terminating below in a small fleshy tuber enclosed in a rather thick sheathing coat, the outer surface of which coat is clothed with short rigid rootlets that adhere to surrounding particles of sand and ground by suckers. *Radicle-leaf* $\frac{3}{4}$ - $1\frac{1}{4}$ in. diam., solitary, orbicular or broadly ovate, obtuse, membranous; nerves 4-5 pair, spreading and arching; petiole slender; besides this leaf there is a single pair of small leaves close to the cyme. *Cyme* on a stout peduncle $\frac{1}{2}$ - $\frac{1}{4}$ in. long; bracts small, oblong. *Flowers* shortly pedicelled, erect, $\frac{1}{2}$ in. long. *Calyx-lobes* triangular with acuminate tips. *Corolla* pubescent. *Stamens* and *style* near the very base of the corolla-tube. *Fruit* $\frac{1}{4}$ in. long.—Named after my coadjutor in this work, C. B. Clarke, F.L.S.

17. **NEUROCALYX**, Hook.

Low herbs. *Leaves* opposite, crowded, membranous, entire or toothed, reticulate; stipules large, 2-fld, or multifid. *Flowers* rather large, pale purple,

in short axillary nodding racemes or heads; bracts simple or 3-toothed or -partite. *Calyx-lobes* 5, broad, membranous, reticulate. *Corolla* rotate; lobes shorter and narrower than the calyx-lobes, valvate. *Stamens* 5, filaments very short; anthers connate in a conical tube, bursting inwards. *Ovary* 2-celled; style filiform, stigma capitate; ovules numerous on swollen peltate placentas. *Fruit* coriaceous or fleshy, usually irregularly bursting, many-seeded. *Seeds* minute, globose, testa crustaceous pitted; embryo obovoid in fleshy albumen.—**DISTRIB.** Species 6-8, on the Dekkan Mts., Ceylon, and Borneo.

1. **N. zeylanicus**, *Hook. Ic. Pl.* t. 174; glabrous, leaves oblanceolate acuminate narrowed into slender petioles, nerves beneath and inflorescence puberulous, flowers racemose, calyx-lobes lanceolate.

CEYLON; Suffragam district, ascending to 4000 ft., *Walker*, &c.

Stem woody, 2-8 in., clothed with spreading subspinescent stipular segments. *Leaves* 4-8 by 1-2 in.; nerves about 20 pair. *Peduncles* numerous, half as long as the leaves. *Flowers* $\frac{3}{4}$ in. diam. *Corolla* not half as long as the calyx, lobes lanceolate.

2. **N. Wightii**, *Arn. in Ann. Nat. Hist.* ii. 22; leaves sessile oblanceolate acuminate glabrous above, nerves beneath and inflorescence furfuraceous, flowers racemose, calyx-lobes ovate acute. *N. Hookeriana*, *Wt. Ic. t.* 52. Argostemma calycinum, *Br. in Benn. Pl. Jav. Rar.* 97; *Wall. Cat.* 8397.

Southern Mountains of the WESTERN PENINSULA; Wynaad, *Hamilton*, &c.; Nilgherri, *Munro*. CEYLON, ascending to 2000 ft., *Walker*, &c.

Stem 2-4 in., woody, tortuous. *Leaves* 6-9 by $1\frac{1}{2}$ -3 in.; nerves 12-15 pair; stipules lanceolate, membranous. *Peduncles* not half so long as the leaves. *Flowers* $\frac{3}{4}$ in. diam. *Corolla* nearly as long as the calyx, lobes ovate.

3. **N. capitata**, *Benth. mss.*; leaves oblanceolate narrowed into long stout petioles, nerves beneath and inflorescence pubescent, flowers capitate, calyx-lobes ovate acute.

CEYLON, *Walker*, *Champion*.

Stem erect, stout, a foot or more high, with distant pairs of large leaves, glabrous. *Leaves* 10-12 by $2\frac{1}{2}$ -4 in.; nerves 15-20 pair; stipules membranous, 2-partite, segments ovate caudate-acuminate, *Peduncles* axillary, shorter than the petioles; heads of flowers globose or oblong. *Flowers* $\frac{3}{4}$ in. diam. *Corolla-lobes* broadly ovate, obtuse, half as long as the calyx.—Very different from *N. Wightii* in the long stout stem, much larger petioled leaves with more numerous nerves, and larger flowers.

4. **N. Championii**, *Benth. in Thw. Enum.* 139; leaves sessile or petioled obovate-lanceolate obtuse bullate above, nerves beneath and inflorescence villous, flowers racemed, calyx-lobes ovate acute.

CEYLON; Kokool Corle, *Thwaites*.

Stem very short, woody. *Leaves* 3-6 by 1-2 in., midrib hairy above, base obtuse or narrowed into the petiole; nerves about 10 pair; stipules membranous, 2-partite. *Racemes* half as long as the leaves. *Flowers* $\frac{1}{2}$ in. diam. *Corolla-lobes* narrow, oblong, equalling the broadly ovate acute calyx-lobes.

5. **N. Gardneri**, *Thw. Enum.* 139; leaves obovate-lanceolate with rounded apiculate tips narrowed into a very short petiole hairy above and beneath, inflorescence racemose villous, calyx-lobes ovate- or orbicular-cordate.

CEYLON; Pasdoon Corle and Hewetsea, *Gardner*, *Thwaites*.

Stem short, stout, woody, villous. *Leaves* 4-10 by $1\frac{1}{2}$ -3 $\frac{1}{2}$ in., very membranous, ciliate, obscurely crenulate; nerves 15-18 pair; stipules 2-partite, segments caudate-acuminate. *Corolla* not seen.

18. **ALLÆOPHANIA**, *Thwaites*.

Undershrubs; branches 4-angled. *Leaves* sessile or shortly petioled, ovate or lanceolate; nerves close; stipules connate into a scarious bristly tube. *Flowers* minute, polygamo-dicecious, in axillary dense cymes, pale purple. *Calyx-tube* obconic; limb bell-shaped, 4-ribbed and with 4 bristle-like teeth, persistent. *Corolla* funnel-shaped; tube and throat hairy; lobes 4, valvate in bud. *Stamens* 4, inserted between the corolla-lobes, filaments of ♂ long exserted; anthers linear-oblong, obtuse. *Ovary* 4-celled; style filiform, ♀ exserted, arms 4 linear; ovules 1 basilar erect in each cell. *Fruit* small, turbinate, with 4 bony indehiscent pyrenes. *Seeds* erect, minute, broadly oblong or subglobose, compressed, narrowed at the base, testa membranous; embryo short, cylindric.—**DISTRIB.** Species 3, one Malayan, the others as below.

1. **A. decipiens**, *Thw. Enum.* 147; more or less hirsute ca. glabrate, leaves sessile or petioled ovate or lanceolate acute or acuminate, nerves strong beneath, stipules broad, calyx-teeth equalling the hairy fruit. *Hedyotis nodulosa*, *var. a. Thw. Enum.* 143, as to *C. P.* 105, not of *Arnott*.

CEYLON; Central Province, alt. 3–7000 ft.

An erect 3-chotomously branched shrub. *Leaves* 1–2½ by ½–1½ in., usually coriaceous and hairy or scabrid above, very variable in shape from broad ovate to narrow-lanceolate, base acuminate rounded or cordate, upper surface flat or bullate; petiole 0 or ¼–½ in.; stipular bristles hairy. *Calyx-limb* membranous. *Corolla-tube* hairy, lobes narrow, villous within. *Style* slender, hairy, arms spreading.—There are three varieties: one with broad sessile or petioled coriaceous leaves, scabrid above, with very strong nerves beneath; the second (*var. flavescens*, *Thw. l. c.*) with ovate-cordate petioled membranous very hairy leaves; the third with narrow-lanceolate coriaceous leaves glabrous and wrinkled above and strong hairy nerves beneath.—Closely allied to *Hedyotis rugulosa*, *Korth.*, of the Malayan Islands, which has much longer calyx-teeth, on which Miquel founded the section *Tetragyneia* of *Hedyotis*.

2. **A. Arnottii**, *Hook. f.*; glabrous or nearly so, leaves petioled ovate-lanceolate acuminate nerves distinct, stipules caducous ovate with few subterminal bristles, calyx-teeth shorter than the glabrous fruit.—*Hedyotis nodulosa*, *var. a. Thwaites Enum.* 143, as to *C. P.* 87, not of *Arnott*.

CEYLON; Newera Ellia, *Gardner*; Adam's Peak, *Thwaites*.

Closely allied to *A. decipiens*, but almost glabrous, with longer differently shaped stipules, smaller glabrous fruit and shorter calyx-teeth; the style, too, is quite glabrous.

19. **FERGUSONIA**, *Hook. f.*

A slender procumbent herb, branching from the base; branches very long, rooting below, acutely 4-angled; nodes ciliate. *Leaves* opposite, subsessile, lanceolate, scaberulous, 1-nerved, margin recurved; stipules connate with the petioles, erect, herbaceous, lanceolate, ciliate, persistent. *Flowers* small, axillary, shortly pedicelled, 2-bracteolate. *Calyx-tube* subpyriform; lobes 4, erect, lanceolate, ciliate, persistent. *Corolla* funnel-shaped, throat glabrous or hairy; lobes 4, short, valvate in bud, tips ciliate. *Stamens* 4, inserted between the corolla-lobes, filaments short; anthers linear-oblong. *Disk* epigynous, 4-lobed. *Ovary* 4-celled; style filiform, arms 2 linear hairy; ovules 1 basilar erect in each cell. *Fruit* of 4 pear-shaped coriaceous cocci crowned with the calyx-teeth. *Seeds* erect, pyriform; embryo compressed, subcylindric, radicle inferior.

1. **F. zeylanica**, *Hook. f. in Hook. Ic. Pl. t. 1124*. *Borreria tetracocca*, *Thw. Enum.* 442; *Bedd. Ic. Pl. Ind. Or. t. 39*.

COORG, *Beddome*; CEYLON, near Colombo, *W. Ferguson*.

Branches 1-2 ft. *Leaves* 1-1½ in., and whole plant pale green when dry. *Corolla* ½ in. long.—A very singular plant, which I was at first disposed to consider as belonging to *Psychotriæ*, but which I think now to be closely allied to *Allæophania*, as I suspected when placing it in that tribe in the "Genera Plantarum." It differs remarkably from the other Hedyotidean genera in the form and insertion of the seed, and in the dimerous style with a 4-merous ovary, but is united with them through *Allæophania*.

20. HEDYOTIS, L.

Herbs, undershrubs or shrubs. *Leaves* very rarely ternately whorled; stipules free or combined in a bristly sheath. *Flowers* white or lilac, in terminal or axillary open close or capitate cymes. *Calyx-lobes* 4, acute, persistent, without interposed teeth. *Corolla* funnel- or bell-shaped; lobes 4, ovate, or linear, valvate in bud. *Stamens* 4, in the tube or throat of the corolla. *Ovary* 2-celled; style filiform, stigma 2-fid or 2-lobed; ovules numerous on sessile or pedicelled placentas, attached to the septum at or below the middle. *Fruit* small, membranous coriaceous or crustaceous, indehiscent or septi- or loculicidal or of 2 separable or connate cocci, 2-many-seeded. *Seeds* plano-convex or angled, testa very rarely winged; embryo clavate in horny albumen.—DISTRIB. Species about 80, chiefly tropical Asiatic.

A very difficult genus to define, a few species being intermediate between it, *Anotis* and *Oldenlandia*. Flowers rarely 5-merous. The solitary ovules on the face of the septum in each cell, and the seeds, distinguish *Spermacoce* from it; in habit they are often very similar.

SECT. I. **Diplophragma.** *Capsule* septicidally splitting into two 1-4 (rarely more-) seeded cocci, which dehisce ventrally, top not protruded between the calyx-teeth.—Erect or decumbent shrubs or herbs; stipules various.

* *Erect shrubs; cymes terminal or axillary, rarely corymbose or panicled, very rarely capitate; stipules not large and sheathing.*

† *Stipules entire or gland-serrate or -crenate, rarely pectinate.*

1. **H. fruticosa**, Linn.; glabrous, branches obtusely 4-angled, leaves petioled lanceolate acuminate, nerves distinct, stipules gland-crenate, cymes terminal panicled, calyx-teeth triangular recurved shorter than the ovoid smooth capsule. *W. & A. Prodr.* 408; *Burm. Fl. Zeyl.* t. 107. *Spermacoce*? hedyotideæ, *DC. Prodr.* iv. 555.—*Rheede Hort. Mal.* iv. t. 57.

TRAVANCORE Mts., *Rottler, &c.* CEYLON, common up 3000 ft.

An erect shrub, green when dry. *Leaves* 2-4 in., coriaceous; nerves 6-12 pair. *Corolla-throat* woolly. *Seeds* 4 in each cell, plano-convex, or concavo-convex.—Wight and Arnott's var. *B.*, with hispid cymes, appears to be *H. pruinosa*; Wallich's 837 *b*, the same authors refer to this species because it was gathered by Rottler, but Rottler's Herbarium contains Malayan plants, and that in question is *H. capitellata*. Wallich's 837 *a*, also from Rottler's Herbarium, is *H. pruinosa*.

2. **H. Maingayi**, Hook. f.; glabrous, leaves shortly petioled lanceolate or ovate-lanceolate acuminate nerveless, stipules entire eglandular, cymes terminal panicled, calyx-teeth lanceolate longer than the capsules.

MALACCA; on Mt. Ophir, *Griffith, Maingay* (*Kew Distrib.* 887).

A short much branched shrub, green when dry, 12-18 in. *Leaves* 1-2 in, acute or rounded at the base, petiole winged. *Flowers* more crowded than in *H. fruticosa*; flowers and fruit and seeds similar, except that the calyx-teeth are much longer and lanceolate.

3. **H. evenia**, *Thwaites Enum.* 140, 419; shining, branches and inflorescence puberulous, leaves shortly petioled elliptic or ovate-lanceolate acute glabrous nerveless, margins recurved, stipules with sparingly glandular tips, cymes terminal paniced, calyx-lobes triangular obtuse shorter than the capsule.

CEYLON; Adam's Peak, *Gardner*.

A small shrub, yellow when dry; branches acutely 4-angled. *Leaves* $\frac{1}{2}$ – $\frac{3}{4}$ in., coriaceous above, varnished and with a few scattered raised points. *Cymes* few-fl. —Fruit unknown, and hence the position of the species in the genus.

4. **H. cymosa**, *Thwaites Enum.* 142; glabrous, leaves sessile lanceolate obtuse or acute, nerves very faint, stipules ovate-lanceolate long-acuminate gland-serrate, cymes terminal paniced, calyx-teeth in fruit lanceolate exceeding the capsule. *Bedd. Ic. Pl. Ind. Or.* t. 35.

CEYLON; Hinidoon Corle, alt. 1000 ft., *Thwaites*.

A shrub, black when dry; branches obtusely angled. *Leaves* 2–3 in., coriaceous, margins not recurved. *Cymes* flat-topped, very minutely puberulous. *Calyx-teeth* much enlarged in fruit. *Capsule* almost didymous. *Seeds* solitary in each cell, much compressed, plano-convex (winged when ripe?).

5. **H. Macraei**, *Hook. f.*; softly pubescent, leaves petioled recurved lanceolate acuminate many-nerved, stipules broader than long abruptly cuspidate eglandular, cymes terminal paniced, calyx-teeth shorter than the capsule.

CEYLON, *Macrae*.

Grey-green when dry; branches obscurely 4-angled. *Leaves* 3–4 in., recurved and complicate, narrowed into a petiole $\frac{1}{4}$ – $\frac{1}{2}$ in. long, rather scabridly pubescent above, softly tomentose beneath; stipules tomentose. *Cymes* large, rounded, with whorled spreading branches. *Flowers* small, $\frac{1}{4}$ in. *Calyx* pubescent, as are the corolla-lobes within. *Capsule* small, ellipsoid, cells many-seeded.

6. **H. purpurascens**, *Bedd. Ic. Pl. Ind. Or.* t. 5 (*purpurea*); quite glabrous, leaves petioled ovate or ovate-lanceolate obtuse or obtusely-acuminate, nerves faint, stipules gland-serrate or pectinate, cymes terminal paniced, calyx-tube produced and teeth much longer than the capsule.

Mts. of TRAVANCORE and TINNEVELLI, *Wight* (Kew Distrib. 1357. *H. stylosa*, var.), *Beddome*.

A small woody shrub, yellow-green when dry; branches tortuous and nodose below. *Leaves* 1–3 in., coriaceous, margins flat, nerves variable in number; stipules pubescent. *Cymes* rounded in flower, flat-topped in fruit. *Calyx-lobes* oblong, obtuse. *Corolla* small, with small lobes. *Capsules* large, $\frac{1}{2}$ in., with the enlarged calyx narrowly ellipsoid, cells many-seeded.—There being an *H. purpurea* previously published (by A. Gray), but unknown to Col. Beddome, I have substituted that of *purpurascens* for his plant.

7. **H. scaberula**, *Hook. f.*; finely scaberulous throughout, branches slender elongate terete, leaves petioled ovate acute flat, nerves faint arched, stipules triangular obtuse appressed, margins glandular, cymes in a loose erect bracteate terminal leafy panicle, flowers pedicelled divaricate, calyx-teeth triangular much shorter than the subglobose capsule.

MARTABAN; at Moulmein, *Lobb*.

A very distinct species, rough to the touch all over, of which I have but one specimen, and that in fruit, pale green when dry; branches strict, slender, with long internodes. *Leaves* 2–3 in., base acute, equally scaberulous on both surfaces; petiole $\frac{1}{8}$ in. *Panicle* elongate, pyramidal in outline, with distant internodes; branches strict rather depressed, the lower with large leaves at the axils, uppermost naked, 3-chotomously branched at the ends. *Capsule* septicidal, the valves loculicidal. *Seeds* about 8 on each placenta.—This may be a climbing species, but there is no evidence of it.

†† *Stipules pectinate.*

8. **H. stylosa**, Br. in Wall. Cat. 853; glabrous, leaves petioled ovate or elliptic-ovate acute glabrous or hairy on the distinct nerves beneath, stipules connate pectinate with long subulate segments, cymes terminal, calyx-tube produced above the ovary, teeth short acute. W. & A. Prodr. 407; Wt. Ic. t. 1027. H.? *Leschenaultiana*, DC. Prodr. iv. 422, excl. var. β . *Knoxia Wightiana*, Schlecht. in Herb. Hohenack., not of Wallich.

Mountains of MALABAR and TRAVANCORE, alt. 5–6000 ft., common, Noton, &c.

A much branched shrub, yellow-green when dry. Leaves 1–2 in., very variable in breadth and shape, coriaceous, margins flat or recurved, nerves few obscure above; stipules pubescent. Cymes short, flowers crowded. Corolla-lobes woolly within. Capsules globose, many-seeded.

9. **H. articularis**, Br. in Wall. Cat. 854; quite glabrous, leaves sessile small lanceolate or elliptic-lanceolate subacute, margins recurved, nerves below very broad, stipules connate pectinate with long subulate segments, calyx-tube produced above the ovary, lobes very short. W. & A. Prodr. 407; Wt. Ic. t. 1028.

NILGHERY Mts., Noton, Wight, &c.

A small rigid stout leafy bush, yellowish when dry. Leaves $\frac{3}{4}$ –1 in., very rigid, with 8–10 very broad and much raised longitudinal nerves beneath, marked by channels above. Cymes terminal, small, dense-flowered. Calyx-limb a 4-toothed cup, unaltered in fruit. Corolla puberulous, lobes glabrous, mouth woolly. Capsule very variable, from $\frac{1}{2}$ in. globose to $\frac{1}{2}$ in., obovoid; cells with 8–10 angular seeds.

10. **H. pruinosa**, W. & A. Prodr. 408; leaves petioled ovate-lanceolate or lanceolate acuminate glabrous, nerves distinct, stipules free pectinate, segments subulate, cymes pruinose, calyx-limb not produced, teeth subulate recurved shorter than the capsule. H. corymbosa, Wall. Cat. 6202, chiefly; 837 a. H. lentiginosa, Bedd. Ic. Pl. Ind. Or. t. 6.

TRAVANCORE and MALABAR; Quilon, Wight; in the backwaters, Beddome.

A shrub, yellowish when dry. Leaves 2–2 $\frac{1}{2}$ in., margins flat; nerves few, slender; petiole $\frac{1}{4}$ – $\frac{1}{2}$ in.; stipules not connate, short. Cymes spreading, many-flowered, hoary. Corolla-mouth woolly. Capsules small, obovoid, subclavate or globose, many-seeded.

11. **H. swertioides**, Hook. f.; leaves sessile glabrous elliptic acute margins undulate, stipules free very long slender pectinate with distant subulate segments, cymes very many in the upper axils and terminal densely pubescent, calyx-limb not produced, lobes lanceolate longer than the tube.

TINNEVELLI; in the Pulney Mts., Wight (Kew Distrib. 359).

A very fine and remarkable species, tall, erect, stout, with distant nodes, and a profuse oblong head of cymes, yellow when dry. Leaves 3 by 1 $\frac{1}{2}$ –1 $\frac{3}{4}$ in., coriaceous, contracted at the base, but hardly petioled; nerves few, hardly raised; stipules $\frac{1}{2}$ – $\frac{3}{4}$ in., erect, stiff. Cymes very many-flowered. Corolla woolly at the mouth. Fruit not seen. —The stout strict branches and erect sessile broad coriaceous opposite leaves give the plant a gentianoid aspect.

12. **H. obscura**, Thwaites Enum. 14; glabrous except the youngest shoots and sometimes the nerves beneath, leaves sessile or petioled elliptic-lanceolate or ovate or suborbicular acute obtuse or acuminate, stipules connate pectinate, peduncles axillary filiform, cymes few-flowered, calyx-teeth subulate shorter than the capsule.

CEYLON; Central provinces, alt. 6–8000 ft., Walker, Gardner, &c.

A rigid woody shrub, black when dry, occurring under three very dissimilar forms, which Thwaites unites.—1. leaves petioled lanceolate 1–3 in., nerves very obscure,

peduncle with often 2 leafy bracts; 2. leaves sessile or subsessile ovate-lanceolate obtuse or subacute, nerves very obscure. *H. ovata*, var. *minor*, *Thwaites in Herb.*; 3. leaves petioled orbicular or broadly ovate acute or obtuse, nerves beneath very strong elevated, peduncles usually filiform very short and 3-8-fld. *H. ovata*, var. *β*. *Thwaites Enum. l. c.*—This last resembles a New Zealand *Coprosma* in habit; grows in shady places; its branches and peduncles are sometimes supra-axillary.

13. **H. Beddomei**, *Hook. f.*; stipules and inflorescence hairy, leaves small petioled elliptic-ovate subacute, nerves strong beneath, stipules broad ovate shortly united pectinate, cymes terminal subsessile capitate, calyx hispid tube shortly produced together with the ovate-lanceolate teeth about equalling the capsule. *H. capitata*, *Bedd. Ic. Pl. Ind. Or. t. 191*.

TRAVANCORE; on the Palghat hills, alt. 6500 ft., *Beddome*.

Stem woody with white bark. *Leaves* yellow when dry, 1-1½ in., contracted into a short flattened petiole, margin recurved when dry; stipules ½ in., acute. *Cymes* axillary and terminal, involucrate. *Corolla-tube* and lobes outside hispid, lobes inside glabrous except at the woolly mouth. *Capsules* sessile, cells about 4-seeded.

14. **H. burifolia**, *Bedd. Ic. Pl. Ind. Or. t. 1*; glabrous, leaves small short-petioled ovate or ovate-cordate acute nerveless margins recurved, stipules connate at the base broad pectinate ciliate, cymes terminal and axillary 3-flowered, calyx-tube produced, teeth lanceolate.

TRAVANCORE; on the higher ranges of the Anamallay Mts., *Beddome*.

A large shrub, branches terete. *Leaves* ¼-½ by ¼ in., glabrous, shining, very coriaceous; stipules with a line of hairs down the centre. *Peduncles* ¼ in. *Flowers* subsessile; bracts filiform, ciliate. *Corolla-lobes* within and mouth villous. *Seeds* numerous.—Description from *Beddome*.

** *Erect shrubs; cymes terminal, capitate, or paniced. Stipules large, forming loose sheaths, which often become white with age.*

15. **H. quinquenervia**, *Thwaites Enum. 141*; nearly glabrous, leaves very coriaceous sessile orbicular very convex with margins and tips especially strongly recurved, very strongly 5-nerved from the base, stipular sheath cupular ciliate, cymes terminal sessile, calyx-tube produced and large ovate teeth together equalling the capsule. *Bedd. Ic. Pl. Ind. Or. t. 8*.

CEYLON; Central province, alt. 7-8000 ft., *Walker, &c.*

Stem woody, di-trichotomously branched; branches white below, above dark (when dry), with 2 lines of pubescence. *Leaves* dark or yellow-brown when dry, ½ in. diam., sometimes obovate-orbicular, abruptly contracted at the base; nerves deeply sunk above, beneath very thick; stipular sheath ½ in. long, loose. *Corolla-tube* glabrous, lobes hispid at the tip, glabrous within, except at the mouth. *Capsule* glabrous, cells 4-seeded.

16. **H. Lessertiana**, *Arn. Pugill. Pl. Ind. Or. 21*; glabrous or nearly so, leaves petioled ovate elliptic or lanceolate acuminate very coriaceous, nerves very strong, stipular sheath ciliate, cymes terminal capitate and subumbelled, calyx-tube more or less produced, teeth and limb together much shorter than the capsule. *Thwaites Enum. 141*; *Bedd. Ic. Pl. Ind. Or. t. 31*. *C. flavescens*, *Thwaites l. c. 141 and 419*.

CEYLON; Central province, alt. 3000 to 8000 ft., abundant.

A shrub with stout branches and leaves very variable in size, sometimes the largest of the genus, yellowish or brownish-green when dry; young shoots sometimes sparsely puberulous. *Leaves* 3-8 by 1-3 in., narrowed into a slender or stout petiole ¼-1½ in., almost plaited (rarely flat with slender nerves), the nerves being deeply sunk in the upper surface and highly raised on the under, where they are sometimes hairy, margins flat or recurved rarely ciliolate; stipular sheath ½-1½ in. long, some-

times 1 in. diam. *Cymes* glabrous or sparsely hairy, more or less umbellate, usually dense-flowered and rounded, sometimes quite capitate. *Corolla-tube* variable in length, lobes and throat usually densely woolly. *Capsule* ellipsoid, cells about 4-seeded.—In a form (*H. marginata*, Thw. mss., N. 3935), from Kotteyagalla, alt. 5000 ft., the leaves are ciliolate, the flowers in dense heads, the calyx-teeth longer, lanceolate, and the corolla-lobes glabrous except at the base.

17. **H. Gardneri**, *Thwaites Enum.* 142; glabrous, leaves sessile recurved lanceolate acuminate, nerves very indistinct, stipular sheath very broad, panicle erect terminal elongate pyramidal, calyx-tube produced and together with the lanceolate teeth equalling the capsule.

CEYLON; Adam's Peak, *Gardner*.

I have seen but one specimen of this remarkable species, which has much the habit of a South Brazilian *Eryngium*; it consists of a stout cylindric stem 6 in. long, clothed with somewhat corky white remains of the stipules, and bears several subterminal crowded rosettes, about 6 in. diam. of recurved yellowish when dry leaves, and a very stout erect branched panicle, 8 in. high by 4 broad, with distant opposite 3-chotomously divided flowering branches. The panicle is evidently a last year's one, and is white with age. *Leaves* 3–3½ by ½ in., complicate, very coriaceous, their bases concealed by the remains of the large stipules. *Capsules* sessile, turbinate, ½ in.

*** *Herbs*, all? annual, with terminal panicked or subumbelled cymes, small flowers, and globose capsules; stipules very small.

18. **H. Wallichii**, *Kurz in Journ. As. Soc.* 1876, ii. 136; a slender sparingly hairy or hispid annual, leaves subsessile ovate or elliptic acute, stipules subulate ciliate, cymes excessively 3-chotomously branched, pedicels long slender, flowers minute, capsule globose with minute calyx-teeth. *H. galioides*, *Wall. Cat.* 866.

TENASSERIM, *Gomez, &c.*; NICOBAR Islands, *Kurz*.—DISTRIB. Borneo.

Stem trichotomously branched from the base; branches acutely 4-angled, all floriferous. *Leaves* ½–¾ in., in remote pairs, ciliate; nerves few, slender. *Pedicels* spreading, often 2–3-nate. *Flowers* about ⅓ in. long. *Capsules* ⅓ in. diam., cells about 6-seeded. *Seeds* microscopic, angled, smooth.—Possibly an *Oldenlandia*, but the capsules dehisce septicidally to the base.

19. **H. elegans**, *Wall. Cat.* 887; quite glabrous, very slender, leaves subsessile ovate-lanceolate long acuminate, nerves very obscure, stipules small very broad acute or cuspidate, flowers sessile on the branches of terminal and axillary subumbellate cymes, calyx-teeth obtuse.

TENASSERIM, *Gomez, Helfer*.

Probably perennial, bright green when dry; stem very long and slender, terete, simple or sparingly branched. *Leaves* in distant pairs, 2–4½ by 1–1¾ in., narrowed into short petioles, margins flat. *Cymes* long-peduncled umbellately or 2–3-chotomously branched from above two linear or oblong bracts; branches 1–3 in. long, spreading or divaricate, rather stout. *Flowers* very shortly pedicelled, ⅓ in. long. *Capsules* ⅓ in. diam., crowned with the triangular obtuse calyx-teeth; cells about 4-seeded.—This resembles a species of *Hance*, No. 11,230, which has broader less acuminate leaves and pedicelled flowers; also very near the Chinese *H. acutangula*, which has acutely angled stem and sessile leaves.

20. **H. Helferi**, *Hook. f.*; quite glabrous, leaves subsessile ovate obtuse or subacute nerveless margin recurved, stipules small broad, cymes small terminal shortly peduncled, branches short, capsules subsessile, calyx-teeth very short obtuse.

TENASSERIM or the ANDAMAN Islands, *Helfer* (Kew Distrib. 2909).

A small species, black in drying; branches stiff, 4-angled. *Leaves* sometimes

3-nate, 1-1½ in., midrib distinct beneath; stipules very inconspicuous. *Cymes* small, bracteate, branches 3-6-flowered. *Capsules* as in *H. elegans*.—Certainly closely allied to *H. elegans*, but the habit is very different, the leaves small and not acuminate, black-brown when dry, and the cymes small. Flowers not seen. It approaches Hance's No. 978, from Whampoa, with narrower ciliate leaves.

**** *Herbs or shrubs, cymes axillary (never terminal), sessile or peduncled, dense- or lax-flowered (or flowers solitary in 27. travancorica); stipules nearly simple or pectinate.*

21. **H. membranacea**, *Thwaites Enum.* 143; quite glabrous, stem obtusely 4-angled, leaves petioled lanceolate or elliptic-lanceolate acuminate, nerves very slender, stipules free ½-circular pectinate, cymes axillary sessile capitate, calyx-teeth foliaceous oblong-lanceolate very much larger than the small ovary.

CEYLON; at no great elevation, *Walker, Thwaites*.

Stem woody below, stout, subsimple. *Leaves* bright green when dry, 3-6 by ¾-1½ in., rather coriaceous, narrowed into the petiole, margins flat; stipules large. *Heads* ½-1 in. diam., surrounding the stem. *Flowers* (not seen) mixed with chaffy bracts. *Capsules* very small, together with the very large calyx-limb ¼ in. long, cells few or many-seeded.

22. **H. macrophylla**, *Wall. in W. & A. Prodr.* 408; *Cat.* 841; annual, stem acutely 4-angled or -winged, leaves petioled ovate elliptic or lanceolate acuminate, nerves distinct, stipules free broad toothed or pectinate, cymes axillary sessile capitate, calyx-teeth lanceolate as long as the small capsule. II. *nodiflora*, *Wall. Cat.* 855; *G. Don Gen. Syst.* iii. 526. *Scleromitrum tetrandrum*, *Kurz in Journ. As. Soc.* 1877, ii. 136. *Rondeletia tetrandra*, *Roxb. Fl. Ind.* i. 524 (according to *Kurz*). *Wendlandia?* *tetrandra*, *DC. Prodr.* iv. 412.

TENASSERIM, *Gomez, Helfer* (Kew Distrib. 2889, 2892). PENANG, *Wallich*. MALACCA, *Griffith* (Kew Distrib. 2889). NICOBAR Islands, *Kurz*.

Stem usually very stout, short, 6-10 in., simple. *Leaves* green or brown when dry, very variable in size and breadth, 3-6 by ½-3 in., sometimes a little rough above; nerves faint; petiole ¼-1 in.; stipules very variously cut, segments sometimes filiform and pubescent. *Heads* often surrounding the stem. *Capsules* small, glabrous or pubescent.

23. **H. Thwaitesii**, *Hook. f.*; stem obtusely 4-angled, leaves petioled elliptic- or ovate-lanceolate acuminate scaberrulous above, nerves distinct, stipules pectinate segments long or short hispid, heads axillary sessile capitate, calyx-teeth foliaceous oblong-lanceolate much longer than the small capsule. H. *macrophylla*, *Thwaites Enum.* 142.

CEYLON; forests about Adam's Peak, *Walker, Thwaites, &c.*

Slender or robust, sparingly branched. *Leaves* 3-8 by 1-2½ in., narrowed into a stout or slender petiole ½-1 in., rather coriaceous, ciliate; stipules ¼-½ in. *Heads* surrounding the stem 1 in. diam. *Capsules* with large calyx ½ in. long, cells 3-seeded.

24. **H. nodulosa**, *Arn. Pugill.* 22; hirsute throughout, branches obtusely 4-angled, leaves petioled ovate or lanceolate acuminate flat, nerves distinct, stipules setose, heads axillary sessile, calyx very hairy, teeth subulate-lanceolate equalling or exceeding the hirsute capsule. H. *nodulosa*, var. *β. Thwaites Enum.* 143. H. *axillaris*, *Gardn. mss. (Thwaites)*.

CEYLON; Adam's Peak, Newera Ellia, and Ambagowa, *Walker, &c.*

Branches or stems 1-2 ft., rather stout, shaggy, especially above and at the nodes and petioles with purplish soft spreading hairs. *Leaves* 2-4 by 1-1½ in., base narrowed or rounded; petiole ¼-1 in.; stipules membranous, connate into a truncate tube with villous bristles. *Heads* very dense. *Corolla-tube* long, glabrous, lobes

lanceolate, mouth woolly. *Capsule* of 2 hard cocci splitting ventrally, each with about 6 angular seeds.—This is certainly Arnott's *H. nodulosa*, who describes it as 2-coccous, and not the *H. nodulosa* α. of Thwaites, which has 4 indehiscent cocci, and is an *Allæophania*.

VAR. *Walkerii*; leaves glabrous above. *H. Walkerii*, Arn. in Nov. Act. Acad. xviii. i. 339; *Walp. Rep.* ii. 493.—Ceylon, *Walker*.

25. **H. cinereo-viridis**, *Thwaites Enum.* 419; slender, much branched, stem obtusely 4-angled, leaves petioled lanceolate acuminate, nerves indistinct, stipules very short cuspidate, cymes opposite on slender peduncles or sessile few-flowered, calyx-teeth triangular-ovate acute or obtuse shorter than the capsule. *H. inamœna*, *Thwaites l. c.* 143, partly.

CEYLON; in the central province, *Thwaites*.

Stem apparently erect; branches acutely 4-angled. *Leaves* green when dry, 2-6 by $\frac{1}{2}$ -2 in., narrowed into a petiole $\frac{1}{4}$ - $\frac{3}{4}$ in.; cusp of stipules longer than the body. *Peduncles* of cymes in one form $\frac{1}{4}$ -2 in. long, in β. of Thwaites 0, with 2 foliaceous bracts under the head. *Flowers* crowded, subsessile. *Capsules* ovoid, smooth, cells 3-4-seeded.

26. **H. albo-nervia**, *Bedd. Ic. Pl. Ind. Or.* t. 3; quite glabrous, much branched, stem obtusely 4-angled, leaves petioled elliptic-lanceolate acuminate, nerves distinct, stipules free deeply pectinate glabrous, cymes small axillary sessile, calyx-teeth lanceolate much longer than the capsule.

TINNEVELLI and TRAVANCORE Mts., alt. 3-4000 ft., rare, *Beddome*.

Very nearly allied to *H. cinereo-viridis*, but differing remarkably in the stipules, the segments of which are sometimes filiform, and in the long lanceolate acuminate calyx-lobes.

27. **H. travancorica**, *Bedd. Ic. Pl. Ind. Or.* 7; quite glabrous, much branched, branches obtusely 4-angled, leaves small petioled elliptic acute or acuminate, nerves indistinct, stipules semi-orbicular pectinate, peduncles axillary capillary 1-flid., calyx-lobes elongate subulate longer than the capsule.

TRAVANCORE and TINNEVELLI Mts., alt. 3-4000 ft., *Beddome*.

A small species; branches woody, divaricating, white when old, youngest only acutely 4-angled. *Leaves* towards the end of the branches, green when dry, $\frac{1}{3}$ -1 $\frac{1}{4}$ in., rather coriaceous; stipules scurfy. *Peduncles* shorter than the leaves, filiform. *Flowers* solitary, $\frac{1}{3}$ in. long, without bracts. *Calyx-tube* not produced above the ovary. *Corolla* funnel-shaped, glabrous except the woolly mouth. *Capsules* glabrous with stiff erect calyx-teeth, cells few-seeded.

28. **H. hirsutissima**, *Bedd. Ic. Pl. Ind. Or.* t. ii.; woody, robust, branches and leaves beneath hirsute, leaves petioled elliptic-lanceolate acuminate scabrid above, nerves strong beneath, stipules very large connate deeply pectinate, cymes on axillary slender peduncles, calyx-teeth ovate-lanceolate equalling the hirsute capsule.

NILGHERY Mts.; between Avalanche and Sispara, alt. 7000 ft., *Wight, Gardner, Beddome*.

Stem terete, spreading, short spreading branches densely clothed with stipular scars, as thick as a goose-quill. *Leaves* crowded at the end of the branches, yellow-brown when dry, 1-3 by $\frac{1}{2}$ -1 in., very coriaceous; petiole short, stout; stipules sometimes $\frac{1}{2}$ in. diam., coriaceous, hirsute; segments subulate. *Peduncles* shorter than the leaves when bearing flowers only and slender, when bracteate with a branched cyme stouter. *Capsule* globose, cells several-seeded.

***** *Herbs with terminal or terminal and axillary globose dense-flowered cymes, often bracteate or involucrate at the base.*

29. **H. verticillaris**, *W. & A. Prodr.* 409; quite glabrous, stem 0 or very short, leaves rosulate sessile linear-lanceolate acuminate strongly nerved, stipules very long narrow, heads small on axillary 3-chotomously forked bracteate branches, calyx-teeth ovate-lanceolate much longer than the tube. *Wight Ic.* t. 1029; *Wall. Cat.* 6188. II. *plantaginifolia*, *Arn. Pugill. Pl. Ind. Or.* 22.

NILGHERY Mts., alt. 7000 ft., *Wight, &c.* CEYLON; in the central province, alt. 7-8000 ft., *Walker, &c.*

Stem as thick as the forefinger, usually inclined and rooting, rarely 1 in. *Leaves* yellow when dry, very numerous, spreading flat on the ground, 3-15 by 1-2 in., straight, longitudinally channelled above and ribbed beneath by the parallel nerves; stipules of the radical leaves hidden, of the branches $\frac{1}{2}$ - $\frac{3}{4}$ in., very slender, gland-toothed entire or divided. *Branches* (or peduncle) horizontal or ascending, rather longer than the leaves, naked below, trichotomously forked above with linear bracts at the forks, and below the head. *Heads* $\frac{1}{4}$ - $\frac{1}{2}$ in. diam. *Corolla-tube* short, lobes linear, mouth woolly. *Capsule* (not seen) small, cells many-seeded (in *Wight's* figure).

30. **H. uncinella**, *Hook. & Arn. Bot. Beech. Voy.* 192; erect, glabrous, stem 4-winged, internodes long, leaves sessile or petioled ovate or ovate-lanceolate acuminate, nerves distinct, stipules small broad pubescent gland-serrate or pectinate, heads terminal and axillary globose bracteate, calyx-teeth ovate-lanceolate recurved equalling the glabrous capsule. *Benth. Fl. Hongkong*, 149. *H. borreroides*, *Champ. in Hook. Kew Journ.* iv. 171. II. *cephalophora*, *Br. in Wall. Cat.* 842.

KHASIA and JYNTEA Mts.; alt. 4-5000 ft., *Wallich, &c.*—DISTRIB. China.

Root perennial. *Stem* usually simple and erect, stout. *Leaves* $1\frac{1}{2}$ -3 by $\frac{1}{3}$ - $1\frac{1}{2}$ in., smooth or slightly rough above; stipules pubescent, cuspidate, produced into a long point. *Heads* $\frac{1}{2}$ - $\frac{3}{4}$ in. *Calyx-lobes* glabrous or ciliate. *Corolla-tube* short, glabrous, lobes linear. *Capsule* broadly ovoid, cells about 6-seeded.—I follow *Bentham* in regarding the Khasian plant as a form of the Chinese, which differs in the narrower often petioled leaves and more pectinate stipules.

SECT. II. **Dimetia**. *Capsule* septicidally splitting into two several-seeded cocci, the top raised and protruding between the calyx-teeth; cocci dehiscing ventrally.—Shrubs usually climbing.

31. **H. Lawsoniæ**, *W. & A. Prodr.* 407 (not of *Wight Ic.* t. 1026); erect, glabrous, branches terete, leaves petioled elliptic-ovate or -lanceolate acute or obtuse, stipules broadly ovate entire, peduncles axillary slender, flowers pedicelled, calyx-teeth very short, top of capsule produced between them.

CEYLON; central province, common between 5-8000 ft.

An erect shrub, variable in habit, greenish when dry. *Leaves* 1-3 in., narrowed into the petiole, pale beneath. *Peduncles* equalling or shorter than the leaves. *Flowers* few, $\frac{1}{2}$ in. long. *Calyx-tube* obconic, limb dilated with 5 small teeth. *Corolla* funnel-shaped, glabrous, mouth woolly. *Capsule* urceolate, cells about 4-seeded.—*Gardner* has collected at Neuera Ellia an abnormal state with obovate convex leaves with revolute margins. *Wight's* figure of *Lawsoniæ* represents the corolla as 5-fid and the fruit as pubescent, and of a totally different shape from this, with different placentation. It is probably a composite plate, in part of an *Ophiorhiza*. De *Candolle's Wendlandia Lawsoniæ*, founded on *Lawsonia purpurea*, *Lamk.*, which again is founded on the "Pontaletsje" of *Rheede* (*Hort. Mal.* iv. t. 57), is a totally different and a Cochin plant, supposed by *Wight* and *Arnott* to be identical with this Ceylon one, but differing in the square stems and terminal cymes, and is *H. fruticosa*.

32. **H. capitellata**, *Wall. Cat.* 837 (excl. *H. fruticosa*, *Hb. Rottler*); glabrous, climbing, branches round, leaves shortly petioled ovate- or elliptic-lanceolate acuminate, nerves distinct, stipules very short cuspidate or toothed,

cymes axillary and terminal, flowers capitate, capsule globose, tip produced between the calyx-teeth. *G. Don Gen. Syst.* iii. 527; *Kurz in Journ. As. Soc.* 1877, ii. 135 (excl. var. γ). *Oldenlandia rubioides*, *Miq. Fl. Ind. Bat.* ii. 353. *H. Finlaysonian*, *Wall. Cat.* 6189.

MALAY PENINSULA; from Tenasserim, *Gomez*, to Malacca, *Griffith* (Kew Distrib. 2903, *H. verticillaris*), *Maingay* (Kew Distrib. 890).—DISTRIB. Sumatra, Banca, Borneo, Yunnan.

A tall climber, greenish when dry. *Leaves* 2-4 in., quite smooth on both surfaces, nerves slender; stipules transverse, ciliate. *Cymes* pyramidal, branches trichotomous, distant, horizontal. *Heads* $\frac{1}{2}$ in. diam., 8-20-flowered, the flowers sessile and radiating. *Calyx* small, limb cupular 4-toothed. *Corolla* glabrous, nearly 4-partite; segments narrow, bearded within. *Capsules* globose, crown loculicidally and septically dehiscing, cells several-seeded.

33. *H. mollis*, *Wall. Cat.* 859; climbing, slender, leaves sessile elliptic-lanceolate acuminate glabrous or hairy above, softly hairy beneath with strong nerves, stipules short connate 2-3-cuspidate, cymes axillary and terminal, flowers umbellulate shortly pedicelled, top of capsule produced between the very short calyx-teeth. *G. Don Gen. Syst.* iii. 527.

PENANG, *Wallich*.

Stem and branches terete, glabrate below, above softly laxly hairy as are the leaves below and young leaves above and cymes. *Leaves* pale and wrinkled when dry, $2\frac{1}{2}$ - $3\frac{1}{2}$ in., contracted at the base sometimes into a very short petiole. *Cymes* sessile or shortly peduncled, sparingly branched and few-flowered; umbellules subglobose, $\frac{1}{2}$ - $\frac{1}{2}$ in. diam. *Calyx-teeth* short. *Corolla* deeply divided, lobes linear, glabrous, bearded at the base, as are the bases of the filaments.—Closely allied to *H. capitellata*, as observed by *Wallich*.

34 *H. scandens*, *Roxb. Hort. Beng.* 10; *Fl. Ind.* i. 364; climbing, glabrous, branches terete, leaves sessile or shortly petioled elliptic or lanceolate acuminate, nerves faint, stipules connate into a short truncate 2-cuspidate cup, cymes terminal, flowers pedicelled, top of capsule produced between the short calyx-teeth. *DC. Prodr.* iv. 422; *Don Prodr.* 134; *Wall. Cat.* 839. *H. polycarpa*, *Br. and H. volubilis*, *Wall. Cat.* 838, 840.

TROPICAL and SUBTROPICAL Himalaya, alt. 2-6000 ft., from Nipal, *Wallich*, to Sikkim, *J. D. H. KHASIA Mts.* and *SILHET*, alt. 0-6000 ft., and *CHITTAGONG*, abundant.—DISTRIB. Upper Birma.

A much-branched climber. *Leaves* 3-5 in., green when dry, sometimes caudate-acuminate, smooth, flat; stipules membranous, ciliolate. *Cymes* spreading, leafy, flat- or round-topped, sometimes puberulous; flowers subumbellate, pedicels $\frac{1}{10}$ - $\frac{1}{8}$ in. *Calyx* obconic; teeth ovate, acute or obtuse. *Corolla-tube* short, glabrous, lobes long bearded within. *Capsule* broadly obovoid, crown very prominent, loculicidally gaping, cells many-seeded.

35. *H. viscida*, *Bedd. Ic. Pl. Ind. Or.* t. 4; climbing? glabrous, slender, leaves long-petioled ovate acuminate, nerves slender, stipules small triangular gland-toothed and bracts viscid, cymes axillary and terminal, peduncles and branches very slender, calyx-teeth lanceolate much longer than the capsule, the tip of which is produced between them.

TINNEVELLY; in the beds of mountain streams, alt. 3000 ft., *Beddome*.

A large handsome shrub, branches very slender. *Leaves* green when dry, 3-5 in., membranous, base rounded; stipules green. *Cymes* on filiform peduncles equalling the leaves, branches few subumbellate few-flowered; flowers shortly pedicelled. *Calyx-tube* obconic, lobes long. *Corolla* glabrous, lobes short bearded within.—*Beddome* figures the stipules as entire, and describes them and the bracts as viscid, the bracts allude to are no doubt those at the ultimate forks of the cyme, which are stipular.—The ripe fruit is unknown.

36. *H. fulva*, Hook. f.; perennial, erect, villous, leaves sessile narrow lanceolate acuminate plaited, nerves 2 pair, stipules membranous with long cilia, cymes glabrous small axillary shortly peduncled, calyx glabrous teeth subulate, tip of capsule produced between them.

KHASIA MTS.; on dry hills near Nurtiung, alt. 4-5000 ft., *J. D. H. & T. T.*

Rootstock woody, sending up strict terete stems a foot high, which and the leaves are bright yellow when dry. *Leaves* 1-1½ in., coriaceous. *Cymes* on short peduncles ¼ in., flowers subcapitate.—This resembles *H. villosa* in many respects, but differs in the strict habit, sessile leaves, with only two pairs of nerves and quite glabrous inflorescence.

37. *H. Griffithii*, Hook. f.; woody, branches erect acutely 4-angled puberulous, leaves sessile lanceolate acuminate coriaceous scaberulous nerveless, stipules short cuspidate coriaceous, heads terminal sessile involucrate, calyx-teeth subulate much shorter than the globose glabrous pedicelled capsule which has a large protruded top.

BHOTAN; in woods, alt. 4200 ft., *Griffith (Bootan Journal, n. 318)*.

An erect shrub, 2 ft. high, with strict stem and branches, nodes distant. *Leaves* 1½-2 in., deflexed, with recurved margins in the fruiting state of the plant, yellowish when dry. *Heads of fruit* globose, ½ in. diam., involucrate by the large upper leaves. *Capsule* smooth, crustaceous, with very many small angular seeds.—A very distinct species, seen in fruit only, the tip of which often exceeds the calyx-teeth; it resembles in habit *H. uncinella*, W. & A.

SECT. III. *Euhedyotis*. *Fruit* indehiscent or tardily dehiscent, or the crown only dehiscing loculicidally.—Herbs, diffuse or subscandent, with usually axillary dense-fl. cymes.

* *Fruit* hard, minute, indehiscent; cells few-seeded. *Cymes* almost all axillary. *Leaves* usually plaited longitudinally with very strong nerves, rarely flat with slender nerves, never only 1-nerved (nerves faint in *H. paradoxa*); stipules ciliate.

38. *H. vestita*, Br. in Wall. Cat. 847; diffuse, villous, leaves petioled elliptic-lanceolate acuminate plaited, nerves 5-7 pair, stipules membranous with long cilia, cymes villous small axillary shortly peduncled, fruit minute globose hairy indehiscent, calyx-teeth subulate. *G. Don Gen. Syst.* iii. 526. *H. costata*, Kurz in Journ. As. Soc. 1877, ii. 135, not of Wallich. *H. coerulea*, Korth. in Ned. Kruidkund. Arch. ii. 160. *H. capituliflora*, Mig. Fl. Ind. Bat. ii. 183. *Metabolus coeruleus*, Blume Bijl. 992; DC. Prodr. iv. 435. *M. lineatus*, Bartl. in DC. l. c. *Spermacece costata*, Roxb. Hort. Beng. 10; Fl. Ind. i. 370.

Subtropical SIKKIM and the KHASIA MTS., alt. 1-5000 ft. ASSAM, CACHAR, the MALAY PENINSULA, and PENANG, common.—DISTRIB. Malay and Philippine Islands.

A stout herb, 1-2 ft. long, branches terete. *Leaves* 2-4 in., greenish when dry; stipules villous, with 1-3 subulate processes. *Cymes* inconspicuous, peduncle 0 or ¼-½ in., simple or branched; flowers very small, crowded in heads ¼-½ in. diam., lilac or pink. *Capsules* ⅛ in.

39. *H. Auricularia*, Linn.; DC. Prodr. iv. 420; annual, suberect or diffuse, branches glabrous or hirsute especially at the nodes, leaves sessile subsessile or petioled ovate or lanceolate acuminate smooth or scabrid above often pubescent beneath, stipules membranous hairy with long cilia, cymes axillary sessile small very dense-flowered, flowers subsessile, calyx-teeth small shorter than the indehiscent glabrous or hispid fruit. Roxb. Fl. Ind. i. 365; ed. Carey & Wall. i. 370, excl. remarks; W. & A. Prodr. 412; Bedd. Ic. Pl. Ind. Or. t. 27. *H. nervosa*, Wall. Cat. 857 (? of Lamk.). *H. procumbens*, Wall. Cat. 861. *H.*

lineata, Wall. Cat. 6198, not of Roxb. *H. costata*, Br. in Wall. Cat. 849; *G. Don Gen. Syst.* iii. 526. *H. multicaulis*, Schldl. Pl. Hohen. No. 845. *H. venosa*, Korth. in Ned. Kruidk. Arch. ii. 160. *Metabolus venosus*, Bl.; DC. Prodr. iv. 435. *Spermacece hispida*, Miq. Pl. Hohen. No. 44. ? *S. lineata*, Roxb. Fl. Ind. ii. 369.—*Rheede Hort. Malab.* x. t. 32.

Throughout eastern Bengal from NIPAL, SIKKIM, and the KHASIA Mts. to ASSAM, CHITTAGONG, MUNEEPOOR, BIRMA, and southward to MALACCA, *Maingay* (Kew Distrib. 891, *H. vestita*). WESTERN PENINSULA, from CANARA, southwards. CEYLON, abundant.—DISTRIB. Yunnan, Malay Archipelago, S. China, Philippines, Australia.

Branches 6–18 in., terete. *Leaves* usually pale green when dry, 1–3 in.; stipules as in the two previous species. *Cymes* always sessile. *Calyx-teeth* variable.—There are several very distinct looking varieties, but I am unable to define them clearly enough for diagnosis. Wallich's *H. lineata*, from the Deccan (No. 6198), is almost glabrous throughout, as are some Khasian specimens. The stems appear to be erect and woody in Wallich's *H. nervosa* (No. 857), and the calyx-teeth are longer in specimens gathered by Thomson and myself in the Khasia at 4–6000 ft., and at Chittagong and Muneypoor by C. B. Clarke. Some Ceylon specimens have leaves with petiole $\frac{1}{2}$ in., and long caudate points, as in Beddome's figure.

40. ***H. lineata***, Roxb. Hort. Beng. 10; Fl. Ind. i. 365; annual, pubescent, suberect or diffuse, leaves sessile ovate- or elliptic-lanceolate acute or acuminate, stipules membranous villous with one or more long cilia, cymes axillary hispid shortly peduncled, branches few-fl., calyx-teeth much longer than the hispid indehiscent pedicelled fruit. DC. Prodr. iv. 420; Don Prodr. 134. *H. ulmifolia*, Wall. in Roxb. Fl. Ind., ed. Carey & Wall. i. 173; Cat. 862; DC. Prodr. iv. 421.

TROPICAL HIMALAYA of NIPAL and SIKKIM, alt. 1–2000 ft. EASTERN BENGAL, SILHET, CHITTAGONG, and TENASSERIM.

Very similar to *H. Auricularia*, but more finely pubescent, with pedicelled branched cymes $\frac{1}{2}$ – $\frac{3}{4}$ in. long, and long calyx-teeth.—I reluctantly postpone Wallich's well-known name of *H. ulmifolia* for Roxburgh's earlier one of *H. lineata*, though there is no convincing evidence of this being Roxburgh's plant; the name has been misapplied to *H. Auricularia* by Wallich.

41. ***H. glabra***, Br. in Wall. Cat. 848; glabrous, diffuse, stem elongate, leaves subsessile elongate-lanceolate caudate-acuminate membranous, stipules short with long simple or branched cilia, cymes on filiform axillary peduncles puberulous small loosely branched spreading, calyx-teeth much shorter than the glabrous indehiscent globose pedicelled fruit. Miq. Fl. Ind. Bat. ii. 183. *Spermacece glabra*, Roxb. Fl. Ind. i. 368. *Knoxia glabra*, DC. Prodr. iv. 569.

SILHET, De Silva. CACHAR, J. D. H. & T. T., &c. BIRMA, Griffith. PENANG, Wallich, Maingay.

Stems 2–3 ft., slender, smooth, terete, fistular; nodes distant. *Leaves* 3–5 by $\frac{1}{4}$ – $1\frac{1}{2}$ in., point often almost filiform, nerves slender; stipules with very slender spinous processes sometimes $\frac{1}{2}$ in. long and much branched. *Peduncles* $\frac{1}{4}$ – $\frac{1}{2}$ in., bracts small. *Flowers* minute, as are the fruits.

42. ***H. paradoxa***, Kurz in Journ. As. Soc. 1876, ii. 135; glabrous, branches obtusely 4-angled robust, leaves sessile long linear or linear-lanceolate acute, nerves beneath very faint, stipules membranous with ciliate bristles, cymes capitate axillary globose very dense-flowered, calyx-teeth subulate hispid longer than the globose pedicelled fruit.

SOUTH ANDAMAN ISLAND; Escape Bay, Kurz.

Apparently a large species; branches smooth, thick, almost terete. *Leaves* 4–6 by $\frac{3}{4}$ –1 in., narrowed at both ends, flat, nerves very oblique; stipular bristles longer

than the sheath. *Cymes* enclosing the nodes, 1 in. diam. *Fruit* small, crustaceous, smooth; cells about 6-seeded.—I have seen but one specimen, and in fruit only.

**** Capsule crustaceous, rarely coriaceous, loculicidal on the crown only; cells many-seeded; seeds usually angular. Cymes sessile, capitate or few-flowered, axillary or terminal; leaves glabrous or hispid, with one central nerve; stipules with long bristles.**—*SCLEROMITRION*, W. & A.

43. ***H. pinifolia*, Wall. Cat. 850**; branches acutely 4-angled, angles sometimes hispid, leaves very narrow linear acuminate scabrid above 1-nerved, margins revolute, stipules with many rigid bristles, cymes sessile capitate axillary and terminal, calyx-teeth subulate shorter than the ovoid hispid capsule. *G. Don Gen. Syst.* iii. 525. *Scleromitron rigidum*, Kurz in *Journ. As. Soc.* 1877, ii. 136, excl. *Syn. Miquel*.

BEHAR and CHOTA-NAGPore, alt. 1-2000 ft., *T. Anderson, C. B. Clarke*. MALAYAN PENINSULA, from Pegu and the Andaman Islands to Singapore and Penang.—DISTRIB. Sumatra, Java, Borneo.

A slender diffuse wiry much-branched annual, 4-8 in. high, black when dry. *Leaves* often fascicled, 1-1½ in., spreading and recurved, rigid; stipules very short. *Heads* ¼-½ in. diam., 3- many flowered.—Kurz's *S. rigidum* agrees with this in the form of the leaves, but he describes these as glabrous, whereas they are distinctly scabrid in *H. pinifolia*; he further, by some error, quoted Miquel's *Hedyotis rigida* (*Fl. Ind. Bat.* ii. 181), a shrubby species described as having lanceolate leaves 6 in. long,

VAR. *cæspitosa*; shorter, branches tortuous, leaves quite glabrous and smooth, much closer set, cymes 1- few-flowered, capsules quite glabrous. *Scleromitron cæspitosum*, Miquel. *Fl. Ind. Bat. Suppl.* 540. Malacca, Griffith; Singapore, G. Thomson; Java, Barnes.—Possibly a different species.

44. ***H. cœrulea*, W. & A. Prodr. 412**; erect, branches terete puberulous, leaves opposite or fascicled linear-subulate aristate smooth above or scabrid 1-nerved, margins revolute, stipules pectinate with filiform bristles, cymes sessile capitate axillary and terminal, calyx-teeth triangular with hair-points rather shorter than the glabrous capsule. *Bedd. Ic. Pl. Ind. Or.* t. 30. *H. pygmæa*, Wall. Cat. 6199. *H. brachiata*, Miquel. *Pl. Hohenack.* No. 373. *H. cyanantha*, Kurz in *Journ. As. Soc.* 1876, ii. 136.

WESTERN PENINSULA from Dharwar southwards, and in CEYLON; in sandy places. A slender strict annual 6-14 in. high, much branched. *Leaves* brown when dry, ½-1½ in., very narrow. *Heads* much fewer-flowered than in *H. pinifolia*, from which the hair-pointed leaves and calyx-teeth well distinguish this.

45. ***H. tenelliflora*, Blume Bijl. 971**; glabrous, diffuse, branches acutely 4-angled, leaves sessile linear-lanceolate acuminate 1-nerved, margins revolute, stipules with long cilia, flowers 1-3 axillary sessile, calyx-teeth rigid ovate or lanceolate equalling the ovoid glabrous capsule. *DC. Prodr.* iv. 419. *H. angustifolia*, Cham. & Schlect. in *Linn.* iv. 153. *H. approximata*, Br. in Wall. Cat. 852. ? *Spermacoe tubularis*, Br. in Wall. Cat. *Scleromitron tenelliflorum*, Korth. & S.; *tetraquetrum*, Miquel. *Fl. Ind. Bat.* ii. 185, 186. *Oldenlandia angustifolia*, Benth. *Fl. Hongk.* 151.

SIKKIM HIMALAYA, *Hb. Griffith*. KHASIA Mts., alt. 1-4000 ft., *J. D. H. & T. T. Nicolson's*, Kurz. PENANG, Wallich.—DISTRIB. Malay Islands, S. China, Philippines.

Stems much branched, slender, 6-18 in. *Leaves* blackish-brown when dry, 1-2 by ½-¾ in., stiff, pale beneath, stipular hairs often exceeding the capsule. *Calyx-teeth* ciliate, variable in breadth and length.—The smooth surfaces of the very narrow leaves distinguish this from *H. hispid*a.

46. ***H. hispida*, Retz Obs. iv. 23**; diffuse, branches and leaves on both surfaces scabrid, leaves sessile elliptic- or linear-lanceolate acute or acuminate

1-nerved, margins recurved, stipules with long cilia, flowers 2-6 in axillary clusters, calyx-teeth triangular about equalling the hispid ovoid capsule. *Roxb. Fl. Ind.* t. 364; *Wall. Cat.* 845. *Scleromitrium hispidum*, *Korth.*; *Miq. Fl. Ind. Bat.* ii. 185. *Oldenlandia hispida*, *Benth. Fl. Hongk.* 150.

TROPICAL HIMALAYA, from Chamba and Kangra, *C. B. Clarke*, to SIKKIM and the KHASIA MTS., ASSAM, CACHAR, CHITTAGONG, and the MALAYAN PENINSULA from Tenasserim to Malacca.—DISTRIB. Malay Islands, S. China.

Annual; branches 6-18 in., terete below, 4-angled above. *Leaves* $1\frac{1}{2}$ - $2\frac{1}{2}$ in., very variable in width, rough and rigid. *Capsule* similar to that of *H. tenelliflora*, but glabrous.

47. **H. nitida**, *W. & A. Prodr.* 412; branches diffuse elongate acutely 4-angled, leaves sessile elliptic- or linear-lanceolate acute scaberulous or smooth above smooth beneath 1-nerved, margins recurved, stipules with long cilia, flowers 1 or few axillary sessile, calyx-teeth triangular erect equalling the glabrous capsule. *H. Neesiana*, *Arn. Pugill.* 23. *H. glabella*, *Br. in Wall. Cat.* 886; *Bedd. Ic. Pl. Ind. Or.* t. 36.

WESTERN PENINSULA, from Dharwar southwards to Travancore and CEYLON? TENASSERIM, *Kurz.*

A slender annual, similar in habit to *H. hispida*, but with leaves smooth or sparingly scabrid towards the margins above only, shining and green, and glabrous capsules.—I have seen no Tenasserim specimens, and it is possible that *Kurz's* plant is *H. hispida*, of which this may be a smooth variety.

*** *Fruit* crustaceous, indehiscent; cymes axillary (and terminal in *H. scabra*), sessile, capitate or few-fld.; leaves flat, with or without lateral nerves; stipules triangular, entire or gland-serrate or fimbriate, not bristly; corolla very short.

48. **H. inamoena**, *Thw. Enum.* 143 in part; shrubby, glabrous, erect, 3-chotomously branched, branches subterete, leaves petioled ovate-lanceolate caudate-acuminate nerves arching faint, stipules connate below triangular glandular-pubescent caducous, cymes axillary very short few-flowered subsessile, calyx-limb cup-shaped teeth broad shorter than the smooth fruit.

CEYLON; Adam's Peak, *Thwaites.*

A tall slender shrub, with long slender erecto-patent branches, obscurely 4-angled above, black when dry. *Leaves* dark brownish-green when dry, 3-5 by $\frac{1}{2}$ - $1\frac{1}{2}$ in., leathery, smooth, with a distinct midrib and faint-arching nerves; stipules short. *Flowers* 3-5, almost sessile, small, glabrous. *Calyx-tube* hemispheric. *Ripe fruit* not seen.—Very like *H. cinerco-viridis*, with which it has been mixed in Herbaria.

49. **H. congesta**, *Br. in Wall. Cat.* 844; robust, glabrous, branches acutely 4-angled, leaves sessile or shortly petioled elliptic or ovate-lanceolate acutely or obtusely acuminate leathery, nerves arching faint, stipules elongate ovate with a long entire serrate or lacerate point, flowers in crowded axillary heads, calyx-teeth broadly triangular obtuse shorter than the ovoid thick smooth fruit. *G. Don Gen. Syst.* iii. 525. *H. argentea*, *Wall. Cat.* 858.

MALAYAN PENINSULA from Tenasserim to Malacca, *Wallich*, &c.; PENANG, *Maingay*. —DISTRIB. Sumatra, Borneo.

A stout shrub with brachiate branches. *Leaves* pale when dry, 3-5 by 1-2 in., quite glabrous and smooth on both surfaces; stipules sometimes $\frac{1}{2}$ in., coriaceous, segments sometimes branched. *Flowers* clustered, small. *Calyx-tube* hemispheric. *Fruit* subdrupaceous, white.

50. **H. prostrata**, *Korth. in Ned. Kruidk. Arch.* ii. 160; glabrous, branches long flexuous prostrate or scandent? obtusely 4-angled, leaves petioled elliptic-lanceolate acuminate, nerves distinct, stipules elongate coriaceous toothed or subpectinate, cymes axillary small subsessile few-flowered, calyx-

teeth triangular. *H. subcarnosa*, Wall. Cat. 860. *Metabolus prostratus*, Bl.; DC. Prodr. iv. 435.

TENASSERIM; Chappedong Hills, Wallich, Helfer.—DISTRIB. Java, Borneo.

Stem flexuous, rooting below, sending out long slender flexuous branches with distant internodes. *Leaves* green when dry, 3-4 by $\frac{3}{4}$ -1 $\frac{1}{2}$ in., quite smooth, rather membranous, narrowed into a slender petiole $\frac{1}{4}$ - $\frac{1}{2}$ in.; stipules coriaceous, very variable in length, with glandular teeth, erect or recurved. *Cymes* very small, flowers not seen. *Fruit* small, smooth, cells about 6-seeded.—This, though referred in Miquel's Flora to § *Diplophragma*, is certainly a *Euhedyotis*.

51. *H. scabra*, Wall. Cat. 880; a low woody herb, branches terete young pubescent, leaves subsessile lanceolate acuminate scaberulous or glabrous, uppermost involucriform, nerves faint, stipules small triangular, cymes terminal (and axillary?) capitate sessile, calyx-teeth triangular-subulate shorter than the small globose glabrous fruit.

MARTABAN and TENASSERIM; Moulmein, Wallich; Mergui, Griffith, &c.

Very much branched, branches woody, whitish, the younger and leaves dark-brown when dry. *Leaves* 1-2 in., the upper stellately spreading round the cymes, base very acute, very obscurely scabrid; stipules pubescent, teeth few glandular. *Cymes* globose, $\frac{1}{2}$ in. diam.; flowers very shortly pedicelled. *Corolla* very small, tube and lobes short. *Fruit* crustaceous, many-seeded, apparently indehiscent, but there is a trace of a loculicidal groove on the crown between the calyx-teeth.—Very near a N. Celebes species, which has longer calyx-lobes.

SECT. IV. *Involucrella*. *Fruit* membranous, 2-3-celled, very many seeded, indehiscent, top not protruded between the calyx-teeth.—A herb with a terminal capitate sessile cyme, which is sunk amongst the bases of the involucriform uppermost leaves, stipules membranous with many very long subequal stiff recurved bristles.

52. *H. connata*, Wall. Cat. 856; decumbent, branches 4-angled pubescent, leaves sessile oblong or linear-oblong acute coriaceous flat, nerves faint, stipular bristles longer than the sheath, calyx-teeth broadly lanceolate many times longer than the oblong fruit. *H. merguensis*, Hook. f. in Gen. Pl. ii. 57.

TENASSERIM; Tavoy, Gomez; Amherst, Wallich; Mergui, Griffith. ANDAMAN Islands, Kurz.

A stout-branched low herb, root woody. *Leaves* 2-3 by $\frac{1}{2}$ -1 in., suddenly narrowed at the base, but hardly petioled, puberulous on the faint nerves beneath; stipules connate, bristles $\frac{1}{2}$ in. long. *Cymes* quite hidden; flowers mixed with long stipular bracteoles, rarely cymes are formed in the lower axils. *Fruit* often 3-celled, bursting irregularly, walls full of raphides. *Seeds* angular, dotted.

SECT. V. *Anotidopsis*. *Fruit* membranous, rarely crustaceous, 2-celled, indehiscent or obscurely dehiscing loculicidally between the calyx-teeth, crown not protruded between the calyx-teeth.—Herbs or small shrubs, with axillary or terminal sessile or peduncled cymes; stipules membranous, usually bristly.—Habit of *Anotis*.

53. *H. cyanescens*, Thwaites Enum. 143; hairy, stems decumbent rooting acutely 4-angled, leaves petioled elliptic-ovate acute membranous nerves distinct, stipules short bristly, cymes axillary dense many-flowered, flowers pedicelled, calyx-teeth lanceolate ciliate many times longer than the membranous many-seeded fruit.

CEYLON; Ambagowa district, Thwaites.

An undershrub, often bluish-purple (Thwaites), branches glabrous or hairy. *Leaves* 1-3 by $\frac{3}{4}$ -1 $\frac{1}{2}$ in., with short scattered hairs above, more pubescent beneath. flat; nerves 5-6 pair, arched; petiole slender, $\frac{1}{4}$ - $\frac{1}{2}$ in.; stipules short, membranous,

with short bristles. *Cymes* compound, branches dense. *Flowers* pedicelled, bluish, mixed with linear ciliate bracteoles. *Corolla-tube* and short lobes hairy, mouth not bearded or villous. *Fruit* elongate obconic, apparently indehiscent, very membranous.

54. **H. monocephala**, Br. in Wall. Cat. 846 (corrected from *macrocephala*); glabrous or puberulous, flaccid, branched, decumbent, leaves subsessile elliptic-lanceolate acuminate, nerves obscure, stipules slender recurved toothed or pectinate, cymes terminal capitate sessile glabrous, calyx-teeth lanceolate longer than the young fruit.

SILHET, Wallich. ASSAM, Hamilton, Masters; UPPER ASSAM, Griffith.

A slender straggling species, dark brown when dry; branches 4-angled, grooved, the ridges puberulous. *Leaves* 1-1½ in., base very acute, quite glabrous on both surfaces; stipules variable, sometimes of one long recurved very slender simple or cut bristle, at others with 2 or more long bristles. *Cymes* ¼-½ in. diam., terminal or rarely on short axillary branches with usually small leaves at their base. *Flowers* quite glabrous, except the corolla-lobes within, larger than in *H. scabra*, but still small. *Ripe fruit* not seen.—An allied plant from Tenasserim or the Andamans (Helfer, Kew Distrib. 2884) is much stouter, with caudate-acuminate leaves. Specimens from Griffith in Herb. Bentham are marked as from Darjeeling, but are probably from Assam. The species was originally found by Hamilton at Birnasherva in 1808 (probably in Assam).

55. **H. stipulata**, Br. in Wall. Cat. 6195 and 863 a; stems lax diffuse rooting below glabrous or puberulous, leaves ovate or lanceolate acute membranous, nerves slender, stipules with long bristles, cymes capitate sessile or peduncled axillary or terminal glabrous, calyx-teeth lanceolate recurved longer than the membranous broadly globose fruit. *H. Lindleyana*, Hook. mss. in W. & A. Prodr. 409. *Oldenlandia japonica*, Miq. in Ann. Mus. Lugd. Bat. ii. 194. *O. hirsuta*, Linn. fil.; DC. Prodr. 127. ? *Anotis capitata*, Korth. in Ned. Kruidk. Archiv. ii. 151.

TEMPERATE HIMALAYA, alt. 3-8000 ft., from Dalhousie to BHOTAN, common. KHASIA MTS., alt. 4-5000 ft.—DISTRIB. Java, Japan.

Branches slender, decumbent, 1-2 ft., terete and leaves dark brown when dry. *Leaves* ¾-2 in., variable in width, glabrous or with a few soft scattered hairs above and on the nerves beneath, base acute or rounded; petiole ½-¾ in.; stipules cut into filiform bristles nearly to the base. *Cymes* ¼-½ in. diam. *Flowers* quite glabrous, pedicelled. *Fruit* membranous, indehiscent or with a loculicidal fissure on the crown between the calyx-teeth. *Seeds* many, small, angular and pitted.—Very similar to *Anotis ingrata*.

56. **H. Thomsoni**, Hook. f.; annual, short, suberect, much branched from the base, leaves fascicled sessile narrow-linear acute margins recurved, stipules forming a short sheath with the petioles bristly, cymes dense in all the axils and terminal, calyx-teeth lanceolate recurved longer than the broadly obconic membranous fruit.

EAST BENGAL; banks of the Megna and Mahanudde, J. D. H. & T. T.

Stem very short with fibrous roots, branches suberect 4-angled leafy. *Leaves* ¾-1 by ⅓ in., spreading and recurved, minutely rough above, midrib strong beneath, rather dilated at the base and united with the stipules into a short membranous sheath, proliferous in the axils; nerves 0. *Flowers* pedicelled. *Corolla* very minute, glabrous, tube and lobes short. *Fruit* apparently quite indehiscent, but there is a loculicidal furrow between the calyx-teeth, pericarp with raphides (as in *H. connata*). *Seeds* very numerous, small, angular, pitted, pale.—A very remarkable little plant, 3-6 in. high, blackish when dry, not found by any previous collector, with the habit of an *Oldenlandia*, but the fruit appears quite indehiscent and the calyx is altogether that of *Hedyotis* and approaches *H. pinifolia*.

ANOMALOUS SPECIES.

57. *H. andamanica*, Kurz in Journ. As. Soc. 1872, ii. 311; annual. succulent, stems furfuraceous, short stout, leaves large sessile or short-petioled oblong or ovate-oblong apiculate flat, stipules bristly, cymes terminal 1-3 in. long, peduncles erect, flowers subcapitate, calyx-teeth longer than the corolla-tube and than the small didymous capsule.

SOUTH ANDAMAN and NICOBAR ISLANDS, Kurz.

Stems 4-6 in. high, erect, simple or branched. Leaves 3-5 pair, 1-2½ by ½-1½ in., membranous, quite glabrous. Peduncles 1-2 in., slender, strict, erect, bearing 2-3 small bracteate heads of subsessile flowers. Calyx-tube short; teeth large, ovate-lanceolate, recurved. Corolla funnel-shaped; tube broad and glabrous; mouth with a few hairs; lobes linear. Stamens much exserted, anthers linear. Capsule with the crown not protruded, gaping loculicidally. Seeds many in each cell, angular, smooth.—Resembles an *Oldenlandia* near *O. nudicaulis*, but the calyx-teeth are close together in fruit, and the seeds, though not ripe, have no appearance of pitting; the corolla, too, resembles that of *Hedyotis*, and the stamens have linear anthers.

21. *OLDENLANDIA*, L.

Slender erect or diffuse di-tri-chotomously branched herbs. Leaves usually small and narrow; stipules acute or bristly. Flowers small, white or pink, in dichotomous axillary and terminal usually paniced cymes, rarely solitary. Calyx-teeth 4, rarely 5, usually erect and distant in fruit, with sometimes alternating teeth. Corolla rotate funnel- or salver-shaped, tube short or long; lobes 4, rarely 5, obtuse, valvate. Ovary 2-celled; style filiform, stigmas 2 linear; ovules numerous, placentas attached to the septum. Capsule small, usually membranous, terete didymous or angled, loculicidal at the top, rarely indehiscent, many-seeded. Seeds angled or globose, testa not winged, smooth or pitted; embryo clavate in fleshy albumen.—DISTRIB. Species about 70, tropical and subtropical, chiefly Asiatic.

SUBGEN. I. *Euoldenlandia*. Corolla-tube usually short, ovary terete. Capsule didymous. Seeds numerous, angled, testa smooth.—Herbs, diffuse or branching, usually very slender, stipules with bristles.

* Peduncles 1-4-fl., from the lower or all the axils.

1. *O. corymbosa*, Linn.; Hiern in Oliv. Fl. Trop. Afr. iii. 62; annual, slender, glabrous, rarely scaberulous, leaves linear or narrowly elliptic-lanceolate, margins often recurved nerveless, peduncles solitary 1-4-flowered (rarely 2-nate 1-2-flowered) and pedicels long capillary, calyx-teeth subulate rather shorter than the corolla-tube, crown of capsule low. *O. biflora*, Lamk. (not of Linn.); Roxb. Fl. Ind. i. 423. *O. ramosa*, Roxb. l. c. 424. *O. herbacea*, DC. Prodr. v. 425 (not of Linn.). *O. scabrida*, DC. l. c. *O. alsinifolia*, G. Don Gen. Syst. iii. 529. *Hedyotis Burmanniana*, Br. in Wall. Cat. 868, in part; W. & A. Prodr. 415; Dalz. & Gibs. Bomb. Fl. 116. *H. biflora*, Roth Nov. sp. 92; Kurz in Journ. As. Soc. 1877, ii. 133. *H. ramosa*, Bl. Bijdr. 973 (? Wt. Ic. t. 822). *H. intermedia*, W. & A. Prodr. 415. *H. alsinæfolia*, Br. in Wall. Cat. 873. *H. graminicola*, Kurz in Trimen. Journ. Bot. 1875, 326. *Gerontogea biflora*, Cham. et Schl. in Linnæa, iv. 155.—Rheede Hort. Mal. x. t. 38.

An abundant weed throughout INDIA, from the Punjab southward and eastward to Ceylon and Malacca.—DISTRIB. Tropical E. Asia to Java and the Philippines; Trop. Africa and America.

Very variable, not always distinguishable from *O. diffusa* and *O. Heynii*. It varies from a diminutive straggling herb, with branches 1-2 in., to an erect one a foot and more high. Leaves from ½-2 by ⅛-½ in., erect spreading or recurved, sometimes

as broad as in narrow-leaved forms of *H. pumila*; stipules small, membranous, irregularly-cut, with a long and several shorter teeth or bristles. *Peduncles* rarely in pairs or 4- or more-flowered, or reduced and very short as in *O. brachypoda*. *Capsule* usually broad, didymous, sometimes hemispheric or narrowed below the calyx-teeth, base acute or rounded, crown usually not rising above the base of the calyx-teeth, at others hemispheric and approaching that of *O. Heynii*.—The various forms of this plant are distinguished by botanists as species; but these run so much into one another, that it is impossible to correlate their descriptions exactly with the specimens in Wallich's and Wight's herbaria. *O. scabrida* is a very scabrid form; *O. alsinifolia* a glabrous, broad membranous leaved one, like a short-capsuled *O. pumila*; its tissues are sometimes full of cystoliths, in specimens from Penang, S. India, and N.W. India. I have followed Mr. Hiern in adopting Linnæus' name of *corymbosa*; it is certainly the plant so named in the Linnæan Herbarium, though whether it is that of the "Species Plantarum" is doubtful, in my opinion.

2. *O. diffusa*, Roxb. *Hort. Beng.* 11; *Fl. Ind.* i. 423; annual, diffuse, glabrous, leaves linear nerveless, margins usually recurved, flowers solitary sessile or shortly peduncled, calyx-teeth subulate rather shorter than the corolla-tube, capsule didymous, crown low. *DC. Prodr.* iv. 426. *O. brachypoda*, *DC. l. c.* 424; *Wall. Cat.* 864. *Hedyotis ramosissima*, *Kurz in Journ. As. Soc.* 1877, ii. 133. *H. diffusa*, *Willd. Sp. Pl.* i. 566.

An abundant weed throughout INDIA, from Rohilkund to Ceylon and Malacca.—**DISTRIB.** Tropical Asia to Borneo, the Philippines, and Japan.

I keep this distinct from *O. corymbosa* on the ground of its being a generally recognised form, more constantly diffuse, always glabrous, with shorter stouter peduncles or pedicels and larger capsules. It is, however, united by many aberrant specimens with that plant.

VAR.? *extensa*; more robust, stems as thick as a crow-quill shining 2 ft. long, leaves often $2\frac{1}{4}$ by $\frac{1}{4}$ in., peduncles longer 1-2-fl., capsule $\frac{1}{2}$ in. diam. *Hedyotis extensa*, *Br. in Wall. Cat.* 869.—Silhet, Wallich, Griffith (Kew Distrib. 2910).

VAR.? *polygonoides*; perennial-rooted, leaves very small $\frac{1}{4}$ — $\frac{1}{2}$ in. narrow. *Hedyotis polygonoides*, *Wall. Cat.* 872.—Birma, Wallich.

3. *O. Heynii*, *Br. in Wall. Cat.* 867, partly (*Hedyotis*); annual or biennial, glabrous, erect, much branched, leaves linear- or linear-lanceolate nerveless, margins usually recurved, peduncles solitary capillary 1-flowered, calyx-teeth subulate much shorter than the slender corolla-tube, capsules didymous globose or ovoid, crown much protruded. *O. herbacea*, *Willd.*; *Roxb. Fl. Ind.* 424 (? of Linnæus). ? *O. linearis*, *linifolia*, and *asperula*, *DC. Prodr.* iv. 425. *Hedyotis Heynii*, *W. & A. Prodr.* 416; *Dalz. & Gibs. Bomb. Fl.* 116.—*Rheede Hort. Mal.* x. t. 23.

Mountainous part of INDIA from Kumaon, alt. 5500 ft., to the Khasia Mts., alt. 4000 ft., and southward to Ceylon; not found in the Malay Peninsula or the Eastern Himalaya.—**DISTRIB.** Malay Islands, Tropical Africa.

Usually a taller stricter much more robust plant than *O. corymbosa*, with a longer more ovoid capsule, having a much protruded crown and usually 1-flowered solitary or 2-nate filiform peduncle equalling the leaves; but these characters are far from constant, and in some examples the flowers are paniced towards the ends of the branches as in the next subsection. The name *Heynii* may have to give place to some of the synonyms cited, if ever these are cleared up.

4. *O. crystallina*, *Roxb. Hort. Beng.* 11; *Fl. Ind.* i. 422; annual, glabrous, branches low diffuse leafy, leaves elliptic- or elliptic-lanceolate subacute flat, peduncles solitary 1-2-fl. filiform equalling the leaves, calyx-teeth triangular-lanceolate, bases touching in fruit, a little shorter than the corolla-tube, capsule obovoid, crown low. *DC. Prodr.* iv. 426. *O. pumila*, *DC. l. c.* 425. *Hedyotis numila*, *Linn. f.*; *Wall. Cat.* 8200. *chiefu*: *W. & A. Prodr.* 414.

Not uncommon in the PLAINS of INDIA from Rohilkund southwards and eastwards, but local. EAST BENGAL, *Griffith* (Kew Distrib. 2912). CHITTAGONG, *C. B. Clarke*. DECCAN not uncommon. (Not found yet in East Himalaya, Assam, the Khasia or Malay Peninsula).—DISTRIB. JAVA.

A diffuse flaccid herb; branches 2-3 in. Leaves $\frac{1}{2}$ – $\frac{2}{3}$ in.—The large calyx-teeth well distinguish this from any of the foregoing species. The tissues are sometimes full of raphides, as in some states of *O. corymbosa*.

** *Peduncles from the upper axils chiefly, many-flowered.*

5. *O. umbellata*, Linn.; DC. *Prodr.* iv. 425; annual, diffuse, glabrous or scaberulous, leaves often fascicled linear flat or almost acicular with recurved margins acute nerveless, peduncles in the upper axils stout 3-many-flowered, pedicels short, calyx-teeth a little shorter than the corolla-tube subulate, capsule didymous, crown low. *Roxb. Cor. Pl. t. 3*; *Fl. Ind. i. 421*. *O. puberula*, *G. Don Gen. Syst.* iii. 530. *Hedyotis umbellata*, *Lamk.*; *W. & A. Prodr.* 413, *excl. some synonyms*; *Wall. Cat.* 871. *H. linearifolia* and *puberula*, *Wall. Cat.* 870 and 884.

WESTERN PENINSULA, from Orissa southwards, *Roxburgh*, &c. CEYLON, common.—DISTRIB. N. BIRMA, *Kurz*.

Stem woody, much branched from the base. Leaves $\frac{1}{2}$ – $1\frac{1}{2}$ in., spreading or recurved. Cymes sometimes sessile and terminal. Capsules much as in *O. corymbosa*.

6. *O. Wightii*, *Hook. f.*; perennial, scabrid, stem woody flexuous, branches rigid diffuse leafy, leaves squarrose linear-lanceolate acuminate, margins revolute, peduncles chiefly in the upper axils strict with terminal capitate cymes, calyx-teeth triangular-lanceolate pungent equalling the broad hemispheric didymous capsule.

WESTERN PENINSULA, *Herb. Wight* (Kew Distrib. 1511).

Stems creeping in red soil or prostrate, several inches long; branches 4-6 in., tufted, erect or ascending. Leaves $\frac{1}{2}$ –1 in., sessile, pungent, scabrid on both surfaces; stipules short, bristly. Peduncles usually exceeding the leaves, stout, scabrid. Heads $\frac{1}{4}$ in. diam.; flowers sessile. Capsules large, scabrid, with a broad low crown and long spreading teeth.—This approaches a *Hedyotis* of the section *Scleromitron*, but the foliage is not that of the majority of that group, and the form of the capsule and distant calyx-teeth well distinguish it.
